1 INTRODUCTION AND BACKGROUND

On May 6, 2002, the Board received a request from the City of Calgary[1] (Calgary) that the Board institute a proceeding to consider generic cost of capital matters for electric and gas utilities under the Board's jurisdiction. The Board responded to Calgary by letter dated June 6, 2002, indicating that it would be appropriate to await the National Energy Board's (NEB) upcoming decision on rate of return before proceeding to deal with this issue.

On September 30, 2002, the Board distributed a letter (attached as Appendix 3) to interested parties indicating that it had decided to call a generic hearing, pursuant to Section 46 of the *Public Utilities Board Act*[2] (PUBA), to consider cost of capital matters for electric, gas and pipeline utilities under its jurisdiction. Gas transmission (pipeline) and electric transmission companies as well as electric and gas distribution companies under the Board's jurisdiction would be included.

In its letter of September 30, 2002, the Board advised that it intended to hold a pre-hearing meeting to deal with the following issues:

- Determination of the scope of the proceeding and list of issues.
- Determination of procedural matters that might be adopted for such a hearing.

A preliminary list of issues and procedural matters was attached to the September 30, 2002 letter. Interested parties were requested to consider the preliminary list of issues and procedural matters and provide the Board with their written submissions on the appropriateness of each issue or matter, as well as their submissions with respect to additional issues or matters that might appropriately be considered through such a generic proceeding.

1 In its May 28, 2003 letter, the Board indicated that for purposes of the proceeding, utility companies would be considered as applicants and all other parties as interveners.
2 R.S.A. 2000, c. P-45

On October 7, 2002, the Board issued a Notice of Proceeding (the Notice). By letter of November 20, 2002, the Board advised parties that their written submissions as a result of the Board's September 30, 2002 letter had been sufficient to clarify the parties' positions with respect to the preliminary issues list and that a pre-hearing meeting was therefore not necessary.

By letter dated December 16, 2002, the Board clarified the next steps in the process with respect to a Generic Cost of Capital proceeding. The Board, in establishing this process, gave regard to the submissions, concerns and questions initially filed by parties pursuant to the Board's letter of September 30, 2002 and the reply submissions filed pursuant to the Board's letter of November 26, 2002. The Board set out its rational for consideration of a generic approach to cost of capital issues and established an initial process module (the Standardized Approach Module) to consider the preliminary question of the appropriateness of a standardized approach in the following manner:

> The Board continues to seek out opportunities to improve and streamline the regulatory process and to decrease the overall cost of regulation. The Board is of the view that the cost of capital matters for gas, pipeline, and electric utilities under its jurisdiction are one such area worthy of consideration, particularly given its importance within GTA/GRA proceedings.
>
> The Board notes the amount of regulatory time and accompanying expense that is expended, whereby parties are engaged in seemingly similar cost of capital issues in multiple applications. Applicants and interveners often address these issues through similar investigative, comparative and interpretive methodologies and cost of capital evidence.
>
> The Board is also cognizant of the increasingly heavy utility regulatory schedule that has resulted from electric and gas industry restructuring, new and expanding Board responsibilities, and the general growth and prosperity of the Province.
>
> The Board notes that in previous proceedings, such as the 99/00 Electric GTA, the Board has addressed the uniformity in treatment between utilities on cost of capital matters by hearing the consolidated evidence from all applicants in the same proceeding and rendering a single Board decision (as occurred in Decision U99099). The Board has also attempted to streamline proceedings in other ways, such as the development of policy guidelines like the Negotiated Settlement Guidelines.
>
> In a first module as discussed below, the Board, following submissions from parties, will assess and determine whether or not to proceed further, in a generic process on this issue. This first module will explore the ability and appropriateness of possibly applying a standardized approach in Alberta for all major gas, pipeline and electric utilities under its jurisdiction, whether collectively or on an industry-by-industry basis. Such an approach may magnify the benefits to all parties and enhance the sustainability of the cost of capital determination process, and thereby streamline the regulatory process. The Board wishes to also explore whether the simultaneous airing of views is likely to be more cost-effective than a separate airing of views over a series of proceedings, which may not be linked in evidentiary terms.

The Board then concluded:

> The Board has determined that it will proceed with a written process followed by a Board decision to address the preliminary issue of whether a standardized approach to cost of capital, including return on equity, capital structure and cost of debt, has the potential to achieve reasonable efficiencies while continuing to result in fair and reasonable rates for all stakeholders. As part of the decision, the Board will determine the subsequent steps, if any, for this generic proceeding.

The Board also presented the initial questions to be considered in the Standardized Approach Module and the Board set out the schedule for the Standardized Approach Module.

Having reviewed the written submissions of the parties on the preliminary questions in the Standardized Approach Module, the Board concluded this module on April 16, 2003 by issuing a Notice of Hearing in respect of the continuation of the Generic Cost of Capital proceeding. The Board noted:

> Having considered the submissions received from the above parties, the Board is of the view that a standardized approach to rate of return on equity and capital structure has the potential to achieve certain positive benefits including reduced regulatory costs, while continuing to result in a fair return for all utilities and in just and reasonable rates for all customers. The Board has therefore determined that it will proceed with a generic cost of capital hearing to focus on the possibility of establishing a standardized approach to rate of return on equity and capital structure for all utilities under the jurisdiction of the Board.

The letter also dealt with transitional issues, minimum filing requirements, and set out a scope for the Generic Cost of Capital Proceeding. The Board also established a preliminary schedule that would result in a hearing commencing on November 12, 2003.

By letter dated May 28, 2003, the Board remarked:

> The Board notes that no party objected to the Board's preliminary scope of the proceeding. Accordingly, the Board confirms the scope for the Generic Cost of Capital Proceeding as set out in Appendix A.

Appendix A of the May 28, 2003 letter outlined the Scope of the Proceeding as follows:

Return on Equity

1. Return on Equity Methodology
2. Allowed 2004 Return on Equity
3. Annual Adjustment Mechanism
4. Process to Review the Return on Equity

Capital Structure

1. Capital Structure for Each Utility Sector
2. Impact on Capital Structure of Utility Holding Company Structures
3. Adjustments to Capital Structure for Non-Taxable Entities
4. 2004 Capital Structure for Each Utility Company
5. Events and Process Which Might Result in Adjustments to Capital Structure

Also in the May 28, 2003 letter, the Board clarified certain transitional issues, refined the minimum filing requirements and indicated that for purposes of the proceeding, utility companies would be considered as applicants and all other parties as interveners. The Applicants are shown below:

Applicant	**Abbreviation**
AltaGas Utilities Inc.	AltaGas
AltaLink Management Ltd.	AltaLink
FortisAlberta (formerly Aquila Networks)	
The ATCO Group of Companies[3]	ATCO
ENMAX Power Corporation (Distribution)	ENMAX
The EPCOR Group of Companies[4]	EPCOR
NOVA Gas Transmission Ltd.	NGTL

A complete list of Participant organizations and their abbreviations is provided in Appendix 1. AltaLink, Aquila and EPCOR collectively referred to themselves as "the Companies". The Board notes that effective May 31, 2004, Fortis Alberta Holdings Inc. (Fortis) completed its acquisition of Aquila and renamed the company FortisAlberta. Any Board decisions or directions in this Decision respecting Aquila should be read as decisions or directions respecting FortisAlberta.

The Board's May 28, 2003 letter also included a Preliminary Schedule shown below:

Notice of Hearing	April 16, 2003
Submissions	May 12, 2003
Reply Submissions	May 20, 2003
Ruling on Procedural and Transitional Issues	May 28, 2003
Utility Applicants Evidence	July 9, 2003
Information Requests (IRs) to Utilities	July 25, 2003
IR Responses from Utilities	August 15, 2003
Intervener Evidence	September 12, 2003
IRs to Interveners	September 26, 2003
IR Responses from Interveners	October 17, 2003
Utility Rebuttal Evidence	November 5, 2003
Hearing Commencement	November 12, 2003

By letter dated, June 24, 2003, the Board clarified the minimum filing requirements, identified electronic filing requirements, and pre-assigned exhibit numbers.

On August 19, 2003, the Board issued a letter advising parties of hearing logistics and a tentative pre-hearing meeting date to resolve scheduling and procedural matters.

By letter dated October 9, 2003, the Board noted that parties generally did not see a need to convene a pre-hearing meeting and accordingly the Board cancelled the meeting that had tentatively been scheduled for October 16, 2003.

[3] ATCO Electric Ltd., ATCO Gas, and ATCO Pipelines
[4] EPCOR Distribution Inc. and EPCOR Transmission Inc.

The Board conducted a public hearing from November 12-14, 2003, November 17-21, 2003 and November 25-27, 2003 at the Board's offices in Edmonton, and from December 1-5, 2003, December 8-12, 2003, December 15-16, 2003, January 5-9, 2004, and January 12-16, 2004, at the Board's offices in Calgary. A list of parties who appeared at the hearing is included in Appendix 1. The Board sat for a total of 33 hearing days.

The Board received written argument on or before February 23, 2004 and written reply on or before April 5, 2004. Accordingly, for purposes of this Decision, the Board considers that the record closed on April 5, 2004.

The Board notes the full participation of a broad range of stakeholders in the proceeding, the large number of parties involved, and the diversity and sophistication of the views represented. The Board also notes the extensive nature of the record of the proceeding which includes pre-hearing submissions, the minimum filing requirements, a thorough set of responses to information requests, detailed expert evidence, hearing transcripts, undertaking responses, and comprehensive argument and reply argument.

Having considered all of the evidence and reviewed the arguments of the interested parties, the Board sets out its Decision with reasons respecting the Generic Cost of Capital Proceeding (Proceeding).

Abbreviations not otherwise defined within the body of the Decision are defined in Appendix 2.

2 SHOULD THE BOARD ADOPT A STANDARDIZED APPROACH TO RATE OF RETURN AND/OR CAPITAL STRUCTURE?

2.1 NGTL Jurisdictional Objection

NGTL submitted that the Board does not have the jurisdiction to implement a formula approach to establish a fair return for NGTL.

NGTL submitted that the specific jurisdiction of the Board in respect of the determination of the fair return for any gas utility comes only from section 37 of the Alberta *Gas Utilities Act*[5] (GUA). Section 37 reads as follows:

> 37(1) In fixing just and reasonable rates, tolls or charges, or schedules of them, to be imposed, observed and followed afterwards by an owner of a gas utility, the Board shall determine a rate base for the property of the owner of the gas utility used or required to be used to provide service to the public within Alberta and on determining a rate base it shall fix a fair return on the rate base.
>
> (2) In determining a rate base under this section, the Board shall give due consideration
>
> a. to the cost of the property when first devoted to public use and to prudent acquisition costs to the owner of the gas utility, less depreciation, amortization or depletion in respect of each, and
>
> b. to necessary working capital.

[5] R.S.A. 2000, c. G-5

> (3) In fixing the fair return that an owner of a gas utility is entitled to earn on the rate base, the Board shall give due consideration to all facts that in its opinion are relevant.

NGTL submitted that based on the wording of subsection 37(1), the Board does not have jurisdiction to fix a fair return for a gas utility "*unless and until it has determined a rate base"* for that gas utility. The rate base will vary from year to year, and the Board must determine the rate base for a particular period before it can determine a fair return for that period. NGTL argued that the Board cannot make a pre-determination of the fair return for a particular period, using a formula, and then apply that return to whatever rate base it subsequently determines is appropriate in respect of that same period. NGTL submitted that application of a formulaic return to a rate base that has yet to be determined would fetter the discretion of future Board panels and is not permitted by the statute.

NGTL also considered the wording of section 45 of the GUA, which provides:

> 45(1) Instead of fixing or approving rates, tolls or charges, or schedules of them, under sections 36(a), 37, 40, 41, 42 and 44, the Board, on its own initiative or on the application of a person having an interest, may by order in writing fix or approve just and reasonable rates, tolls or charges, or schedules of them,
>
> (a) that are intended to result in cost savings or other benefits to be allocated between the owner of the gas utility and its customers, or
>
> (b) that are otherwise in the public interest.
>
> (2) The Board may specify terms and conditions that apply to an order made under this section.

NGTL submitted that section 45 of the GUA was implemented to permit approval of negotiated settlements and does not empower the Board to establish a formulaic approach to fair return. NGTL submitted that by its terms, section 45 relates to "rates, tolls or charges", not to return.

NGTL also submitted that the fact it did not raise the jurisdiction issue in the first module of this proceeding does not prohibit it from raising the issue in argument.

Jurisdiction to Interpret the GUA Provisions

The NGTL position in effect poses the following question: "Does the Board have jurisdiction to fix a fair return for a gas utility through a standardized approach based on a formula?" (the Jurisdictional Question) Before the Board can address this question, it must first determine if it has jurisdiction to interpret the subject provisions of the GUA. The Board finds it does have such jurisdiction on the basis of the reasons stated below.

The Board notes section 36(1)(a) of the PUBA which provides:

> The Board has all the necessary jurisdiction and power
>
> (a) to deal with public utilities and the owners of them as provided in this Act;

The Board further notes section 36(2) of the PUBA, which provides:

> In addition to the jurisdiction and powers mentioned in subsection (1), the Board has all necessary jurisdiction and powers to perform any duties that are assigned to it by statute or pursuant to statutory authority.

In order for the Board to perform the duties assigned to it pursuant to sections 37 and 45 of the GUA, the Board must be able to interpret and apply the wording of the legislation.

Board also notes the provisions of section 38 of the PUBA, which provides:

> The Board may, as to matters within its jurisdiction, hear and determine all questions of law or of fact.

The interpretation of the Board's governing legislation is a question of law or of fact.

The Board further notes the decision of the Alberta Court of Appeal in *ATCO Electric Ltd. v. Alberta* (Energy and Utilities Board) [2003] A.J. No. 1634, (2003) 339 A.R. 152 as a recent acknowledgment of the ability of the Board to construe its own legislation.

Accordingly, the Board finds that the ability to interpret sections 37 and 45 of the GUA is within its jurisdiction.

Is the Matter One of Interpretation?

Next, the Board must determine if the Jurisdictional Question is a matter of interpretation of the relevant provisions.

The Board finds that the Jurisdictional Question is a question of law or of fact, the answer to which is dependant on an interpretation of sections 37 and 45 of the GUA and the relevant legislation taken as a whole. Having found that the interpretation of its own legislation is within the Board's jurisdiction, the provisions of section 38 of the PUBA provide the Board with the authority to settle questions of law or of fact within that jurisdiction.

Accordingly, the Board finds that it has the jurisdiction to address the Jurisdictional Question and that the question is matter of law or of fact, dependant on the interpretation of the relevant statutory provisions.

The Jurisdictional Question

With respect to the Jurisdictional Question itself, the Board finds that the proper interpretation of section 37 of the GUA would allow the Board to determine the capital structure for the relevant test period (2004 or 2005) for each gas utility under its jurisdiction by way of a generic proceeding and to establish a standardized approach based on a formula for determining the return on common equity for gas utilities.

The Board makes this finding for the following reasons:

1. In this Decision, the Board has established a standardized approach to setting a rate of return on common equity (ROE), which is adjusted annually by way of a formula, subject to the limitations set out herein. In addition, this Decision has established the capital structure for each utility for the relevant test period. NGTL objects to the adoption of a formula in setting a fair return that determines a result independently, and prior to, the determination of rate base. Although, the Board does not agree with NGTL's submissions in this regard, it does note and agrees with NGTL's explanation of the elements of fair return when it states on page 2 of its Written Evidence, Exhibit 013-04:

    > The fair return on rate base is fixed by the regulator through determinations of the deemed utility capital structure, the reasonable cost of debt capital and the fair return on equity (ROE) capital.

    In this Decision, the Board has not determined all elements of the fair return for a Utility. The Board has implemented a formula in connection with the determination of ROE with an annual adjustment mechanism. The Board has also set the capital structure for utilities in the Proceeding for the relevant test period. It has not dealt with the cost of debt capital. Further, it has left open the possibility that a utility may request changes in its capital structure with respect to subsequent test periods by way of future general rate applications where circumstances so warrant. An applicant is also free to apply to the Board to review the ROE formula in the manner provided for in this Decision. Even without an application by a particular party, the ROE formula will be subject to review in certain circumstances and in any event will be considered for review after five years.

    This Decision approves a formula and adjustment mechanism for ROE, being one element of a fair return, following a long and complex public process. The result furthers regulatory and cost efficiencies while ensuring fairness to parties and future safeguards to address material changes in circumstance. ROE is not the only element required to determine a fair return. On its own, ROE is not determinative of the fair return component of a utility's revenue requirement. It is only when the ROE is combined with the other elements of the fair return and then applied to the rate base that it is included within the revenue requirement of a utility and subsequently in customer rates. Accordingly, the ROE determined in accordance with the formula approved by this Decision is not included within rates until the remaining relevant elements of a fair return and the rate base applicable for a particular period have been determined. With respect to a particular utility, it is the individual panel(s) of the Board seized with the responsibility of making determinations in respect of the appropriate revenue requirement for a particular test period and with fixing just and reasonable rates which must make the final determination that the revenue requirement, inclusive of all elements of a fair return when combined with the ROE determined in this Proceeding, is appropriate and that the rates are just and reasonable.

    The Board also notes that the embedded cost or appropriateness of existing long term debt is not reconsidered each time that the rate base is determined. Individual long term debt issuances are considered by the Board either when the debt is incurred, on a pre-approval basis, or within a GRA/GTA proceeding. Once approved, long term debt costs normally continue in the revenue requirement for the duration of the debt instrument

2. The Board notes and agrees with the submission of CAPP at page 2 of its Reply Argument that the mechanical approach proposed by NGTL to interpreting the GUA would leave the Board without clear authority to utilize the ROE mechanism in its determination of what is a fair return. In this regard, the Board also notes the decision of the Supreme Court of Canada in *Bell Canada v. Canada* (Canadian Radio-Television and Telecommunications Commission), [1989] 1 S.C.R. 1722 at page 1756 where the Court held:

   > The powers of any administrative tribunal must of course be stated in its enabling statute but they may also exist by necessary implication from the working of the act, its structure and its purpose. Although courts must refrain from unduly broadening the powers of such regulatory authorities through judicial law-making, they must also avoid sterilizing these powers through overly technical interpretations of enabling statutes.

   The Board also notes the decision of the Supreme Court of Canada in *ATCO Ltd. v. Calgary Power* [1982] 2 S.C.R. 557, wherein the Court discusses the nature of the powers of the Board to carry out its responsibilities under the PUBA and the GUA. At page 576, the Court stated:

   > It is evident from the powers accorded to the Board by the legislation in both statutes mentioned above that the legislature has given the Board a mandate of the widest proportions to safeguard the public interest in the nature and quality of the service provided to the community by the public utilities.

   The Board agrees with the following submission of CAPP appearing at page 2 of its Reply Argument:

   > In CAPP's submission, the GUA is properly interpreted as prescribing a form of regulation, namely, rate base/rate of return regulation based on depreciated book cost plus working capital. The GUA does not prescribe how the Board is to determine a fair return and does not prescribe the exact order in which decisions can be made. Nothing precludes the Board from adopting an approach in which rate base is determined independently whatever the level of return and in which return is determined independently of rate base or other cost items such as debt cost. All that is required is that the rates that result would be in accord with the Act, namely, be based on rate base/rate of return among other things.

3. The Board notes that section 45 of the GUA does not require the Board to consider rate base before fixing or approving rates. The Board notes that such rates would include a fair return component either explicitly or implicitly. The Board must consider whether such rates are in the public interest. A consideration of the resultant rates in the context of the public interest is consistent with fixing just and reasonable rates pursuant to section 37 of the GUA and with the Board's approach in this Decision of establishing a just and reasonable standardized approach to establishing rate of return on equity.

With respect to regulatory efficiency, economy of process, cost effectiveness, and procedural fairness to all parties, the Board notes CAPP's submission at page 2 of its Reply Argument that NGTL failed to question the Board's jurisdiction in its submissions on the Standardized Approach Module of the proceeding. The issue that was addressed in that module was whether or not the Board should proceed further with a generic cost of capital process and the ability and appropriateness of possibly adopting a standardized approach. While CAPP acknowledged that jurisdiction couldn't be conferred by consent, it did call into question the merit of the argument.

The Board agrees with CAPP that the appropriate time to challenge the jurisdiction of the Board to establish a standardized approach to elements of a fair return would have been during the submissions leading to the Board's decision on April 16, 2003 to proceed with the generic cost of capital hearing following the Standardized Approach Module. In its letter of December 16, 2002 wherein the Board established the process for the Standardized Approach Module, the Board stated:

> The Board has determined that it will proceed with a written process followed by a Board decision to address the preliminary issue of whether a standardized approach to cost of capital, including return on equity, capital structure and cost of debt, has the potential to achieve reasonable efficiencies while continuing to result in fair and reasonable rates for all stakeholders. As part of the decision, the Board will determine the subsequent steps, if any, for this generic proceeding.

The Board's letter requested parties to respond to specific questions in their submissions. Question 6 requested parties to respond to the following question:

> Would it be correct to consider a standardized approach to setting:
> - Utility equity rate of return;
> - Utility capital structure; and
> - Utility cost of debt,
>
> for all types of gas and electric utilities under the Board's jurisdiction?

NGTL did not raise its jurisdictional concerns in its response to the Board's request for submissions on this first module, nor did NGTL give notice of jurisdictional concerns following the Board's initial module decision to continue with the generic cost of capital proceeding hearing process. In fact, NGTL actively participated in the proceeding, filing evidence, asking information requests of other parties, presenting 3 panels of witnesses for cross-examination and cross examining other parties.

NGTL raised its jurisdictional concerns for the first time in written argument. The Board considers that the appropriate time to have raised the subject jurisdictional concerns was during the initial module process.

2.2 Should the Board Adopt a Standardized Approach?

AltaGas supported a standardized approach to ROE and capital structure, but only if the starting points recommended by Ms. McShane were implemented. Similarly, the Companies had no objection to the adoption of a rate of return adjustment formula providing that the formula was appropriate and contained reasonable starting point values.

ENMAX had reservations regarding the adoption of a generic approach and submitted that a generic approach must be flexible enough to account for differences between utilities and to consistently meet the comparable investment, capital attraction and financial integrity criteria.

ATCO and NGTL opposed a standardized approach to ROE and capital structure. ATCO submitted that a formula approach would not add to consistency, would not add to predictability and would not necessarily reduce regulatory lag.

As discussed in the previous section of this Decision, NGTL submitted that the Board does not have the jurisdiction to implement a formula approach to establish a fair return for NGTL. NGTL also submitted that even if the Board could legally implement a formula approach for NGTL, practical considerations should preclude the Board from doing so; and furthermore, if the Board establishes a formula for NGTL, then the mitigating measures suggested by Dr. Kolbe were essential.

All of the interveners supported a generic approach. Benefits cited for a generic approach generally included improved efficiency of the regulatory process in Alberta, greater consistency between utilities, and greater certainty and predictability of utility returns. Many interveners noted that the NEB and other Canadian regulators have had generic approaches in place for many years, and submitted that there was no reason why a generic approach could not also be used in Alberta.

The Board notes that some Applicants and all interveners supported a generic approach to ROE and capital structure. The Board considers that a generic approach would improve regulatory efficiency. As set out above, the Board does not agree with NGTL that there are legal impediments to the adoption of a generic process for gas utilities. The Board notes that other regulators have successfully implemented generic approaches to ROE and capital structure. Therefore, the Board is not persuaded that there are any practical impediments to the adoption of a generic process for utilities regulated by the Board.

Accordingly, the Board finds that the evidence in the Proceeding indicates that implementation of a generic approach is in the public interest and accordingly, the Board will implement a generic approach to ROE and capital structure. In the following sections, the Board will address the issues associated with the determinations necessary to appropriately implement this approach.

3 LEGISLATIVE AND JUDICIAL FRAMEWORK

In its letter of April 16, 2003, wherein the Board indicated its decision to proceed with a generic hearing, the Board outlined the purpose of the proceeding in the following manner:

> Having considered the submissions received from the above parties, the Board is of the view that a standardized approach to rate of return on equity and capital structure has the potential to achieve certain positive benefits including reduced regulatory costs, while continuing to result in a fair return for all utilities and in just and reasonable rates for all customers. The Board has therefore determined that it will proceed with a generic cost of capital hearing to focus on the possibility of establishing a standardized approach to rate of return on equity and capital structure for all utilities under the jurisdiction of the Board.

This section reviews the legislative and judicial framework that the Board has had regard to in reaching the determinations made herein.

3.1 Legislation

Authority to Hold an Inquiry
By letter dated September 30, 2002, the Board indicated that it had decided to call a generic hearing pursuant to its powers to hold an inquiry under section 46 of the PUBA to consider cost of capital matters for electric, gas and pipeline utilities under its jurisdiction. Section 46 provides the Board with the necessary statutory authority to commence the process that has culminated in this Decision.

The Board also notes that no party has asserted that the Board lacks the jurisdiction to conduct this generic proceeding. The Board notes however, the assertion of NGTL that the Board lacks the jurisdiction to establish a fair return for a gas utility unless and until it has determined a rate base for that gas utility pursuant to subsection 37(1) of the GUA. The Board has dealt with this objection in Section 2 of this Decision.

Authority to Set Fair Return
The Board's jurisdiction to set rates and in particular, a fair return for the utilities under its jurisdiction, is found in the following statutes:

- PUBA, including Part 2, Division 1 and in particular section 90 thereof;
- GUA, including Part 4 thereof and in particular section 37 thereof;
- *Electric Utilities Act*[6] (EUA), including Part 9 thereof and in particular section 122 thereof.

3.2 Relevant Judicial Decisions

Many of the parties quoted passages from decisions of the Supreme Court of Canada and of the U.S. Supreme Court to delineate the relevant judicial guidance for the Board when embarking on a process to establish a fair return for the utilities under its jurisdiction. The Board has provided below extracts from the most frequently cited decisions. These seminal decisions have, in turn, influenced subsequent decisions referred to by the parties.

In *Northwestern Utilities v. the City of Edmonton* [1929] S.C.R. 186; [1929] 2 DLR 4 (*NUL 1929*), the Supreme Court of Canada found at page 192:

> The duty of the Board was to fix fair and reasonable rates: rates which, under the circumstances, would be fair to the consumer on the one hand, and which, on the other hand, would secure to the company a fair return for the capital invested. By a fair return is meant that the company will be allowed as large a return on the capital invested in its enterprise (which will be net to the company) as it would receive if it were investing the same amount in other securities possessing an attractiveness, stability and certainty equal to that of the company's enterprise. In fixing this net return, the Board should take into consideration the rate of interest which the company is obliged to pay upon its bonds as a result of having to sell them at a time when the rate of interest payable thereon exceeded that payable on bonds issued at the time of the hearing. To properly fix a fair return the Board must necessarily be informed of the rate of return which money would yield in other fields of investment. Having gone into the matter fully in 1922, and having fixed 10% as a fair return under the conditions then existing, all the Board needed to know, in

[6] S.A. 2003, c. E-5.1

> order to fix a proper return in 1927, was whether or not the conditions of the money market had altered, and, if so, in what direction, and to what extent.[7]

In *Federal Power Commission et al. v. Hope Natural Gas Company*, 320 U.S. 591 (1944) (*Hope*), the U.S. Supreme Court found at page 591:

> The rate-making process under the Act, i.e. the fixing of 'just and reasonable' rates, involves the balancing of the investor and the consumer interests. Thus we stated in the Natural Gas Pipeline case that 'regulation does not insure that the business shall produce net revenues'. But such considerations aside, the investor interest has a legitimate concern with the financial integrity of the company whose rates are being regulated. From the investor or company point of view, it is important that there be enough revenue not only for operating expenses but also for the capital costs of the business. These include service on the debt and dividends on the stock. By that standard the return to the equity owner should be commensurate with returns on investments in other enterprises having corresponding risks. That return, moreover, should be sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital. The conditions under which more or less might be allowed are not important here. Nor is it important to this case to determine the various permissible ways in which any rate base on which the return is computed might be arrived at. For we are of the view that the end result in this case cannot be condemned under the Act as unjust and unreasonable from the investor or company viewpoint.[8]

In *Bluefield Waterworks and Improvement Company v. Public Service Commission of the State of West Virginia et al.*, 262 U.S. 679 (1923) (*Bluefield*), the United States Supreme Court found at page 692:

> The company contends that the rate of return is too low and confiscatory. What annual rate will constitute just compensation depends upon many circumstances and must be determined by the exercise of a fair and enlightened judgement, having regard to all relevant facts. A public utility is entitled to such rates as will permit it to earn a return on the value of the property which it employs for the convenience of the public equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties; but it has no constitutional right to profits such as are realized or anticipated in highly profitable enterprises or speculative ventures. The return should be reasonably sufficient to assure confidence in the financial soundness of the utility and should be adequate, under efficient and economical management, to maintain and support its credit to enable it to raise the money necessary for the proper discharge of its public duties. A rate of return may be reasonable at one time and become too high or too low by changes affecting opportunities for investment, the money market and business conditions generally.[9]

The Board notes that no party took issue with the general consensus that in order for a return to be fair, it must meet the tests of "comparable investment", "capital attraction" and "financial integrity" described in the above decisions. The Board concurs that the above decisions are the most relevant judicial authorities with respect to the establishment of a fair return for regulated utilities.

