1.0 EXECUTIVE SUMMARY

Load research data provides estimates of class demands on the system at specific times. The class demand estimates are used in the cost of service study to determine the portion of system demand costs that should be recovered from each customer class.

From December 2003 to March 2006, Newfoundland Power conducted a load research program (the "2006 LRP"). The previous class load estimates were obtained from a load research study conducted over the period 1992 to 1994 (the "1994 Study").

The 2006 LRP collected data from a statistically representative sample of customers from each metered customer rate class served by Newfoundland Power. Load recorders, that store customer usage by time interval throughout the day¹, were installed on 470 customer premises. The data collected from the sample was extrapolated to estimate class demands by time interval using a statistical process referred to as ratio estimation.

Generation and transmission demand costs are allocated to customer classes in the cost of service study based on each customer classes' contribution to the winter system peak. The Hydro winter season system peaks normally occur in the early evening around suppertime. Distribution demand costs are allocated to customer classes based on the relative size of the class peak demand. Generally, the Domestic customer class peaks at suppertime and General Service customer classes peak in the morning hours during the weekdays.

The 2006 LRP results indicate there are significant changes to the demand allocators for each rate class compared to the 1994 Study. The primary reasons for the differences in the results are:

- (i) a change in the time of Hydro system peak from morning during the period of the 1994 Study to evening peaks during the period of the 2006 LRP; and
- (ii) the 2006 LRP class load estimates for General Service Rates 2.1 and 2.2 were derived from a statistically valid study whereas the cost of service estimates used previously were derived based on coincidence estimates applied to billing demand data.

In general, the results indicate an increase in the demand cost allocations to the Domestic class and a decrease in the demand cost allocations to the General Service classes is warranted. The effect of the change in the demand cost allocators may require the rebalancing of revenue requirements from some classes.

2.0 INTRODUCTION

Load research data is used to assess the reasonableness of cost recovery among customer classes. The information gathered is used to determine the portion of system demand costs that should be recovered from each customer class. Load research data provides estimates of class demand on the system at specific times. This differs from the typical energy meter which records the cumulative energy used by customers over a period of time.

Data is stored for every 15 minute period.

The load research data being used to estimate class demands in the embedded cost of service study was from the 1994 Study. In Order No. P.U. 19 2003, the Board approved capital expenditures in the amount of \$425,000 for the 2006 LRP.² Beginning in December 2003, a comprehensive load research program to encompass the next 3 winter seasons was undertaken. This report provides an analysis of the data collected.

To maximize the efficiency of obtaining load research data for the Province, Newfoundland Power also conducted the sample design and data analysis for both the Island and Labrador interconnected rural customer classes of Newfoundland and Labrador Hydro (Hydro). Hydro was responsible for purchasing and installing the required metering equipment as well as data collection for its customers in Labrador.

3.0 STUDY SCOPE

To adequately study the load characteristics of a class of customers, data representative of their population is required. The 2006 LRP included data collection from a sample of customers from all customer rate classes (excluding Street and Area Lighting³) served by Newfoundland Power and the interconnected retail customer rate classes (excluding Street and Area Lighting) served by Hydro⁴.

This report summarizes the results of the Newfoundland Power component of the 2006 LRP.

4.0 STUDY METHODOLOGY

4.1 **Design Methodology**

For purposes of designing a statistically accurate load research program, the sample design followed the sample accuracy level formerly specified in U.S. federal legislation, the *Public* Utility Regulatory Policies Act of 1978 (the "PURPA standard"). This standard is also referenced in the AEIC Load Research Manual, 2nd Edition. The PURPA standard is ±10% relative accuracy at a 90% confidence level.

The Island Interconnected System is a winter peaking system; customer demand requirements are approximately twice as high in winter months than in summer months. Generation and transmission demand costs are allocated by customer classes in the cost of service study based on each customer classes' contribution to the winter system peak (i.e., based on coincident peak). Distribution demand costs are allocated based on the relative size of the class peak demands (i.e., based on non-coincident peak).

Actual Load Research Capital Costs totaled \$356,373.53.

Class demand estimates for the street and area lighting are derived from a separate study on hours of operation based on hours of darkness determined by operations of photocell devices.

Appendix A contains the detailed sample design.

The single coincident peak method (1 CP). For the purposes of the load research study, the system peak is based on the time of Hydro's system peak because the majority of the generation and transmission demand costs are related to Hydro's assets.

The sample design for each customer class was designed to achieve the desired statistical accuracy of class demand at time of system peak. To minimize the 2006 LRP cost and achieve the PURPA standard of accuracy, stratified random sampling was employed using the Model Based Statistical Sampling methodology.

