

**Q. Re: Supplementary Evidence page 2**

**Please provide information with regards to the approach to hydraulic forecasting used by North American Hydro-based generation utilities. Please indicate which use 30 year rolling average forecasts versus 50 year forecasts (or the full available historic record) as the long-term average. Please indicate whether these utilities use all available data or whether they exclude earlier years of the available hydraulic forecasts. Please indicate which of these utilities use moving averages, and whether any weight the more recent years more than the earlier years. Please indicate whether any of these utilities adjust historical numbers to reflect changes in the climate.**

A. Mr. Brockman based his testimony about the calculation of hydraulic averages upon data provided by Hydro in this case. He has not conducted a study of other hydraulic systems in North America.
