

1     Q.     With regard to the R. D. Greneman evidence (page 14, lines 15 to 16),  
2             provide details of how Hydro incorporates marginal cost price signals in its  
3             rates for Industrial Customers. Reconcile this statement with the statement  
4             on page 17, lines 7 to 8 that “Stone & Webster Consultants does not believe  
5             that marginal costs are as appropriate for the Island Industrial Customers as  
6             for NP”.

7  
8  
9     A.     As indicated in page 14, lines 18-21, the fuel rider, which is applicable to NP  
10            and the Industrial Customers, adjusts the rates for all energy by using the  
11            updated forecast cost of fuel. Although not in the form of an explicit price  
12            signal, the industrial customers have the sophistication to understand the  
13            overall effect of additional energy use. Non-firm energy for the industrial  
14            customers is based on the marginal cost of fuel. The statement on page 17,  
15            lines 7-8 was not to suggest that explicit marginal cost signals should not be  
16            incorporated in rates for the Industrial Customers, but rather, to recognize  
17            that these customers already actively plan their energy requirements to  
18            minimize their power on order. The extent to which explicit marginal energy  
19            and demand price signals to the Industrial Customers would enable  
20            additional conservation is uncertain in light of this.