4.1.1 Customer Class Considerations

Due to the predominance of domestic electric heating load served by Newfoundland Power, two subclasses within the Domestic rate class were studied. Separate samples were designed for domestic customers that use electric heat as their primary heating source ("Domestic All-Electric subclass") and domestic customers that use an alternate primary heating source ("Domestic Regular subclass")⁶. The separate studies would allow evaluation through the cost of service study of whether cross-subsidization exists between the two Domestic customer subclasses.

The Rate 2.4 customer class includes the Company's largest General Service customers with annual peak demands of 1,000 kVA and greater. Because of the diverse load patterns of these customers and the relatively small number of customers in the class (approximately 55), load research monitoring equipment (i.e., load recorders) was installed on a large proportion of customers in the class.

The sample size for each class is provided in Table 1 below.

Table 1 2006 LRP Sample Sizes							
Customer Rate Class	Sample Size						
Domestic							
1.1 All-Electric	60						
1.1 Regular	90						
General Service							
2.1 0 - 10 kW	90						
$2.2 \ 10 - 100 \ \text{kW}$	90						
2.3 110 kVA- 1000 kVA	90						
2.4 1000 kVA and Over	50						
Total	470						

_

The distinction between Domestic All-Electric subclass customers that use electric heat as their primary heating source and Domestic Regular subclass customers that use an alternate heating source is based on customer information coded in the Company's Customer Service System.

4.2 Data Analysis

To interpret the data collected from the sample required the sample results to be expanded to represent the class population characteristics⁷. The method chosen for this expansion of data was the Ratio Estimation method.⁸ The output of the Ratio Estimation method is a class demand estimate by time interval and the achieved statistical accuracy level.⁹

The load estimates for each class are combined with load estimates for Street and Area Lighting and system losses to derive total load estimates at peak times. To assess the reasonableness of the results, the class load estimates are totalled and then compared to actual total produced and purchased for the time interval (See Table 2).

5.0 2006 LRP RESULTS

This report presents and assesses the results for the 2006 LRP.

For the winter season of 2003/2004, the Hydro system peak occurred on February 16, 2004 at 18:00 hours. For the winter season 2004/2005, the Hydro system peak occurred on December 6, 2004 at 16:45, and for 2005/2006 the peak occurred on January 23, 2006 at 17:45¹⁰. Graphs showing the load curves for the Newfoundland Power native peak on the Hydro system peak days for the three winter seasons are provided in Appendix B.

Appendix C contains the load estimates and accuracy level derived from the load research data for each month of the 2006 LRP.

Ratio estimation requires an interval by interval ratio between demand and annual energy for the sample. It then applies those ratios to the population energy to derive the total class load profiles.

A 30 minute interval was chosen to balance data variability while still maintaining the ability to accurately capture load fluctuations.

Frazzle ice conditions at NP's generation facilities reduced generation capability during the morning of January 23rd, 2006, causing Hydro system peak to occur at 9:44 am. If Newfoundland Power generation facilities were capable of typical generation levels, the Hydro system peak would have occurred at 5:45 pm. Therefore, for purposes of the load research analysis, the winter peak was assumed to occur at 5:45 pm.

Table 2 provides the breakdown of the estimated loads by rate class and the percentage of load for each estimated peak.

Table 2 Class Contribution at Time of Hydro System Peak								
	2003/2004 Peak February 16, 2004 18:00		2004/2005 Peak December 6, 2004 16:45		2005/2006 Peak January 23, 2006 17:45			
	Estimated Load (MW)	% of Peak	Estimated Load (MW)	% of Peak	Estimated Load (MW)	% of Peak		
Domestic 1.1	676.9	62.1%	743.5	62.7%	695.9	61.9%		
GS 2.1	16.8	1.5%	17.4	1.5%	16.8	1.5%		
GS 2.2	107.2	9.9%	119.1	10.0%	120.1	10.7%		
GS 2.3	141.2	13.0%	147.3	12.4%	140.9	12.5%		
GS 2.4	60.6	5.6%	66.0	5.6%	61.7	5.5%		
Streetlights	8.5	0.8%	8.5	0.7%	8.5	0.8%		
Losses	77.0	7.1%	84.3	7.1%	79.9	7.1%		
Estimated NP Native Peak at Hydro System Peak	1,088.2	100%	1,186.1	100%	1123.8	100%		
Actual NP Native Peak at Hydro System Peak	1,099.4		1,142.6		1123.3			

To assess the reasonableness of the results, the total of the class load estimates was compared to the actual total produced and purchased for the time interval. The total of the estimated class loads at time of Hydro system peak was within 3.8% of the actual Newfoundland Power load at time of Hydro system peak. The reasonableness of the results is also confirmed as the demand estimates for the system peak hour for each winter season achieved the design accuracy level in each class.

