**Attention: Ms. G. Cheryl Blundon, Director of Corporate Services  
and Board Secretary**

Dear Ms. Blundon:

**Re: Newfoundland and Labrador Hydro's- Application for Revisions to Cost of Service  
Methodology- Requests for Information IC-PUB-001 to 016 and IC-NLH-001 to 028**

Further to the above, enclosed please find the original and eight (8) copies of the Island Industrial Customers Group Requests for Information dated June 11, 2019 IC-PUB-001 to IC-PUB-016 (directed to the Brattle Group) and IC-NLH-001 to IC-NLH-028 (directed to Hydro and CA Energy Consulting).

We trust this is in order.

Yours truly,

Stewart McKelvey

Paul L. Coxworthy

**REQUESTS FOR INFORMATION OF  
THE ISLAND INDUSTRIAL CUSTOMERS GROUP**

**Hydro's COS Methodology Review Application/Report; CA Energy Consulting Report**

- 1  
2
- 3
- 4 **IC-NLH-001** At page 1 of Schedule 1 of the 2018 Cost of Service (COS)  
5 Methodology Review Report, lines 4-6, it is noted that *"for many*  
6 *years, load growth on the Island Interconnected System has been*  
7 *supplied by the Holyrood Thermal Generating Station ("Holyrood")*  
8 *until capacity growth warranted a generation plant addition."*
- 9 Please provide the annual growth statistics for the Island  
10 Interconnected System for energy and demand for the last 10  
11 years.
- 12 **IC-NLH-002** At page 1 of Schedule 1 of the 2018 COS Methodology Review  
13 Report, lines 6-9, it is noted that *"upon commissioning of the*  
14 *Muskrat Falls Project, supply cost payments to cover the cost of*  
15 *transmission and generation assets will commence under the*  
16 *Transmission Funding Agreement ("TFA") and Muskrat Falls*  
17 *Power Purchase Agreement ("PPA")"*
- 18 Please provide details of how the COS study relies on these facts,  
19 including the approximate relative share of the "supply cost  
20 payments" noted by Hydro as either fixed or variable.
- 21 **IC-NLH-003** At page 1 of Schedule 1 of the 2018 COS Methodology Review  
22 Report, lines 14-16, it is noted that *"prior to the accessibility of off*  
23 *island purchases, approximately 85% of the test year revenue*  
24 *requirement related to Holyrood was classified as energy-related*  
25 *costs."*
- 26 Please indicate how much of the Holyrood generation is expected  
27 to be replaced by Maritime Link purchases.
- 28 **IC-NLH-004** Please provide details of how much of the Holyrood costs in the  
29 2013 Amended GRA and 2017 GRA revenue requirements were  
30 fixed and how much were variable.
- 31 **IC-NLH-005** Please provide classification of the Holyrood costs, excluding fuel,  
32 in the 2013 Amended GRA and 2017 GRA.
- 33 **IC-NLH-006** On page 3 of Hydro's COS Methodology Review Report, Hydro  
34 notes that legislative impacts include the establishment of a  
35 Labrador Industrial Rates Policy to promote the development of  
36 industrial activity in Labrador.
- 37 Please provide and explain Hydro's viewpoint on whether similar  
38 policies to promote the development of industrial activity (including

1 maintenance of current industrial activity) should also be extended  
2 to the Island portion of the province. Is Hydro, from the overall  
3 perspective of the efficient management of the power system,  
4 indifferent to the maintenance of Island industrial load?

5 **IC-NLH-007**

6 On pages 23 and 24 of COS Methodology Review Report, it is  
7 noted that *“Hydro has also recommended that charges incurred by*  
8 *Hydro through the TFA and Muskrat Falls PPA be functionalized*  
9 *as generation. This includes the costs related to LIL, LTA and*  
10 *Muskrat Falls generation. If the costs of LIL or LTA are determined*  
11 *to be 100% functionalized as transmission, these costs become*  
12 *demand-related because functionalized transmission costs are*  
13 *treated as 100% demand-related. This approach would have*  
14 *similar impacts as those illustrated for the classification approach.”*  
[underline added]

15 Please provide detailed calculations that lead to the underlined  
16 statement by Hydro. Please provide revised Tables 7 and 8 [page  
17 22 of the COS Methodology Review Report] assuming LIL and  
18 LTA costs as 100% transmission and 100% demand related.