4 RETURN ON EQUITY

4.1 Common Return on Equity for all Utilities versus Utility-Specific ROEs

In this section, the Board will address whether there should be a common ROE applicable to all Applicants or whether there should be utility-specific ROEs. The Board will address the potential use of an adjustment mechanism for ROE, which could be applicable to either a common ROE or to utility-specify ROEs, in a later section of this Decision.

The following table summarizes the positions of the parties with respect to the issue of a common ROE applicable to all Applicants versus utility-specific ROEs:

Table 1. Common ROE versus Utility-Specific ROE Requirements

Recommended or Not Opposed to Common ROE	Opposed to Common ROE – Favoured Utility–Specific ROE
AltaGas	Companies
ATCO	NGTL
Calgary	
CAPP	
Cargill	
CG	
ENMAX	
IPCAA	
IPPSA	

Parties who supported a common ROE indicated that differences in business risk should be reflected through adjustments to capital structure. Certain of these parties also indicated that in the event that adjusting capital structure was not adequate to reflect the business risk for a particular Applicant, the common ROE could be adjusted for that particular Applicant. These parties generally took the position that the onus should be on each individual Applicant to establish the need for an exception to the common ROE. Interveners took the position that none of the Applicants had established such a need. ATCO, while supporting a common ROE, submitted that an exception was required for ATCO Pipelines.

The Board does not consider that persuasive arguments were raised against the use of a common ROE. The Board disagrees with NGTL's view that a common ROE fails to recognize the impact of leverage on the cost of equity and with the Companies' view that companies in the same industry may have different investment risks that require different ROEs. In the Board's view, a common ROE approach can accommodate these differences, by adjusting for any material differences in investment risk that would otherwise occur, through an adjustment to the capital structure, or, in exceptional circumstances, through a utility-specific adjustment to the common ROE.

The Board will therefore establish a common, or generic, ROE to be applied to all Applicants. The Board will address the need for any utility-specific adjustments to the common ROE in the capital structure section of this Decision.

In this regard, the Board considers that unique utility-specific adjustments to the common ROE should only be made in exceptional circumstances where adjusting capital structure alone is not sufficient to reflect the investment risk for a particular Applicant.

4.2 ROE Methodology and 2004 ROE

4.2.1 Introduction

The following table summarizes the 2004 ROE recommendations of the expert witnesses:

Table 2. 2004 ROE Recommendations by Expert Witnesses

Witness (Sponsoring Party)	Applies to	ERP Tests ROE Results (%)	DCF Test ROE Results (%)	CE Test ROE Results (%)	2004 Recommended ROE (%)
Ms. McShane[10] (AltaGas/ATCO)	All except ATCO Pipelines	10.5-10.75	11.0-11.25	No less than 13	11.0-11.5
Dr. Evans[11] (Companies)	Companies	9.8-10.4		12 (for ETI)	10.5-11.25
Dr. Neri[12] (ENMAX)	ENMAX	10.05-11.65	10.5-10.95		11.5
Drs. Kolbe & Vilbert[13] (NGTL)	NGTL	11	10.3-14.1,[14] used as check		11 at 40% common equity
Dr. Booth[15] (Calgary/CAPP)	All	8.12	Confirmed ERP of 8.12 was fair	9-10, used as check	8.12
Drs. Kryzanowski & Roberts[16] (CG)	All	8.05			8.05

The Board notes that no party relied directly on an ATWACC approach to setting a fair return for utilities. For the ERP results in the above table, all experts relied at least in part on the CAPM form of the ERP test. Most experts also relied in part on various other tests, including other forms of the ERP test, the DCF test, the CE test, and other measures of comparable investment. The Board will consider each of these approaches in the following sections.

4.2.2 After Tax Weighted Average Cost of Capital

NGTL's evidence (Exhibit 013-03) states:

> In the first phase of this proceeding, NGTL recommended that the Board cast the issues net broadly enough to include methodologies other than the traditional. While the EUB Notice of Hearing does not explicitly exclude the ATWACC approach, it does so implicitly by establishing the scope of the proceeding in capital structure/return on equity terms. NGTL has therefore focused its evidence on the traditional methodology, subject to the fundamental precepts that the cost of equity depends on the amount of financial risk of the company, and that financial risk changes with capital structure.[17]

10 Exhibit 005-10-2, Evidence of Kathleen McShane, page 5
11 Exhibit 003-03, Evidence of Robert E. Evans, pages 24 and 25 and Exhibit 012-01, Evidence of Robert E. Evans Supplement C page C-20
12 ENMAX, Argument, page 16
13 NGTL Argument, page 20
14 Exhibit 013-06, Evidence of Michael J. Vilbert, page 52
15 Calgary/CAPP Argument, page 17 and Exhibit 016-11(a), pages 14 and 36
16 CG Argument, page 47
17 Exhibit 013-03, NGTL Evidence, page 5, line 15

In its Argument, NGTL stated:

> In the first phase of this proceeding, NGTL recommended that the Board cast the issues net broadly enough to include methodologies other than the traditional. The EUB Notice of Hearing implicitly excluded the ATWACC approach by establishing the scope of the proceeding in capital structure/return on equity terms.[18] (Footnotes excluded)

Notwithstanding NGTL's statements that the Board had not explicitly excluded the ATWACC approach, under cross-examination NGTL confirmed that it had not requested the Board to consider the ATWACC approach to cost of capital matters. The following dialogue occurred during examination by Board Counsel of NGTL's witness, Mr. Brett:

> Q………..Are you in the context of your evidence, suggesting that the Board should consider ATWACC and ATWACC methodology in terms of coming up with a fair return for NGTL?
>
> A. MR. BRETT:…..We have not asked the Board to set tolls using an ATWACC methodology which, for example, is what we did in the fair return. What we have indicated is that leverage matters and that capital structure impacts the return that is required; and to our mind, in order to determine that interrelationship, you have to be cognizant of the overall return on capital.
>
> Q……….. So, again, just to be clear, you're not asking the Board to consider ATWACC in terms of how it would set a fair return; moreover, it is being suggested by the company that it is one of the tools it uses as, perhaps, a check in terms of what a fair return would be; would that be a fair statement?
>
> A. MR. BRETT: …..I think what I said, and what I intended to say, is we have not asked the Board to use a return on capital or ATWACC for setting a revenue requirement. We have applied for the traditional ROE on equity thickness.[19]

Given the submissions at the beginning of the proceeding, the Board's written views on the scope for the proceeding and the examination during the Hearing, the Board does not agree with NGTL's stated interpretation of the Board's Notice of Hearing dated April 16, 2003. The Board considers it clear that the Notice of Hearing did not limit, either explicitly or implicitly, any submissions or evidence that a party might wish to present in respect of the approach or the methodology that a party would urge upon the Board to consider in making a determination of an appropriate fair return.

In the Notice of Hearing, the Board stated:

> Having considered the submissions received from the above parties, the Board is of the view that a standardized approach to rate of return on equity and capital structure has the potential to achieve certain positive benefits including reduced regulatory costs, while continuing to result in a fair return for all utilities and in just and reasonable rates for all customers. The Board has therefore determined that it will proceed with a generic cost of capital hearing to focus on the possibility of establishing a standardized approach to rate

[18] NGTL Argument, page 18
[19] Transcript, Volume 20, pages 2777- 2778

> of return on equity and capital structure for all utilities under the jurisdiction of the Board.[20]

It is clear that the Notice refers only to the possibility of establishing a standardized approach to rate of return on equity and capital structure for utilities. Further, in the Board's letter of May 28, 2003, the Board clarified that it had not already made a final determination to adopt a standardized approach to rate of return and capital structure.

> The Board confirms that it expects to adopt a standardized approach to rate of return and capital structure. The Board decided to continue with a generic cost of capital hearing based on a record that supports the overall merits of a standardized approach to rate of return and capital structure. **The Board wishes to emphasize, however, that the approach ultimately adopted by the Board may differ between industries or on some other appropriate basis.**[21] (Emphasis added)

The language in the Board's Notice reinforced the decision of the Board to proceed to a hearing to consider a standardized approach to rate of return and capital structure. However, the last sentence of the paragraph clarified to parties that a standardized approach to rate of return and capital structure may not be found to be appropriate and that the Board remained open to other cost of capital approaches.

The Board also notes the statement of NGTL in their evidence:

> Properly applied, ATWACC and the traditional methodology should yield similar results.[22]

This statement by NGTL clearly indicates its position that the results obtained under one methodology for determining a fair return should be similar to the results obtained through the other methodology, when each methodology is properly applied. The Board also notes that the NGTL evidence and argument provided submissions on an appropriate return on equity and capital structure for NGTL as well as the ATWACC equivalent.[23]

4.2.3 CAPM Test

As noted above, all experts relied at least in part on the CAPM form of the ERP test. The Board will address other forms of the ERP test relied on by the experts in this Proceeding in the next section of this Decision.

[23] For example Exhibit 013-03, NGTL Evidence, pages 4 and 6 and NGTL Argument pages 19, 89, 92 and 117

The following table summarizes the CAPM recommendations of the expert witnesses:

Table 3. CAPM Recommendations[24]

Witness (Sponsoring Party)	Risk-free Rate (%)	MRP (%)	Beta	Flotation Allowance (%)	ROE (%)
Ms. McShane (AltaGas/ATCO)	5.75	6.0	0.60-0.65[25]	0.50	10.0
Dr. Evans (Companies)	5.60	5.75	0.60	0.75	9.8
Dr. Neri (ENMAX)	6.15	6.5	0.60	0.50[26]	10.5[27]
Drs. Kolbe & Vilbert[28] (NGTL)	5.65	5.5	0.61	0.50[29]	9.5[30]
Dr. Booth (Calgary/CAPP)	5.5	4.5	0.45-0.55[31]	0.50	8.25
Drs. Kryzanowski & Roberts (CG)	5.6	4.7	0.50	0.10	8.05

Risk-Free Rate

A forecast of the long-Canada bond yield is traditionally used as the risk-free rate, for CAPM purposes. The Board notes that none of the experts suggested departing from this practice.

The Board notes from the above table that the range of risk-free estimates was from 5.5-6.15%. Dr. Booth's (sponsored by Calgary/CAPP) estimate of 5.5% was at the low end of the range. However, CAPP noted in argument that the November 2003 Consensus Forecast used by the NEB for its 2004 ROE determination resulted in a forecast of the long-Canada bond yield used by the NEB for 2004 of 5.68%, which would increase CAPP's 2004 ROE recommendations.

The Board notes that Dr. Neri's (sponsored by ENMAX) estimate of 6.15% is significantly higher than any other estimate. Excluding both Dr. Booth's and Dr. Neri's estimates would result in a range of risk-free estimates of 5.60-5.75%.

The Board considers this range of 5.60-5.75% to be a reasonable range for the 2004 risk-free rate, with a midpoint of 5.68%.

The Board notes that this midpoint of 5.68% is the same as the risk-free rate used by the NEB for 2004, which was based on the November 2003 Consensus Forecast. The Board considers the use of a risk-free rate based on the November 2003 Consensus Forecast is consistent with the formula to adjust the generic ROE that the Board establishes in a later section of this Decision. Use of the November 2003 Consensus Forecast is also consistent with the objective of establishing utility revenue requirements based on forecasts made in advance of the test year.

[24] Cargill Argument, page 15, except as otherwise indicated
[25] Exhibit 005-10-2, Evidence of Kathleen McShane, page 30
[26] The Board has added the 0.50% flotation cost indicated in the CAPP/Calgary Argument at page 7
[27] Ibid.
[28] Exhibit 013-06, Table No. MJV-10, panel B, "Average C" ("Averages A & B" are virtually identical to C) and Exhibit 013-06, page 39
[29] Flotation costs assumed to be 50 basis points; NGTL considered flotation costs as a valid cost, but did not make a specific recommendation. NGTL Argument, page 55
[30] Ibid.
[31] Exhibit 016-11(a), Evidence of L.D. Booth, page 23

Therefore, the Board finds that an appropriate risk-free rate for 2004 is 5.68%.

MRP (Market Risk Premium)
The Board notes that some parties, including IPCAA, argued that the arithmetic average MRP overstates the returns that investors have received or can expect to receive in the future. In the Board's view, when a forecast is based on the historic average, the arithmetic average MRP represents the best estimate of the short-term return and the geometric average represents the best estimate of the long-term return. The Board has not been persuaded that it should change its practice of using the arithmetic average. Consequently, the Board will maintain its practice of using the arithmetic average rather than the geometric average.

The following table summarizes the evidence on the average arithmetic MRPs in Canada and the U.S. for various time periods:

Table 4. Historical Arithmetic Canadian and U.S. MRPs

	Canada	U.S.
1802-1998[32]		4.7
1900-2002[33]	5.5	6.4
1924-2002[34]	5.0	
1926-2001[35]		7.0
1936-2002[36]	4.7	
1947-2002[37]	5.0	6.7
1957-2002[38]	2.3	4.2

In this Proceeding, a number of concerns were raised regarding the use of historic data as a reasonable estimate for the future MRP:

1. Dr. Booth indicated that Canadian data prior to 1956 should not be used. However, Dr. Booth indicated that the Canadian equity risk premium since 1956 has been only about 2.3%. Dr. Booth then adjusted this figure upward to 4.5%, to take into account the influence of earlier data, the unexpected performance of the bond market, and the U.S. data.[39] This indicates that Dr. Booth was unable to rely on the historic data without a material adjustment;
2. ATCO noted a number of problems in using Canadian historical data including structural changes in the economy, the recent impact of a few large firms on the market proxy and the need to consider U.S. data;[40] and
3. CG noted that the current equity risk premium could be expected to be about 1% lower than the historical equity risk premium due to current lower trading costs.[41]

---

33 Exhibit 017-05(a), Evidence of Kryzanowski and Roberts, Schedules, Schedule 4.3 and 4.5
34 Exhibit 016-11(a), Evidence of L.D. Booth, Schedule E1 (Canadian Institute of Actuaries Data)
35 Exhibit 012-01, EPCOR Transmission, Direct Evidence and Supplements of Robert E. Evans, Dec. 2002, Supplement C, page C-10
36 Exhibit 009-02(b) Schedule 5 (Canadian Institute of Actuaries data)
37 Exhibit 005-10-2, Table 4, page 27
38 Exhibit 016-11(a), Evidence of L.D. Booth, Appendix E, Schedule E1 and Appendix F, Schedule F2
39 Exhibit 016-11(a), Evidence of L.D. Booth, page 24
40 ATCO Argument, pages 25 and 26
41 CG Argument, page 31

In the Board's view, a reasonable approach is to consider the longer-term average historic Canadian equity risk premium and then adjust this upward or downward based on the Board's judgment and the Board's assessment of the evidence regarding the prospective outlook for the equity risk premium.

In the Board's view, in general, the present Canadian market already reflects the impact of U.S. data based on the current degree of North American market integration. Participants make market trade-offs in their decisions on how to participate in the various markets around the world. The present high degree of integration would not have been fully reflected historically, accordingly, the Board considers that the U.S. historical MRP should be considered as one of many factors in applying judgment to adjust the Canadian historic MRP. The Board notes Dr. Booth's evidence that U.S. MRPs need to be tax-adjusted and that therefore U.S. market returns are biased high for Canada, but still provide a ceiling for Canadian estimates.

The Board notes from Table 3, that the range of the experts' recommended MRP estimates was from 4.5-6.5%, with a midpoint of 5.5%. The Board also notes from Table 4 above that the historic arithmetic risk premium in Canada has been 4.7-5.5% for those periods ending in 2002 that provide 50 or more years of history. In the Board's view, the historic evidence, along with some recognition of the higher U.S. figures, supports the midpoint of the experts' estimates at 5.5%.

Considering all of the above, the Board finds that an MRP of 5.5% is appropriate.

The Board also notes that this midpoint of 5.5% is consistent with the MRP used by the Board in its most recent rate of return determinations.[42]

Beta

The Board notes that there was general agreement that use of actual data from very recent years, to calculate beta, would under-estimate the prospective beta due to the technology-related market bubble and subsequent collapse, and that there was also general agreement that beta is a relative risk factor that requires judgment.

The Board notes from Table 3 that the range of beta estimates recommended by the expert witnesses was from 0.45-0.65. Dr. Booth's estimate of beta of 0.45-0.55 was the lowest estimate in the range. The next lowest estimate was 0.50, proposed by Dr. Kryzanowski (sponsored by CG). The Board also notes from the argument of Calgary/CAPP that the beta of 0.55 recently used by the Board[43] was at the top of Dr. Booth's range, but "is well within normal estimation error".[44] The Board also notes that the high estimate of 0.65 was partially based on adjusted U.S. data and partially based on a relative risk calculation that utilized standard deviations and not the more usual regression analysis calculation.[45]

Based on the above, the Board finds that a reasonable estimate of beta, or the relative risk factor of utilities versus the overall equity market, is 0.55.

[42] Includes Decisions 2003-63, 2003-71, 2003-72 and 2003-100
[43] Decisions 2003-63, 2003-71, 2003-72 and 2003-100
[44] Calgary/CAPP Argument, Section 4.2.3.2, page 15
[45] Exhibit 008-01, ATCO Pipelines 2003-2004 Application, Evidence of Kathleen McShane, pages 44-47 of 63

The Board also notes that this estimate of beta of 0.55 is consistent with the value that the Board has assigned to beta in its most recent rate of return determinations.[46]

Flotation Cost Allowance

The Board notes that all parties, except the Companies and CG, recommended or were not opposed to a 0.50% allowance for flotation costs and financing flexibility.

The Board notes that CG and CAPP suggested that an alternative to an ongoing flotation allowance was to expense the costs of flotation. CG proposed that this expense could be amortized over 50 years. In the Board's view, there was limited support for changing its past approach to flotation costs.

The Board notes that the Companies argued that the flotation allowance should be increased to 0.75%, based on the increased capital markets volatility. However, the Board considers that there is merit in CG's argument that the apparent higher volatility in the markets was due to a rapid increase in listings by smaller and more risky firms and was not due to the utility sector.[47] The Board is therefore not convinced that a change is required to the 0.50% flotation cost allowance used in recent decisions.

Based on the above, the Board finds that continuation of a 0.50% allowance for flotation costs and financing flexibility is appropriate.

CAPM Conclusions

Based on the above-determined risk-free rate of 5.68%, MRP of 5.50%, beta of 0.55, and allowance for flotation costs of 0.50%, the Board concludes that a reasonable CAPM estimate for 2004 is 9.20%.

The Board will now consider the other ROE methodologies suggested by the parties to determine if the results, obtained from the application of such methodologies, warrant an adjustment to the Board's CAPM estimate of ROE.

4.2.4 Other Forms of the ERP Test

Dr. Booth gave equal weight to CAPM and to a multi-factor ERP model that indicated that a utility's equity risk premium over the long-Canada rate was a function of both the MRP and of the term spread of long-Canada rates over shorter-term rates. The midpoint of the results of Dr. Booth's multi-factor ERP model was approximately 7.5%,[48] which indicated an ROE of approximately 8.0% after including an allowance for flotation costs of 0.50%.

Dr. Booth's multi-factor ERP model would directionally support a reduction from the midpoint of the Board's CAPM range. However, the Board will only place limited weight on the results of Dr. Booth's multi-factor model for the following reasons:

1. The model has a low R-squared statistic, indicating low reliability of the model;
2. Today's interest rates are at the bottom edge of the range experienced over the study period; and

[46] Decisions 2003-63, 2003-71, 2003-72 and 2003-100

[47] CG Reply Argument, page 29

[48] Exhibit 016-11(a), Evidence of L. D. Booth, pages 25-29

3. The adjustments that Dr. Booth indicated were required in developing the model.[49]

Dr. Vilbert (sponsored by NGTL) used both a CAPM model and an ECAPM model. His ECAPM model included an adjustment factor to compensate for an alleged tendency of CAPM models to under-estimate required returns for lower risk companies. Dr. Vilbert's ECAPM model resulted in a recommendation for an 11% ROE on a 40% common equity ratio. Dr. Vilbert's ECAPM results would directionally support an increase from the midpoint of the Board's CAPM range.

The Board notes Calgary/CAPP's argument that applying CAPM using long-term interest rates (long-Canada bond yields) in determining the risk-free rate, as was done by all experts in this Proceeding, already corrects for the alleged under-estimation that ECAPM was designed to address.[50] Calgary/CAPP argued that the under estimation would only be present if the CAPM were applied using short-term interest rates, which none of the experts did in this Proceeding.

The Board finds the Calgary/CAPP position persuasive and considers that the use of long-term Canada bond yields largely adjusts for the tendency of CAPM, when based on short-term interest rates, to under estimate the required returns for lower risk companies. Therefore, the Board will only place limited weight on the results of the ECAPM model.

Ms. McShane (sponsored by AltaGas/ATCO) used a DCF-based ERP test that resulted in a utility risk premium of 4.9%.[51] The Board notes that this implies a total utility ROE of 11.15%, after adding her recommended risk-free rate and the flotation cost. Ms. McShane also provided a realized historic utility ERP, based on Canadian and U.S. utility returns, which indicated a utility risk premium of 4.75%.[52] The Board notes that this implies a utility ROE of 11.0%.

Dr. Neri applied two ERP tests in addition to the CAPM, based on U.S. electric utilities and on U.S. gas distribution utilities, which produced utility equity risk premiums of 5.14 and 5.53%,[53] respectively. The Board notes that this implies a total utility ROE of 11.79% and 12.18%, respectively, after adding Dr. Neri's risk-free rate recommendation of 6.15% and a flotation allowance of 0.50%.

The Board notes that these utility return results of Ms. McShane's and Dr. Neri's other ERP tests are higher than many estimates of the market required return.

Ms. McShane's and Dr. Neri's other ERP tests would directionally support an increase from the midpoint of the Board's CAPM range. However, the Board shares CG's[54] and CAPP's[55] concern that it is not reasonable for the prospective required return on low risk firms to be close to or above the prospective overall market return.

49 Exhibit 016-11(a), Evidence of L. D. Booth, page 26
50 Calgary/CAPP Argument, page 12
51 Exhibit 005-10-2, Kathleen McShane, page 33
52 Ibid.
53 Exhibit 009-02(b), Schedules 6&7
54 CG Argument, page 49
55 CAPP Argument, page 17

On balance, the Board concludes that the results of the ERP tests other than CAPM would generally support a 2004 ROE above the Board's CAPM estimate, but that for the reasons set out above only limited weight should be placed on the results of the ERP tests other than CAPM.

4.2.5 Discounted Cash Flow Test

The Board notes from Table 2 that the Applicants' standard-method DCF estimates for ROE ranged from 10.3-14.1%. The Board notes ATCO's argument that any upward bias in analyst growth estimates may be less prevalent for stable industries including utilities. Nevertheless, the Board considers that there is merit in the intervener arguments[56] that the analysts' earnings forecasts used in the development of the DCF estimates have been biased high, resulting in DCF estimates that overstate the required return. The record of the Proceeding reveals no evidence on an appropriate discount to apply to the DCF test results to appropriately adjust for an overstatement in the required returns. Accordingly, the Board finds reliance on the Applicant's DCF estimates problematic.

The Board notes that Dr. Booth's DCF approach[57] was not based on an assessment of analysts' earnings forecasts, but was based on an assessment of the growth of the overall economy. Dr. Booth considered that the market as a whole would grow at the same rate as the nominal GDP growth rate of about 6%, which would indicate a total investor market return of 8.5% after including average dividends of 2.5% (which included an estimated 0.5% to account for share repurchases as surrogate dividends). Dr. Booth indicated that this was a geometric market return estimate and therefore under estimated the average short-run growth rate, since the arithmetic rate exceeds the geometric rate. Dr. Booth further indicated that his DCF analysis confirmed that an 8.12% allowed ROE for a regulated utility was fair and reasonable. However, the Board notes that Dr. Booth did not quantify the impact of converting from a geometric rate to an arithmetic rate, did not quantify, in this case, the impact of utilities having less risk than the market average, and did not add an allowance for flotation costs.

As a result of the above noted concerns, the Board concludes that no weight should be placed on the results of the DCF tests presented in this Proceeding.

4.2.6 Comparable Earnings Test

The Board notes that several Applicants indicated that the comparable investment test, envisioned in the court decisions referred to in Section 3 of this Decision, obligated the Board to place weight on the CE test.[58] However, in the Board's view, the CE test is not equivalent to the comparable investment test. The CE test measures **actual** earnings on **actual book value** of comparable companies, which, in the Board's view, does not measure the return "*it **would** receive if it **were** investing the same amount in other securities possessing an attractiveness, stability and certainty equal to that of the company's enterprise*"[59] (emphasis added) (unless the securities were currently trading at book value). The Board notes that Cargill[60] expressed a similar view.

56 For example, Cargill Argument, page 23, and CG Argument, page 13
57 Exhibit 016-11(a), Evidence of L.D. Booth, page 36
58 ATCO Argument page 8, Companies Argument page 24
59 NUL, 1929, at 192-193
60 Cargill Argument, pages 6 and 7

The Board considers that the application of a market required return (i.e. required earnings on market value) to a book value rate base is appropriate in the context of regulated utilities.

The Board notes Ms. McShane's CE test result of "no less than 13%". The Board notes that this result is in excess of Ms. McShane's 11.75% estimate of the market return, excluding flotation allowance, incorporated in her CAPM result in Table 3. The Board also notes Dr. Booth's evidence that at no time in the last fourteen years has the average ROE of Corporate Canada exceeded 12.0%, and only twice in the last thirteen years has the average ROE been in double digits.[61]

In the Board's view, based on Dr. Booth's evidence regarding the achieved ROEs of Corporate Canada, and her own CAPM estimate, Ms. McShane's CE test result of "no less than 13%" exceeds a reasonable forecast of the prospective market required return. In the Board's view, CE test results for low risk companies, that exceed the forecast required return on the overall market, raise serious conceptual or methodological concerns regarding the relevance of the CE test. The Board does not consider it reasonable for the prospective required return on low risk firms to exceed the prospective overall market required return. The Board notes Ms. McShane's evidence that lower risk firms have outperformed the market over certain historical periods. However, in the Board's view, to forecast this result would not be credible.

The Board also notes that, in this Proceeding, various implementation problems with the CE test were discussed. These included sample selection problems, accounting differences, market power concerns, and problems matching the current business cycle stage. The Board recognizes that all traditional ROE tests suffer from methodological difficulties.

The Board concludes that it should place no weight on the CE test because of the implementation problems of the CE test and the above-noted conceptual and methodological concerns with the CE test.

4.2.7 Other Measures of Comparable Investment

Although the Board will not place any weight on the CE test, the Board considers that there may be other measures of comparable investment that should be considered in the establishment of an appropriate ROE. In this section, the Board will address other such measures of comparable investment that were raised in the Proceeding.

Return Awards for Other Canadian Utilities

The Board acknowledges the potential for circularity when considering awards by other regulators. Nevertheless, the Board considers that awards by other Canadian regulators may provide some indication of the appropriate ROE for the Applicants.

[61] Calgary/CAPP Argument, page 6

Dr. Evans provided, at the Board's request, a detailed compilation of ROE awards and other matters for Canadian utilities.[62] The following table is an excerpt from that compilation:

Table 5. Awarded ROEs for Other Canadian Utilities

	Date	Awarded ROE (%)
British Columbia		
Aquila Networks Canada (BC) Ltd.	November 2003	9.55
Pacific Northern Gas Ltd.	November 2003	9.90
Terasen Gas Inc.	November 2003	9.15
Ontario		
Enbridge Gas Distrbution	November 2003	9.69
Union Gas Ltd.	Jan. 1999/July 2001	9.95
Quebec		
Gaz Metropolitain	September 2002	9.89
Nova Scotia		
Nova Scotia Power Inc.	October 2002	10.15
Prince Edward Island		
Maritime Electric	October 2001	11.00
Newfoundland		
Newfoundland Power Inc.	June 2003	9.75
National Energy Board	November 2003	9.56

Directionally, the evidence on recent awards for other Canadian utilities would support a 2004 ROE above the Board's CAPM estimate. However, the Board concludes that limited weight should be placed on this evidence due to the potential for circularity.

Return Awards for U.S. Utilities

The Applicants generally took the view that it is appropriate to consider utility ROEs awarded by U.S. regulators, due to the similarity between Canadian and U.S. utilities and due to the high degree of integration of the capital markets of the two countries.

The Board notes the evidence of various Applicants that low risk gas distribution utilities in the U.S. have allowed returns in the 11% range on a 45% common equity component, and that prior to incentives, the base return for interstate electric transmission companies allowed by FERC is in excess of 12% on a 50% equity component.[63]

The Board also notes the submissions of various interveners that there are several differences between Canadian and U.S. regulation. The Board, in particular, notes CAPP's submission that U.S. pipelines operate under a regulatory regime that has exposed them to severe realized and potential risks. In this regard, the Board notes the evidence[64] of CAPP indicating low actual returns of a number of U.S. interstate pipelines.

