

IC-448 PUB

Please confirm that the SCCT units referred to by EES, at page 8 are fired by natural gas. Please confirm that the statement “gas is currently available for generation within both the Island and Labrador Interconnected systems and thus the peak credit method will work well to classify the costs of hydropower, diesel units and contracts in these areas” sets out the basis EES uses for determining that the peak credit method is appropriate.

Response:

Please refer to NLH-207 PUB.
