

1    Q.    **Reference:    Regulated Activities Evidence**

2            What is the basis for determining the firm energy capability for wind farm  
3            production at St. Lawrence and Fermeuse? (Regulated Activities Evidence, page  
4            2.41, lines 15 to 16)

5

6

7    A.    The firm energy capability for wind farm production at St. Lawrence and Fermeuse  
8            is based on the P90 Probability of Exceedance at the St. Lawrence Wind Farm site,  
9            as supplied in the response to the 2005 RFP *Request for Proposals for a Wind*  
10           *Generation Project RFP 31315 OQ*. It is approximately 88% of average energy  
11           output.

12

13           The P90 Probability of Exceedance is the value which the annual energy production  
14           of the wind farm will exceed 90% of the time.
