

1 Q. **Cost of Service Study (COSS) evidence - Exhibit JAB**

2

3 **(1) Industrial revenues:** Explain the basis for (a) the Industrial - Firm  
4 revenue credit of \$40,326 in Schedule 1.2, line 4, column 4, and (b) the  
5 Industrial - Non Firm Revenues of \$381,121 in Schedule 102, line 5, column  
6 2. In each instance, indicate all billing determinants and rates assumed for  
7 these estimates.

8

9 **(2) Industrial -Non Firm costs:**

10 (a) Indicate any cost based rationale for the demand charge of \$1.50 per kW  
11 proposed for non-firm sales to IC.

12 (b) Confirm that the COSS provides no analysis of any demand related costs  
13 for non-firm sales, and that the costs assigned to this service in the COSS  
14 are solely the firm energy cost of \$.02311 per kWh. (Schedule 1.3, page 1)

15 (c) Provide a table setting out the assumed COSS generation (MWh) by  
16 source (hydraulic, No. 6 fuel, diesel fuel, gas turbine fuel, power purchases  
17 from NUGs, power purchases from non-NUGs) and month for the test year  
18 2002 for the Island Interconnected System. Indicate the likely percent of load  
19 supplied by thermal during off-peak hours (low load evenings and weekend  
20 hours) during each month.

21 (d) Indicate annual functionalized cost of service for each of the above  
22 generation sources (in (c) above) and for transmission based on COSS for  
23 the Island Interconnected System, showing separately for each generation  
24 source and for transmission (where this is separate): fuel expenses, O&M,  
25 depreciation, expense credits, disposal gain/loss, return on debt and return  
26 on equity. Indicate classified generation and transmission costs (Production  
27 Demand, Production and Transmission Energy, Transmission Demand)  
28 separately for each fuel source and for transmission.

1 (e) Compare in detail the COSS firm energy cost of \$.02311 per kWh and the  
2 non-firm energy charge rate as proposed in Schedule A of the Application  
3 (page 3), assuming the average cost of fuel assumed for the COSS; indicate  
4 how this charge could likely vary by month and time of day, based on the  
5 assumptions adopted for COSS as to expected fuel use. Explain how in  
6 practice it will be determined what fuel source is used to supply non-firm  
7 energy. What will happen if this energy is supplied in whole or in part from  
8 non-thermal sources?  
9

10 **(3) Holyrood average capacity factor:** Provide, on the same basis as  
11 Schedule 4.3, the calculations to indicate the forecast net capacity factor for  
12 Holyrood for the year 2002. Explain the factors affecting variances in this  
13 capacity factor for the years 1997 through 2002. Assuming that the COSS for  
14 2002 assumes No. 6 fuel consumption based on average hydraulic  
15 generation availability and forecasts loads, why would it not be more  
16 appropriate to use the net capacity factor consistent with these assumptions  
17 rather than one based on the prior 5-year actual average?  
18

19 **(4) Loads used for COSS:** Provide a table of the Island Interconnected  
20 System test year 2002 setting out for each rate class the following  
21 projections: billing demands at customer meter; coincident peak loads at  
22 customer meter and at generator (after provision for losses); 2CP kW at  
23 customer meter and at generator (after provision for losses); sales at  
24 customer meter and generation energy requirements after losses; number of  
25 customers for COSS allocation purposes. Explain all assumptions used to  
26 derive these projections.  
27

28 **(5) Load Factor classification - generation costs:** Review the rationale  
29 behind the Board's 1993 Report recommendation for splitting hydraulic plant

1 costs for the Island Interconnected System between energy and demand  
2 based on the system load factor. Indicate the change that this creates from  
3 the previous COSS adopted by Hydro for the last rate hearing. Indicate the  
4 rationale for also applying the load factor of each Isolated Diesel system  
5 group in order to split diesel plant costs between energy and demand.  
6