62 Exhibit 021-24
63 ATCO Argument, pages 29-30
64 Exhibit 015-11, Written Evidence of CAPP, pages 49-50

In the Board's view, the Applicants did not demonstrate that the regulatory regimes in the two countries are sufficiently comparable that the Board should place significant weight on the return awards for U.S. utilities. For example, the Board notes differences in legislation, public and regulatory policies, the higher prevalence of longer-term settlement arrangements, the federal/state jurisdictional divisions, the development of RTOs and other differences in the structure of regulated industrial sectors, and differences in national fiscal, tax and monetary policies. The Board notes AltaLink acknowledged that there are some differences in the Canadian and U.S. electric industry structures that may impact some of the higher return and equity component awards in the U.S.[65]

Furthermore, the Board notes the recent acquisitions, at premiums to book value, by U.S. companies of an interest in TransAlta Corporation's former distribution and transmission businesses. The Board considers these acquisitions, which are discussed further below, may be an indication that the regulated returns available in Alberta are not too low for U.S. firms, relative to investment opportunities in their home country given all relevant circumstances.

Directionally, the evidence on the awards available to U.S. utilities would support a 2004 ROE above the Board's CAPM estimate. However, the Board concludes that limited weight should be placed on this evidence due to the differences in the regulatory, fiscal, monetary, and tax regimes in the two countries.

FERC Incentives for Transmission Facilities

A number of the applicants suggested that if the Board did not reflect the incentive awards that FERC has in place for new electric transmission facilities, then capital might not be available for utility infrastructure in Alberta. These applicants argued that above-market ROEs would be in the public interest in order to ensure that sufficient capital is attracted for Alberta's infrastructure needs.

The Board is not persuaded that the existence of certain FERC-regulated transmission projects with allowed returns above the current market required rate of return would impair the ability of Alberta utilities to attract capital. In the Board's view, Alberta utilities do not compete for capital only with these projects, but rather with a broad universe of investment opportunities. Furthermore, if the higher allowed returns for these projects were material to the Canadian market required return, the Board considers that the impact of these higher allowed returns would already be reflected in the Canadian market required return.

Furthermore, the Board notes that the FERC incentives are intended to encourage RTO participation, independent ownership of transmission facilities, and investment in new facilities found appropriate pursuant to an RTO process. The Board notes that the objectives of encouraging RTO participation and encouraging independent ownership of transmission facilities are not applicable in Alberta. Similarly, the objective of encouraging investment in new independent transmission facilities into areas presently serviced by vertically integrated utilities is also not applicable in Alberta. Furthermore, the Board notes that both AltaLink and ATCO expressed continued strong interest in infrastructure development in Alberta.

The Board considers that there is no persuasive evidence in this Proceeding that demonstrates that above-market awarded returns are required to attract capital, and the Board notes that there

[65] AltaLink Specific Reply Argument, third page

is no evidence of any Alberta TFO having any difficulty in attracting capital to date. The Board considers that to award such returns in the absence of need would unnecessarily and inappropriately result in additional costs to consumers.

Furthermore, the Board considers that if it were satisfied in some future application that it was appropriate to award incentive returns to attract capital in connection with the construction of certain new electric transmission facilities in Alberta, such returns would not be appropriate on existing facilities and may not be necessary in respect of all new infrastructure developments.

The Board is not persuaded that there is any requirement at this time to offer above-market ROEs or other incentives to attract capital for the construction of new electric transmission facilities in Alberta. The Board will not put any weight on the FERC incentives for transmission facilities, for the purposes of determining the generic ROE.

Alliance and Maritime and North East Pipelines (M&NP)
NGTL's view was that Alliance and M&NP are particularly relevant comparisons for NGTL. NGTL noted that both Alliance and M&NP are regulated and ship into markets served by gas that moves through NGTL and TransCanada Pipelines Ltd. (TCPL)'s Mainline. NGTL submitted that Alliance and M&NP, as the most recent large greenfield pipelines, show what returns are necessary to entice investment in regulated natural gas pipelines. Alliance has an ROE of 11.25% on 30% deemed equity and M&NP has an ROE of 13% on 25% deemed equity.

In regards to the regulated returns of Alliance and M&NP, the Board agrees with CAPP that these returns are not directly relevant, due to different circumstances (such as the level of ROE being locked in for a long period of time) and because they date back to a period of higher interest rates and returns. In this respect, the Board notes CAPP's argument that Alliance takes risks that NGTL does not, including some volume risk on an exception basis, long-term shipper contract default risk, and long-term interest rate risk,[66] and that the M&NP was built for a new untested basin with few pools having been delineated. In addition, the Board notes that the deemed equity ratios for Alliance and M&NP are lower than any Board-approved equity ratio, which would directionally reduce the impact on customer rates of a higher ROE.

Although, directionally, the absolute level of return for Alliance and M&NP would support a 2004 ROE above the Board's CAPM estimate, the Board concludes, based on the above analysis, that it should place limited weight on the Alliance and M&NP returns.

Market-to-Book Ratios and Acquisition Premiums
The Board notes the evidence, including that of AltaGas[67] and Calgary/CAPP[68] that the equity of utilities that earn a large portion of their earnings based on regulated formulas in other Canadian jurisdictions tends to trade at market-to-book ratios well above 1.0, albeit at premiums less than the average market premium.

The Board also notes that there have been a number of acquisitions of Alberta utilities in recent years, at prices that significantly exceeded book value. For example, in 2000, Aquila acquired TransAlta Corporation's distribution and retail businesses at a total price of 1.5 times book value. Book value was forecast to be $472 million at time of close, resulting in a forecast premium of

66 Exhibit 015-11 Written Evidence of CAPP, page 36 and 49
67 AltaGas Argument, page 24
68 Exhibit 016-11(b), Written Evidence of J.D. McCormick, page 5

$238 million.[69] Aquila subsequently sold TransAlta's former retail business to EPCOR Energy Services (Alberta) Inc. for $110 million, including a premium of $99 million.[70]

As well, in 2004, Fortis purchased Aquila for a premium of $215 million above the book value of $601 million.[71]

Similarly, with respect to the AltaLink acquisition of TransAlta Corporation's transmission assets, the Board notes Mr. McCormick's[72] evidence that a premium of $200 million was paid to acquire a rate base of approximately $644 million.

The Board agrees with the Applicants that there are a number of factors impacting market-to-book ratios of utility holding companies and that one has to be cautious making inferences regarding the regulated utilities. The Board also agrees that there may be strategic factors affecting the price that is paid to acquire a utility.

For example, NGTL submitted that its parent did not acquire a further interest in the Foothills pipeline, paying 1.6 times book value, for the opportunity to earn a return at the NEB formula rate; rather, the investment was made in an effort to increase the probability that TCPL will participate in a Northern pipeline project. The Board also recognizes that, in some cases, a premium might be paid for regulated assets in anticipation of significant future growth in rate base, to achieve geographic diversification or to obtain a foothold in a new market. However, parties are also aware of the constraints placed on regulated utilities with respect to affiliate transactions, particularly those with unregulated affiliates.

In the absence of such strategic factors, the Board would not expect a prudent investor to pay a significant premium unless the currently awarded returns are higher than that required by the market. The Board acknowledges the views of some parties that payment of a premium over book value for a regulated utility indicates that the recent ROE awards may have been higher than required by the market. The Board is not aware of the strategic factors that may have affected the price paid to acquire Alberta utilities in recent years. Nevertheless, the experience regarding the market-to-book values of utilities and the experience regarding the acquisition of Alberta utilities in recent years gives the Board some comfort that its recent ROE awards have not been too low.

Further in this regard, the Board notes AltaLink's testimony, in response to examination by the Chairman,[73] that AltaLink's decision to purchase TransAlta's transmission business considered Board awards for transmission entities of 9.75% ROE on a capital structure including 35% equity.

Directionally, the Board concludes that the experience regarding the market-to-book ratios of utilities and the experience regarding the acquisition of Alberta utilities in recent years is relevant and supports continuation of an ROE at or below the Board's CAPM estimate.

[71] Decision 2004-035, page 18
[72] Exhibit 016-11(b) Evidence of J.D. McCormick, pages 39-40
[73] Transcript, Volume 15, pages 2004-2006

Income Trusts

The Board notes the significant disagreement among parties with respect to return expectations of investors in Income Trusts. The Board notes that Mr. McCormick relied primarily on a sample of only five Income Trusts and that the validity of his sample selection was the subject of substantial debate.

In the Board's view, the theoretical return, indicated by Mr. McCormick, based on ROE does not address actual investor expectations on investment or actual historic returns on investment of Income Trust investors. For example, the Board notes that Income Trust prices often rose despite the fact that part of the distributions represented return of capital.

The Board generally agrees with the views of the Applicants that Income Trusts may be overvalued[74] due to investors' misperceptions and may be too new to be a reliable indication of required market returns. The Board also does not consider that there is any evidence that the allegedly lower return requirements for Income Trusts are achievable in a corporate structure. The Board notes that no party advocated that the Applicants be required to reconstitute as Income Trusts. The Board also notes that some Income Trusts have much higher equity ratios than the Applicants, which would directionally offset the impact of a lower ROE on customer rates.[75]

Nonetheless, the Board notes that Income Trusts are attracting a substantial amount of new capital.

Directionally, the Board considers that the experience with Income Trusts would support an ROE at or below the Board's CAPM estimate. However, for the reasons cited above, the Board concludes that limited weight should be placed on this experience.

Pension Return Expectations

Interveners generally took the position that TCPL's forecast pension return on Canadian equity investments of 9.5% was an indicator of the Canadian market return expected by TCPL. NGTL argued that the forecast of 9.5% was prepared by its actuaries and was not comparable to an investment hurdle rate. NGTL further argued that the forecast of 9.5% was a geometric estimate rather than an arithmetic estimate.

The Board acknowledges that forecast pension returns on equity investments may be conservative by their nature, but the Board nevertheless considers that forecast pension returns on equity investment are a valid indicator, albeit potentially conservative, of the forecaster's current market equity return expectation. However, the Board agrees with NGTL that the forecast pension return is akin to a geometric average and would therefore understate the forecaster's short-term expectation for the market return. Directionally offsetting this impact, the Board would expect the required return for utilities to be below the required overall equity market return.

On balance, the Board concludes that the evidence on forecast pension returns would support a modest increase from the Board's CAPM estimate.

[74] NGTL Argument, page 105-107; ATCO Argument, page 43
[75] NGTL Argument, page 107

Other Investment Alternatives Available To Utility Shareholders

The Board notes NGTL's evidence that its parent, TCPL, has other investment alternatives, such as unregulated power generation projects, that earn a return higher than the return allowed for NGTL. NGTL also argued that TCPL has the option of making investments at higher returns in the U.S. and repatriating the profits to Canadians via the dividend tax credit. NGTL submitted that it requires a higher return in order to compete with these other investment opportunities of TCPL.

The Board agrees with the interveners[76] that NGTL's evidence regarding earnings on power generation projects were merely forecasts of earnings, and represented a limited and select sample. The Board also notes that NGTL did not supply any evidence that evaluated historical returns from other investments versus returns from its Canadian utility investments, which is one relevant factor to be considered when making prospective investment decisions.

The Board concludes that there is no basis on which to place any weight, other than already reflected in earlier tests, on other specific investment opportunities potentially available to utility investors or on stated expectations of return from such opportunities.

4.2.8 2004 ROE

The Board found above that a reasonable CAPM estimate for 2004 is 9.20%. The Board considers that it is appropriate to assess the results of other tests to determine if the 2004 ROE should be above or below the CAPM estimate.

The Board found above that the following evidence would generally support a 2004 ROE at or below the CAPM estimate:

1. Market-to-Book Ratios and Acquisition Premiums
2. Income Trusts

Similarly, the Board found above that the following evidence would generally support a 2004 ROE at or above the CAPM estimate:

1. ERP Tests Other Than CAPM
2. Return Awards for Other Canadian Utilities
3. Return Awards for U.S. Utilities
4. Alliance and M&NP
5. Pension Return Expectations

As discussed above, the Board did not put any weight on the following evidence in determining whether the 2004 ROE should be above or below the CAPM estimate:

1. Discounted Cash Flow Test
2. Comparable Earnings Test
3. FERC Incentives for Transmission Facilities
4. Other Investment Alternatives Available to Utility Shareholders

[76] Cargill Argument page 22 and CAPP Argument page 23

In the next section of this Decision, the Board establishes an adjustment mechanism that includes an adjustment factor of less than 100% of the change in the long-Canada yield, which in the Board's view also supports a 2004 ROE above the CAPM estimate since the allowed ROE will not reflect a 100% adjustment factor, which is implicitly suggested by CAPM, and since a formulaic approach effectively creates a longer test period with respect to ROE.

In consideration of the impact of the above factors, it is the judgment of the Board that it would be appropriate to establish the 2004 ROE at a level that is 40 basis points above the Board's CAPM estimate. Therefore, the Board concludes the generic ROE for 2004 should be set at 9.60%.

4.3 Annual Adjustment Mechanism

As outlined earlier in this Decision, the Board will now address the potential use of an adjustment mechanism for ROE.

The following table summarizes the positions of the parties:

Table 6. Annual Adjustment Mechanism Recommendation by Parties

Party	Annual Adjustment Mechanism Recommendation
AltaGas/ATCO	50% of long-Canada bond yield change
Companies	75% of long-Canada bond yield change
ENMAX	100% of long-Canada bond yield change plus 100% of utility bond spread change
NGTL	Link to changes in Corporate bond yields
Calgary/CAPP	75% of long-Canada bond yield change
Cargill	75% of long-Canada bond yield change (80% or 100% also acceptable)
CG	75% of long-Canada bond yield change plus 50% of market dividend yield change
IPCAA	75% of long-Canada bond yield change

The Board notes that most parties favored an adjustment formula with the ROE changing by 75% of the change in the forecast long-Canada bond yield, provided that the Board accepted their starting positions on ROE.

The Board also notes Dr. Evan's evidence that a change based on 75% of the change in the long-Canada bond yield is driven by the differential tax rates between bonds and equity.[77]

The Board notes ATCO's and ENMAX's concern that it would be unfair to set an initial ROE based strictly on a CAPM analysis and to then allow only 75% of any increase in the long-Canada bond yield. In such a situation, ATCO and ENMAX favoured a 100% adjustment. The Board notes that in the previous section of this Decision, the Board established a generic ROE for 2004 of 9.60%, a level that is 40 basis points above the Board's CAPM estimate of 9.20%.

The Board does not consider that ENMAX's proposal to adjust the ROE by the sum of the change in the long-Canada bond yield and the change in the utility bond spread to be appropriate due to the difficulty of determining and tracking bond yields for a representative sample of corporate bonds.

[77] Companies Argument, page 89

The Board also does not consider CG's proposal to adjust the ROE by the sum of 75% of the change in the long-Canada bond yield and 50% of the change in the market dividend yield to be appropriate because of potential double-counting and because independent forecasts of dividend yields are not readily available in the same manner as the Consensus Forecast for debt.

The Board notes the Companies' proposal that the adjustment formula not commence until the year 2006. The Board notes that no other party proposed that implementation of an adjustment formula not commence until the year 2006. The Board does not consider that there is any reason to delay implementation of the adjustment formula until 2006.

Considering all of the above, the Board concludes that an adjustment to the generic ROE based on 75% of the change in long-Canada bond yield would be appropriate, beginning in 2005.

The Board considers the formula proposed by Dr. Evans (sponsored by the Companies) to be an appropriate method of implementing this adjustment:

$$ROE_t = 9.60\% + [0.75 \text{ x } (YLD_t - 5.68\%)]$$

where YLD_t = the forecast long-term Canada bond yield for year t.

Consistent with the approach used by the NEB, the forecast long-term Canada bond yield for year *t* shall be calculated as the average of the 3-month-out and 12-month-out forecasts of 10-year Canada yields as reported in the Consensus Forecasts[78] issue in November of the previous year, plus the average of the daily difference between the 10-year and the 30-year Canada bond yields for the month of October in the previous year, as reported in the National Post.

[78] Consensus Forecasts Inc., London, England

4.4 Process to Review ROE

The following table summarizes the review process recommendations of the parties:

Table 7. Process to Review ROE – Recommendations by Parties

Party	Periodic Review	Other Review Triggers
AltaGas/ATCO	Review in 2007	• Long-Canada yield below 4% or above 8%. • A-rated utility bond spreads exceed 50% of the generic risk premium.
Companies	5 years	
ENMAX	Not more than 3 years	• Any Alberta utility is downgraded by a rating agency. • Formula result rises or falls more than 200 basis points from initial level.
NGTL	2 years	
Calgary/CAPP	5 years	• Long-Canada bond yield changes by more than 3.0%.
Cargill	3 to 5 years	
CG	3 years for the first review; 5 years thereafter	• Material change in investment risk of the regulated sector. • Material change in the market equity risk premium.
IPCAA	5 years	
IPPSA	5 years	

In the Board's view, it would be appropriate to trigger a review of whether the adjustment mechanism continues to yield a fair ROE, if there is a material change in the forecast long-Canada bond yield from the November 2003 forecast.

The Board considers that the most straightforward method of implementing this trigger is by placing bounds on the range of ROEs that can be established pursuant to the adjustment mechanism.

In this regard, the Board considers ENMAX's proposed change of 200 basis points in the generic ROE to be a reasonable trigger. The Board notes that a change of 200 basis points in the generic ROE is equivalent to a change of 267 basis points in the long-Canada bond yield, which is effectively higher than the long-Canada bond yield trigger proposed by ATCO but lower than the long-Canada bond yield trigger proposed by Calgary/CAPP.

Therefore, if the ROE resulting from the adjustment mechanism results in an ROE of less than 7.6% or greater than 11.6%, the Board will seek the views of parties on whether the adjustment mechanism continues to yield a fair ROE in the manner described below.

The Board considers that ATCO's proposed trigger of A-rated utility bond spreads exceeding 50% of the generic risk premium would be difficult and contentious to implement, principally due to controversy in the choice of the sample of utility bonds.

The Board does not consider ENMAX's proposed automatic trigger of any Alberta utility downgraded by a rating company to be appropriate because of the many factors and judgments that may contribute to a downgrade for an individual company, including their unregulated business results.

The Board considers that CG's proposed triggers of a material change in the investment risk of the regulated sector or a material change in the market risk premium would be difficult and contentious to implement. The Board considers that material changes in investment risk of the regulated sector or in the market risk premium can be addressed at the time of the periodic review.

The Board notes that all parties agreed that a review of whether the adjustment mechanism continues to yield a fair ROE should be conducted after a defined period of time. The Board notes that the time period for a review suggested by the parties varied from 2-5 years.

The Board considers that a review period of 5 years would appropriately balance the desire to achieve regulatory efficiencies through the use of an adjustment mechanism and the need to ensure that the ROE adjustment process continues to result in an appropriate ROE.

In the Board's view, triggering an early consideration on whether or not to conduct a review if the ROE resulting from the adjustment mechanism is less than 7.6% or greater than 11.6% also supports the selection of a five year review period.

The Board notes the Companies' proposal of a *de novo* review of all cost of capital matters at the end of five years. However, the Board does not consider that it would be appropriate to automatically trigger a *de novo* review either in the event that the adjustment mechanism results in a ROE of less than 7.6% or greater than 11.6% or at the end of five years, without first assessing whether the adjustment mechanism continues to yield an appropriate ROE result.

Therefore, the Board will first seek the views of parties on the preliminary question of whether the adjustment mechanism continues to yield a fair ROE prior to the establishment of the common ROE for the year 2009, or earlier if the ROE resulting from the adjustment mechanism for years prior to 2009 is less than 7.6% or greater than 11.6%. The Board will consider the views of parties on this preliminary question before deciding whether to undertake a general review of ROE or of the adjustment mechanism.

The Board notes that any party, at any time, will be free to petition the Board to consider a review of the adjustment formula, or to exempt a particular party from its application. The Board agrees with the submissions of the Companies,[79] Calgary/CAPP,[80] and IPCAA[81] that there would be an element of judgment involved in determining whether circumstances have changed sufficiently to warrant review, and that the ROE and adjustment mechanism determined by the Board should be entitled to a presumption of reasonableness, with any party seeking early review or an exemption bearing the onus of demonstrating that circumstances have rendered them unreasonable. The petitioning party would bear the onus of demonstrating a material change in facts or circumstances from the evidence filed in this Proceeding to merit a review of the adjustment formula or an exclusion from the formula.

[81] IPCAA Argument, page 24

5 CAPITAL STRUCTURE

5.1 Introduction

The Board notes that the capital structures determined in this Proceeding are premised on the business risks that existed at the time of the Proceeding.

For the convenience of readers, the following table (ordered by sector) compares the equity ratios that were last approved by the Board with the equity ratios recommended by the Applicants, CG and Calgary/CAPP:

Table 8. Recommended Equity Ratios vs. Last Board Approved Equity Ratios

	Last Board-Approved (%)	Recommended by Applicant (%)	Recommended by CG (%)	Recommended by Calgary/CAPP (%)
Electric and Gas Transmission				
ATCO Electric TFO	32.0	38.0	30.0	30.0
AltaLink	34.0[4]	37.5	30.0	32.0
EPCOR TFO	35.0	40.0	30.0	35.0
NGTL	32.0	40.0	32.0	33.0
ATCO Pipelines	43.5	50.0[3]	40.0	38.0
Electric and Gas Distribution				
Aquila	N/A [1]	42.5	35.0	35.0
ATCO Electric DISCO	35.0	45.0[2] (+ 5-10 %)	35.0	35.0
ENMAX DISCO	N/A [5]	50.0	35.0	40.0
EPCOR DISCO	N/A [5]	45.0	35.0	40.0
ATCO Gas	37.0	40.0	37.0	35.0
AltaGas	41.0	45.0	40.0	35.0

1 The Board did not specifically approve this ratio; it was part of a negotiated settlement approved in Decision 2003-019, which included a deemed 40% equity ratio as one of many settled parameters of the revenue requirement.
2 ATCO Electric DISCO requested a further increase of 5-10%, beyond its original request of 45%, in its equity ratio to account for ATCO's perception of additional business risks resulting from the *RDS Amendment Regulation.*[82]
3 ATCO Pipelines, in addition to a 50.0% equity ratio, also proposed a 0.5% addition to ROE.
4 In Decision 2003-061, the Board approved an equity ratio for AltaLink of 32%, plus an additional 2% to offset the impact on the interest coverage ratio of a partial allowance of income taxes in the revenue requirement.
5 ENMAX and EPCOR Distribution were subject to Board jurisdiction effective January 1, 2004.

The Board notes that, with the exception of CGA, the interveners who did not sponsor expert evidence generally supported the views of CG and Calgary/CAPP in argument. The Board also notes that the Applicants did not generally take a position on the appropriate capital structures for other Applicants.

In the Board's view, setting an appropriate equity ratio is a subjective exercise that involves the assessment of several factors and the observation of past experience. The assessment of the level of business risk of the utilities is also a subjective concept. Consequently, the Board considers that there is no single accepted mathematical way to make a determination of equity ratio based on a given level of business risk.

82 *Regulated Default Supply Amendment Regulation* (AR 323/2003)

To determine the appropriate equity ratio for each Applicant, the Board will consider the evidence and, where applicable, the experts' views and rationales in each of the following topic areas:

1. The business risk of each utility sector and Applicant;
2. The Board's last-approved equity ratio for each Applicant (where applicable);
3. Comparable awards by regulators in other jurisdictions;
4. Interest coverage ratio analysis; and
5. Bond rating analysis.

The Board notes the general consensus that the electric and gas transmission sectors had the least risk of all Applicants in this Proceeding. Further, the Board notes that no party argued otherwise.

The Board will first consider the appropriate capital structures for the electric and gas transmission Applicants, and the Board will subsequently consider the appropriate capital structures for the electric and gas distribution Applicants.

5.2 Electric and Gas Transmission

The Board notes from the above Table 8 that for the taxable electric transmission companies,[83] the Applicants proposed equity ratios of 37.5 and 38.0%, whereas the interveners proposed an equity ratio of 30.0%.

With respect to transmission companies that are not fully taxable, the Board will provide its findings later in this Decision.

With respect to gas transmission, NGTL proposed an equity ratio of 40%, while the interveners proposed 32 and 33%. The equity ratios proposed by all submitting parties for ATCO Pipelines were materially higher than the equity ratios each proposed for NGTL. The Board will address ATCO Pipelines later in this Decision.

Business Risk

The Board notes that the Companies[84] compared the risks of electric transmission companies with the risks of NGTL as they existed in 1995. Dr. Evans (sponsored by the Companies) considered that electric transmission companies have more risk today than NGTL had at the time NGTL's equity ratio was last approved, for 1995.[85]

However, the Board considers that because it now has evidence regarding all Applicants' current risks, the utilities should be compared based on the business risks that existed at the time of this Proceeding. This was the approach of the experts other than Dr. Evans.

ATCO submitted that electric transmission companies were more risky than NGTL, principally due to the smaller size of the electric transmission companies relative to NGTL, the higher expected growth rates of the electric transmission companies relative to NGTL, and ATCO's

83 In this Proceeding, AltaLink assumed it was fully taxable, but the Board did not.
84 Companies Argument, page 96
85 Companies Argument, page 98

perception of a greater degree of regulatory uncertainty for the electric transmission companies relative to NGTL.

Although NGTL did not compare its level of business risk to that of other utilities, it did submit extensive evidence with respect to its own business risks, including operating expense risk, supply risk, competition risk, volume risk and credit risk.

Calgary/CAPP[86] and CG[87] each considered NGTL to have higher short and long-term business risk than the electric transmission companies, because NGTL faces operating expense risk, supply risk, competition risk, volume risk and credit risk, whereas the electric transmission companies only face operating expense risk. The interveners[88] viewed TFO growth prospects as an opportunity rather than a risk.

The Board agrees with the interveners that NGTL has a higher short-term business risk than the electric transmission companies, principally due to higher competition and credit risks. The Board also considers that NGTL potentially faces higher long-term risks due to supply risk although, in the Board's view, the bulk of that risk, if it materializes, will likely be identified early enough for NGTL to apply to the Board for potential adjustments to throughput forecasts and/or depreciation rates.

The Board also notes that NGTL does not have the same revenue certainty, as do the electric transmission companies. The Board also considers the higher expected growth rates of the electric transmission companies to be an opportunity for the TFO shareholders to increase their investments, and not fundamentally a matter of increased risk. The Board notes that utilities are allowed a return on funds used during construction. In addition, the Board was not persuaded that electric transmission companies have a greater degree of regulatory uncertainty than gas transmission companies.

The electric transmission companies have a single customer, the AESO. The Board considers the AESO to be of minimal credit risk. Further, the Board notes that the AESO pays the electric transmission companies 1/12 of their approved revenue requirement on a monthly basis with no adjustment for changes in demand or supply of electricity carried by the TFO.

For all of the above reasons, the Board does not agree with ATCO and the Companies that the electric transmission companies are more risky than NGTL.

The Board concludes that taxable electric transmission companies have the lowest business risk of any utility sector regulated by the Board, and that the risks of NGTL are somewhat higher than the risks of a fully taxable electric TFO.

The Board notes, from the above Table 8, that CG's and Calgary/CAPP's recommended equity ratios for NGTL were 2% and 3%, respectively, higher than their recommended equity ratio for a fully-taxable electric TFO. The Board also notes that NGTL did not provide the Board with an indication of its views respecting its risks relative to electric transmission companies, and, more particularly, did not indicate a view on an appropriate equity ratio differential compared to electric transmission companies.

---

86 CAPP/Calgary Argument, page 56
87 CG Argument, pages 67-70
88 CG Argument, page 70; Calgary/CAPP Argument, pages 67-70

The Board considers that business risk, in isolation, would indicate an equity ratio for NGTL that is 2-3 % higher than the equity ratio for a fully taxable TFO.

Comparison to Previous Board Awards

The Board notes that the last Board-approved equity ratio for NGTL of 32% was established for 1995.[89] The Board agrees with the general view of the experts that the business risks of NGTL have increased since 1995, principally due to a potentially higher supply risk and a higher competition risk.

Directionally, the Board concludes that NGTL's higher business risk, in isolation, supports an equity ratio for NGTL higher than 32%.

In Decision U99099, the Board established an equity ratio for electric transmission companies (TFOs) of 35%. In Dr. Evan's view,[90] the risks of electric TFOs have not changed since the time of Decision U99099, which would indicate that no change in equity ratio was appropriate. However, the Board considers that the risks of electric transmission companies have likely decreased since the time of Decision U99099 due to increased clarity of the role of the TFO, increased clarity with respect to the AESO's role and structure, the resolution of liability issues and the changes in transmission policy including the role of competitive bidding.

Directionally, the Board considers that this factor, in isolation, supports an equity ratio for fully taxable electric transmission companies lower than the 35% determined in Decision U99099.

The Board notes the last approved equity ratio for ATCO Electric TFO was 32% and for AltaLink was 34% (32% + 2% for the interest coverage ratio adjustment). However, these ratios were established when NGTL's award was 32%.

Directionally, the Board considers that this factor, in isolation, supports an equity ratio for fully taxable electric transmission companies similar to the last award of 32% or marginally higher.

Comparable Awards by Regulators in Other Jurisdictions

The Board acknowledges the potential for circularity when considering awards by other regulators. The Board also recognizes that business risks may be quite different in other jurisdictions. The Board has discussed some of these differences in the ROE section of this Decision and will provide further comment in following sections of this Decision. Nevertheless, the Board considers that comparable awards by other regulators may provide some indication of the appropriate capital structures for the Applicants.

