

1    Q.    Further to Response to Requests for Information NP-NLH-038 and PUB-NLH-100:  
2            Given the actual number of litres and not the test year number of litres is used in  
3            the proposed account definition, doesn't the volume change from test year also get  
4            reflected in the calculation of the transfers to this account?

5

6

7    A.    The proposed account definition will include the price variance on actual litres  
8            consumed, but the Test Year cost of any volume change will not be recovered or  
9            refunded. This is similar in operation to the RSP, where separate variance  
10          calculations are required to account for Test Year fuel changes related to load,  
11          water, and other sources of energy supply (as proposed), and the fuel price  
12          variation accounts only for the change in price from the Test Year.