7 **(6) Generation cost allocation:** As reviewed in the evidence of J. A.  
8 Brickhill (page 8), generation costs for the Island Interconnected System  
9 have been allocated among rate classes based on a 2CP allocator. Provide  
10 the loss of load hours (LOLH) study carried out by Hydro which supports use  
11 of a 2CP allocator because it indicates a greater risk of loss of load hours  
12 largely in two winter months. Provide the annual data supporting Schedule II  
13 of J. A Brickhill's evidence for each year indicated in this schedule (1994,  
14 1996, 1997, 1998, 1999, 2000); provide the same information for 1995 (if  
15 available), projections for 2001, and the numbers supporting the projections  
16 for 2002. Indicate any other tests that could reasonably be considered when  
17 testing an allocation method in addition to the variation in results over time,  
18 and assess the 2CP method in light of each such test.  
19

20 **(7) Changes to rural deficit allocation:** L. A Brickhill indicates at page 14  
21 that the method of allocating the rural deficit between customers has  
22 changed to reflect the change in methodology from AED-based to CP-based.  
23 Indicate the difference in COSS results due to this one change in  
24 methodology, and the impact that this change has on allocation of the rural  
25 deficit for the 2002 test year.  
26

27 **(8) Changes in RSP allocation:** L. A Brickhill indicates at page 15 that the  
28 RSP has historically been split between participating customer groups based  
29 on Hydro's COSS. Indicate what changes, if any, the current COS

1 methodology makes with respect to such splits compared to the COSS  
2 methodology used previously and provide an assessment of the differences if  
3 any that result to the test year 2002 RSP allocation as provided for in  
4 schedule 1.2.1 of the COSS.

5  
6 A. (1)(a) The Industrial - Firm revenue credit of \$40,326 in Schedule 1.2, line 4,  
7 column 4, (Exhibit JAB-1, page 4) was allocated to customer classes based  
8 on revenue requirement. The \$40,326 was therefore calculated as follows:

9

10	Industrial Firm Revenue Requirement	
11	Before Deficit and Revenue Credit	\$ 50,005,883
12	Divided by:	
13	Total Island Interconnected Revenue	
14	Revenue Requirement (Excluding Non-	
15	Firm Revenue Requirement)	\$277,812,814
16	Equals	18%
17	Multiplied By	
18	Total Island Interconnected Non-Firm	
19	Revenue Credit	\$ 224,033
20	Equals	\$ 40,326

21  
22 (1)(b) The Industrial - Non Firm Revenues of \$381,121 in Schedule 1.2, line  
23 5, column 2 was calculated as shown on the attached Page 11 of 12.

24  
25 (2) Industrial -Non Firm costs:

26 a) Please see response to NP-183.

27  
28 b) The costs assigned to non-firm sales are as detailed in the Island  
29 Interconnected schedule showing the allocation of functionalized

1 amounts to classes of service (Exhibit JAB-1, pages 39-40). The  
2 \$157,088 is comprised of only energy cost allocations. The firm  
3 energy cost of \$.02311 per kWh was derived from these allocated  
4 costs, rather than providing the basis for determining the costs.

5

6 c) The table below shows the assumed Cost of Service Generation by  
7 source for the test year 2002 for the Island Interconnected System.

8

**Island Interconnected System  
Assumed Cost of Service Generation by Source  
(MWh)**

Month	Hydraulic Plants	Holyrood (No.6 Fuel)	Diesel Plants	Gas Turbine Plants	Power Purchase	NUGs Power Purchase	Other Power Purchase
January	410,410	304,890	30	1,070	11,600	0	0
February	368,120	275,390	30	240	9,320	0	0
March	426,860	228,670	30	220	9,920	0	0
April	353,830	196,700	30	220	11,120	0	0
May	331,890	152,450	30	220	13,810	0	0
June	329,580	98,350	30	220	13,320	0	0
July	408,050	0	30	220	13,000	0	0
August	401,530	0	30	220	12,820	0	0
September	273,460	147,530	30	220	12,360	0	0
October	290,850	203,260	30	220	13,240	0	0
November	314,300	245,880	30	220	12,870	0	0
December	362,790	304,760	30	900	12,520	0	0
Total	4,271,670	2,157,880	360	4,190	145,900	0	0

9

10 While thermal generation is required to complement production from  
11 Hydro's hydraulic resources in order to meet the overall system load,  
12 its output is varied to maintain system security and for water  
13 management reasons.

