

1 **Q. DISTRIBUTION**

2  
3 **EXTENSIONS (POOLED), p. 25 of 81, \$6,766,000**

4  
5 **PUB 10.0**

6 **Please provide a summary, by year, of the high and low data that has been excluded**  
7 **from the data provided in Table 2, p. 26 of 81, and of the effect that the inclusion of**  
8 **this data would have on the Unit Cost for each year from 2001 to 2006B.**

9  
10  
11 A. The comment in the paragraph following Table 2 indicates that as part of the historical  
12 unit costing methodology, unusually high and low data is excluded in calculating  
13 historical unit costs. This describes the process in general, and is intended to indicate the  
14 exclusion of any unusually high or low data, only if it exists.

15  
16 Nothing has been excluded from Extensions in the years from 2001 to 2005 in arriving at  
17 the data provided in Table 2. The stated expenditure for each year is the actual  
18 expenditure for Extensions in that year. The adjusted cost is based on the total actual  
19 expenditure, normalized for inflation only.

20  
21 The 2006 budget expenditure shown in Table 2 on page 26 of 81 is therefore calculated  
22 as the actual average inflation adjusted unit cost over the period from 2001 to 2005  
23 multiplied by the projected number of new customers, as follows.

24	25	26	27	28	29	30	31	32	33	34	35	36	37	38
		Actual average inflation adjusted unit cost <sup>1</sup>												
			(\$2,105 + \$1,830 + \$1,859 + \$2,034 + \$1,961) / 5	=			\$1,958							
		Multiplied by the 2006 inflation factor			x		1.0158							
		Equals 2006 forecast unit cost			=		\$1,989							
		Multiplied by the projected number of new customers			x		3,402							
		Equals the budgeted expenditure for 2006 <sup>2</sup>			=		\$6,766,000							

39 <sup>1</sup> 2005 Dollars.

40 <sup>2</sup> Rounded.
