| 1 | Q. | Cost of Service | | | | |
|----------|----|--|--|--|--|--|
| 2 | | What is the system load factor used in the cost of service study and what is the | | | | |
| 3 | | basis for using this system load factor? Please provide a comparison of the amounts | | | | |
| 4 | | allocated to each customer class on the Island Interconnected System in dollars and | | | | |
| 5 | | average cents/kWh based on the proposed system load factor and the forecast | | | | |
| 6 | | system load factor averaged over the period January 1, 2015 through December 31, | | | | |
| 7 | | 2017. | | | | |
| 8 | | | | | | |
| 9 | | | | | | |
| 10 | A. | The system load factor used in classifying hydraulic generation in the 2015 Test Year | | | | |
| 11 | | Cost of Service Study is 55.08%. The calculation of the system load factor is | | | | |
| 12 | | provided in Exhibit 13, Schedule 4.2, Page 1 of 1 of the Evidence to Hydro's | | | | |
| 13 | | Amended Application. | | | | |
| 14 | | | | | | |
| 15 | | The use of system load factor was approved in the Board's February 1993 report on | | | | |
| 16 | | the Cost of Service Methodology to be used by Hydro. The Board's report with | | | | |
| 17 | | respect to the method of classification of hydraulic generation states: | | | | |
| 18 | | | | | | |
| 19 | | Re-examination of cost of service methodology has been an infrequent | | | | |
| 20 21 | | occurrence in Newfoundland and in anticipation that this may hold in the future as in the past, the Board is concerned that the methods of | | | | |
| 22 | | classification will reflect changes in load patterns and use of generating | | | | |
| 23 | | facilities. Neither the equivalent peaker nor the specific facilities method | | | | |
| 24 | | have this ability, since both rely totally on past investment decisions. | | | | |
| 25 | | | | | | |
| 26 | | The Board therefore finds it necessary to consider classification methods | | | | |
| 27 | | based on operating parameters; namely, system load factor and plant | | | | |
| 28 | | capacity factors. Such classification methods would be more flexible with | | | | |
| 29 | | the dynamic nature of the system. | | | | |

Page 2 of 3

The system load factor is the ratio of average demand to peak demand, and average demand is the amount of capacity required to supply the system energy requirement under ideal conditions, i.e., constant demand throughout the year. It is therefore logical to regard the system load factor as the fraction of plant investment necessarily incurred to meet the energy requirement and to classify this portion as energy-related.

As shown in Table 1 below, an estimate of the average system load factor for the period January 1 2015 to December 31 2017 period is 55.49%. Applying this updated value of 55.49% instead of the 55.08% which has been used in the 2015 Test Year proposed Cost of Service, would, in Hydro's opinion, have an immaterial impact on the amounts allocated to the Island Interconnected System customer classes as illustrated in Table 2 below.

Table 1: Calculation of Three-Year Average System Load Factor

| | 2015 Test Year | 2016 Forecast | 2017 Forecast | Three-Year Avg |
|----------------------|----------------|---------------|---------------|----------------|
| Sales + Losses (MWh) | 7,238,900 | 7,523,800 | 7,610,900 | <u> </u> |
| Hours in Year | 8,760 | 8,760 | 8,760 | |
| Average Demand (kW) | 826,358 | 858,881 | 868,824 | |
| CP @ Generation (kW) | 1,500,405 | 1,532,400 | 1,569,700 | |
| System Load Factor | 55.08% | 56.05% | 55.35% | 55.49% |