14

1 Normally, thermal generation is base loaded at an efficient output  
2 level. Hydraulic generation is used to track the system load. Thermal  
3 output may be reduced for system security or for system loading  
4 reasons (ie. not enough load to share amongst required on-line  
5 generation). As well, thermal output may be increased from its base  
6 load to meet system peak requirements.

7

8 Each week, System Operations sets the thermal base load  
9 requirement to manage the water resource while respecting power  
10 system security. The likely percent of loading supplied by thermal  
11 generation during off peak hours varies as a result of the items  
12 previously mentioned, however, the likely percent of system load  
13 supplied by thermal generation in the off-peak hours is 2 to 5 percent  
14 higher than the percent of system load supplied by thermal generation  
15 in the on-peak hours.

16

17 d) This analysis is not currently available, but work is in progress.

18

19 e) The following table compares the industrial firm energy charge with  
20 the industrial non-firm energy charge by month for 2002. It uses the  
21 average cost of fuel used in the cost of service for each source.

**Comparison of Industrial Firm Rates and Non-Firm Energy Rates**

Month	Firm Energy Rate	Holyrood Non-Firm Energy Rate	Variance from Firm	Gas Turbine Non-Firm Energy Rate	Variance from Firm	Diesel Non-Firm Energy Rate	Variance from Firm
January	\$0.02311	\$0.04387	\$0.02076	\$0.10401	\$0.08090	\$0.10743	\$0.08432
February	\$0.02311	\$0.03914	\$0.01603	\$0.10278	\$0.07967	\$0.10743	\$0.08432
March	\$0.02311	\$0.03914	\$0.01603	\$0.10367	\$0.08056	\$0.10743	\$0.08432
April	\$0.02311	\$0.03745	\$0.01434	\$0.10360	\$0.08049	\$0.10743	\$0.08432
May	\$0.02311	\$0.03745	\$0.01434	\$0.10354	\$0.08043	\$0.10743	\$0.08432
June	\$0.02311	\$0.03686	\$0.01375	\$0.10524	\$0.08213	\$0.10743	\$0.08432
July	\$0.02311	\$0.03686	\$0.01375	\$0.10518	\$0.08207	\$0.10743	\$0.08432
August	\$0.02311	\$0.03686	\$0.01375	\$0.10514	\$0.08203	\$0.10743	\$0.08432
September	\$0.02311	\$0.03657	\$0.01346	\$0.10686	\$0.08375	\$0.10743	\$0.08432
October	\$0.02311	\$0.03639	\$0.01328	\$0.10686	\$0.08375	\$0.10743	\$0.08432
November	\$0.02311	\$0.03620	\$0.01309	\$0.10683	\$0.08372	\$0.10743	\$0.08432
December	\$0.02311	\$0.03613	\$0.01302	\$0.10814	\$0.08503	\$0.10743	\$0.08432

1           The non-firm energy charge will be at the Holyrood non-firm rate for all  
2           periods including the periods when no thermal source is operating,  
3           except when either or both of the diesel plants and the gas turbine  
4           plants are operated or their output must be increased to meet the non-  
5           firm load. Typically the diesel plants or gas turbine plants would be  
6           required to meet non-firm energy requirements during peak load  
7           periods or when there are transmission restrictions to the area of the  
8           grid where the customer is located. Although the higher non-firm rates  
9           could apply during any hour of the year due to transmission or  
10          generation problems, the probability is higher in the winter period  
11          (December to March) and during the peak hours of 0800 to 2000  
12          hours each day.