The largest contribution to peak load was from the Rate 1.1 Domestic rate class with a 62.2% average share over the three winter season peaks. Of the general service rate classes, Rate 2.3 was the largest contributor at a 12.6% average share. Each rate classes' relative contribution to system peak remained fairly consistent for each winter season.

6.0 APPLYING RESULTS IN COST OF SERVICE STUDY

The class peak demand proportions provided in Table 1 provide reasonable estimates of the customer rate class responsibility for the actual system peaks that occurred over the past three winter seasons. However, on a go-forward basis, differing rates of load growth by class would result in the proportional allocations from Table 1 becoming out-of-date. To address this issue Newfoundland Power uses class load factors rather than proportional load estimates for demand cost allocations in the cost of service study¹¹.

_

Appendix D provides load factor estimates for each class on a coincident and non-coincident peak basis for use in the Cost of Service study.

Load factor expresses average demand as a percentage of peak demand for a time period (e.g., month or year). The load factors are applied to normalized sales to determine the cost of service demand estimates by class. The demand estimates for each class in the cost of service study are used for demand cost allocation to each class.

Class load factors calculated based on the time of system peak can vary significantly depending on the weather, month it occurs, time of day, and the day of the week. Volatility in cost of service results from year to year can occur if a single peak that occurred at an unusual time period was used in determining demand cost allocations. To ensure reasonable demand cost allocation, Newfoundland Power averages the annual load factors over the period of the study.

Table 3 provides both the annual and average load factors derived for each class based on the data collected. The non-coincident peak class load factors ¹² are used in determining distribution demand cost allocations. The coincident-peak class load factors ¹³ are used in determining generation and transmission demand cost allocations.

Classes with lower load factors are allocated a lower proportion of the system energy costs and a higher proportion of the system demand costs. Whereas classes with high load factors are allocated a higher proportion of the system energy costs and a lower proportion of the system demand costs.

Table 3 Class Load Factors									
		Non-Coin	cident Pea	ık		Coincid	lent Peak		
14						2005- 2006	Average		
Domestic All-Electric	46.2%	45.6%	51.8%	47.9%	48.1%	44.0%	48.3%	46.8%	
Domestic Regular	48.7%	41.6%	38.8%	43.0%	53.4%	50.0%	51.9%	51.8%	
1.1 Total Domestic	46.4%	44.0%	46.5%	45.6%	49.2%	45.6%	48.9%	47.9%	
GS 2.1	49.2%	49.6%	53.9%	50.9%	66.0%	63.8%	65.7%	65.2%	
GS 2.2	53.3%	54.4%	50.2%	52.6%	63.1%	57.8%	58.1%	59.7%	
GS 2.3	58.4%	58.5%	53.1%	56.7%	68.9%	66.7%	69.7%	68.4%	
GS 2.4 ¹⁵	66.0%	64.8%	67.7%	66.2%	75.1%	72.9%	75.3%	74.4%	

Non-Coincident peak load factor = (12 months normalized sales ÷ (maximum class demand in 12 months x # of hours in the 12-month period)).

Coincident peak load factor = (12 months normalized sales \div (class demand at time of system peak x # of hours in the 12-month period)).

¹⁴ 2003-2004 reflects the time period of April 2003 to March 2004 inclusive. This April to March period was used for each year rather than the calendar year to reflect a full winter season in the calculation of annual load factor.

The class peak for General Service Rate 2.4 occurred in the month of July in both summer seasons of the 2006 LRP.

7.0 DIFFERENCES FROM 1994 STUDY

Table 4 provides a comparison of the class load factors from the 2006 LRP and the 1994 Study. There are significant differences in load factors compared to the 1994 Study. The primary reasons for the differences in the results are:

- (i) a change in the time of Hydro system peak from morning during the period of the 1994 Study to evening peaks during the period of the 2006 LRP; and
- (ii) the 2006 LRP class load estimates for General Service Rates 2.1 and 2.2 were derived from a statistically valid study whereas the cost of service estimates used previously were derived based on coincidence estimates applied to billing demand data.

Further information on the effects of each is provided in the following sections.