As a result of the electric industry restructuring in Alberta, the Board notes that there are no TFO entities in the other provinces of Canada that are directly comparable to TFO entities in Alberta. However, in the Board's view, Canadian federally regulated natural gas transmission pipelines are of some assistance in drawing comparisons to both NGTL and the taxable electric transmission companies.

89 U96001, Nova Gas Transmission Ltd., 1995 General Rate Application, Phase 1
90 Companies Argument, page 110

The Board considers that the nature of NGTL as a gathering system, with numerous receipt and delivery points, a diverse customer base, and other related factors demonstrates an additional degree of business risk for NGTL when compared to the TCPL Mainline. However, the breadth of NGTL's diverse customer base mitigates the additional risk to a large degree, since the loss of any one customer or point of supply would likely not be material to the long-term risks faced by NGTL. The Board notes that in RH-4-2001, dated June 2002, the NEB awarded TCPL's Mainline a 33% common equity ratio based on its conclusion that "the level of business risk facing the Mainline has increased since 1995…".[91] The NEB cited "increases in the risks resulting from pipe-on-pipe competition and increased supply risk but noted, "other sources of risk have not changed materially".[92]

The Board notes that NGTL's last awarded equity ratio of 32% for 1995 was 2% higher than the contemporaneous NEB award of 30% for TCPL's Mainline. The Board notes that the same 2% differential if applied today would result in an equity ratio of 35% for NGTL. The Board considers that this factor, in isolation, supports an equity ratio of 35% for NGTL.

Since the Board considers electric transmission companies to have less risk than NGTL, the Board considers that this factor, in isolation, supports an equity ratio of less than 35% for taxable electric transmission companies.

The Board notes Dr. Evan's evidence,[93] provided at the Board's request, that the awarded equity ratios for the Foothills, ANG and TQM pipelines remain at the 30% level that the NEB established in 1995.

However, the Board notes the NEB's view[94] that Foothills and ANG operated on a lower risk monthly cost of service basis, and that TQM had a high degree of assurance that its costs would be recovered. For these reasons, the Board considers the risks of the taxable electric transmission companies and NGTL are somewhat higher than the risks of Foothills, ANG and TQM. Consequently, the Board considers that this factor, in isolation, supports an equity ratio of more than 30% for both the taxable electric transmission companies and NGTL.

The Board notes that the awarded equity ratio of the Westcoast Energy pipeline remains at 35%, which was set by the NEB in 1995. The Board also notes the NEB's view[95] that Westcoast had higher risks due to the nature of its gathering system and processing plants and due to the hydrogen sulfide content of the gas it transports. For these reasons, the Board considers the risks of taxable electric transmission companies to be lower than the risks of Westcoast and the Board considers the risks of a large gathering system like NGTL to be more similar to Westcoast than to the electric transmission companies. Consequently, the Board considers that this factor, in isolation, supports an equity ratio of approximately 35% for NGTL and less than 35% for the taxable electric transmission companies. However, the Board would note that there are also differences between Westcoast and NGTL.

94 RH-2-94, page 26
95 RH-2-94, page 25

Interest Coverage Ratio Analysis

The Board notes that S&P provides guideline interest coverage ratios,[96] corresponding to various corporate credit ratings, for utilities of various business risk profiles (risk ranking levels). The Board further notes ATCO's evidence[97] that the estimated S&P risk ranking for ATCO Electric transmission is "2" and that the actual S&P business risk profile ranking for NGTL is "3".

The S&P guidelines indicate that for a utility with a risk ranking of "2", a pretax interest coverage ratio in the range of 2.3 to 2.9 times is indicated for an "A" debt rating.

The Board notes that S&P does not rigorously apply its guidelines with respect to each specific financial ratio. In addition to interest coverage ratios, S&P reviews a number of other key financial ratios, as well as many diverse and often subjective factors, in order to arrive at a specific credit rating for an individual utility.

The Board notes that Enbridge Gas has been assigned a risk ranking of "2", which would imply that electric and gas transmission companies, which are less risky, could be considered to be ranked at less than "2".

The Board does not have a target credit rating for utilities under its jurisdiction. The Board is of the view, however, based on the evidence before it in this Proceeding, that interest coverage ratios and credit ratings are important considerations in assessing the appropriate capital structure. However, the Board considers that the foregoing are just one set of factors to consider.

The Board notes that DBRS has indicated, in its NGTL credit rating report,[98] that an interest coverage ratio "above 2 times … is acceptable for a regulated cost of service-based business".[99] The Board notes that the DBRS report, "Methodologies in Rating Utilities", dated June 2002,[100] indicates a fixed-charge coverage ratio of 1.5 for a DBRS debt rating from BBB to A. The report's definition of fixed-charge coverage, in cases where preferred shares do not exist, is the same as the definition of interest coverage that the Board has used throughout this Decision. The Board notes the apparent inconsistency in the two statements, but considers that taken together, a conclusion can be drawn that an interest coverage ratio near 2 times might be appropriate for low risk regulated entities. The Board also notes Dr. Booth's (sponsored by Calgary/CAPP) evidence that an interest coverage ratio of 2.15 times is reasonable for pipelines, considering their historic actual levels.[101]

The Board notes that some parties have expressed a concern that the acceptable equity ratios for regulated utilities in Alberta could potentially be overstated,[102] if the S&P guidelines with respect to interest coverage ratios were applied in a mechanical manner without consideration of other factors.

101 Exhibit 016-11(a), Evidence of L.D. Booth, page 63
102 Calgary/CAPP Argument, page 28

The Board has calculated the pretax interest coverage ratios that would result for a utility, with no preferred shares, using a 2004 tax rate of 33.87%,[103] using the ROE that the Board determined in this Decision of 9.6%, and applying a range of equity ratios and embedded debt costs. The Board will use the following table as one of several tests to evaluate and determine the appropriate common equity ratios.

The interest coverage ratio results for a range of equity ratios and embedded debt costs are as follows:

Table 9. Pretax Interest Coverage Ratios at Varying Embedded Debt Costs

Equity	Embedded Debt Cost					
Ratio	6.0%	6.5%	7.0%	7.5%	8.0%	8.5%
30.0%	2.0	2.0	1.9	1.8	1.8	1.7
31.0%	2.1	2.0	1.9	1.9	1.8	1.8
32.0%	2.1	2.1	2.0	1.9	1.9	1.8
33.0%	2.2	2.1	2.0	2.0	1.9	1.8
34.0%	2.3	2.2	2.1	2.0	1.9	1.9
35.0%	2.3	2.2	2.1	2.0	2.0	1.9
36.0%	2.4	2.3	2.2	2.1	2.0	2.0
37.0%	2.4	2.3	2.2	2.1	2.1	2.0
38.0%	2.5	2.4	2.3	2.2	2.1	2.0
39.0%	2.6	2.4	2.3	2.2	2.2	2.1
40.0%	2.6	2.5	2.4	2.3	2.2	2.1
41.0%	2.7	2.6	2.4	2.3	2.3	2.2
42.0%	2.8	2.6	2.5	2.4	2.3	2.2
43.0%	2.8	2.7	2.6	2.5	2.4	2.3
44.0%	2.9	2.7	2.6	2.5	2.4	2.3
45.0%	3.0	2.8	2.7	2.6	2.5	2.4

The above table shows the results of the mathematical calculations. The Board understands that bond ratings do not rely solely on precise mathematical results. Bond ratings incorporate a variety of factors, including the use of judgment.

The Board cautions readers not to interpret the level of precision expressed in the above table to be absolute in arriving at the appropriate equity ratio.

The Board is aware that some companies have higher embedded debt costs but these embedded debt costs are expected to decline as older, higher-cost debt is retired. The Board also notes that the embedded debt cost for AltaLink is lower than 6%, but that this embedded cost of debt could be understated since AltaLink's long-term financing does not appear to be fully in place.

The Board did not use the above table in a precise mathematical manner. Rather, the Board evaluates the data in the table above by looking at ranges, various company situations, longer-term effects, impacts of declining embedded costs, stability of capital structure awards as embedded debt costs change, and the consideration of other factors that are discussed in this Decision.

[103] 21% Federal rate, 1.12% surtax and 11.75% provincial tax (12.5% through March 31, 11.5% thereafter)

The Board further considers that all of these differing ratios are merely indicators in arriving at a level of coverage that is considered comfortable and acceptable.

Accordingly, based on the evidence and the above discussion, the Board concludes that an acceptable pretax interest coverage ratio for electric and gas transmission companies, in isolation, is near 2 times.

The Board considers that interest coverage ratio analysis, in isolation, supports equity ratios for taxable electric transmission companies and gas transmission companies greater than the currently approved equity ratios of 32% for ATCO Electric and NGTL.

The Board considers gas transmission companies to have slightly more risk than electric transmission companies and, therefore, the Board considers that this factor, in isolation, indicates that gas transmission companies should have slightly more equity than electric transmission companies.

Bond Rating Analysis

As noted above, the Board does not have a target credit rating for utilities under its jurisdiction. Further, the Board has discussed bond ratings, earlier in this Decision, in the context of the interest coverage ratios. Bond ratings are another factor in determining an appropriate capital structure.

With respect to the indications provided by actual bond ratings, Dr. Evans provided, at the Board's request, a detailed compilation of comparable equity ratios and bond ratings. The following table is an excerpt from that compilation, showing the awarded and the adjusted actual equity ratios for each utility regulated by the Board that has its own bond rating:

Table 10. Equity Ratios and Bond Ratings

	Last Board Awarded Equity (%)	Adjusted Actual Equity[104] (%)	DBRS credit rating[105] and deemed equity ratio at the same date (%)		S&P credit ranking and common equity ratio at the same date (%)	
AltaLink L.P.	34	38.3	A (high)	34.0[106]	A-	35 – 40 implied[107]
EPCOR Transmission	35	37	BBB (high) [108]	35.7[109]		
NGTL	32.2+0.3 preferred	40.3	A	38.9[110]	A-	36.0[111]
Aquila	40 (settlement)	41.9	A (low)	45.5 / 40.0[112]		

104 Exhibit 021-24 Dr. Evans calculated the most recently available Adjusted Actual Equity by treating short-term debt as debt, and by treating preferred shares and subordinated debt as 80% equity, consistent with the treatment described at page 106 of Decision 2003-061.

105 Source: Dr. Evans, Exhibit 021-24

106 Exhibit 021-45, AltaLink DBRS credit report, dated September 26, 2004, page 6

107 Exhibit 003-02-6, AltaLink S&P credit report dated May 16, 2003, page 4, indicates expected allowed equity of 35% and actual debt at 60-65% (implies actual equity of 35 to 40%).

108 Exhibit 012-03-h, DBRS letter regarding EPCOR Transmission Inc.'s indicative bond rating dated June 19, 2002

109 Exhibit 012-03-b, EPCOR Transmission Inc. Cost of Capital

110 Exhibit 021-43(c), beginning page 21 of 52, DBRS report on NGTL dated October 17, 2003, page 5

111 Exhibit 013-17, page 23 of 25, S&P report on NGTL dated June 19, 2003, page 3

Regarding EPCOR Transmission, the Board notes that the DBRS rating in the above table was only an indicative DBRS rating of BBB (high)[113] if DBRS had rated EPCOR in 2002, assuming no debt guarantee from the parent. The DBRS rating indication did not show the equity ratio used. However, the Board notes that an equity level of 35.7% for EPCOR Transmission was applicable[114] at the time that DBRS determined their bond rating to be BBB (high). The Board notes that the cost of debt has been declining since 2002[115] and as a result, the bond rating for a given equity ratio should improve as debt reaches maturity and is replaced. Consequently, the Board considers that this factor, in isolation, indicates that the equity ratio for EPCOR Transmission should be approximately 36%.

From the above table, the Board notes that AltaLink had DBRS and S&P credit ratings of A (high) and A- based on an equity ratio of 34% and a projected equity ratio of 35 to 40%, respectively. Furthermore, the Board notes that AltaLink has a substantial amount of goodwill on its books,[116] amounting to approximately 19% of its assets, which would require incremental equity support, compared to a TFO without goodwill. Consequently, the Board considers that this factor, in isolation, supports an equity ratio for AltaLink, based on rate base, somewhat below 34%.

The Board notes that NGTL has DBRS and S&P credit ratings of A and A- based on equity ratios of 38.9 and 36.0% respectively. In addition, the Board notes that the DBRS credit rating[117] of NGTL is partly based on its parent, TCPL. However, the Board notes that the S&P report[118] indicates that the credit rating is effectively that of TCPL, rather than that of NGTL itself. Therefore, in the Board's view, the adjusted actual equity ratio of NGTL may not be indicative of its required equity ratio, on a standalone basis.

Conclusion

At the beginning of this section, the Board indicated that it would consider a variety of factors for the electric and gas transmission companies.

As discussed in the preceding sections, in the Board’s view, setting an appropriate equity ratio is a subjective exercise that involves the assessment of several factors and the observation of past experience. The assessment of the level of business risk of the utilities is also a subjective concept. Consequently, the Board considers that there is no single accepted mathematical way to make a determination of equity ratio based on a given level of business risk.

The following table summarizes the indicated equity ratios that arise from various factors as discussed in the earlier sections.

---

112 Exhibit 004-12, DBRS Report on Aquila, page 5, indicating 54.5% net debt at March 31, 2002 (implies 45.5% equity), and indicating 40.0% deemed equity at December 31, 2001

113 Exhibit 012-03-h, DBRS letter regarding EPCOR Transmission Inc.’s indicative bond rating dated June 19, 2002

114 Exhibit 012-03

115 Ibid.

116 Exhibit 021-45, AltaLink DBRS credit report, dated September 26, 2004, page 6

117 Exhibit 021-43(c), page 21 of 52, DBRS report on NGTL dated October 17, 2003, page 1

118 Exhibit 013-17, page 23 of 25, S&P report on NGTL dated June 19, 2003, page 1

Table 11. Indicated Common Equity Ratios for Transmission Companies By Factor

Factor	Indicated Electric Transmission	Indicated Gas Transmission
Business Risk	Lowest	TFO + 2-3%
Previous Board Awards	≥32%, <35%	>32%
Awards in Other Jurisdictions	>30%, <35%	~35%
Interest Coverage Ratio Analysis	>32%	>32%, >TFOs
Bond Rating Analysis	EPCOR ~36% AltaLink <34%	May not be indicative

After considering all of the above factors and after applying its judgment, the Board concludes that an appropriate common equity ratio for fully taxable electric transmission companies, with no preferred shares, is 33.0% and that an appropriate common equity ratio for gas transmission companies is 35.0%.

The Board will now consider each electric and gas transmission Applicant, individually.

5.2.1 ATCO Electric Transmission

The Board considers that ATCO Electric Transmission does not have any material differences in business risk from the typical TFO.

The Board also notes that ATCO Electric Transmission has preferred shares in its capital structure. Although the preferred shares provide additional support to the capital structure, in this analysis, the Board has evaluated the appropriate common equity ratio as if the company had no support from its preferred shares.

For the same reasons that were provided above, the Board concludes that an appropriate common equity ratio for ATCO Electric Transmission, a fully taxable TFO, is 33.0%.

The Board will further address the issue of ATCO's preferred shares later in this Decision.

5.2.2 EPCOR Transmission

The Board considers that EPCOR Transmission does not have any material differences in business risk from the typical TFO.

The Board therefore considers that any difference between the equity ratio for a fully-taxable electric TFO with no preferred shares and the equity ratio for EPCOR Transmission should only reflect the fact that EPCOR Transmission does not have any allowance for income taxes in its approved revenue requirement.

Dr. Evans (sponsored by the Companies, including EPCOR Transmission) recommended that non-taxable utilities be allowed an extra 2.5% equity. Dr. Evans argued that this additional equity component was warranted due to the generally lower interest coverage ratios and the greater variability of net income for non-taxable utilities.[119]

[119] Companies Argument, page 94

For similar reasons, Calgary/CAPP recommended that non-taxable entities be allowed an extra 5% equity.[120]

ENMAX argued[121] that its non-taxable status justified an additional 8% equity, based on the precedent established by the Board for AltaLink in Decision 2003-061.

All other parties who took a position, on the issue of non-taxable utilities, were of the view that no allowance for additional equity should be provided for non-taxable entities, principally due to a perceived offsetting benefit of lower, more competitive rates. ATCO argued that such an increment to the equity ratio would provide an inappropriate competitive advantage to non-taxable entities.

The Board agrees that a non-taxable entity has a higher volatility of earnings than an otherwise equivalent taxable company, arising from the lack of an income tax component in its forecast revenue requirement. The Board notes that there was no disagreement that the absence of taxation, while lowering costs, increases the volatility of earnings.

In the Board's view, arguments regarding the competitive advantage of non-taxable entities do not have persuasive merit in the context of regulated electric utilities, which do not compete with each other.

However, the Board is not persuaded that the higher volatility of earnings warrants an increase in the equity ratio as high as recommended above. The Board considers that an extra 2% equity would appropriately account for the higher business risks and earnings volatility of a non-taxable entity.

Adding the 2% increment to the 33% equity ratio determined above for a fully taxable TFO, the Board concludes that an appropriate common equity ratio for EPCOR Transmission is 35.0%.

5.2.3 AltaLink

The Board considers that AltaLink does not have any material differences in business risk from the typical TFO.

The Board therefore considers that any difference between the equity ratio for a fully-taxable TFO with no preferred shares and the equity ratio for AltaLink should only reflect the differences in the amount of income taxes included in the respective revenue requirements.

The Board notes that in Decision 2003-061, the Board allowed an additional 2% on the equity ratio to recognize the disallowance of 25% of the requested income taxes, bringing the total common equity component to 34%. The additional 2% equity was intended to maintain the same interest coverage ratio as if there had been no disallowance of income taxes. The Board recognizes that a review and variance application with respect to Decision 2003-061 is pending.

The Board notes the adjustment to AltaLink's equity ratio was intended to maintain the same interest coverage ratio as if there had been no disallowance of income taxes, whereas the purpose of the adjustment to the equity ratios of the municipally owned utilities in this Decision is to

[120] Calgary/CAPP Argument, page 59-60
[121] ENMAX Argument, page 36

appropriately account for their higher volatility of earnings. The Board considers these two situations to be fundamentally different.

The Board notes that no party addressed the appropriate adjustment to AltaLink's equity ratio to reflect the partial disallowance of income tax. Assuming that the Board's disallowance of 25% of the requested income taxes is continued, the Board considers that it would continue to be appropriate to adjust AltaLink's equity ratio to maintain the same interest coverage as if there had been no disallowance of income taxes.

Adding the 2% adjustment to the 33% equity ratio determined above for a fully taxable TFO, the Board concludes that an appropriate common equity ratio for AltaLink is 35.0%.

If AltaLink were to have a full income tax allowance included in its approved revenue requirement, the Board considers that the appropriate common equity ratio for AltaLink would then be 33.0%.

5.2.4 NGTL

For the same reasons that were provided above, the Board concludes that an appropriate common equity ratio for NGTL, a gas transmission company, is 35.0%.

5.2.5 ATCO Pipelines

The Board notes that no party took the position that ATCO Pipelines has the same or lower business risk as NGTL, the other gas transmission Applicant. From Table 8, the Board notes that Calgary/CAPP considered ATCO Pipelines to be the highest risk investor owned utility, and that CG considered ATCO Pipelines to be tied with AltaGas as the highest risk utility.

Accordingly, in this section, the Board will assess the appropriate equity ratio for ATCO Pipelines and its differences from the typical gas transmission company. In this regard, the Board will draw on its previous analysis and discussion earlier in this section. Further, the Board will address the additional information applicable to ATCO Pipelines.

The Board notes the general consensus that ATCO Pipelines has higher competition risk than NGTL. Several parties suggested that resolution of outstanding gas pipeline competition issues could result in a reduction to the competition risk faced by ATCO Pipelines. The Board notes that at least some of the competition risk faced by ATCO Pipelines may have resulted from the growth of the system to connect customers either already served by NGTL or in direct competition with NGTL for those loads. The Board also notes that ATCO's largest customer is ATCO Gas, which, in the Board's view, has little credit risk. In any event, the Board considers that it should establish capital structures for 2004 based on the business risks that exist at the time of this Proceeding. The Board does not consider that it should speculate on the possible resolution of outstanding pipeline competition issues.

The Board notes that in NGTL's last Phase I proceeding,[122] the Board indicated that there would be a proceeding to address outstanding gas pipeline competition issues (the Competitive Pipeline Module). The Board considers that the Competitive Pipeline Module is the appropriate forum to

[122] Application 1315423, Transcript Volume 1, pages 44-49

deal with the inter-pipeline competition matters that may impact the business risks presently confronting ATCO Pipelines.

The Board directs ATCO Pipelines, at the time of its first GRA following the Board's decision in the Competitive Pipeline Module, to apply either:

a) For a change to its deemed equity ratio, to reflect the change in business risk arising from any directions contained within such a decision; or

b) For maintenance of its then existing capital structure on the basis that no change to business risk resulted from the decision in the Competitive Pipeline Module.

The Board notes that CG recommended that the equity ratio of ATCO Pipelines be set at 40%, which was 8% higher than its recommendation for NGTL, while Calgary/CAPP's recommendation for the equity ratio of ATCO Pipelines at 38% was 5% higher than its recommended equity ratio for NGTL.

The Board notes that if the interveners' differentials were applied to the Board's 35% determination for NGTL, the result would be a range of 40% to 43% for ATCO Pipelines.

The Board agrees with all parties that ATCO Pipelines has higher business risk than NGTL.

The Board notes that the last Board decision for ATCO Pipelines, Decision 2003-100, set the 2003 common equity ratio for both ATCO Pipelines North and ATCO Pipelines South at 43.5%.

Regarding gas transmission companies with higher risk than NGTL, the Board notes Dr. Evan's evidence[123] that Pacific Northern Gas (PNG) had an awarded equity ratio of 42.9% and an adjusted actual equity ratio of 44.2%, with a credit rating of BBB (low). The Board also notes Dr. Booth's view[124] that PNG is a highly risky utility and Dr. Robert's view[125] that PNG is riskier than the other utilities.

The Board also notes that ATCO Pipelines has preferred shares in its capital structure. Although the preferred shares provide additional support to the capital structure, in this analysis, the Board has evaluated the appropriate common equity ratio as if the company had no support from its preferred shares.

Considering all of the above, the Board concludes that an appropriate common equity ratio for ATCO Pipelines is 43.0%.

The Board will further address the issue of ATCO's preferred shares below.

5.3 Electric and Gas Distribution

The Board will now consider the appropriate capital structures for the electric and gas distribution Applicants in light of the 5 topic areas set out in section 5.1 as shown below:

1. The business risk of each utility sector and Applicant;

123 Exhibit 021-24
124 Exhibit 016-11(a), Evidence of L. D. Booth, page 54
125 Transcript, Volume 34, page 5602

2. The Board's last-approved equity ratio for each Applicant (where applicable);
3. Comparable awards by regulators in other jurisdictions;
4. Interest coverage ratio analysis; and
5. Bond rating analysis.

Business Risk

The Board notes the consensus that electric distribution companies are subject to more business risk than electric transmission companies, principally due to their recovery of a significant amount of fixed costs in variable charges and their greater exposure to credit risks.

ATCO proposed that the difference in the equity ratio between its electric distribution companies and its electric TFO should be 12.0-17.0%. The Board observes that 5%-10% of this difference in the equity ratio was due to ATCO's perception of a higher regulatory risk following the passage of the *RDS Amendment Regulation*.[126]

The Board is not persuaded that the *RDS Amendment Regulation* has materially increased the risk to an electric distribution company that has appointed a third-party as RRT provider. The Board notes that the requirement for an electric distribution company to provide a hedged rate is contingent on the default of its RRT provider. The Board notes that it did not receive evidence regarding what contractual protections and security, if any, are available to ATCO in the event of a default by its appointed RRT provider. Also, it is possible that a default would be foreseeable over some period of time prior to it occurring, which may permit time to implement contingency plans to minimize associated impacts. Further, in the event of such a default, an application could be made to the Board to recover, from customers, prudent costs incurred by the electric distribution company in resuming the provision of the RRT. The Board would then consider the merits of such an application, considering factors such as the contractual circumstances and remedies available to the electric distribution company, the circumstances of the RRT appointment, and the potential harm to customers. The Board also notes that no other electric distribution company filed evidence asserting a similar increase in risk.

ATCO also argued that its electric distribution company had higher risk than its electric TFO as a result of potential franchise loss. However, in light of the lack of recent actual occurrences of municipalities closing a transaction pursuant to an option to acquire utilities assets, the Board does not consider, at this time, that the risk of franchise loss or of a municipality acquiring utility assets has increased over what it has been historically. Should there be a material change in the business risk arising from risk of franchise loss an affected utility could apply to the Board at that time to seek appropriate relief.

As shown in Table 8, the Companies, CG and Calgary/CAPP all recommended equity ratios for fully taxable electric distribution companies that were 5% higher than their recommended equity ratios for fully taxable electric transmission companies. The Board understands that this does not necessarily mean that the recommended differential would always be 5%.

ATCO considered the business risk of ATCO Gas to be lower than the business risk of its electric distribution company due to ATCO's perception of a higher regulatory risk for its

[126] Ministerial Order 73/2003, November 4, 2003

electric distribution company. As discussed above, the Board does not agree with ATCO's perception of the magnitude of the regulatory risk for its electric distribution company.

The Board notes that Calgary/CAPP and CG considered that ATCO Gas has the same or slightly higher business risk than a fully taxable electric distribution company, due to higher volatility of revenue resulting from a different rate design and higher sensitivity to fluctuations in weather conditions.

The Board agrees that a gas distribution company has slightly more risk than a taxable electric distribution company due to higher revenue volatility. The Board does not agree with ATCO that the higher revenue volatility of ATCO Gas is more than offset by higher regulatory risk for electric distribution companies.

The Board notes from Table 8 that parties making recommendations, other than ATCO Gas, suggested that the difference between the equity ratio for ATCO Gas and the equity ratio for a fully-taxable electric distribution company should be in the range of 0-2%.

The Board concludes that electric distribution companies have higher business risks than electric transmission companies, and that gas distribution companies have slightly higher business risk than electric distribution companies.

The Board considers that business risk, in isolation, would indicate that gas distribution companies should have a common equity ratio that is 0-2 % higher than the equity ratio for fully taxable electric distribution companies.

Comparison to Previous Board Awards

The Board notes from Table 8 that the most recent equity ratio approved by the Board for a taxable electric distribution company was 35%, and the most recent equity ratio approved by the Board for fully-taxable electric transmission companies was 32%, a difference of 3%. Earlier in this Decision, the Board determined an equity ratio of 33% for taxable electric transmission companies. The Board considers that this factor, in isolation, would indicate an equity ratio of 36% for the taxable electric distribution companies. Since the Board considers that ATCO Gas has slightly higher business risk than the electric distribution companies, the Board considers that this factor, in isolation, this would indicate an equity ratio of more than 36% for ATCO Gas.

The Board notes from Table 8 that the last equity ratio approved for ATCO Gas was 37%, established in Decision 2003-072. The Board considers that the business risks of ATCO Gas have not changed materially from those assessed by the Board in this prior decision, which, in isolation, would indicate an equity ratio for ATCO Gas of 37%.

Comparable Awards by Regulators in Other Jurisdictions

The Board notes its earlier caveats on relying on comparable awards by other regulators in a previous section of this Decision.

The Board notes that the gas distribution companies in Ontario, Enbridge Gas and Union Gas have been awarded a common equity ratio of 35 to 37% and a total equity ratio of 38 to 40%, treating preferred shares as 80% equity.[127]

[127] Exhibit 021-24

The Board considers that this information, in isolation, would indicate that the equity ratio for ATCO Gas could be maintained at its current level of 37%.

The Board does not consider that there are any other electric distribution companies in Canada that are comparable to the electric distribution companies in the restructured electric industry in Alberta.

Interest Coverage Ratio Analysis

The Board notes that Enbridge Gas has been awarded an S&P rating of "2".[128] The Board notes Ms. McShane's estimate that ATCO Gas would warrant an S&P risk profile of between "2" and "3". The Board notes that Ms. McShane estimates an S&P risk ranking of "3" for ATCO Electric. However, the Board earlier noted its view that ATCO had over-stated the business risk level of ATCO Electric. In the Board's view, an appropriate S&P risk score for both distribution utilities is between "2" and "2.5".

The S&P guidelines indicate that for a utility with a risk ranking of "2", a pretax interest coverage ratio in the range of 2.3 to 2.9 times is indicated for an "A" debt rating.

Similarly, the S&P guidelines indicate, through pro-rating the guidelines for a "2" and for a "3", that for a utility with a risk ranking of "2.5", a pretax interest coverage ratio in the range of 2.55 to 3.15 times is indicated for an "A" debt rating.

The Board refers the reader to the Interest Coverage Ratio Analysis section provided earlier in the Electric and Gas Transmission section, including the DBRS guidelines indicated there, as additional factors to consider for determining the appropriate common equity ratio for either an electric or a gas distribution company.

Based on this evidence, the Board concludes that an acceptable pretax interest coverage ratio for a taxable electric distribution company distribution company is at or above 2.2 times.

The Board considers that this factor, in isolation, indicates an equity ratio for taxable electric distribution companies and for gas distribution companies higher than the currently approved 35% for ATCO Electric Distribution.