13  
14          The decision to use a higher cost source is made by the power system  
15          operator when he determines there is insufficient power or energy

1 available from other sources, either hydroelectric or Holyrood to meet  
2 the load demanded on the system, or there is insufficient transmission  
3 capacity to an area where the non-firm load is being demanded.

4

5 (3) The Holyrood net capacity factor for the year 2002 based on the forecast  
6 energy production is as follows:

7

$$8 \quad \frac{2,157,880,000}{466,000 \times 8,760} = 52.86\%$$

9

10  
11 The capacity factors from 1997 to 2000 are based on the thermal production  
12 required in those years. Both hydraulic generation and system load affect  
13 the Holyrood net production requirement. In all of these years the hydraulic  
14 generation was above average resulting in reduced Holyrood requirements.  
15 In addition, in 1998 and 1999 net production at Holyrood was reduced further  
16 due to the lower load caused by extended labour disputes in the pulp and  
17 paper industry. The capacity factors for 2001 and 2002 are based on  
18 forecast net production at Holyrood, which is based on the load forecast for  
19 those years with average hydraulic production.

20

21 (4) The table requested is shown on the attached page 12 of 12.

22

23 (5) At the last rate hearing, hydraulic plant costs for the Island Interconnected  
24 System were split on a 50% demand/50% energy basis in the 1992 COS  
25 Study.

26

27 Diesel plants in the Isolated Systems are operated as base load plants  
28 similar to the Holyrood Thermal plant. For this application, Hydro has

1 proposed using the system load factor for the Labrador and Island Isolated  
2 Systems as a proxy for capacity factor as used for Holyrood for consistency.

3  
4 (6) See response to NP-135 for copy of 2CP allocator report. See response  
5 to IC-137 regarding data supporting Schedule II of J.A. Brickhill. Other tests  
6 which could be reasonably considered are Bonbright's fair-cost-  
7 apportionment objective and the consumer rationing objective. The 2CP  
8 method meets both. It fairly distributes the generation demand requirement  
9 among the Island Interconnected System customers as it reflects cost  
10 causality. It promotes the use of economically justified service because it  
11 allocates costs to those who cause the incurrence of the costs.

12  
13 (7) The 1992 test year Cost of Service (COS) methodology used Average  
14 and Excess Demand (AED) kW to allocate production and transmission  
15 demand costs to rate classes. The proposed methodology uses Coincident  
16 Peak (CP) to perform these allocations. The Cost of Service, revised to  
17 reflect the AED methodology, is attached.

18  
19 (8) The 1992 test year Cost of Service (COS) methodology used Average  
20 and Excess Demand (AED) kW to allocate production and transmission  
21 demand costs to rate classes. The proposed methodology uses Coincident  
22 Peak (CP) to perform these allocations. This change in methodology  
23 impacts the RSP customer splits, as revised actual energy amounts, using  
24 AED methodology, also affected demand costs, and revised demands were  
25 therefore also required for the RSP split between customer groups.  
26 Schedule 1.2.1 (exhibit JAB-1, pages 9-10) is impacted in that CP kW are  
27 also used to determine the unit costs of the deficit. It is important to note that  
28 cost allocation also would change if AED were used. This analysis does not

1 consider those impacts. The effects of allocating the rural deficit (Schedule  
2 1.2.1) using AED on the 2002 forecast annual RSP activity are:

3

4		<u>Proposed</u>	<u>Revised</u>	<u>Difference</u>
5	Newfoundland Power	\$19,380,610	\$19,375,272	\$(5,338)
6	Island Industrial	5,909,874	5,909,874	-
7	Labrador interconnected	<u>199,739</u>	<u>205,077</u>	<u>5,338</u>
8		<u>\$25,490,223</u>	<u>\$25,490,223</u>	<u>-</u>