19 **IC-NLH-008**

20 At page 8 of Schedule 1 of the COS Methodology Review Report,  
21 Hydro states that *“Hydro’s current classification/allocation*  
22 *approach is comparable to the traditional approaches used by*  
23 *most electric utilities.”*

24 Please explain if using equivalent peaker methodology would also  
25 be comparable to the approaches used by most Canadian electric  
26 utilities, with specific examples of utilities that use the approach.  
27 For each example, please indicate if the equivalent peaker  
28 approach is used for only select plants or for the system as a  
whole.

29 **IC-NLH-009**

30 On page 7 of Schedule 1 of the COS Methodology Review Report,  
31 Hydro notes that it *“proposes to maintain separate cost of service*  
32 *studies for the Labrador Interconnected System and the Island*  
33 *Interconnected System for use in determining customer rates.*  
34 *This approach is consistent with the Government direction*  
35 *exempting customers on the Labrador Interconnected System*  
*from paying costs related to the Muskrat Falls Project.”*

36 In light the Brattle Group’s recommendation to use one cost of  
37 service study for the Labrador Interconnected System (LIS) and  
38 the Island Interconnected System (IIS), has Hydro reconsidered  
39 its proposal to maintain separate cost of service studies for the  
40 LIS and IIS? Is it Hydro’s position that separate cost of service  
41 studies are the only means of complying with the above-noted  
42 Government direction?

43 **IC-NLH-010**

44 Further to IC-NLH-009 above, please explain if there are any cost  
45 impacts to customers of using two separate cost of service studies  
compared to one cost of service study.

1 **IC-NLH-011** On pages 8 and 9 of Schedule 1 of the COS Methodology Review  
2 Report, Hydro notes that *"upon interconnection of the system to*  
3 *the North American grid, marginal generation energy and reserve*  
4 *costs will be represented in most hours by wholesale prices from*  
5 *eastern regions of that grid. For the Island Interconnected grid,*  
6 *marginal generation capacity costs will reflect the costs incurred*  
7 *on the island to serve additional capacity due to the potential for*  
8 *transmission constraints applying at times of peak demand."*

9 If the marginal generation energy values (from added or lost  
10 exports) are relatively low, and the marginal costs due to capacity  
11 constraints are relatively high, does Hydro/CA Energy Consulting  
12 view this as an indication that cost of service classification ratios  
13 should err towards capacity? Why or why not?

14 **IC-NLH-012** On page 11 of Schedule 1 of the COS Methodology Review  
15 Report, Hydro notes that *"the Muskrat Falls Project was selected*  
16 *as the least cost alternative to replace Holyrood primarily based*  
17 *on the projected fuel costs savings over the long term; therefore*  
18 *from a cost causality approach, it appears reasonable that most of*  
19 *the Muskrat Falls Project costs would be considered energy-*  
20 *related."*

21 Please confirm that the alternative supply option to the Muskrat  
22 Falls Project was the Island Isolated Option, as substantially  
23 described in the Public Utilities Board's Final Report dated March  
24 30, 2012 in the Muskrat Falls Review, and in particular at section  
25 4.2, pages 16-18 of that Report. Please confirm that the Isolated  
26 Island Option included more hydraulic and wind generation, and  
27 that this Option was not simply based on reliance on a rebuilt  
28 Holyrood generation facility.

29 **IC-NLH-013** On page 16 of Schedule 1 of the COS Methodology Review  
30 Report, Hydro notes that *"the use of the generation credit provides*  
31 *Newfoundland Power with an estimated coincident peak demand*  
32 *requirement in the cost of service study that is effectively the*  
33 *same as if Newfoundland Power was operating its generation at*  
34 *peak times (with an adjustment for reserves). The provision of the*  
35 *generation credit removes the incentive for Newfoundland Power*  
36 *to operate its thermal generation to minimize its peak demand*  
37 *purchases from Hydro."*

38 Is the rationale above different from the rationale for the CBPP  
39 Pilot Agreement? Please explain.

40 **IC-NLH-014** On page 18 of Schedule 1 of the COS Methodology Review  
41 Report, Hydro proposes that *"net export revenues be classified in*  
42 *the same manner as the classification of the Muskrat Falls Project*  
43 *costs in the cost of service study" and that "net export revenues*  
44 *be included in the test year cost of service study for rate making*  
45 *with variations from forecast net export revenues be dealt with*  
46 *through a deferral account mechanism."*

1 Considering the net export revenues in the cost of service study  
2 are proposed to be classified in the same manner as the  
3 classification of the Muskrat Falls Project costs, how would the  
4 proposed deferral account allocate the costs? Would Hydro use  
5 the cost of service classification factors to allocate variances  
6 (demand and energy), or would it use energy ratios in a manner  
7 similar to the Energy Supply Cost Variance Deferral Account?  
8 Please explain.