The Board considers gas distribution companies to have slightly more risk than electric distribution companies and, therefore, the Board considers that this factor, in isolation, indicates that gas distribution companies should have slightly more equity than electric distribution companies.

Bond Rating Analysis

The Board notes that Aquila is the only electric or gas distribution company regulated by the Board with its own bond rating. From Table 10, the Board notes that Aquila has a DBRS rating of A (low) based on an equity ratio of 40 to 45.5%. However, the Board notes that Aquila has a

128 Exhibit 005-11-1, Capital Structures for the ATCO Utilities, Kathleen McShane, page 11

substantial amount of goodwill[129] on its books, amounting to approximately 29% of its assets at the time of the DBRS report, which would require equity support compared to a distribution company without goodwill. Therefore, based on this factor in isolation, the Board concludes that the target equity ratio for a taxable electric distribution company is somewhat below 40%.

The Board considers the most comparable other Canadian gas and electric distribution companies, available in Dr. Evan's evidence, to be Union Gas and Enbridge Gas.

The Board notes that Union Gas Ltd. has an adjusted actual equity ratio of 35% and credit ratings of A and A-.[130] The Board notes that Enbridge Gas has an adjusted actual equity ratio of 51% and credit ratings of A and BBB+.[131] The Board notes that the date of the adjusted actual equity ratio date is not necessarily the same as the dates of the two credit reports. The Board considers this broad range of adjusted actual equity ratios for Ontario gas distribution utilities and its impact on bond ratings to be of little assistance in this Proceeding.

Conclusion

At the beginning of this section, the Board indicated that it would consider a variety of factors for its determination of the appropriate level of equity in the capital structure of electric and gas distribution companies.

As discussed in the preceding sections, in the Board's view, setting an appropriate equity ratio is a subjective exercise that involves the assessment of several factors and the observation of past experience. The assessment of the level of business risk of the utilities is also a subjective concept. Consequently, the Board considers that there is no single accepted mathematical way to make a determination of equity ratio based on a given level of business risk.

The following table summarizes the indicated equity ratios that arise from various factors as discussed in the earlier sections:

Table 12. Indicated Common Equity Ratios for Distribution Companies by Factor

Factor	Indicated Electric Distribution	Indicated Gas Distribution
Business Risk	Lowest for Distribution	Electric DISCO + 0-2%
Previous Board Awards	~36%	~37%
Awards in Other Jurisdictions	N/A	~37%
Interest Coverage Ratio Analysis	>35%	>35%, >DISCOs
Bond Rating Analysis	<40%	N/A

After considering all of the above factors and after applying its judgment, the Board concludes that an appropriate common equity ratio for a fully taxable electric distribution company with no preferred shares is 37.0%, and that an appropriate common equity ratio for a gas distribution company is 38.0%.

The Board will now consider each electric and gas distribution Applicant, individually.

129 Exhibit 004-12, July 31, 2002 DBRS Report on Aquila, page 5 indicating 54.5% net debt at March 31, 2002 (implies 45.5% equity), and indicating 40.0% deemed equity at December 31, 2001; and Decision 2004-035, page 18

130 Exhibit 021-24

131 Ibid.

5.3.1 FortisAlberta/Aquila

The Board considers that FortisAlberta (formerly Aquila) does not have any material differences in business risk from the typical electric distribution company.

The Board notes that Aquila is a fully taxable electric distribution company with no preferred shares.

Therefore, for the same reasons that were provided above, the Board concludes that an appropriate common equity ratio for FortisAlberta is 37.0%.

5.3.2 ATCO Electric Distribution

The Board considers that ATCO Electric Distribution does not have any material differences in business risk from the typical electric distribution company.

The Board also notes that ATCO Electric Distribution has preferred shares in its capital structure. Although the preferred shares provide additional support to the capital structure, in this analysis, the Board has evaluated the appropriate common equity ratio as if the company had no support from its preferred shares.

The Board concludes that an appropriate common equity ratio for ATCO Electric Distribution is 37.0%.

The Board will further address the issue of ATCO's preferred shares below.

5.3.3 ENMAX Distribution

The Board considers that ENMAX Distribution does not have any material differences in business risk from the typical electric distribution company.

The Board notes ENMAX's argument that it has additional risks due to its municipal ownership, including a fixed dividend requirement, lack of equity access, and the change in regulator, and that as a result it required a capital structure with 50% common equity.

The Board does not agree with ENMAX that its fixed dividend or lack of access to public equity markets raises its risks in the circumstances. In the Board's view, having established a fair return, the Board need not concern itself with the particular internal policies to which a utility may be subject regarding distributions of dividends or acquisition of equity. The Board also considers that the change in regulator for ENMAX does not result in ENMAX having higher risks, all else being equal, than other electric distribution companies regulated by the Board.

With respect to the ENMAX DISCO, which just came under Board jurisdiction in 2004, the capital structure determined in this Proceeding is based on the assumption that the deferral accounts that the Board will ultimately approve for this Applicant will not be materially different than those in existence at the time of this Proceeding for FortisAlberta/Aquila and ATCO Electric Distribution.

For the same reasons that were provided with respect to EPCOR Transmission above, the Board concludes that the equity ratio for a non-taxable electric distribution company should be 2.0% higher than the equity ratio for a fully taxable electric distribution company.

Therefore, the Board concludes that an appropriate common equity ratio for ENMAX Distribution is 39.0%.

5.3.4 EPCOR Distribution

The Board considers that EPCOR Distribution does not have any material differences in business risk from the typical electric distribution company.

With respect to the EPCOR Distribution, which came under Board jurisdiction in 2004, the capital structure determined in this Proceeding is based on the assumption that the deferral accounts that the Board will ultimately approve for this Applicant will not be materially different than those in existence at the time of this Proceeding for FortisAlberta/Aquila and ATCO Electric distribution companies.

For the same reasons that were provided with respect to ENMAX Distribution above, the Board concludes that an appropriate common equity ratio for EPCOR Distribution is 39.0%.

5.3.5 ATCO Gas

The Board considers that ATCO Gas does not have any material differences in business risk from the typical gas distribution company.

The Board notes that ATCO Gas also has preferred shares in its capital structure. Although the preferred shares provide additional support to the capital structure, in this analysis, the Board has evaluated the appropriate common equity ratio as if the company had no support from its preferred shares.

As determined above, the Board concludes that an appropriate common equity ratio for ATCO Gas is 38.0%.

The Board will further address the issue of ATCO's preferred shares below.

5.3.6 AltaGas

The Board considers that AltaGas has greater business risk than the typical gas distribution company.

AltaGas and ATCO Gas considered the business risks of AltaGas to be higher than the business risks of ATCO Gas, due to AltaGas' relatively small size, rural service area, geographically dispersed customers and high level of customer contributions.

Calgary/CAPP was the only party who took the position that AltaGas did not have higher business risks than ATCO Gas. Calgary/CAPP considered the main risk to AltaGas to be commodity cost risk, for which AltaGas has a deferral account. As a result, Calgary/CAPP recommended the same equity ratio for AltaGas as for ATCO Gas.

The Board notes that AltaGas' parent has a credit rating of BBB (low) and has been unable to raise debt with a term longer than five years. AltaGas had the view that, due to its size, it was very unlikely that it would be able to access debt on more favourable terms than its parent.[132]

The Board notes that AltaGas' parent is involved in a significant level of non-regulated activities. The Board is unable to establish the effect that those activities have on the parent's rating. The Board is not persuaded that that AltaGas would not have a higher rating than its parent and that it would not be able to access debt on more favourable terms than its parent. Nonetheless, the Board is persuaded that the business risks of AltaGas are greater than the business risks of a typical gas distribution company because of the nature of its service territory, not necessarily because of its smaller size.

The Board notes that CG's recommended equity ratio for AltaGas was 3% higher than its recommended equity ratio for ATCO Gas, whereas AltaGas and ATCO considered that the equity ratio for AltaGas should be 5% higher. The Board considers that this factor, in isolation indicates that the equity ratio for AltaGas should be 41-43%.

The Board notes that the previous Board approved equity ratio for AltaGas was 41%.

Considering all of the above, the Board concludes that an appropriate common equity ratio for AltaGas is a continuation of its currently approved 41%.

5.4 Utility-Specific Adjustments to ROE

Some parties in this Proceeding indicated that when a common ROE approach is used, it might be necessary to consider a utility-specific adjustment to the common ROE to adequately reflect the investment risks of individual utilities.

In particular, the Board notes that ATCO Pipelines indicated that an adjustment to its ROE was required to adequately compensate its investors for the risks confronting the company, because adjustments to capital structure would not be sufficient.

As noted earlier in this Decision, the Board considers that unique utility-specific adjustments to the generic ROE should only be made in exceptional circumstances where adjusting capital structure alone is not sufficient to reflect the investment risk for a particular Applicant.

The Board notes that the equity ratio approved for ATCO Pipelines in this Decision is marginally lower than the last Board-approved equity ratio for ATCO Pipelines. The Board considers that the capital structure for ATCO Pipelines in this Decision adequately reflects the investment risk for ATCO Pipelines.

The Board concludes that there is no need for utility-specific adjustments to the common ROE for any of the Applicants.

5.5 2004 Deemed Common Equity Ratios

Based on the Board's findings above, the Board approves the following deemed common equity ratios for 2004:

[132] AltaGas Argument, page 32

Table 13. Board Approved Equity Ratios

	Last Board-Approved Common Equity Ratios (%)	2004 Board Approved Common Equity Ratios (%)	Change in Approved Common Equity Ratio (%)
ATCO TFO	32.0	33.0	1.0
AltaLink	34.0[133]	35.0	1.0
EPCOR TFO	35.0	35.0	0.0
NGTL	32.0	35.0	3.0
ATCO Electric DISCO	35.0	37.0	2.0
FortisAlberta (Aquila)	N/A [134]	37.0	N/A
ATCO Gas	37.0	38.0	1.0
ENMAX DISCO	N/A [135]	39.0	N/A
EPCOR DISCO	N/A [125]	39.0	N/A
AltaGas	41.0	41.0	0.0
ATCO Pipelines	43.5	43.0	(0.5)

5.6 ATCO Utilities Preferred Shares

In earlier sections, the Board noted that the 2004 approved common equity ratios in this Decision for the ATCO utilities were not adjusted to reflect any impact of ATCO's use of preferred shares. The Board notes that there was essentially no evidence presented regarding the impact of preferred shares on the required common equity ratios.

The Board has recognized in previous decisions that during the period of time when income tax rebates were in place, it was prudent to utilize preferred share financing in place of debt.

However, the Board considers that there may be merit in further consideration of the appropriateness of the continuing use of preferred shares as a form of financing, to understand the redemption options and to fully explore the related implications and options.

The Board directs ATCO to address the appropriateness of the continuing use of preferred shares as a form of financing, in the next Phase 1 GRA/GTA for ATCO Gas, ATCO Pipelines or ATCO Electric, whichever comes first.

5.7 Process to Adjust Capital Structure

The Board notes that all parties, except for CG, considered that it would be appropriate to address any future changes in capital structure in utility-specific GRA/GTAs. CG proposed a scheduled review of the capital structures of all Applicants.

The Board agrees with the general consensus that it would be more appropriate to address any future changes in capital structure in utility-specific GRA/GTAs. The Board also agrees with the general consensus that such changes should only be pursued if parties perceive that there has

---

133 In Decision 2003-061, the Board approved an equity ratio for AltaLink of 32%, plus an additional 2% to offset the impact on the interest coverage ratio of a partial allowance of income taxes in the revenue requirement.

134 The Board did not specifically approve this ratio; it was part of a negotiated settlement approved in Decision 2003-019, which included a deemed 40% equity ratio as one of many settled parameters of the revenue requirement.

135 Both EPCOR and ENMAX Distribution were subject to Board jurisdiction effective January 1, 2004.

been a material change in investment risk since the time of this Proceeding, except as otherwise specifically directed in this Decision.

6 DIRECTIONS TO APPLICANTS

The Board directs any Applicant that has a Board-approved revenue requirement for 2004 that includes a placeholder for ROE and/or capital structure to file with the Board by August 1, 2004, for information, its plans on how it intends to comply with any outstanding directions from the Board to replace the placeholders for ROE and/or capital structure, when these changes might be reflected in customer rates, and the magnitude of the impact on customer rates for the changes arising from this Decision. The Board would appreciate being advised of the status and magnitude of any other known adjustments to rates that might be forthcoming in the same timeframe as the adjustments arising from this Decision.

With respect to applications to establish a 2004 revenue requirement that are currently before the Board for a decision, the Board will use the 2004 generic ROE and capital structure approved in this Decision.

With respect to applications presently before the Board and future applications to establish a revenue requirement for 2005 or later, the Board will apply the generic ROE for that year resulting from the adjustment mechanism approved in this Decision and the capital structure provided for in this Decision, barring the applicant demonstrating a material change has occurred requiring adjustment to capital structure.

7 SUMMARY OF BOARD FINDINGS AND CONCLUSIONS

This section is provided for the convenience of readers. In the event of any difference between the Approvals in this section and those in the main body of the Decision, the wording in the main body of the Decision shall prevail.

1. With respect to the Jurisdictional Question itself, the Board finds that the proper interpretation of section 37 of the GUA would allow the Board to determine the capital structure for the relevant test period (2004 or 2005) for each gas utility under its jurisdiction by way of a generic proceeding and to establish a standardized approach based on a formula for determining the return on common equity for gas utilities. 7

2. Accordingly, the Board finds that the evidence in the Proceeding indicates that implementation of a generic approach is in the public interest and accordingly, the Board will implement a generic approach to ROE and capital structure. In the following sections, the Board will address the issues associated with the determinations necessary to appropriately implement this approach. 11

3. The Board will therefore establish a common, or generic, ROE to be applied to all Applicants. The Board will address the need for any utility-specific adjustments to the common ROE in the capital structure section of this Decision. 14

4. Based on the above-determined risk-free rate of 5.68%, MRP of 5.50%, beta of 0.55, and allowance for flotation costs of 0.50%, the Board concludes that a reasonable CAPM estimate for 2004 is 9.20%.. 21

5. On balance, the Board concludes that the results of the ERP tests other than CAPM would generally support a 2004 ROE above the Board's CAPM estimate, but that for the reasons set out above only limited weight should be placed on the results of the ERP tests other than CAPM. 23

6. As a result of the above noted concerns, the Board concludes that no weight should be placed on the results of the DCF tests presented in this Proceeding. 23

7. The Board concludes that it should place no weight on the CE test because of the implementation problems of the CE test and the above-noted conceptual and methodological concerns with the CE test. 24

8. Directionally, the evidence on recent awards for other Canadian utilities would support a 2004 ROE above the Board's CAPM estimate. However, the Board concludes that limited weight should be placed on this evidence due to the potential for circularity. 25

9. Directionally, the evidence on the awards available to U.S. utilities would support a 2004 ROE above the Board's CAPM estimate. However, the Board concludes that limited weight should be placed on this evidence due to the differences in the regulatory, fiscal, monetary, and tax regimes in the two countries... 26

10. Although, directionally, the absolute level of return for Alliance and M&NP would support a 2004 ROE above the Board's CAPM estimate, the Board concludes, based on the above analysis, that it should place limited weight on the Alliance and M&NP returns. 27

11. Directionally, the Board concludes that the experience regarding the market-to-book ratios of utilities and the experience regarding the acquisition of Alberta utilities in recent years is relevant and supports continuation of an ROE at or below the Board's CAPM estimate. 28

12. Directionally, the Board considers that the experience with Income Trusts would support an ROE at or below the Board's CAPM estimate. However, for the reasons cited above, the Board concludes that limited weight should be placed on this experience............................ 29

13. On balance, the Board concludes that the evidence on forecast pension returns would support a modest increase from the Board's CAPM estimate. 29

14. The Board concludes that there is no basis on which to place any weight, other than already reflected in earlier tests, on other specific investment opportunities potentially available to utility investors or on stated expectations of return from such opportunities. 30

15. In consideration of the impact of the above factors, it is the judgment of the Board that it would be appropriate to establish the 2004 ROE at a level that is 40 basis points above the Board's CAPM estimate. Therefore, the Board concludes the generic ROE for 2004 should be set at 9.60%. 31

8 SUMMARY OF BOARD DIRECTIONS

This section is provided for the convenience of readers. In the event of any difference between the Directions in this section and those in the main body of the Decision, the wording in the main body of the Decision shall prevail.

9 ORDER

For and subject to the reasons set out in this Decision, IT IS HEREBY ORDERED THAT:

1. With respect to Applicants that have a Board-approved revenue requirement for 2004 that includes a placeholder for ROE and/or capital structure, the placeholder for ROE shall be replaced by 9.60% and the placeholder for capital structure shall be replaced as set out in this Decision;

2. With respect to applications by an Applicant to establish a 2004 revenue requirement that are currently before the Board, the Board shall apply an ROE of 9.60% and shall apply the capital structure as set out in this Decision; and

3. With respect to current or future applications by an Applicant to establish a revenue requirement for 2005 or later years, the Board shall apply the common ROE for that year resulting from the adjustment mechanism approved in this Decision and shall apply the capital structure as set out in this Decision for such Applicant, unless the Applicant can demonstrate to the satisfaction of the Board that there has been a material change in business risk that warrants a change to the capital structure set out in this Decision.

Dated in Calgary Alberta on July 2, 2004.

File No. 5681-1

September 30, 2002

Sent to Parties on Various Utility Branch Lists via Email

Dear Sir/Madam:

PROCEEDING NO. 1271597
GENERIC COST OF CAPITAL HEARING - ELECTRIC AND GAS UTILITIES

- **Notice of Registration as Intervenors**
- **Notice of Pre-hearing Meeting – November 26, 2002**

On May 6, 2002, the Board received a request from the City of Calgary (Calgary) that the Board institute a proceeding to consider generic cost of capital matters for electric and gas utilities under the Board's jurisdiction. The Board responded to Calgary by letter dated June 6, 2002. Copies of both letters are attached as Appendix B and Appendix C[1], respectively.

The Board has decided to call a generic hearing pursuant to its powers to hold an inquiry under Section 46 of the *Public Utilities Board Act* (PUB Act) to consider cost of capital matters for electric, gas and pipeline utilities under its jurisdiction. This would include pipeline and electric transmission companies as well as electric and gas distribution companies.

The Board will hold a pre-hearing meeting as specified below to deal with the following issues:

- Determination of the scope of the proceeding and list of issues
- Determination of procedural matters that might be adopted for such a hearing.

A preliminary list of issues and procedural matters that the Board will consider through such a process is attached to this letter as Appendix A.

The Board requests that interested parties consider this preliminary list of issues and procedural matters and provide the Board with their detailed written submissions on the appropriateness of each issue or matter as well as their submissions with respect to additional issues or matters that might appropriately be considered through such a generic proceeding.

[1] Please note that these Appendices are embedded and may take a second or two to appear.

The following are key dates that the Board has established as follows:

Registration as intervenors with the Board	October 18, 2002
Written Submissions: List of Issues and Procedural Matters	November 12, 2002
Pre-Hearing Meeting	November 26, 2002
Hearing (Preliminary Schedule)	2^{nd} Quarter 2003

After receiving parties' written submissions the Board will prepare a consolidated list of issues and procedural matters for discussion at the pre-hearing meeting.

The pre-hearing meeting will be held as follows:

- DATE: November 26, 2002
- TIME: 9:00 a.m.
- PLACE: Govier Hall, EUB Calgary offices (2^{nd} floor, 640 – 5 Avenue SW)

The generic hearing would likely be scheduled for the 2^{nd} quarter of 2003.

The Board is prepared to consider submissions respecting cost recovery for this proceeding given possible future cost savings associated with streamlining of the Cost of Capital determination process. The Board has the ability to allow costs of the proceeding and to direct that such costs be borne by consumers through the utilities' hearing cost reserve accounts pursuant to the Board's discretion under Section 68 of the PUB Act and pursuant to Rules 55 and 57 of the Board's Rules of Practice.

The Board would appreciate the efforts of any or all parties to work together, in advance of the pre-hearing meeting, in order to consolidate and simplify the views of parties on any matter, including procedural and timing issues.

Any questions or correspondence, including submissions, should be directed to the writer in the EUB's Calgary office. I can be reached at (403) 297-3539 telephone, (403) 297-6104 fax, or via email at jim.wilson@gov.ab.ca. Parties should also file an electronic copy of their registrations and any submissions at the email address eub.utl@gov.ab.ca.

Yours truly,

(Original signed " J. Wilson")

Jim Wilson
Lead Application Officer

APPENDIX A

Preliminary List of Issues and Procedural Matters

A preliminary list of issues and procedural matters that will be considered at a pre-hearing meeting for a EUB generic hearing into utility cost of capital matters.

For clarity, the Board will not be discussing the merits of each issue in the list below (i.e. in section **I. Preliminary List of Issues)** but the Board, in its Decision arising from the pre-hearing meeting, will determine the scope of the proceeding.

Further, the Board will make determinations, in its Decision arising from the pre-hearing meeting, on procedural items listed below (i.e. in section **II. Preliminary List of Procedural Matters**)

I. Preliminary List of Issues

A. Pros and Cons of a Standardized Approach

1) In general and without specifying which methodology (ies) might be used, what are the pros and cons of adopting a standard methodology (ies) for setting equity rate of return in utility rate cases?

2) In general and without specifying which methodology (ies) might be used, what are the pros and cons of adopting a standard methodology (ies) for setting capital structure in utility rate cases?

3) Is the adoption of a generic approach to utility equity rate of return and capital structure in keeping with developments in other jurisdictions in North America?

B. Alternatives within a Standardized Approach

1) Assuming that the establishment of a standardized approach to setting equity rate of return is desirable:

    i. What options or alternatives should the Board consider? For example, the comparative earnings method, the risk premium method, the discounted cash flow method, ATWACC, and the NEB's approach that includes an adjustment formula.

    ii. What are the pros and cons of each option or combination of options?

2) Assuming that the establishment of a standardized approach to setting utility capital structures is desirable:

   i. What options should the Board consider?

   ii. What are the pros and cons of each option or combination of options?

C. Standardized vs. One-by-One Approach?

1) Would it be correct to consider a standardized approach to setting utility equity rate of return for all types of utilities under the Board's jurisdiction, including gas transmission, gas distribution, gas retail, electric transmission, electric distribution and electric regulated rate option providers?

2) Would it be correct to consider a single standardized approach to setting utility capital structure for all types of utilities under the Board's jurisdiction, again including gas transmission, gas distribution, gas retail, electric transmission, electric distribution and electric regulated rate option providers?

3) What principles should guide the determination of capital structure for utilities that are owned by holding companies, i.e. what principles and issues should be taken into account in dealing with a deemed vs. actual capital structure?

4) What differences exist between investor owned and municipally owned utilities that affect determination of cost of capital issues and how should those differences be taken into account with respect to cost of capital issues including return on equity, capital structure, debt costs and income tax?

D. Timing Issues

1) The Board is considering setting an implementation date for any cost of capital methodology (ies) adopted sufficiently far in advance, so as not to impact rate cases or settlement negotiations occurring during the generic hearing process. Alternately, the Board could direct parties to use placeholders for rate of return and capital structure with respect to applications not presently before the Board. What are the pros and cons of each approach?

2) What are the implications of the substance and timing of a cost of capital generic hearing with respect to the possible regulation by the Board of municipally owned utilities?

3) Should the Board consider setting an expiry date or a mandatory review date for any methodology (ies) it may determine to be appropriate for cost of capital issues? If so, what is an appropriate length of time that should elapse before a review is required?

4) How should adjustments in equity rate of return and capital structure be dealt with between test periods?

E. Special Considerations

1) Should parties have the option of agreeing, through a negotiated settlement process, on an equity rate of return and/or capital structure that is different from the equity rate of return and/or capital structure that would result using the standardized approach?

2) What provision, if any, would an inquiry into cost of capital issues need to make with respect to the Performance Based Rates (PBR) methodology or other evolving methodologies for setting rates or rate components?

3) Should the Board consider negotiated pricing arrangements in respect of expansion or merchant projects as a substitute for traditional forms of earning through equity rate of return and capital structure, (for example the Alliance Pipeline)?

II. Preliminary List of Procedural Matters

A. One or Two Phases

1) At a generic hearing:

   i. Should the Board conduct a single-phase hearing to consider both equity rate of return and capital structure generic issues?

   ii. Alternately, should there be two separate phases, one into equity rate of return applicable to all types of utilities and the other into capital structure for each type of utility?

   iii. Should the proceeding be with respect to all utilities or do the distinctions between gas, pipeline and electric industries merit separate and distinct generic hearings or phases?

B. Schedule for the Proceeding

1) Designation of "Applicant(s)" for initial evidence submission

2) Desired Process and dates for the following:

    i. Initial Evidence
    ii. IRs
    iii. Response to IRs
    iv. Intervenor Evidence
    v. IRs to Intervenors
    vi. Response to IRs to Intervenors
    vii. Rebuttal Evidence

C. Costs

1) With respect to costs for the generic hearing(s):

    i. Should some parties be only partially funded?

    ii. If so, which parties should this apply to?

    iii. How could parties be provided with incentives to combine positions where possible to achieve cost and time efficiencies?

May 6, 2002

Alberta Energy and Utilities Board
640 - 5th Ave. S.W.
Calgary, AB T2P 3G4

Attention: R. D. Heggie
Executive Manager, Utilities Branch

Dear Sirs:

Re: Cost of Capital for Electric and Gas Utilities under the Board's Jurisdiction

Pursuant to the provisions of the *Public Utilities Board Act*, R.S.A. 2000 c. P-45 (the "PUB Act"), the *Gas Utilities Act*, R.S.A. 2000, c. G-5, (the "GUA"), the *Electric Utilities Ac*t, R.S.A. 2000 (the "EUA"), c. E-5, and the A*lberta Energy and Utilities Board Act*, R.S.A. 2000, c. A-17 (the "AEUB Act"), The City of Calgary ("Calgary") hereby applies to the Board to convene a proceeding or inquiry to establish a mechanism for the appropriate cost of capital (return on equity and capital structure] for the gas and electric utilities under the Board's jurisdiction. This Application is being made on behalf of Calgary by its legal counsel Burnet Duckworth & Palmer LLP. The particulars of, and support for, this Application, are provided in the following sections.

Interest of Calgary

As the Board is aware, Calgary has a long history of intervention in regulatory proceedings which impact its citizens. With respect to gas utilities, core customers within Calgary represent approximately 70% of the gas consumption and revenue requirement of ATCO Gas South. Through the ATCO Gas South and ATCO Pipelines South rate structure, core customers within Calgary are also responsible for approximately 40% of the revenue requirement of ATCO Pipelines South. Consumers within Calgary also consume approximately one-sixth of the provincial electrical production, and are affected by the rates charged by the Transmission Facility Owners ("TFO"'s).

Cost of capital (including return on equity, capital structure, and associated income taxes) is a significant portion of the revenue requirement of any regulated utility. Using the applied for amounts for 2001 for ATCO Gas South, return on equity and taxes were about 16% of the revenue requirement, and for ATCO Pipelines South about 33%. Based on the TFO materials filed for 2001, return on equity and associated taxes for ATCO Electric and TransAlta were approximately 35% and 33% respectively (EPCOR Transmission Inc. with no tax was approximately 16%).[1]

[1] The percentages increase significantly if return on rate base is used instead of return on equity.

Frank L. Burnet Q.C. (1890-1982)
Thomas J. Duckworth Q.C., Counsel

In recent years Calgary has retained experts to present evidence on cost of capital in several proceedings: Canadian Western Natural Gas 1997/1998 GRA, the 2001 TFO Tarff Applications of ATCO Electric, TransAlta and EPCOR Transmission Inc., the ATCO Gas South 2001/2002 GRA, and the ATCO Pipelines South 2001/2002 GRA. As one of the few parties that can afford to carry the significant cost of presenting evidence in this area, Calgary expects that it will be presenting cost of capital evidence in future proceedings affecting its citizens.

As a result, the citizens represented by Calgary are directly affected by return on equity and capital structure issues

Grounds

As noted above, cost of capital constitutes a significant portion of the revenue requirement of the utilities regulated by the Board. Dealing with cost of capital issues is also a significant portion of hearing costs. Cost of capital is also an area where there are a limited number of experts available and the costs of presenting such expert reports is a substantial cost to an intervention – often at rates that exceed the Board's guidelines.

In the recent ATCO Gas South and ATCO Pipelines South proceedings the return on equity and capital structure experts retained by ATCO and Calgary cost just under $200,000 for each proceeding. In the TFO proceedings for 2001 rates, where the three TFO’s each filed separate return on equity evidence, expert witness costs totaled about $711,000 for Calgary, ATCO Electric and TransAlta[2]. In addition to the fees of the cost of capital experts, there are significant additional costs for legal counsel, and other experts, to interact with the cost of capital experts to present the case. Where an intervenor incurs these costs as part of the hearing process, the intervenor not only must carry the cost until a Costs Order is issued, but also bears the risks that the utility will oppose the costs which the intervenor has incurred to benefit all customers, or that hourly rates that are in excess of the Board's guidelines will be denied. In addition, the intervenors also bear the utility's costs through the revenue requirement and the hearing reserve account.