Table 4 Change in Class Load Factors (%)									
	Non-Coincident Peak Coincident Peak								
	2006 LRP	1994 Study	Difference	2006 LRP	1994 Study	Difference			
Domestic All-Electric	47.9%	39%	8.9	46.8%	48%	-1.2			
Domestic Regular	43.0%	51%	-8.0	51.8%	70%	-18.2			
1.1 Total Domestic	45.6%	42%	3.6	47.9%	52%	-4.1			
GS 2.1	50.9%	35%	15.9	65.2%	42%	23.2			
GS 2.2	52.6%	38%	14.6	59.7%	45%	14.7			
GS 2.3	56.7%	51%	5.7	68.4%	52%	16.4			
GS 2.4	66.2%	61%	5.2	74.4%	64.8%	9.6			

7.1 Change in Time of System Peak

For the past nine winter seasons, the Hydro system peak has occurred during the evening hours of 5 pm to 6 pm. The current consistent pattern of evening system peaks is different from the times of the Hydro system peaks during the 1994 Study. Table 5 provides a listing of the time and amount of Hydro's system peak since 1990.

Morning peaks appear possible given extremely windy and cold morning weather conditions that improve as the day progresses. However, morning peaks are not the norm. Evening peaks occurred for the seven highest system peak days during the three winter seasons of the 2006 LRP. For the years prior to 1992, evening system peaks were also the norm. In addition to weather conditions, the profile of Newfoundland Power's own generation across the hours of the day will also impact the timing of Hydro's system peak. A 1 CP allocation method is approved

for generation and transmission demand related costs in the Cost of Service study¹⁶. Consistent with this approach, it is reasonable to use load factors based on evening peaks when that single peak is most likely to occur.

Table 5 Hydro System Peaks								
Year	Date	Time	Peak Load (MW)					
1989/90	Feb. 3, 1990	18:00	1,316					
1990/91	Jan. 26, 1991	18:52	1,281

2001/02	Jan, 31, 2002	17:48	1,403					
2002/03	Feb. 15, 2003	18:03	1,402					
2003/04	Feb. 16, 2004	18:00	1,405					
2004/05	Dec. 6, 2004	16:45	1,402					
2005/06	Jan. 23, 2006	17:45 ¹⁷	1,247					

7.1.1 Effect on Demand Cost Allocations

Because generation demand costs and transmission demand costs are allocated by class based on their load at time of Hydro system peak, the shift from morning system peak to evening system peak can have a significant impact on demand costs allocated by class.

In the 2001 Hydro GRA, Newfoundland Power presented evidence recommending the use of a multiple CP for allocation of generation and transmission demand costs. In Order No. P.U. 7 (2002-2003), the Board approved the use of a 1 CP methodology for allocation of generation and transmission demand costs.

Newfoundland Power – 2013/2014 General Rate Application

Frazzle ice conditions at NP's generation facilities reduced generation capability during the morning of January 23rd, 2006, causing Hydro system peak to occur at 9:44 am. If NP generation facilities were capable of typical generation levels, system peak would have occurred at 5:45 pm. Therefore, for purposes of the load research analysis, the winter peak was assumed to occur at 5:45 pm.

Appendix E provides the class load data by 30 minute intervals for the winter season peak days. The differences in peak times by class is clearly illustrated in the load curves and data provided.

The peak times for each class over the past three winter seasons are provided in Table 6.

Table 6 Time of Class Peaks								
	2003/04	2004/05	2005/06					
Domestic	17:30	18:00	17:30					
General Service Rate 2.1	11:00	11:00	10:00					
General Service Rate 2.2	11:00	12:30	11:00					
General Service Rate 2.3	09:30	11:00	12:00					
General Service Rate 2.4	12:00	10:30	11:00					

When system peak occurs during the morning hours, a higher percentage of system demand costs are allocated to General Service customers because the peak demand requirements for these customer classes is higher during those hours. Whereas, when system peak occurs in the evening hours, the Domestic class is allocated a higher percentage of demand costs because the Domestic class peak demand requirements are generally greatest in the evening ¹⁸.

The 2006 LRP indicates the Domestic class peaks in the evening when the General Service classes are reducing their load requirements. The higher demand requirements for the Domestic class at the time of system peak results in a higher demand cost allocation to the Domestic class. The lower demand requirements for the General Service classes at the time of system peak results in a lower demand cost allocation to the General Service classes.

7.2 **Class Load Factors**

This section provides a comparison of the load factors derived from the 2006 LRP and those used in the cost of service study filed with the Board in the 2003 Newfoundland Power General Rate Proceeding.

7.2.1 Domestic Load Factors

Table 7 indicates that the non-coincident peak load factor for the Total Domestic class has changed from 42% to approximately 45.6%. The non-coincident peak load factor is calculated based on the maximum class demand independent of the time of system peak.

Appendix E provides graphs of each class's load pattern on peak days for each winter season.