9 **IC-NLH-015** With reference to Exhibit 1 of the COS Methodology Review  
10 Report, at page 3 of 3, please explain why Muskrat Falls levelized  
11 cost per kW includes cost related to transmission facilities (LIL  
12 and LTA).

13 **IC-NLH-016** Further to IC-NLH-15, please provide a version of Table 1 in  
14 Exhibit 1 of the COS Methodology Review Report, at page 1 of 3,  
15 which removes LIL and LTA costs from Muskrat Falls levelized  
16 cost per kW.

17 **IC-NLH-017** With reference to Exhibit 1 of the COS Methodology Review  
18 Report, at page 2 of 3, please provide details of the assumptions  
19 used for the gas turbine levelized cost per kW. Please also  
20 provide calculations in MS excel with formulas intact.

21 **IC-NLH-018** With reference to Exhibit 1 of the COS Methodology Review  
22 Report, at page 3 of 3, please provide details of the assumptions  
23 used for calculating the Muskrat Falls levelized cost per kW,  
24 including calculations of levelized costs for LTA and LIL  
25 transmission assets. Please also provide calculations in MS excel  
26 with formulas intact.

27 **IC-NLH-019** With reference to Exhibit 1 of the COS Methodology Review  
28 Report, at page 3 of 3, please provide details of the calculations  
29 that would be applied in future runs (e.g., in 10 years) of the cost  
30 of service study under Hydro's proposal to use the equivalent  
31 peaker method.

32 **IC-NLH-020** CA Energy Consulting report, at page 3, notes "*Section 5.3*  
33 *updates the description of Hydro's investigation of its ability to*  
34 *track operating and maintenance expenditures on specifically*  
35 *assigned transmission facilities of Island Industrial customers.*"

36 Please clarify whether Hydro has the ability to track actual O&M  
37 expenses only for industrial customers or for all Hydro customers  
38 with specifically assigned facilities (including NP).

39 **IC-NLH-021** In CA Energy Consulting's view, how does the fact that most of  
40 the Muskrat Falls costs for Hydro are fixed affect economic  
41 price signals and marginal cost?

42 **IC-NLH-022** Paragraph 3(b)(i) of the *Electrical Power Control Act, 1994*  
43 (EPCA) provides

1 3. It is declared to be the policy of the province that  
2 (b) all sources and facilities for the production, transmission and distribution of  
3 power in the province should be managed and operated in a manner

4 (i) that would result in the most efficient production, transmission and  
5 distribution of power,  
6

7 Please describe CA Energy Consulting's consideration of whether  
8 NP's generation credit incents efficient management and  
9 operation of the power system (i.e., absent a COS credit, NP  
10 would be incented to behave in a manner that is not efficient) and  
11 of whether the CBPP Pilot Agreement incents efficient  
12 management and operation of the power system (i.e., in the  
13 absence of the Pilot Agreement, CBPP's supply contract incents it  
14 to operate in a manner that is inefficient rather than maximizing  
15 the annual energy generation potential from its own hydraulic  
16 generation).

17 **IC-NLH-023** CA Energy Consulting is asked to confirm that, absent the Pilot  
18 Agreement, CBPP is effectively economically incented (by way of  
19 Hydro's contract and rate design) to operate its hydro generation  
20 in a manner that is inefficient, prioritizing a flat load (whether this  
21 is beneficial to the system or not) at the expense of energy  
22 generation? How would CA Energy Consulting recommend this be  
23 addressed in a new CBPP rate design?

24 **IC-NLH-024** CA Energy Consulting is asked to confirm that there is no  
25 incremental cost to the Hydro customers from continuing the  
26 CBPP Pilot Agreement.