In the ATCO Gas South and ATCO Pipelines South 2001/2002 GRA’s the utilities filed identical return on equity evidence. Calgary, as the intervenor dealing with return on equity, then had to file evidence responding to the utilities’ return on equity requests in two different proceedings, with two attendances by the experts. In Decisions 2000-96 and 2000-97 dealing with these GRA’s, the Board issued identical reasons on return on equity matters[3] and made, *inter alia*, the following observations:

> The Board is concerned that, despite its volume, the nature of the expert evidence provided is ultimately of little probative value to the Board in establishing this important determinant of the utility’s revenue requirement.
>
> In particular the Board notes the effect that the application of professional judgement [sic] has on the outcome of the equity risk premium test. This test has been noted to be the mainstay of this Board and other Canadian regulatory boards over recent periods…
> ….

[2] Calgary, $163,000 (for evidence on all three TFO's); ATCO Electric TFO, $79,000; TransAlta, $468,000. Calgary has not yet been provided details of EPCOR Transmission Inc.'s costs.
[3] Decision 2000-96 pages 52 – 59; Decision 2000-97 pages 31 - 38.

> Further, these [equity risk premium] estimates are far enough apart that the underlying evidence is of little value to the Board in establishing an accurate and well justified estimate of the utility rate of return required to maintain the financial integrity of the utility in the eyes of investors and the market. Subsequently, the Board must rely on an examination of past awards to CWNG to determine if there is a requirement for adjustments to those awards. The Board is also of the view that alternative methods of determining appropriate utility return may need to be examined for use in future rate cases. (emphasis added)

Other Canadian regulatory boards have addressed concerns with respect to the determination of the appropriate cost of capital by taking what could be called a "generic" or formulaic approach to the issue. These include:

- National Energy Board, Multi-Pipeline Cost of Capital, RH-2-94[4],
- British Columbia Utilities Commission, Return on Common Equity Decision, June 10, 1994, Order G-35-94
- Ontario Energy Board Draft Guidelines on a Formula-Based Return on Common Equity for Regulated Utilities, March 1997,
- Manitoba Public Utilities Board Order 49095, page 50.

In Alberta, there has been some limited discussion of a generic approach to return on equity:

- In the Board's Costs Workshop of June 20, 2000 the question of why intervenors did not reduce costs through a different approach to return on equity was raised. Intervenors responded that they had to deal with the applications as filed by the utilities, and no utility had filed for a formula based approach to return on equity.

- In the 2001 TFO proceeding the evidence of Drs. Booth and Berkowitz on behalf of Calgary recommended the use of an adjustment formula for 2002 return on equity[5]. The issue of a formula based approach to return on equity was briefly discussed during the TransAlta portion of the hearing.[6]

- In the 2001/2002 ATCO Gas South and ATCO Pipelines South GRA's the evidence of Drs. Booth and Berkowitz on behalf of Calgary again suggested consideration of an adjustment formula for 2002.[7]

To date, so far as Calgary is aware, none of the utilities under the Board's jurisdiction has filed an application to have cost of capital determined on a generic or formulaic basis, nor is Calgary aware that any of the utilities are planning on doing so. However, Calgary believes that there will be several proceedings in the near future where cost of capital will have to be addressed. These include:

- ATCO Gas 2003 – 2000x GRA for ATCO Gas North and South combined,

[4] In proceeding RH-4-2001 TransCanada PipeLines Limited sought a review of the RH-2-94 Decision and presented a methodology that the EUB was presented with by TransAlta in the 1999/2000 GTA, and was included in TransAlta's 2001 TFO filing.
[5] Applications 2000132, 2000133 and 2000134, Evidence of Laurence D. Booth and Michael K. Berkowitz, page 75.
[6] 2001/2002 TFO Proceeding, September 25, 2000, Volume 3, pages 497 – 501.
[7] AGS GRA Exhibit 43, Evidence of Laurence D. Booth and Michael K. Berkowitz, page 68; APS GRA Exhibit 69, Evidence of Laurence D. Booth and Michael K. Berkowitz, page 63.

- A combined ATCO Pipelines North and South 2003 – 2000x GRA,

- The ATCO Electric TFO (and DISCO) negotiated settlement expires in 2002, and ATCO Electric has notified the Board that a 2003 – 2005 combined application for Transmission and Distribution will be filed in mid to late second quarter 2002.

- The EPCOR Transmission Inc. TFO negotiated settlement will expire at the end of 2002 and, presumably, a 2003 GRA will result,

- Altalink Management Ltd. TFO will need to file a GRA for 2002 and subsequent years.

In addition to the foregoing there may be other gas and electric utilities, with which Calgary is not involved, that will require rate hearings for 2003 and beyond.

Given the recent history with cost of capital matters, and the likelihood of several hearings in the near future dealing with cost of capital, it is Calgary's view that there would be several advantages to a "generic" cost of capital proceeding:

- *Reduction in expert witness costs.* Even if all of the utilities used different experts for a generic proceeding, there would be a likely cost saving to intervenors in only having to retain cost of capital experts for a single proceeding, instead of for multiple proceedings.

- *Reduction in overall hearing costs.* The fees for cost of capital experts are only a portion of the overall expense of dealing with cost of capital in a hearing. Fees for counsel and other experts to deal with cost of capital matters and present the case are also significant. Calgary would expect that a generic proceeding would result in cost reductions through synergies or economies of scale.

- *Efficiencies in use of Board resources.* Dealing with cost of capital matters for several utilities at the same time would, presumably, allow the Board to deal with the issues more expeditiously as it would not have to be dealing with evidence filed at different times, and in different proceedings, when ensuring that the issues are addressed in a consistent manner.

- *Future Cost Savings.* Should a generic proceeding result in Board decisions on cost of capital that last over a period of years, then Calgary would expect that future cost savings would be achieved either through simplification of future GRA's, or through facilitation of negotiated settlements by removing the cost of capital issue from negotiations.

Statutory Provisions

Calgary believes that the Board has the required jurisdiction to convene a generic cost of capital proceeding pursuant to the provisions of the AEUB Act (ss. 13 and 15); the PUB Act (ss. 36, 37, 46, 47, 89 and 90); the GUA (ss. 22, 36, and 37); and the EUA (ss. 47, 49, and 52).

Consultation Process

As discussed above, Calgary does not believe that the utilities under the Board's jurisdiction have shown any interest in the past in a generic approach to cost of capital issues. As a result, and considering the number of utilities potentially involved, Calgary concluded that the best way to address this issue was through an application to the Board that would allow all interested parties to express their views. Calgary has, however, held informal discussions with some intervenor groups and believes that customer groups, who ultimately bear the burden of cost of capital litigation, will be supportive of any approach that has the potential to reduce costs.

Summary of Relief Requested

Calgary requests that the Board institute a proceeding to determine:

1. the appropriate rate of return on common equity for each utility examined,

2. the appropriate capital structure for each utility examined,

3. the time frame over which the rate of return on common equity should apply,

4. if the time frame for the rate of return on common equity is to be more and one year, or other specified test period, the mechanism by which the rate of return would be adjusted in further years,

5. the time frame over which capital structure should apply, and the process for adjusting capital structure,

6. the appropriate regulatory process for future proceedings dealing with return on equity and capital structure.

Communications

All communications with respect to this Application can be addressed to the undersigned.

Service

Calgary will be providing a copy of this Application to the Interested Party lists from the ATCO Gas South and ATCO Pipelines South GRA's, GCRR Methodology Proceeding, the 2001/2002 TFO Proceeding, and the TransAlta/Altalink Proceeding. Copies will be provided to any other party, or list, that the Board directs.

Yours truly,

Burnet, Duckworth & Palmer LLP

CALGARY AB T2P 3N9

Dear Mr. Brander:

APPLICATION 1271597
COST OF CAPITAL FOR ELECTRIC AND GAS UTILITIES UNDER THE BOARD'S JURISDICTION

I refer to your letter of May 6, 2002, on behalf of the City of Calgary, requesting that the Board convene a proceeding or inquiry to establish a mechanism for determining the cost of capital for utilities under the Board's jurisdiction.

The Board has now had the opportunity to thoroughly review this request. Upon reflection, the Board considers that it would be appropriate to await the National Energy Board's upcoming decision on rate of return before proceeding to deal with this issue.

We will be contacting interested parties further with respect to procedure once this decision has been released.

Yours truly,

Order U2004-423

MADE at the City of Calgary, in the Province of Alberta, on 30th day of November 2004.	ALBERTA ENERGY AND UTILITIES BOARD

Board Initiated Proceeding 2005 Return on Equity	Proceeding No. 1371189

1 BACKGROUND AND DETAILS

The Alberta Energy and Utilities Board (Board) released Decision 2004-052 on July 2, 2004 regarding the Generic Cost of Capital proceeding. This Decision set a generic rate of return on common equity (Return on Equity or ROE) of 9.60% for 2004.[1] This Decision also approved an annual adjustment mechanism or formula for the purpose of establishing the generic ROE for 2005 and later years.

The adjustment formula set out in Decision 2004-052, at page 32, is as follows:

> $ROE_t = 9.60\% + [0.75 \times (YLD_t - 5.68\%)]$
>
> where YLD_t = the forecast long-term Canada bond yield for year t.
>
> Consistent with the approach used by the NEB, the forecast long-term Canada bond yield for year t shall be calculated as the average of the 3-month-out and 12-month-out forecasts of 10-year Canada yields as reported in the Consensus Forecasts[2] issue in November of the previous year, plus the average of the daily difference between the 10-year and the 30-year Canada bond yields for the month of October in the previous year, as reported in the National Post.

The 3-month-out and 12-month-out forecasts of 10-year Government of Canada (Canada) yields as reported in the November 2004 Consensus Forecasts issue were 4.90% and 5.20% respectively, resulting in an average forecast 10-year Canada bond yield of 5.05% for 2005. To this forecast, the EUB added 0.50% or 50 basis points, representing the average of the daily difference between the 10-year and the 30-year Canada bond yields for the month of October 2004, as reported in the National Post. This calculation resulted in a forecasted 2005 long-term Canada bond yield (YLD_{2005}) of 5.55%, which is 0.13%, or 13 basis points, lower than the Board approved forecast long-term Canada bond yield of 5.68% for 2004. Multiplying this 13 basis point yield differential by 75% produced a downward adjustment of 0.10% or 10 basis points.

---

1 Page 31
2 Published by Consensus Economics Inc., London, England

Applying this downward adjustment of 10 basis points to the 2004 ROE of 9.60% results in a generic ROE of 9.50% for 2005.

The 2005 generic ROE is applicable to any adjudicated determination of a 2005 revenue requirement, for each of the Applicants listed in Decision 2004-052, as presented below. The Board may also apply the 2005 generic ROE to any other utility that is currently or that comes under its jurisdiction. For greater certainty, the Board notes that the 2005 generic ROE would not apply to any utility that continues to operate under its final 2004 rates and for which there is no proceeding to establish revised final rates for 2005.

The Applicant utilities for Decision 2004-052 were:

AltaGas Utilities Inc.
AltaLink Management Ltd. (AltaLink, L.P.)
ATCO Electric Ltd. (Distribution)
ATCO Electric Ltd. (Transmission)
ATCO Gas
ATCO Pipelines
ENMAX Power Corporation (Distribution)
EPCOR Distribution Inc.
EPCOR Transmission Inc.
FortisAlberta
NOVA Gas Transmission Ltd.

2 ORDER

The Board hereby approves, in accordance with Decision 2004-052, a 2005 generic Return on Equity of 9.50%.

END OF DOCUMENT

Board Initiated Proceeding, 2006 Generic ROE Formula Result
EUB Order - U2005-410

MADE at the City of Calgary, in the Province of Alberta, on 22nd day of November 2005.	ALBERTA ENERGY AND UTILITIES BOARD

Board Initiated Proceeding 2006 Generic Return on Equity Formula Result	Application No. 1428134

1 BACKGROUND AND DETAILS

The Alberta Energy and Utilities Board (Board) released Decision 2004-052 on July 2, 2004 regarding the Generic Cost of Capital proceeding. Decision 2004-052 set a generic rate of return on common equity (Return on Equity or ROE) of 9.60% for 2004.[1] Decision 2004-052 also approved an annual adjustment mechanism or formula for the purpose of establishing the generic ROE for 2005 and later years.

The adjustment formula set out in Decision 2004-052, at page 32, is as follows:

> $ROE_t = 9.60\% + [0.75 \text{ x } (YLD_t – 5.68\%)]$
>
> where YLD_t = the forecast long-term Canada bond yield for year t.
>
> Consistent with the approach used by the NEB, the forecast long-term Canada bond yield for year t shall be calculated as the average of the 3-month-out and 12-month-out forecasts of 10-year Canada yields as reported in the Consensus Forecasts[2] issue in November of the previous year, plus the average of the daily difference between the 10-year and the 30-year Canada bond yields for the month of October in the previous year, as reported in the National Post.

The 3-month-out and 12-month-out forecasts of 10-year Government of Canada (Canada) yields as reported in the November 2005 Consensus Forecasts issue were 4.4% and 4.7% respectively, resulting in an average forecast 10-year Canada bond yield of 4.55% for 2006. To this forecast, the EUB added 0.23% or 23 basis points, representing the average of the daily difference between the 10-year and the 30-year Canada bond yields for the month of October 2005, as reported in the National Post. This calculation resulted in a forecasted 2006 long-term Canada bond yield (YLD_{2006}) of 4.78%, which is 0.90%, or 90 basis points, lower than the Board approved forecast long-term Canada bond yield of 5.68% for 2004. Multiplying this 90 basis point yield differential by 75% produced a downward adjustment of 0.68% or 68 basis points

---
1 Page 31
2 Published by Consensus Economics Inc., London, England

(rounded to two decimal places). Applying this downward adjustment of 68 basis points to the 2004 ROE of 9.60% results in a generic ROE of 8.93% for 2006. This is 0.57% or 57 basis points lower than the 2005 generic ROE of 9.50%

The 2006 generic ROE is applicable to any adjudicated determination of a 2006 revenue requirement, for each of the Applicants listed in Decision 2004-052, as presented below. The Board may also apply the 2006 generic ROE to any other utility that is currently, or that subsequently comes under its jurisdiction. For greater certainty, the Board notes that the 2006 generic ROE would not apply to any utility that continues to operate under final rates from a previous test year and for which there is no proceeding to establish revised final rates for 2006.

The Board may also provide additional clarification to address circumstances not covered in the preceding paragraph.

The Applicant utilities for Decision 2004-052 were:

AltaGas Utilities Inc.
AltaLink Management Ltd. (AltaLink, L.P.)
ATCO Electric Ltd. (Distribution)
ATCO Electric Ltd. (Transmission)
ATCO Gas
ATCO Pipelines
ENMAX Power Corporation (Distribution)
EPCOR Distribution Inc.
EPCOR Transmission Inc.
FortisAlberta Inc.
NOVA Gas Transmission Ltd.

2 ORDER

The Board hereby approves, in accordance with Decision 2004-052, a 2006 generic Return on Equity of 8.93%.

END OF DOCUMENT

Board Initiated Proceeding, 2007 Generic ROE Formula Result
EUB Order - U2006-292

Other Utilities – Miscellaneous
Order U2006-292 (Errata)

MADE at the City of Calgary, in the Province of Alberta, on 30th day of November 2006.	Laurie Bayda ALBERTA ENERGY AND UTILITIES BOARD

Board Initiated Proceeding 2007 Generic Return on Equity Formula Result	Application No. 1487360

The Alberta Energy and Utilities Board (Board) released *Order U2006-292: 2007 Generic Return on Equity Formula Result*, on November 27, 2006. Order 2006-292 correctly set the 2007 Generic Return on Equity at 8.51%. However, the Board has discovered that one of the inputs that it used in the formula was incorrect. The difference between the 10-year and the 30-year Canada bond yields for the month of October 2006, as reported in the National Post, was actually 0.07% rather than the 0.08% that the Board used. However, due to the effects of rounding, this input error did not affect the final result.

The corrected derivation of the formula result, with changes highlighted, is as follows:

The 3-month-out and 12-month-out forecasts of 10-year Government of Canada (Canada) yields as reported in the November 2006 Consensus Forecasts issue were 4.1% and 4.2% respectively, resulting in an average forecast 10-year Canada bond yield of 4.15% for 2007. To this forecast, the EUB added **0.07%**, representing the average of the daily difference between the 10-year and the 30-year Canada bond yields for the month of October 2006, as reported in the National Post. This calculation resulted in a forecasted 2007 long-term Canada bond yield (YLD_{2007}) of **4.22%,** which is **1.46%** lower than the Board approved forecast long-term Canada bond yield of 5.68%, for the base year, 2004. Multiplying this **1.46%** differential by 0.75 produced a downward adjustment of **1.095%.** Applying this downward adjustment of **1.095%** to the 2004 ROE of 9.60% results in a generic ROE of 8.51% **(rounded to two decimal places)** for 2007. This is 0.42% lower than the 2006 generic ROE of 8.93%.

Accordingly, the amended Order U2006-292 is appended as Appendix A.

END OF DOCUMENT

APPENDIX A – AMENDED ORDER U2006-292

1 BACKGROUND AND DETAILS

The Alberta Energy and Utilities Board (Board) released *Decision 2004-052: Generic Cost of Capital*, on July 2, 2004. Decision 2004-052 set a generic rate of return on common equity (Return on Equity or ROE) of 9.60% for 2004.[1] Decision 2004-052 also approved an annual adjustment mechanism or formula for the purpose of establishing the generic ROE for 2005 and later years.

The adjustment formula set out in Decision 2004-052, at page 32, is as follows:

> $ROE_t = 9.60\% + [0.75 \times (YLD_t - 5.68\%)]$
>
> where YLD_t = the forecast long-term Canada bond yield for year t.
>
> Consistent with the approach used by the NEB, the forecast long-term Canada bond yield for year t shall be calculated as the average of the 3-month-out and 12-month-out forecasts of 10-year Canada yields as reported in the Consensus Forecasts[2] issue in November of the previous year, plus the average of the daily difference between the 10-year and the 30-year Canada bond yields for the month of October in the previous year, as reported in the National Post.

The 3-month-out and 12-month-out forecasts of 10-year Government of Canada (Canada) yields as reported in the November 2006 Consensus Forecasts issue were 4.1% and 4.2% respectively, resulting in an average forecast 10-year Canada bond yield of 4.15% for 2007. To this forecast, the EUB added 0.07%, representing the average of the daily difference between the 10-year and the 30-year Canada bond yields for the month of October 2006, as reported in the National Post. This calculation resulted in a forecasted 2007 long-term Canada bond yield (YLD_{2007}) of 4.22%, which is 1.46% lower than the Board approved forecast long-term Canada bond yield of 5.68%, for the base year, 2004. Multiplying this 1.46% differential by 0.75 produced a downward adjustment of 1.095%. Applying this downward adjustment of 1.095% to the 2004 ROE of 9.60% results in a generic ROE of 8.51% (rounded to two decimal places) for 2007. This is 0.42% lower than the 2006 generic ROE of 8.93%.

The 2007 generic ROE is applicable to any adjudicated determination of a 2007 revenue requirement, for each of the Applicants listed in Decision 2004-052, as presented below. The Board may also apply the 2007 generic ROE to any other utility that is currently, or that subsequently comes under its jurisdiction. For greater certainty, the Board notes that the 2007 generic ROE would not apply to any utility that continues to operate under final rates from a previous test year and for which there is no proceeding to establish revised final rates for 2007.

The Board may also provide additional clarification to address circumstances not covered in the preceding paragraph.

1 BACKGROUND AND DETAILS

The Alberta Energy and Utilities Board (Board) released *Decision 2004-052: Generic Cost of Capital*, on July 2, 2004. Decision 2004-052 set a generic rate of return on common equity (Return on Equity or ROE) of 9.60% for 2004.[1] Decision 2004-052 also approved an annual adjustment mechanism or formula for the purpose of establishing the generic ROE for 2005 and later years.

The adjustment formula set out in Decision 2004-052, at page 32, is as follows:

> $ROE_t = 9.60\% + [0.75 \text{ x } (YLD_t – 5.68\%)]$
>
> where YLD_t = the forecast long-term Canada bond yield for year t.
>
> Consistent with the approach used by the NEB, the forecast long-term Canada bond yield for year t shall be calculated as the average of the 3-month-out and 12-month-out forecasts of 10-year Canada yields as reported in the Consensus Forecasts[2] issue in November of the previous year, plus the average of the daily difference between the 10-year and the 30-year Canada bond yields for the month of October in the previous year, as reported in the National Post.

The 3-month-out and 12-month-out forecasts of 10-year Government of Canada (Canada) yields as reported in the November 2006 Consensus Forecasts issue were 4.1% and 4.2% respectively, resulting in an average forecast 10-year Canada bond yield of 4.15% for 2007. To this forecast, the EUB added 0.08%, representing the average of the daily difference between the 10-year and the 30-year Canada bond yields for the month of October 2006, as reported in the National Post. This calculation resulted in a forecasted 2007 long-term Canada bond yield (YLD_{2007}) of 4.23%, which is 1.45% lower than the Board approved forecast long-term Canada bond yield of 5.68%, for the base year, 2004. Multiplying this 1.45% differential by 0.75 produced a downward adjustment of 1.09% (rounded to two decimal places). Applying this downward adjustment of

[1] Page 31
[2] Published by Consensus Economics Inc., London, England

1.09% to the 2004 ROE of 9.60% results in a generic ROE of 8.51% for 2007. This is 0.42% lower than the 2006 generic ROE of 8.93%

The 2007 generic ROE is applicable to any adjudicated determination of a 2007 revenue requirement, for each of the Applicants listed in Decision 2004-052, as presented below. The Board may also apply the 2007 generic ROE to any other utility that is currently, or that subsequently comes under its jurisdiction. For greater certainty, the Board notes that the 2007 generic ROE would not apply to any utility that continues to operate under final rates from a previous test year and for which there is no proceeding to establish revised final rates for 2007.

The Board may also provide additional clarification to address circumstances not covered in the preceding paragraph.

TABLE OF CONTENTS

Page No.

1.0 EXECUTIVE SUMMARY

On June 30, 2005, Terasen Gas Inc. ("TGI") and Terasen Gas (Vancouver Island) Inc. ("TGVI") applied to the Commission to determine the appropriate return on equity and capital structure and to review and revise the automatic adjustment mechanism. TGI's return on equity and capital structure were established following a generic hearing by the Commission in 1994, at 350 basis points over the forecast long Canada bond yield and an equity component of 33 percent. The automatic adjustment mechanism was amended in 1999, with the result that when long Canada bond yields are forecast to be below 6 percent, the ROE rises and falls in step with the forecast long Canada bond yield. TGI has the lowest return on equity and smallest equity component of capital structure of any gas distribution company in Canada.

Up to 2002 TGVI's return on equity and capital structure were established by Special Direction issued by the Lieutenant Governor in Council to the Commission. Thereafter, under the Commission's negotiated settlement process, they were determined to be a 50 basis point premium over the return on equity of the benchmark low-risk utility (which the Commission determined to be TGI) and an equity component of 35 percent.

The Applicants seek the following returns on equity (based on the November 2006 consensus long Canada bond yield forecast of 4.79 percent) and equity component:

TGI	10.16%	38%
TGVI	10.91%	40%

The Commission Panel determines that both the comparable earnings standard and the capital attraction standard are equally relevant in establishing a fair return.

Accordingly, the Commission Panel gives weight to both the Equity Risk Premium and the Discounted Cash Flow approaches to establishing a fair rate of return. It is unable to give any weight to the Comparable Earnings of low-risk Canadian industrials in this proceeding, although it believes that this approach may play a role in future hearings.

The Commission Panel concludes that the appropriate return on equity for a benchmark low-risk utility is 3.90 percent over the forecast long Canada bond yield. The Commission Panel determines that TGI will continue to be the benchmark low-risk utility. The Commission Panel also concludes that a revision to the automatic adjustment mechanism is appropriate, such that the return on equity will be adjusted by 75 percent of the change in forecast long Canada bond yields, effective January 1, 2006. Accordingly, the return on equity for

TGI for 2006 will be 8.80 percent and its equity component will be 35 percent. For TGVI the Commission Panel determines that a 70 basis point premium over the benchmark low-risk utility is appropriate for a return for 2006 of 9.50 percent, and an equity component of 40 percent.

2.0 INTRODUCTION AND BACKGROUND

2.1 Introduction

On June 30, 2005 Terasen Gas Inc. ("Terasen Gas" or "TGI") and Terasen Gas (Vancouver Island) Inc. ("TGVI") collectively referred to as the "Companies" or the "Applicants" jointly filed an application (the "Application" with the British Columbia Utilities Commission ("BCUC" or the "Commission") to determine the appropriate return on equity ("ROE") and capital structure, and to review and revise the automatic adjustment mechanism ("AAM").

2.2 Overview

2.2.1 TGI

In 1994 the Commission was the first in Canada to hold a generic hearing into the appropriate rates of return on common equity and capital structure for utilities subject to its jurisdiction. It determined BC Gas Utility Ltd. ("BC Gas") (now Terasen Gas Inc.) to be the benchmark low-risk utility and established rates of return on common equity and capital structure for BC Gas, West Kootenay Power Ltd. (now FortisBC Inc.) and Pacific Northern Gas Ltd. ("PNG"). In addition, its Order No. G-35-94 established an AAM for calculating the allowed ROE on an annual basis.

In 1997 the Commission, by Order No. G-49-97, amended the AAM to correct for certain problems and to make it more consistent with the practices of other Canadian jurisdictions. In that Order the Commission directed that the range of forecast long Canada bond yields over which the AAM would apply would be 6.0 percent to 12.0 percent.

In November or December of each year from 1995 through 1998 the Commission issued letters to the Utilities subject to its jurisdiction establishing the ROE allowed for rate making purposes for each subsequent year based on calculations pursuant to the AAM. Centra Gas British Columbia's (now TGVI) ROE was set by Special Direction during that period.

In 1999, following an oral public hearing into the ROE for a low-risk benchmark utility and into the AAM, the Commission issued Order No. G-80-99, which directed that the AAM should continue to be employed, with certain exceptions:

- at forecast long Canada yields of 6.0 percent or below, the equity risk premium for a low-risk benchmark utility will be fixed at 350 basis points;

- at forecast long Canada yields of greater than 6.0 percent, the current contraction/expansion factor (i.e., the sliding scale) of 0.8 of the difference in forecast long Canada yields shall be retained and shall be driven off a low-risk benchmark utility ROE of 9.5 percent;

- to determine the forecast long Canada yield, the period over which the 10- to 30-year spread is to be measured shall be redefined as all the trading days in the October preceding the November Consensus forecast; and

- the Commission will canvass interested parties on the need for a review of the automatic adjustment formula when long Canada rates exceed 8.0 percent for a period of at least six months.

On November 1, 2000, BC Gas applied to the Commission to adjust the application of the automatic ROE adjustment formula to address the then current situation of yields on 10-year Government of Canada bonds exceeding the yields on 30-year Government of Canada bonds. The Commission reviewed the submissions of the various parties and decided not to vary the application of the ROE adjustment mechanism for 2001, as stated in Letter No. L-61-00.

In Letter No. L-62-01 the Commission established a written public hearing to review the yield spread between medium and long-term bonds in 2001 to consider whether amendments should be made to the mechanism for 2002. Following that written proceeding, the Commission determined by Order No. G-109-01 that the treatment of the yield spread between 30-year and 10-year bonds did not require adjustment. The Commission also determined that the ROE for the benchmark low-risk utility, expressed as a percentage, should be rounded to two decimal places prior to adding the utility-specific risk premium.

On July 22, 2004, TGI wrote to the Commission requesting the Commission convene a hearing to review return on equity and capital structure. By Order No. G-88-04 the Commission determined that a hearing was not warranted at that time but concluded that such a review may be appropriate in the Fall of 2005 in time for implementation January 1, 2006.

By Application dated June 30, 2005, the Companies submit that since 1994, when the Commission introduced its ROE adjustment mechanism for setting rates of returns, which reflected the economic climate and circumstances of the day, much has changed and that in British Columbia, in Canada and in North America there is intense competition for capital.

The Applicants ask the Commission to move in accordance with these changed circumstances and recognize that it is not appropriate to subject investors in TGI to the lowest allowed return on equity in Canada.

Further the Applicants ask that the Commission recognize that British Columbia utilities must compete for capital with other Canadian utilities and with utilities in the U.S. and award returns on equity, and establish capital structures, that are appropriate in today's financial markets and reflect the business and financial risks of the utilities in British Columbia.

TGI requests that the Commission acknowledge changed circumstances by allowing it a common equity component of 38 percent in its capital structure, and a return on equity of 10.50 percent when long-term Canada bonds are forecast to yield 5.25 percent. TGVI requests that it be allowed a common equity component of 40 percent and be granted an additional 75 basis point increment over the allowed return on equity of TGI (i.e., 11.25 percent when the forecast yield on long-term Canada bonds is 5.25 percent).

Finally, the Applicants ask that the AAM be revised to make it comparable with other Canadian jurisdictions, both federal and provincial, which have established a sliding scale adjustment of 0.75:1 through its entire range of application.

On August 3, 2005, the Commission held a Procedural Conference, pursuant to Order No. G-69-05, to address the scope of the Commission's review of the Application, the steps and timetable associated with the regulatory review process and any other matters to assist the Commission to efficiently review the Application.