Table 7
Domestic Load Factors

	Noi	n-Coincident l	Peak	Coincident Peak			
	2006 LRP 1994 Study Difference			2006 LRP	1994 Study	Difference	
Domestic All-Electric	47.9%	39%	8.9	46.8%	48%	-1.2	
Domestic Regular	43.0%	51%	-8.0	51.8%	70%	-18.2	
1.1 Total Domestic	45.6%	42%	3.6	47.9%	52%	-4.1	

Table 7 also indicates that the coincident peak load factor for the Total Domestic class has declined from 52% to 47.9%. The coincident peak load factor is calculated based on the class demand at time of system peak so the load factor decline is primarily related to the change in time of system peak.

The decline in coincident peak load factor is most pronounced in the Domestic Regular subclass. The Domestic Regular subclass peaks during the suppertime hours and was highly coincident with the time of Hydro system peak during the 2006 LRP. In the 1994 Study, less demand was required to serve the Domestic Regular subclass because the Hydro system peak occurred in mid-morning.

The coincident peak load factors for the Domestic class from 1994 Study would be similar to the results of the 2006 LRP had the system peaks occurred in the evening during the 1994 Study.

7.2.2 Large General Service Class Load Factors

The 2006 LRP class load factors for the large general service rate classes (Rate 2.3 and Rate 2.4) are higher than determined in the 1994 Study. See Table 8.

Table 8	
Large General Service Class Load Factors	5

	No	on-Coincident l	Peak	Coincident Peak		
	2006 LRP	1994 Study	Difference	2006 LRP	1994 Study	Difference
GS 2.3	56.7%	51%	5.7	68.4%	52%	16.4
GS 2.4	66.2%	61%	5.2	74.4%	64.8%	9.6

The non-coincident class load factors from the 2006 LRP were higher than the non-coincident class load factors from the 1994 Study for both the Rate 2.3 and Rate 2.4 rate classes.

There is an even higher increase in the coincident peak load factors for the large general service classes. This increase is predominantly related to the change in time of system peak from morning to evening. The coincident peak load factors for the large General Service classes from 1994 Study would be similar to the results of the 2006 LRP had the system peaks occurred in the evening during the 1994 Study.

7.2.3 Small General Service Class Load Factors

Newfoundland Power did not have load research data from the 1994 Study for its Rate 2.1 or its Rate 2.2 customer classes. The Company has historically used the Bary Curve to estimate load factors for these classes. The Bary Curve uses the class load factor based on billing information for the peak month (i.e., using the sum of the monthly demands and total energy for the class) to estimate the percentage of customer maximum demands being used at time of class peak (i.e., coincidence).

The results of the 2006 LRP indicate significantly higher load factors than have been used in the cost of service study. See Table 9.

Table 9 Small General Service Class Load Factors								
	No	on-Coincident l	Peak	Coincident Peak				
	2006 LRP Bary Curve Difference			2006 LRP	Bary Curve	Difference		
GS 2.1	50.9%	35%	15.9	65.2%	42%	23.2		
GS 2.2	52.6%	38%	14.6	59.7%	45%	14.7		

The accuracy level achieved for these classes at the time of system peak is 90% confidence within $\pm 6.6\%$. This provides confidence in the reliability of the results. Additional confidence in the results is provided as the load factors derived from the 2006 LRP for these rate classes are comparable with the load factors used by Nova Scotia Power and Maritime Electric for its small general service classes. ²⁰

The Bary Curve is based on historical load research data from U.S. utilities.

Based on information obtained in 2001. Nova Scotia Power used a load factor of 66% on a coincident peak basis using a 3 CP method for its Small General (<12,000 kWh/year) and General (>12,000 kWh/year) classes of service. Maritime Electric used 61% load factor on a coincident peak basis for its Small General Service class.

8.0 CONCLUSIONS

The class load factors derived from the 2006 LRP are reasonable to use in the cost allocation process. This conclusion is supported by:

- (i) the achieved accuracy levels of the class load estimates during the peak periods;
- (ii) the reconciliation of the class load estimates to system peak data;
- (iii) the relative consistency in the results over the three winter seasons; and
- (iv) the relative consistency of the class load factors for the small general service classes with those used by other Atlantic Canada utilities.

The materiality of the differences on cost allocations is assessed through the cost of service study. That assessment is not included in this report. However, the significant change in the demand cost allocations that will result from applying the results of the 2006 LRP may require the rebalancing of revenue requirements from some classes.

Detailed Sample Design

^{*} Note: The Domestic & All-Electric subclass (Rates 110 & 112) Non-Coincident Peak load factors are calculated based upon the subclass demands at time of class peak. For this reason it is possible for the non-coincident peak load factors to be higher than the coincident load factors for the domestic subclasses.