27 **IC-NLH-025** On page 16 of its report, CA Energy Consulting states that "*The  
28 levelized annual revenue requirement for Muskrat Falls generation  
29 and its associated transmission investments of LIL and LTA is  
30 approximately \$1,249 per kW, while the estimated levelized  
31 annual cost for a new CT is \$248 per kW, stated in CDN\$. The  
32 demand share of Muskrat Falls would be \$248/\$1,249, or about  
33 20%. The energy share would be the residual 80%, which is  
34 slightly below the 85% historical share of Holyrood's revenue  
35 requirement that is classified as energy-related. Based on this  
36 estimate, it may be that the final shares developed by the  
37 equivalent peaker approach will better account for the main  
38 reason underlying the resource choice favoring Muskrat Falls—  
39 very large fuel costs savings over future decades.*"

40 On page 29 of its report, CA Energy Consulting states that "*In the  
41 absence of marginal cost-based cost allocation, Hydro would use  
42 the results of its ELCC study to classify wind generation as 22%  
43 capacity-driven. Industry practice supports the use of such a  
44 value. Assuming that the system planners would factor wind  
45 power into its capacity planning, such a percentage seems  
46 sensible.*"

1 Further to the above-cited statements from its report, CA Energy  
2 Consulting is asked to explain how, if wind as a non-dispatchable  
3 resource is being classified as 22% demand, a 20% allocation to  
4 demand makes sense for the Muskrat Falls Project investment,  
5 given that Muskrat Falls is a dispatchable and routinely loaded  
6 plant that is highly likely to be contributing material capacity at all  
7 peak hours.

8 **IC-NLH-026**

9 On page 15 of its report, CA Energy Consulting states that "*Yet  
10 another classification alternative is the equivalent peaker  
11 methodology. This approach postulates that any cost per unit of  
12 capacity that exceeds that of a peaking unit should be classified  
13 as energy-related, while the peaking unit cost component is  
14 classified as demand related. Baseload and intermediate units are  
15 typically more expensive to build than peaking units, and that  
16 extra expense is viewed as being energy-driven. That extra cost is  
17 incurred in order to save fuel cost relative to peaking unit  
18 production, with generation investment occurring to attain least  
cost production.*"

19 On page 16 of its report , CA Energy Consulting states that "*The  
20 equivalent peaker method is viewed by some as giving formal  
21 recognition to the generation planner's selection of a range of  
22 plants to serve the system. (The argument is that generation  
23 planners must design their system to meet not only peak demand,  
24 but also the full range of load durations, and to do so at least cost.  
25 Costs not incurred to meet peak load are deemed to be incurred  
26 to supply energy)*" and "*To implement this approach, the utility  
27 develops an estimate of the cost per kW of a peaking unit, and  
28 compares that with the cost per kW of the new generation unit,  
29 being careful to use the same vintage as the plant under study*"

30 On page 17 of its report , CA Energy Consulting states that "*the  
31 equivalent peaker method is thus tied to the system planner's  
32 perspective on generation. On this basis, the equivalent peaker  
33 approach may merit review.*"

34 The equivalent peaker method is about investment in plant made  
35 by the utility. In the case of Muskrat Falls, Hydro will receive  
36 service under a power purchase agreement. Hydro neither made  
37 the investment nor owns the asset. CA Energy Consulting is  
38 asked to explain how it is appropriate to compare this  
39 arrangement to actual Hydro investment in a peaking turbine.

40 **IC-NLH-027**

41 Further to IC-NLH-025 and IC-NLH-027: Under an equivalent  
42 peaking methodology, the classification ratio is the cost of the gas  
43 turbine cost per kW (fixed) divided by the Muskrat Falls cost per  
44 kW (still being assessed). If the Muskrat Falls final in-service cost  
45 grows, the equivalent peaker ratio would fall, meaning a larger  
46 share of the larger overall cost of Muskrat Falls would be  
classified to energy. CA Energy Consulting is asked to explain

1 how such cost changes (arising after the investment decision was  
2 made) would be justified as a 100% energy cost?

3 **IC-NLH-028**

4 CA Energy Consulting supports classifying existing hydraulic  
5 assets on a system load factor basis, but suggests this is not an  
6 appropriate approach for Muskrat Fall assets since this result  
7 "seems out of step with Muskrat Falls' envisioned purpose of  
8 serving base load and, in doing so, producing substantial fuel cost  
savings" (per CA Energy Consulting, page 16, lines 23-24).

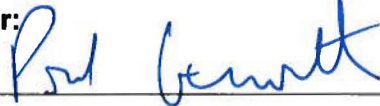

9 CA Energy Consulting is asked to explain how this generation  
10 characteristic (serving base load) is any different for the Bay  
11 D'Espoir generation facility. In its analysis, CA Energy Consulting  
12 is asked to consider this generation characteristic in relation to  
13 when the Bay D'Espoir generation facility was first put into service  
14 and in relation to its ongoing function in the Island System.