With input provided by Utilities and Intervenors at the Procedural Conference, the Commission defined the scope of the proceeding as follows:

1) The automatic ROE adjustment mechanism and all issues related thereto with respect to the establishment of the low-risk benchmark utility return used in the calculation of the appropriate ROE for utilities;

2) The capital structure for TGI and TGVI and utility-specific risk premium, if any, used in the calculation of the appropriate ROE for TGI and TGVI; and

3) The date the decision becomes effective.

A public hearing was held in Vancouver on November 14-18, 2005. Written Argument and Reply were received by January 5, 2006. Supplementary oral argument was heard by the Commission Panel on January 17, 2006.

2.2.2 TGVI

Under the terms of the Special Direction to the Commission issued under the Vancouver Island Natural Gas Pipeline Act ("VINGPA") by the Lieutenant Governor in Council through Order in Council 1510/95 the equity component of the capital structure and return on equity were set at 35 percent and 362.5 basis points over the long Canada bond yield respectively until December 31, 2002, after which time the Commission would set rates in accordance with the regulatory principles that are generally applied by it from time to time to gas distribution companies operating within British Columbia. In 2001 BC Gas Inc. (now Terasen Inc. or "TI") acquired Centra Gas British Columbia Inc. In 2003, in accordance with the negotiated settlement, the Commission approved by Order No. G-2-03 that TGVI's equity component of capital structure would be 35 percent and its ROE set at a premium of 50 points basis over the benchmark low-risk utility ROE.

2.2.3 The Law and the Jurisdiction of the Commission

Intervenors and Applicants cite four court decisions that they submit are relevant to the matters in this proceeding: *B.C. Electric Railway Co. Ltd. v. Public Utilities Commission of B.C. et al.* [1960] S.C.R. 837 ("*B.C. Electric Railway*"), *Hemlock Valley Electrical Services Ltd. v. BCUC* (1992) 66 B.C.L.R. (2d) 1 (B.C.C.A.) ("*Hemlock Valley"), Bell Canada v. Canada* (CTRC) [1989] 1 S.C.R. 1722 ("*Bell Canada*"), and *Northwestern Utilities Ltd. v. Edmonton and Board of Public Utility Commissioners of Alberta* [1929] S.C.R. 186 *("Northwestern Utilities").*

In addition, the B.C. Old Age Pensioners' Organization et al. ("BCOAPO") reminds the Commission of its duties under the Utilities Commission Act ("Act", "UCA") in setting just and reasonable rates. These are:

1. a fair and reasonable charge for service of the nature and quality provided by the utility,
2. sufficient to yield a fair and reasonable compensation for the service provided by the utility, or a fair and reasonable return on the appraised value of its property, and
3. not unjust or unreasonable for any other reason [Utilities Commission Act ("UCA"), s. 59].

The Applicants submit that the *B.C. Electric Railway* and the *Hemlock Valley* cases make it clear that the obligation to allow a utility to earn a fair and reasonable return is absolute, and that a rate is unjust or unreasonable if it fails to yield a just and reasonable return on rate base (TGI/TGVI Submissions, p. 34, para. 115).

The BCOAPO cites *Bell Canada* and *Northwestern Utilities* and submits that the Commission must balance the interests of customers to a fair and reasonable charge for services with the interests of shareholders to fair and reasonable compensation. The BCOAPO submits that the Commission should take into account the rate increases that would result if the Application is approved (BCOAPO Submission, p. 7).

The Joint Industry Electrical Steering Committee ("JIESC") submits that all of the resources TGI and TGVI require, including the capital, must be obtained at the lowest possible cost and that the return must be equal to the returns available to investors on investments of comparable risk (JIESC Submission, p. 3; T7: 995).

The Commercial Energy Consumers Association of British Columbia ("CEC") submits that the obligation to allow a utility to earn a fair and reasonable return on rate base is not absolute, and that the Commission must balance the interests of customers and shareholders. The CEC further submits that if the obligation to allow a utility to earn a fair and reasonable return on rate base is absolute it would entitle new shareholders, who have paid a premium to departing shareholders of a regulated utility, to request a fair return on their investment, including any premium paid for the investment (CEC Submission, pp. 2-3).

<u>Commission Determinations</u>

The Commission's mandate is to ensure that ratepayers receive safe, reliable and non-discriminatory energy services at fair rates from the public utilities it regulates, and that shareholders of those public utilities are afforded a reasonable opportunity to earn a fair return on their invested capital. The process to establish a fair return and just and reasonable rates is enshrined in the UCA where "the commission must consider all matters that it considers proper and relevant affecting the rate" and in doing so it must have due regard to the setting of a rate that "is not unjust or unreasonable" within the meaning of section 59 (of the Act) [*UCA*, s.60 (1)(a) and (b)(i)].

The reasons of Locke J. and Martland J. in the *B.C. Electric Railway* case are ad idem on the matter of the need to consider both the costs of providing service and a fair return on invested capital used or prudently incurred to provide the service. First Locke J. said:

> "…I do not think it is possible to define what constitutes a fair return upon the property of utilities in a manner applicable to all cases or that it is expedient to attempt to do so. It is a continuing obligation that rests upon such a utility to provide what the Commission regards as adequate service in supplying not only electricity but transportation and gas, to maintain its properties in a satisfactory state to render adequate service and to provide extensions to these services when, in the opinion of the Commission, such are necessary. In coming to its conclusion as to what constituted a fair return to be allowed to the appellant these matters as well as the undoubted fact

> that the earnings must be sufficient, if the company was to discharge these statutory duties, to enable it to pay reasonable dividends and attract capital, either by the sale of shares or securities, were of necessity considered. Once that decision was made it was, in my opinion, the duty of the Commission imposed by the statute to approve rates which would enable the company to earn such a return or such lesser return as it might decide to ask" (Exhibit A3-5, p. 848).

Martland J. said:

> "The rate to be imposed shall be neither excessive for the service nor insufficient to provide a fair return on the rate base. There must be a balancing of interests. In my view, however, if a public utility is providing an adequate and efficient service [as it is required to do by s. 5 of the Act (now s. 38)], without incurring unnecessary, unreasonable or excessive costs in so doing, I cannot see how a schedule of rates, which, overall, yields less revenue than would be required to provide that rate of return on its rate base which the Commission has determined to be fair and reasonable, can be considered, overall, as being excessive" (Exhibit A3-5, p. 856).

The submissions of the Applicants and the Intervenors in this proceeding are not ad idem regarding the appropriate consideration of the "balancing of interests". The Commission Panel finds the reasons of Locke J. and Martland J. instructive, and notes that they are accepted in the *Bell Canada* case. The Commission Panel does not accept that the reference by Martland J. to a "balancing of interests" to mean that the exercise of determining a fair return is an exercise of balancing the customers' interests in low rates, assuming no detrimental effects on the quality of service, with the shareholders' interest in a fair return. In coming to a conclusion of a fair return, the Commission does not consider the rate impacts of the revenue required to yield the fair return. Once the decision is made as to what is a fair return, the Commission has a duty to approve rates that will provide a reasonable opportunity to earn a fair return on invested capital. As Martland J. said, "The rates to be imposed shall be neither excessive for the service nor insufficient to provide a fair return on rate base." With the use of AAM, the determination of the cost of service and the determination of a fair return are now issues for separate processes.

As for the JIESC's lowest cost argument, the Commission Panel shares the view of the NEB, which recognized that "lowest possible" was not the appropriate test when it stated, at page 25 of its RH-2-94 Decision on generic cost of capital:

> "Contrary to what some parties advocated during the hearing, the Board is of the view that it is not appropriate to over-leverage a pipeline in order to identify the minimum acceptable deemed common equity ratio possible."

2.3 The Applications

2.3.1 Benchmark low-risk utility

The Applicants seek revised capital structures and a return on equity appropriate to a benchmark low-risk utility.

TGI (then BC Gas Utility Ltd.) was deemed the benchmark utility in 1994 when the first generic ROE adjustment mechanism was established, and has continually been regarded as such by the Commission (Exhibit B-1, Tab 1, p. 2).

TGI's expert witness, Ms. McShane, describes a "benchmark low-risk utility" as a hypothetical construct. She considers that one objective measure of what constitutes a low-risk utility would be the utility's ability, on a stand-alone basis, to achieve debt ratings of A. In her view "The benchmark return is derived from data for utilities across industries (electric, gas distribution and gas pipeline), as well as from data for non-utilities. It is based on no specific utility and hence reflects no specific business or financial risk characteristics" (Exhibit B-1, Tab 2, p. 11).

2.3.2 Basis for filing the Applications

According to the Companies, the basis for the filing of the Applications is:

1) The AAM has resulted in TGI being allowed the lowest return on investment of any regulated energy utility in Canada.

2) The AAM has had unintended consequences when forecast long Canada bond yields are below 6 percent.

3) There have been significant changes in the Canadian economy and financial markets since 1994.

4) The business risk profile of TGI has changed since 1994, while its capital structure has been weakened by the elimination of preferred shares.

5) The capital structure and ROE should enable the companies to maintain adequate debt coverage ratios to avoid alarms from debt rating agencies.

6) The Commission should give weight to all three methods of determining the cost of equity capital namely the Equity Risk Premium, the Discounted Cash Flow and the Comparable Earnings tests (Exhibit B-1, pp. 2-3).

2.3.3 TGI

TGI states that in order to be designated the benchmark low-risk utility, it requires a common equity component in the capital structure of 38 percent as compared to the current 33 percent and a ROE of 10.5 percent when long Canada bonds are forecast to yield 5.25 percent (Exhibit B-1, Cover Letter, p. 3; TGI/TGVI Submissions, p. 1). Based on the consensus long Canada bond yield forecast of 4.79 percent the determination of the formula-based allowed ROE for 2006 is 8.29 percent (Exhibit B-25; B-26). The Applicants submit that any variance from a long-term Canada forecast bond yield of 5.25 percent should be accommodated through an adjustment in the ROE by 75 percent of the variance of long-term Canada bond forecast. On this basis, the 2006 ROE for TGI should be set at 10.16 percent [10.5%-(.75*(5.25-4.79))] (TGI/TGVI Submissions, p. 26; TGI/TGVI Reply Submissions, p. 46).

2.3.4 TGVI

TGVI seeks a common equity ratio of 40 percent and equity risk premium relative to the benchmark low-risk utility of 75 basis points. The current common equity component of TGVI is 35 percent and the premium is 50 basis points relative to the benchmark utility (Exhibit B-1, Tab 2, p. 18; Exhibit B-3, BCUC IR 40.1; Exhibit B-14A; TGI/TGVI Argument, pp. 32, 33). The determination of the formula-based 2006 allowed ROE for TGVI is 8.79 percent (Exhibit B-26). TGVI submits that its ROE should be set at 10.91 percent (i.e., 10.16 percent plus 75 basis points) (TGI/TGVI Submissions, p. 62; TGI/TGVI Reply Submissions, p. 46).

2.4 Acquisition of Terasen Inc. by Kinder Morgan, Inc.

The Applicants filed their application with the Commission on June 30, 2005. On August 1, 2005 Kinder Morgan, Inc. (“KMI”) and Terasen Inc., the sole shareholder of the Applicants, announced a definitive agreement whereby KMI would acquire all of the outstanding shares of TI for $35.91 per share. This amount is 2.7 times the book value of each TI share. The total purchase price, including the assumption of debt, is announced to be $6.9 billion. Following the announcement of the transaction Moody’s Investors Service announced that it would place TGI on credit watch with negative implications until it had investigated the implications of the transaction on TGI’s credit quality. Moody’s Investors Service downgraded TGI on December 19, 2005, stating that it had evaluated TGI’s credit on a stand-alone basis assuming that the regulatory ring-fencing imposed by the Commission would be effective in insulating TGI from the higher business and financial risk of its parent entities (Exhibit B-27, p. 1).

The Applicant's treasurer, Mr. Bryson commented on the transaction:

> "Well, I think that 2.7 book value was for the entire Terasen entity, which includes not just the gas utility business, but includes the pipeline business and the water business. You know, as we've indicated to investors over the past several years and demonstrated to investors over the last several years, we've got tremendous growth potential in our pipelines business…I think, you know, their public statements are clear that they saw the greatest potential in the pipelines business. When you add up the various growth opportunities that Terasen has in front of it, I mean, we're a $5-billion organization currently, with more that $5 billion of growth potential in that business segment alone" (T2: 123).

On August 17, 2005, KMI applied to the Commission under section 54 of the UCA for approval of the acquisition of the shares of TI. On November 10, 2005 the Commission approved the transaction, subject to certain conditions concerning "ring-fencing," independent governance and location of data. The ring-fencing provisions are designed to insulate TGI and TGVI from credit rating downgrades and related financial risks associated with any affiliates in the large Terasen/KMI corporate family. The conditions approved by the Commission are as follows:

1) Each Terasen Utility shall maintain, on a basis consistent with BCUC orders and accounting practices, a percentage of common equity to total capital that is at least as much as that determined by the Commission from time to time for ratemaking purposes.

2) No Terasen Utility will pay a common dividend without prior Commission approval if the result would reasonably be expected to violate the restriction in (1) above.

3) (a) No Terasen Utility will lend to, guarantee or financially support any affiliates of the Terasen Utilities, other than between TGI and TGS, or as otherwise accepted by the Commission.

   (b) TGI and TGS shall together maintain separate banking and cash management arrangements from other affiliates. TGVI shall establish separate banking and cash management arrangements from other affiliates once it has completed its proposed refinancing.

   (c) No Terasen Utility will enter into a tax sharing agreement with any affiliate of the Terasen Utility, unless the agreement has been approved by the Commission.

4) No Terasen Utility will enter into transactions with affiliates that are not in compliance with Commission guidelines, policies or directives regarding affiliate transactions, and no Terasen Utility will enter into transactions with affiliates on terms less favourable to the Terasen Utility than those available from third parties on an arms-length basis, unless otherwise approved by the Commission.

5) No Terasen Utility will engage in, provide financial support to or guarantee non-regulated businesses, unless otherwise approved by the Commission.

The intervenors filed the evidence of Dr. Booth on October 11, 2005. Dr. Booth summarizes his evidence with the following observation:

> "Kinder Morgan's (KMI) proposed takeover of Terasen Inc. is at an 11.8X expected 2006 EBITDA or 2.7X book value. This extreme valuation implies that the financial parameters applied to the Terasen companies are extremely generous and confirms my judgment that they should be reduced. The KMI takeover also calls into question the lack of ring fencing of Terasen Gas and the need for restrictions on inter affiliate cash management and transactions. Failing such ring fencing, in the face of the double leverage used by KMI to finance the transaction, there is a grave risk that Terasen Gas Inc.'s bond rating will suffer and ratepayers will be paying unfair and unreasonable debt costs" (Exhibit C2-6, p. 3).

Dr. Booth refers to a CIBC World Markets report dated August 19, 2005 that claims KMI plans a "double dip" financing structure, which would enable it to claim interest as an expense in both Canada and the U.S. which would result in lower taxes being paid by the new group (Exhibit C2-6, p. 83).

BCOAPO argues that the gas distribution companies were an integral reason that a premium was paid by KMI. This position is based on the expert evidence of Dr. Booth, who testified that because TGI represents 65 percent of the earnings of TI, "part of that 2.7 times clearly reflects the fact that they were happy with Terasen Gas" (BCOAPO Argument, p. 10).

The CEC argues that the KMI purchase at its high valuation is conclusive evidence in and of itself that the existing ROE and debt/equity structure is delivering a more than fair, just and reasonable return to departing shareholders and the new shareholders involved in the purchase (CEC Submission, p. 3).

The JIESC takes the position that when the allowed return equals the investors required return, the market to book ratio will be equal to one. The Intervenor cautions that if the ROE is set too generously, the market to book ratio will rise and the customers will pay more than is necessary to attract capital (JIESC Submission, p. 4).

The Companies in Reply Argument clarify that the KMI acquisition did not cause any change in the shareholding of either TGI or TGVI as the shares of both companies continue to be owned by TI. The Companies argue that the CEC was incorrect to suggest that TGI and TGVI are seeking to recover the premium over book value that KMI paid on the purchase of the shares of TI, and that there is no support for the Intervenors' argument that the new shareholder of TI was satisfied with the current ROE (TGI/TGVI Reply Submissions, pp. 6-7).

The Companies submit that the acquisition of TI by KMI should play no part in the Commission's determination of the requests for relief that was made in the Applications. The Companies argue that the Commission cannot infer that KMI was satisfied with the return that was in place (T7: 1031).

Commission Determinations

In considering the premium paid by KMI for the shares of TI, the Commission Panel is cognizant of the findings of the Alberta Energy Utility Board ("AEUB") in its Generic Cost of Capital Decision, July 2, 2004 (Exhibit A3-1, p. 28):

> "The Board also agrees that there may be strategic factors affecting the price that is paid to acquire a utility. The Board also recognizes that, in some cases, a premium might be paid for regulated assets in anticipation of significant future growth in rate base, to achieve geographic diversification or to obtain a foothold in a new market. The Board is not aware of the strategic factors that may have affected the price paid to acquire Alberta utilities in recent years."

The Commission Panel is aware of a number of strategic and fiscal factors that may have affected the price paid by KMI for the shares of TI. KMI can employ double leverage and can claim interest expenses in both the U.S. and Canada ("the double dip") to make the acquisition earnings accretive. TI's oil transportation business has significant growth opportunities. To protect the financial integrity of TI's gas distribution subsidiaries the Commission has initiated "ring-fencing" conditions. The Commission notes that Moody's Investors Service has announced that it is satisfied with the "ring-fencing" conditions imposed by the Commission and that the downgrading by Moody's of TGI was unrelated to the transaction. There is no evidence before the Commission that any of the premium paid by KMI will be included in either of the Companies' rate bases and recovered from their customers. The Commission's role is to determine a suitable capital structure for the Applicants and return on equity for a benchmark low-risk utility and the KMI/TI transaction is not relevant to the Commission's determination.

3.0 AUTOMATIC ADJUSTMENT MECHANISM

3.1 Evidence and Argument

TGI has applied to change the contraction/expansion factor (or “sliding scale”) component of the Commission’s AAM such that the ROE will be adjusted by 75 percent of the change in forecast long Canada bond yields.

In 1994 the Commission implemented an adjustment mechanism for annually setting returns on equity, with revisions to the mechanism in the interim, including in 1999 as part of the Commission’s 1999 ROE and Capital Structure Decision. The current mechanism increases the annual allowed return on equity by 80 percent of the change in forecast long Canada yields above 6.0 percent, and reduces the annual allowed return on equity by 100 percent of the change in forecast long Canada yields below 6.0 percent. Through its 1999 Decision the Commission also established that it would canvass interested parties on the need for a review of the automatic adjustment formula when long Canada rates exceed 8.0 percent for a period of at least six months.

Ms. McShane recommends that the Commission implement a symmetric 75 percent sliding scale, which she states would recognize that interest rates and the cost of equity do not rise and fall in tandem. She also submits that a 75 percent sliding scale would recognize the validity of the objectives of maintaining a stable financial profile and stable rates, and would put B.C. utilities on a similar footing as their Canadian peers (Exhibit B-1, Tab 2, p. 100). In support of her recommendation, Ms. McShane points to the results of her DCF-based equity risk premium test, which she concludes suggests that the utility cost of equity is less sensitive to changes in government bond yields than implied by the current sliding scale. In support, Ms. McShane also refers to her evidence of an average 75 percent ratio of Canadian utility dividend yields to long Canada bond yields in the period 1996-2004 as well as to her demonstration that a one percentage point change in the before-tax yield on a long-term Canada bond requires roughly a 70 basis points change in the utility return on equity to maintain a similar after-tax equity risk premium (Exhibit B-1, Tab 2, pp. 98-99).

Ms. McShane recommends that the formula should be reviewed if forecast long Canada yields fall below 4 percent or exceed 8 percent on the basis that long Canada yields outside of the range of 4.0-8.0 percent may indicate a materially altered relationship between long Canada yields and the utility cost of equity (Exhibit B-1, Tab 2, p. 100).

TGI submits that the current BCUC adjustment mechanism increasingly disadvantages B.C. utilities as long Canada bond yields decline, being the only such mechanism that provides for a one to one relationship between bond yields and allowed returns on equity (TGI/TGVI Submissions, p. 64). The Companies submit that the "penalization" of B.C. utilities can only be rectified by establishing a fair and reasonable return and implementing an adjustment formula with a symmetrical 75 percent sliding scale (TGI/TGVI Submissions, p. 64).

While Dr. Booth is not aware of any research to justify adjustment coefficients of either 0.75 or 0.80, and does not believe that risk premiums vary in a mechanical fashion with interest rates, he does support adjustment mechanisms as balancing the interests of shareholders and consumers and providing a viable compromise that avoids annual repetitive rate hearings. Dr. Booth judges that whether the adjustment coefficient is 0.75 or 0.80 is not material, but submits that that these coefficients are in the right range (Exhibit C2-6, pp. 67-68).

Dr. Booth recommends a sliding scale with an adjustment coefficient of 0.75. Dr. Booth has not specified any range in long Canada yields outside of which the formula should be reviewed since such cut-off points depend heavily on the economic situation that generates them, which cannot be specified ahead of time. Instead, Dr. Booth relies on the company, intervenors and Board staff to decide when a hearing is needed, based on their analysis of ongoing economic events (Exhibit C2-7, p. 85).

The JIESC accepts Dr. Booth's recommendation to change the adjustment mechanism after the benchmark return is reset so that for future changes being made pursuant to the adjustment mechanism, the return on equity is raised or lowered by 75 basis points for every 100 basis points change in long-term Canada yields (JIESC Submission, p. 40).

Other intervenors either made no submission on the sliding scale component of the AAM, or adopted the evidence of Dr. Booth and the submissions of the JIESC.

Commission Determinations

The Commission Panel notes that aside from recommended changes to the sliding scale component of the AAM, no other changes were recommended, such as to the method used to determine the forecast long Canada bond yield.

The Commission Panel is satisfied with the reasonableness of the proposed changes to the sliding scale recommended by TGI and supported by Intervenors. The Commission Panel approves a change to the adjustment mechanism such that the benchmark return on equity is raised or lowered by 75 percent of the change in the forecast long Canada bond yield.

The Commission Panel calculates that the result of this adjustment will be to increase the ROE for the benchmark low-risk utility for 2006 from 8.29 percent to 8.60 percent. The determination of the appropriate ROE is discussed in Section 6.

3.2 Review Process

Neither the Applicants nor the Intervenors make any recommendations concerning a periodic review of the process, or concerning events that should trigger such a review. In light of the AEUB finding in its 2004 Generic Cost of Capital Decision, the Commission Panel will adopt a review period of five years, while noting that any party continues to be free at any time to apply to the Commission to consider a review of the AAM. In addition, should the AAM result in a ROE for the benchmark low-risk utility of less than 8 percent or greater than 12 percent the Commission will canvass the views of the parties on whether the AAM should be reviewed.

4.0 RISK

4.1 Risk Defined

The Applicant and Intervenors broadly agree on the definition of risk to a benchmark low-risk utility. Investment risk comprises the sum of business risk, financial risk and regulatory risk.

Business risk is the risk that the utility will not be able to earn a return on its capital or of its capital. Dr. Booth summarized those elements that constitute business risk as:

> "…stemming from uncertainty in the demand for the firm's product resulting, for example, from changes in the economy, the actions of competitors, and the possibility of product obsolescence. This demand uncertainty is compounded by the method used by the firm and the uncertainty in the firms' cost structure, caused, for example, by uncertain input costs, like those for labour or critical raw or semi-manufactured materials" (Exhibit C2-6, p. 22, line 13).

Financial risk is measured through the debt equity ratio of a utility (Exhibit C2-6, p. 23).

Regulatory risks are those that might arise from regulatory lag, from disallowed operating or capital costs or from punitive awards.

4.2 TGI

4.2.1 <u>TGI's Submission</u>

TGI submits that since the generic hearing and the introduction of the AAM in 1994 the competitive environment in which it operates has greatly changed, and that its business risks have increased significantly. The Companies identify nine components to the increase in the business risks of TGI and TGVI.

1) The operating cost advantage of natural gas versus other energy sources has declined; TGI provides Exhibit B-6 to illustrate a narrowing of the gap between gas and electricity for its residential customers in the Lower Mainland and Central interior of the province.

2) TGI's gas versus electricity price advantage is the lowest among Canadian gas distribution companies. Table 1 on page 7 of Exhibit B-1, Tab 1 shows gas to have a considerable price advantage over electricity in Alberta and Ontario.

3) Price competitive trends have led to declining captive rates for new customers. In addition to a greater proportion of new construction being multifamily dwelling, where TGI has experienced lower capture rates, TGI is experiencing reduced capture rates in single-family homes and estimates

its capture rate to have declined by 10 percent from the low 90 percent to the low 80 percent (Exhibit B-3, p. 64).

4) Alternative energy sources are more prevalent now than in the early 1990s. TGI cites ground source heat pumps in the residential sector, and industrial customers' ability to switch fuel types.

5) The annual use of natural gas by residential customers has declined through the 1990s and is forecast to continue to decline in the future; TGI states that residential use declined by 12.5 percent between 1997 and 2004, with a further 2 percent decline forecast to occur by 2009 (Exhibit B-1, Tab 1, p. 12-4). In Exhibit B-2, page 43, TGI notes that despite lower average consumption, its residential customers are paying more for use of natural gas.

In addition, TGI files data regarding its actual volumes sold and transported, which show a considerable decline:

Recorded Actual TGI Volumes – TJs

	Sales	**Transport**	**Total**
1995	124,856	56,426	181,282
1996	144,084	60,377	204,461
1997	135,866	58,305	194,171
1998	129,537	58,304	187,841
1999	136,150	63,382	199,532
2000	135,216	62,268	197,484
2001	120,553	58,806	179,359
2002	124,260	64,169	188,429
2003	113,391	62,415	175,806
2004	109,799	62,914	172,713

Notes
1. Includes Fort Nelson
2. Sales includes rates 1-7
3. Transport includes rates 22-27, excludes BC Hydro and TGVI Wheeling volumes (Exhibit B-12)

6) Changes in the gas supply environment have required TGI to become very proactive in the regional gas market and to develop strict controls on acceptable transactions and credit positions with external counterparties; TGI notes that it has proposed to extend its hedging program from 24 to 36 months. This necessitates larger credit lines to support mark to market losses on forward positions, and the need to contract only with creditable counterparties (Exhibit B-1, Tab 1, pp. 15-16).

7) TGI is limited in its ability to pass costs through because of the competitive pressure from other energy sources; this has required it to invest in software applications, which enable it to capture productivity gains (Exhibit B-3, p. 77).

8) Potential accounting changes for rate regulated enterprises, such as the elimination of accounting for regulatory deferral accounts, could introduce significant volatility into the earnings of such businesses and negatively impact compliance with excessive covenants and the ability to attract capital in the future (Exhibit B-1, Tab 1, p. 17).

9) TGI rejects the suggestion that deferral accounts eliminate or substantially reduce its business risk. Almost all utilities in North America now have energy cost deferral accounts and many have weather normalization accounts. This was not the case in 1994 when TGI was deemed to be the benchmark low-risk utility. TGI claims that, when compared to other regulated utilities, it is inappropriately designated as a "benchmark low-risk utility" (Exhibit B-1, Tab 1, pp. 17-18).

Ms. McShane, the Applicant's witness, submits that a 33 percent common equity ratio is too low for TGI to be considered equivalent to the benchmark low-risk utility. Her conclusion is based on factors that were similar to those cited by TGI: an increasingly competitive business environment in which TGI operates, and the fact that all major gas distributors have deferral accounts for the commodity cost of gas and many have rate stabilization or weather protection deferral accounts. In addition, Ms. McShane cites the relatively high concentration of TGI's demand in the industrial sector (40 percent) and the concentration of industrial load in a single industry, pulp and paper (Exhibit B-1, Tab 2, p. 15; T3: 326).

4.2.2 The Intervenors' Response

Dr. Booth disagrees with TGI's assessment of its business risk and submits that there is no significant increase in risk for TGI from higher natural gas costs. Dr. Booth notes that TGI continues to add customers and to grow its customer base, and that Terasen stated in its 2004 Annual Information Form (March 2005) that "Natural gas maintains a competitive advantage in terms of pricing when compared to alternative sources of energy in British Columbia." Dr. Booth also contends that if the risk of residential customers switching to alternative fuels was a significant risk to TGI it would be expected to be tracking and monitoring the situation, and the fact that it does not indicates that this is not considered to be a serious risk (Exhibit C2-6, pp. 32-34).

In Dr. Booth's view, "...utilities have the lowest business risk of just about any sector in the Canadian economy" and notes that the costs and revenues from gas distribution are very stable so that the underlying uncertainty in operating income is very low. Dr. Booth also notes that "...in the event of unanticipated risks, regulated utilities are the **only** group that can go back to their regulator and ask for "after the fact" rate relief" (Exhibit C2-6, p. 28, emphasis in the original).

Dr. Booth addressed TGI's business risk of not earning a return of capital, and offered the following solution:

> "The second and more risky situation is if the company can not rebalance to achieve its revenue requirement. This unlikely situation might occur if industrial and commercial users refuse to pay the higher rates resulting from the loss of residential load. In this case the recovery of the rate base is in question and Terasen runs the risk of stranded assets. However, if this risk is realistic, then the correct response is to change the depreciation rate so that the cost of potentially stranded assets is recovered from the existing users" (Exhibit C2-6, p. 33).

TGI counters this suggestion by citing an excerpt from a NEB decision re TransCanada Pipelines RH-2-2004:

> "…there is a potential that a company's tolls may not incorporate sufficiently high depreciation rates because competitive factors would prevent such rates from being charged. This potential, if significant, is appropriately compensated through the cost of capital.
>
> The assessment of cost of capital should assume that the depreciation rates reflect the best assessment of economic life of the pipeline. Consequently, resetting depreciation rates to reflect a new best estimate of economic life does not, by itself, reduce business risk from what it would be absent a change in the best estimate" (Exhibit B-5, Response to JIESC et al. 7.2c).

The parties do not address the issue further in their Submissions, in the Commission Panel's view, correctly. There is nothing before the Commission Panel to suggest either that the Applicants' depreciation rates do not reflect their best assessment of the economic life of their plant in service; or that their business risks can be eliminated by a change in depreciation rates.

4.2.3 Competitiveness of Natural Gas versus Electricity

With respect to the risks related to the competitive position of natural gas versus electricity, the JIESC notes that TGI had indicated that a year ago it had determined that there was a 95 percent probability that its residential natural gas rates would remain at or below British Columbia Hydro and Power Authority's ("BC Hydro") electricity rates (JIESC Submission, p. 10; T2: 97). However, the Companies submit that this statement refers to its information a year ago and that gas prices have increased since then, further decreasing its competitiveness (T3: 290). The JIESC also notes that TGI's estimate of the competitive electricity price was based on an internal estimate that assumed that electricity prices would increase at approximately one-half the rate of increase of BC Hydro's probable scenario in its 2004/05 Electricity Load forecast (Exhibit C2-15). The JIESC argues that Ms. McShane indicated that gas prices would be expected to moderate somewhat from the current high prices resulting from "the aftermath of the hurricanes" (T3: 330).

The JIESC files a slide from TGI's 2005 Annual Review that shows the five-year forward gas prices at the AECO Hub™ declining from approximately $13.50 Cdn/GJ in January 2006 to $7.00 Cdn/GJ in October 2010 (Exhibit C2-23). This trend is directionally consistent with the opinion of the Companies' witness Ms. McShane (T3: 329-330).

The JIESC also files a page from BC Hydro's December 2004 Electric load forecast for the period 2004/05 to 2024/25. The BC Hydro forecast states that its probable scenario assumes that electricity prices will increase at the rate of inflation (Exhibit C2-15), whereas TGI assumes a rate of increase for electricity prices that was one-half the rate of inflation (T2: 84).

The CEC argues that the risk associated with electric to gas competition has existed since the deregulation of natural gas pricing and as such it is a risk for which the utility has been compensated for a long time. In the view of the CEC, recent competitive pressures reflect supply tightening in the natural gas commodity sector and the realization of underlying risks, which have remained constant (CEC Submission, p. 19). The CEC also notes that Terasen did not use electricity price forecasts available from BC Hydro, nor had it studied the anticipated cost pressures on BC Hydro's electricity rates. The CEC also cites the testimony of Ms. McShane who agreed that a forecast of electric rate increases twice as high as that used by TGI would reduce the competitive pressure (CEC Submission, pp. 20-21).

The CEC disputes Terasen's claim that the customer attachment rate as a percentage of housing starts is approximately one-half of what it was in the mid-1990s (T2: 84). The CEC argues that if one accounts for the lag between the measurement of housing starts and customer attachments the relationship is more constant (CEC Submission, pp. 22-23). The CEC also argues that declining use rates are a normal result of higher efficiency equipment, more use of thermostat controls, increased insulation and trends towards multi-family dwellings. In the view of the CEC, these trends will create lower customer bills and improve the competitiveness of natural gas, even as electricity goes through a similar process of increasing efficiency. The CEC considers the trends concerning TGI to be evidence of "...the consolidation and firming of the core market towards its more fundamental needs..." for natural gas and not a factor increasing risk (CEC Submission, p. 24).

The Companies dispute the CEC argument that accounting for the timing difference between housing starts and customer attachments eliminates the decline, and replies that there has been a significant decline in customer additions and the number of customer additions as a proportion of housing starts since the early 1990s. The Companies also argue that while high efficiency furnaces and other advances may partly explain the decline in use per account, the fact remains that use per account and throughput are decreasing, which will lead to higher unit charges (TGI/TGVI Reply Submissions, p. 16; Exhibit B-12).

The Companies submit that the price competitiveness of natural gas has deteriorated since 1994 and 1999 and that, even though Exhibit C2-23 shows the forward price of natural gas declining over time from current levels, these forward prices continue to be higher than past prices and the Companies will face greater competition from electricity than in the past. The Companies argue that whether or not BC Hydro rates will increase at 1 percent or 2 percent per year is immaterial, when compared to the dramatic change in the relative prices in the price of natural gas and electricity and the volatility of gas prices (TGI/TGVI Reply Submissions, pp. 13-14). The Companies further argue that consumers' purchasing decisions are influenced not only by the absolute level of gas prices but also by their perception of price and volatility (TGI/TGVI Submissions, p. 10).

4.2.4 Deferral Accounts

The Applicants seek no change in their deferral accounts. TGI provides a listing and description of its deferral accounts plus a comparison to Union Gas Limited ("Union"), Enbridge Gas Distribution Inc. ("Enbridge"), Gaz Metro, and ATCO Gas (Exhibit B-3, Appendix 26.5).

TGI maintains two significant commodity deferral accounts: the Commodity Cost Reconciliation Account ("CCRA") and the Midstream Cost Reconciliation Account ("MCRA"). These commodity deferral accounts collect the difference between the actual incurred gas costs and recoveries from rates. TGI's non-commodity deferral accounts defer elements of gross margin and of costs. The most significant deferral account for TGI is the Revenue Stabilization Account Mechanism ("RSAM"). The Company describes its operation as follows:

> "The RSAM account deals with the Company's delivery margin and stabilizes the margins recovered from residential and commercial customers. The RSAM stabilizes delivery margin received from these customer classes on a use per customer basis. If customer use rates vary from the forecast levels used to set the rates, whether due to weather variances or other causes, the Company records the delivery charge differences in the RSAM account for refunding or charging through a rate rider to the RSAM rate classes over the ensuing three years. Having an RSAM mechanism does not offer the company protection against forecasting errors due to variances between recorded and forecast number of customers nor does it mitigate any forecasting risks associated with the non-RSAM customer classes such as industrial customers" (Exhibit B-3, Response to BCUC IR1 26.4.1).

TGI states that the approved 2005 delivery margin, including other operating revenues, totals $522.1 million, of which $100.5 million (21.2 percent) is subject to risk without deferral account protection. This amount comprises non-RSAM class customers of $82.4 million (15.8 percent), other operating revenues of $26.0 million (5 percent) and new customer additions of $2.1 million (0.4 percent) (Exhibit B-3, Response to BCUC IR1 26.7).

At December 31, 2004, the unrecovered balance on the RSAM Account was $59.5 million less related tax of $20.5 million (net of $39.0 million). TGI states that the balance on the account has accumulated over 11 years, with the balance being reduced in only two of those years (1996 and 1999).

Cost deferral accounts include the short-term and long-term interest rate deferral accounts which absorb interest rate fluctuations, and pension cost and insurance premiums deferral accounts, the latter two established as part of the 2004-2007 PBR settlement (Exhibit B-3, Appendix 1.5, p. 32). On the expense side, TGI states that of its 2005 test year expenses, O&M expenses of $152.1 million have no deferral protection, along with depreciation of $80.8 million (Exhibit B-5; JIESC IR No. 1, p. 15).

The JIESC argues that the Commission has allowed TGI "some of the most generous risk mitigation measures in the industry through extensive use of deferral accounts and through PBR regulation which provides an opportunity to earn returns above and beyond the allowed return" (JIESC Submission, pp. 11-13).

The CEC also submits that TGI "...has the most attractive deferral account treatment when considering that other jurisdictions are adopting some of these treatments....", and that deferral accounts contribute to providing the Company with very stable and predictable earnings. The CEC states that TGI's concern about deferral accounts is that these are ineffective in dealing with gas on electric competition, and argues that while deferral accounts provide TGI with very stable and predictable earnings, they are not intended to deal with gas on electric competition (CEC Submission, pp. 24-27). The CEC notes that only 18.1 percent of TGI's 2005 Test Year revenue is not covered through deferral accounts and consequently it has a highly predictable accounting income and a highly stable ability to earn its ROE (CEC Submission, pp.17-18; Exhibit B-5, Volume 5, Response to JIESC-BCOAPO-CEC IR1 7.1).

The JIESC notes that TGI earned its allowed return in every year since 1995, with the exception of 1998, which was due to employee severances paid out as a result of a major corporate restructuring to take advantage of PBR (JIESC Submission, p. 17; Exhibit B-5, JIESC-BCOAPO-CEC IR 7.1; T2: 79). The BCOAPO and the CEC echo this argument (BCOAPO Submission, p. 9; CEC Submission, p. 12).

The Companies agree with the CEC's submission that deferral accounts cannot deal with gas on electric competition and have not been proposed for such a purpose. The Companies also note that Dr. Booth indicated that the RSAM account should not affect the return on equity allowed (TGI/TGVI Reply Submissions, pp. 17-18).

The Companies acknowledge that PBR is beneficial to shareholders, but argue that it takes on additional risk by committing to O&M and capital targets, and by limiting its ability to seek relief from the Commission (T3: 286; TGI/TGVI Reply Submissions, p. 12).

4.2.5 The Companies' Response to Risk

The JIESC points to the TI annual report and testimony regarding the annual report to argue that:

> "The failure of Terasen to disclose any new material competitive risks in its annual report, where they must be disclosed or there will be legal penalties, should be proof that there are no new material risks the shareholders, or for that matter, there are no new material risks that the Commission should be concerned about" (JIESC Submission, p. 15).

In the JIESC's view there is no evidence that any prudently acquired asset of TGI will be economically stranded or that it will be unable to earn its allowed ROE in the future as it has in the past (JIESC Submission, p. 9).

The CEC also argues that if the risks to TGI were substantive, one would expect it to have invested in studying those risks and to have disclosed them in their Annual Report and Prospectuses where there is a legal obligation to disclose and be truthful. The CEC submits that the TI Annual Report and Prospectuses contain scant, if any, discussion of risks or disclosure of the potential to switch to alternative fuels. The CEC further argues that TGI appears not to have done any serious analysis to study or demonstrate the validity of the risk related to the price of gas relative to electricity, nor of consumer behaviour that would enable it to cope with competitive risks if they were significant (CEC Submission, pp. 32-36).

The CEC further submits that TGI has neglected to take actions that could mitigate the risks it perceives and has undertaken actions that exacerbate the problems it cites, including investment in expensive or uneconomic projects. The CEC also argues that TGI proceeded to acquire TGVI in spite of risks that were present before TGI purchased the utility. In summary, the CEC argues that TGI's response to its perceived risk is "tepid and weak" and consequently should not be granted any increased ROE or equity component at this time (CEC Submission, pp. 30-39).

The CEC dismisses TGI's claims with respect to various other risk adjustment factors, such as gas supply management challenges, cost management issues, regulatory accounting risks, and lack of growth. The CEC argues that TGI's claims with respect to these risks are either self-contradictory or unsupported by the evidence. The CEC submits that the underlying risk differs from the realized outcomes associated with risk and that the realization of a risk that has existed for some time does not change the risk of a company (CEC Submission, pp. 28-29).

The Companies contend that the risk disclosure in the TI Annual Report is appropriate in the context of Terasen Inc. and that an exhaustive discussion of TGI and TGVI's business risks comparable to the discussion in the hearing would give investors a distorted view of the overall business risk of Terasen Inc. "...given that its business risk remains relatively low compared to the broad equity market" (TGI/TGVI Reply Submissions, p. 11).

The Companies acknowledge that TGI is less risky than the "average" company (quotation marks in original) but argues that the evidence demonstrates that the relative risks of both TGI and TGVI have increased and that the risks faced by the Companies are greater than those faced by most other gas utilities in Canada (TGI/TGVI Reply Submissions, p. 10).

Commission Determinations

The Commission Panel finds that the vast majority of gas distribution companies in North America have some form of commodity deferral account, and that this protects both the utility from commodity risk and the customers from imprudent purchasing and from the utilities profiting from the purchase, transportation and storage of gas.

With the exception of the RSAM, which is discussed below, the Commission Panel finds that many of the other costs which are deferred by TGI are deferred as a result of PBR so that TGI is not penalized for underestimating or rewarded for overestimating a cost over which it has little or no control. Thus, the deferral is symmetrical. The Commission Panel finds the RSAM to be a unique account. It has two facets that the Commission Panel will consider separately.

The RSAM acts as a weather normalization account. In this regard, TGI is similar to a number of utilities in North America (including Gaz Metro and Newfoundland Power Inc., in Canada) that can defer the effects of temperature when and where it differs from a long-term norm used to set rates. The Commission Panel agrees with Dr. Booth and Ms. McShane that weather is a symmetrical risk, with equal odds of over and underachieving, that should not be taken into account when establishing the ROE for a benchmark low-risk utility.

The second function of the RSAM is to enable TGI to defer margin variances arising from residential and commercial customers consuming more or less gas than forecast. The Commission Panel considers this aspect of the RSAM to be a short-term business risk mitigant, which is not available to TGI's comparators. By "short-term", the Commission Panel means that it agrees with the Applicants that "the RSAM does not provide for recovery of the return on, or of, capital in the longer-term."

The issue is "whether the Applicants' business risk has increased," that is to say has the probability of TGI not earning a return on and of its capital increased since 1994. The evidence before the Commission Panel is clear: TGI has consistently achieved its allowed ROE in all years except one. The Commission Panel views the AAM, PBR and the RSAM as mechanisms that act to reduce the risk that TGI will not earn a return on its capital. As to earning a return of its capital, that is to say will TGI be able to recover its investment in property and plant in service through rates for service collected from its customers, the evidence is not as clear. In 1994, the evidence before this Commission was of a utility whose product enjoyed a broad competitive edge over electricity, whose long-term supply at reasonable prices seemed assured, and which was able to capture a significant share of new residential market. As Dr. Booth observed "So what happens is the growth allows more customers to lower the unit costs on the system, thereby making the distribution charge slightly lower making it slightly more competitive" (T5: 673). Today, TGI's competitive advantage has been significantly attenuated; its supply outlook has been altered by shippers moving B.C. gas east; and its capture rates in the new residential market have declined.

The Commission Panel can say with certainty that TGI's business risk has not declined in the period 1994-2005. It cannot say by how much its business risk increased, but it can say that although the probability of TGI not earning a return of its capital has increased, it continues to be very low.

The Commission Panel also shares the CEC's observation that if TGI genuinely perceives that it is facing increasing risk, it has a responsibility to undertake cost-effective actions that will mitigate risk. Such actions could include monitoring customer behaviour more closely in terms of such issues as fuel switching, disconnections, and energy efficiency and increasing efforts to offset the customer perception, cited by TGI, that natural gas is an expensive fuel.

4.3 TGVI

4.3.1 Evidence and Argument

In addition to the risks faced by TGI, the Companies set out the following risks peculiar to TGVI:

1) Building a new market on Vancouver Island;

   Ms. McShane describes TGVI as a relatively small greenfield utility, its market being built from the ground up over the past 15 years. TGVI's rates have been structured to compete with alternative energy sources and to induce potential customers to convert to natural gas. Ms. McShane summarizes that until 2003 TGVI's rates were set at a discount to competing fuels, too low to recover TGVI's cost of service and resulting in accumulations to the Revenue Deficiency Deferral Account ("RDDA"). Since 2003 TGVI's rates have been based on a cost of service model, incorporating a soft cap mechanism to maintain the competitiveness of rates in the residential and commercial sectors relative to electricity or oil alternatives (Exhibit B-1, Tab 2, pp. 18-19).

2) Continuing recovery of the RDDA:

   The Companies state that BC Hydro revenues from firm transportation of natural gas to the Island Cogeneration Project ("ICP"), in conjunction with royalty payments pursuant to the VINGPA, have allowed TGVI to reduce the RDDA to approximately $60 million at December 2004 from its peak at $88 million in 2002.

   The Companies argue that while TGVI and BC Hydro have signed a two-year transportation service agreement for the firm transportation of natural gas to ICP, there is no commitment from BC Hydro as to what will happen after the expiry of that contract. The Companies are concerned about the uncertainty of recovering roughly $16 million of the RDDA balance from BC Hydro in 2008 (TGI/TGVI Submissions, p. 19). The Companies summarize that under the approved 2006-2007 negotiated settlement agreement the RDDA balance is expected to be reduced by approximately $17.4 from a total of $52 million as of December 31, 2005 (TGI/TGVI Submissions, p. 20), or to roughly $34.6 million by the end of 2007 (Exhibit A3-6, Appendix A, Schedule 1, p. 14).

3) Planning for the elimination of Provincial royalty revenues in 2012 covering approximately 20 percent of the current cost of service;

   The Companies summarize that under VINGPA, TGVI receives royalty payments from the Provincial Government that reduce the cost of the gas commodity, which, in turn, improves the margin available to recover delivery costs. The Companies state that after the payments terminate at the end of 2011, TGVI's customers will be required to absorb the full commodity cost of gas. The Companies contend that the ability of TGVI to mitigate the impact of rising costs on customer rates will partly depend on its ability to add new customers, which hinges in large part on the competitiveness of TGVI's rates versus electricity rates. The Companies submit that given the intensely competitive market in which TGVI operates, there is a material risk that it will be unable to recover its full investment in utility assets (Exhibit B-1, Tab 2, p. 19).

   The Companies expect that the annual royalty payments will have grown to $60 million by 2012. The Companies submit that if TGVI has to apply for a $60 million revenue requirement increase in 2012 it would result in a rate increase of 35 to 40 percent across all customer classes, and that the current mechanism does not provide an adequate level of return to compensate for this risk (TGI/TGVI Submissions, p. 20).

4) High dependence on industrial load, in excess of 65 percent of throughput, two thirds of which is contracted on a year to year basis. The Companies note that 66 percent of TGVI's load and 38 percent of its margin is industrial, comprising of the ICP and seven pulp mills.

5) Security of supply risk since all gas to the Island flows from a single source on the mainland and is also dependent on the use of undersea high pressure transmission facilities. Ms. McShane describes TGVI as facing greater supply risks than the typical distribution utility, due to its dependence on a single pipeline system that traverses rugged terrain, with underwater and marine crossings (Exhibit B-1, Tab 2, p. 19).

6) Future repayment of $75 million non-interest-bearing senior government debt, currently sitting (sic) as a credit to rate base. The Companies point out that repayment will increase TGVI's rate base, contribute to higher cost of service and impact TGVI's competitive position (Exhibit B-1, Cover letter, p. 12).

The Applicants testify that, after the filing of the Application on June 20, 2005, BC Hydro has advised that it is evaluating the operation of the ICP as a peaking unit and purchasing transmission on an interruptible basis. As a consequence of this advice, TGVI states that it has elected not to proceed with its plan to sell a long-term bond issue to Canadian institutions and has chosen to refinance its debt in the amount of $350 million with short-term bank debt. This event has also caused its plan to obtain a rating for its long-term debt to be put on hold (T3: 316).

4.3.2 TGVI Deferral Accounts

A comparison of TGVI and TGI's deferral accounts to other Canadian gas utilities was provided (Exhibit B-3, Appendix 1.5). TGVI maintains a commodity deferral account called the Gas Cost Variance Account that captures the difference between actual and approved cost of gas. TGVI's most significant non-commodity deferral account is the RDDA, which has been operating for 15 years (Exhibit B-1, Tab 2, p. 18).

TGVI states that its approved 2005 delivery margin, including other operating revenues, is $118.0 million. Of this amount, $18.0 million of forecast revenue surplus is at risk without deferral account protection. The $18.0 million equates to 15.3 percent of TGVI's delivery margin.

TGVI states that the Special Direction provides for TGVI to have a RDDA funded by its shareholder. The RDDA shareholder funding mechanism has the result that in years when the revenues of TGVI are insufficient for it to earn its allowed return the shareholder funds the shortfall to cause the utility to have sufficient revenues to earn its return and vice versa (TGI/TGVI Submissions, pp. 19-20).

TGVI claims that its RDDA provides apparent protection against revenue risk, but it only does so through the shareholder funding the revenue deficiencies. Therefore, in reality, all revenues are at shareholder risk. It expects that in the longer term, if and when the RDDA balance is reduced to zero, a mechanism similar to TGI's RSAM will be put in place. The risk for TGVI is not so much delivery margins risk, but rather credit collection risk and whether its rates can ever be competitive, particularly after royalty revenues cease after 2011 (Exhibit B-3, p. 88).

Schedule 1 in TGVI's Negotiated Settlement Agreement for the 2006-2007 Revenue Requirements on line 28 (Exhibit A3-6), shows that in 2002 the RDDA reached a peak accumulated deficit of $88 million. From 2003 to 2004 TGVI has realized annual surpluses (Exhibit B-16, lines 41-42). These surpluses are expected to continue through to the end of 2007 resulting in a forecast RDDA balance of $34.7 million. Since 2003, TGVI's "soft-cap" rate design mechanism, together with revenues from the transportation agreement with BC Hydro, have allowed TGVI to incur annual surpluses. These surpluses allow TGVI to pay down the accumulated shareholder funded deficits and thus reduce the RDDA balance.

The RDDA allows TGVI to earn its allowed ROE before the VINGPA provision of $1.9 million and (Exhibit B-16, lines 1-10, col. a) which was a component in the Special Direction and agreed to in the VINGPA agreement in a negotiated arrangement (T3: 250). In a deficit year the RDDA revenue deficiency is added to earnings before revenue deficiency and in a surplus year the RDDA revenue surplus is subtracted from earnings before revenue deficiency in order to calculate net earnings (Exhibit B-16, lines 41-49, col. b).

The JIESC argues that some of the risks cited by TGVI, particularly the accumulation of a deficit that peaked at approximately $88 million in 2002, but has since been reduced approximately to $53 million in 2006 and $40 million in 2007, the planning for the elimination of the provincial royalty revenues in 2012, and the recent reductions in industrial gas throughput, could be a concern if they are taken out of context. The JIESC submits that while considering these concerns one should remember:

- That BC Hydro believes electricity rates will probably increase at the rate of inflation;
- That natural gas prices will probably decrease from current record levels; and
- That the combination of the two previous factors should make dealing with adverse factors much easier than anticipated by the Companies in the TGVI evidence (JIESC Submission, pp. 20-21).

The JIESC argues that the risks to TGVI are not new risks, but part of this project since its inception, and assumed by Terasen Inc. voluntarily when it purchased TGVI in March 2002. The JIESC stresses that in January 2003, TGVI voluntarily accepted a capital structure of 35 percent and a return on equity 50 basis points above the allowed return on equity of the benchmark utility as part of the 2003-2005 settlement agreement, and that there is no good reason to change either now. Further, the JIESC contends that the increased risks cited by TGVI are simply too remote to warrant any change in the capital structure or the return on equity of TGVI, particularly when upside opportunities are considered along with risk. The JIESC submits that both the allowed ROE and the capital structure should remain at present levels (JIESC Submission, p. 21). It also argues that to increase these components would make the utility less competitive and would affect recovery of the RDDA (JIESC Submission, p. 24).

The CEC argues that TGI proceeded with the acquisition of TGVI knowing the risks that TGVI faced and that the Commission cannot hope to deal with these risks through increasing equity and return on equity (CEC Submission, p. 38). The CEC contends that a utility that is now facing the realization of a risk for which it has been and continues to be compensated should not have access to even greater returns and even greater investment levels when the risks are being realized (CEC Submission, p. 29). The CEC also submits that TGI should work with the Provincial Government and its customers to develop long term plans for dealing with the pending materialization of risk that TGVI faces (CEC Submission, p. 45).

The Companies submit that the JIESC's statement that the TGVI risks are not new risks ignores the evidence that there has been a marked change in the risks of TGVI. While the JIESC says that risks are simply too remote, particularly when upside opportunities are considered along with risks, the Companies submit that the

Commission should not wait until an event occurs before recognizing the potential for that event to be a risk faced by a utility. The Companies contend that there is nothing remote about the loss of industrial demand, or high gas prices, or the loss of Royalty Revenues at the end of 2011 (TGI/TGVI Reply Submissions, p. 24).

The Companies argue that CEC's suggestion that TGI [sic] work with the Provincial Government and its customers recognizes that TGVI has significant risk that is materializing. The Companies submit that there is an obligation on the Commission to consider and determine those risks at this time; the Commission cannot avoid its obligations by referring TGVI's problems to the Provincial Government (TGI/TGVI Reply Submissions, pp. 30-31).

Commission Determinations

Section 3.1 of this decision deals directly with the TGI's business risks, and the Commission Panel attributes the same determinations to the change in the similar components ascribed to TGVI's business risk. The following determinations deal only with those TGVI risks summarized at the beginning of this section.

In assessing the business risk of TGVI, the Commission Panel is cognizant of the standard it set above when it defined business risk as the ability to earn a return on and of capital.

The Commission Panel finds that the uncertainty surrounding the contract with BC Hydro beyond 2007 creates a significant incremental change to TGVI's business risk together with uncertainty as to the ultimate recovery of the balance on the RDDA. In addition, the uncertainty regarding the cessation of royalty payments from the Provincial Government and the need to repay the interest free loans from senior levels of government demonstrate that TGVI is exposed to considerably greater business risk than a benchmark low-risk utility. It is evident to the Commission Panel that in TGVI's case the probability of not earning a return on and of capital is considerably higher than is the case with the five "mature" gas distribution companies in Canada.

5.0 CAPITAL STRUCTURE

This section considers the appropriate capital structures for TGI and TGVI.

Dr. Booth believes the Commission should adjust for changes in business risk through the establishment of deferral accounts, as far as is practicable, then to alter the amount of debt financing; and then to alter the allowed ROE (Exhibit C2-6, p. 24). A review of deferral accounts is outside the scope of this proceeding. Therefore, determinations in this decision with respect to capital structure and returns on equity assume the deferral accounts are not changed. Further, the Commission Panel has used both capital structure and rates of return for establishing the appropriate financial profile for the Applicants. In this decision, the capital structure of TGI will be determined so as to equate TGI to the benchmark low-risk utility. In the case of TGVI, the reasonableness of the proposed capital structure and equity premium off of the return on equity for the benchmark low risk utility will be considered.

The capital structures of other B.C. utilities are outside the scope of this proceeding, although the approved capital structures of other B.C. utilities are considered relevant to the determination of an appropriate capital structure for TGI and TGVI.

5.1 TGI

The Applicants apply for a 38 percent common equity ratio for TGI.

5.1.1 Capital Structures of Other Canadian Gas Distribution Utilities

The table below provides the capital structures of other Canadian Gas Distribution Utilities:

Source: Exhibit B-1, Tab 2, Schedule 5, p. 1

As indicated in the above table, all the other major gas distribution utilities have preferred shares in their capital structures. Since 1994 the allowed common equity of TGI has been 33 percent. In 1999 preferred shares were redeemed that accounted for 9.4 percent of the capital structure. The preferred shares of ATCO Gas, Enbridge, and Union are perpetual preferred shares. The Commission Panel accepts the evidence of TGI that it does not have a credit rating high enough to enable it to issue perpetual preferred shares (T3: 267). Therefore, the Commission Panel concludes that the preferred shares of ATCO Gas, Enbridge and Union need to be considered when comparing the capital structures of those utilities with TGI.

Ms. McShane and Dr. Booth reach similar conclusions regarding the relative risk of Canadian utilities. Ms. McShane's view is that TGI's business risks are comparable to those of the major Alberta and Ontario distributors, and exceed those of electric transmission companies by a considerable margin (Exhibit B-1, Tab 2, p. 16). Dr. Booth is also of the view that electric transmission companies have a lower risk than TGI, and are judged to be the lowest risk regulated utilities in Canada. The AEUB has found that appropriate capital structure for electric transmission companies with no preferred shares is 33 percent.

McShane is of the view that TransCanada Pipelines and Nova Gas Transmission face no higher business risk than TGI. Dr. Booth is of the view that the gas transmission pipelines are the second lowest risk group. The allowed common equity ratio for TransCanada Pipelines, Mainline and Nova Gas Transmission are 36 percent and 35 percent respectively.

Dr. Booth then judged the local distribution companies, including both gas and electric as the next riskiest. Ms. McShane is of the view that TGI's business risks are comparable to those of the major Alberta and Ontario gas distributors. The allowed common equity ratios for the Ontario major gas distributors are in the range of 35 percent and the allowed common equity ratios for the Alberta gas distributors are higher at 38 percent.

In testimony, Dr. Booth indicated that TGI is riskier than ATCO Gas and Enbridge, roughly on par with Union, while being less risky than Gaz Metro (T5: 619-620). Dr. Booth views PNG and Gaz Metro as the riskiest regulated utilities in Canada (Exhibit C2-6, p. 36).

Although Dr. Booth recommends 35 percent for a typical local gas distribution company, he recommends 33 percent for TGI because of more comprehensive deferral accounts. The Commission Panel accepts that the TGI's earnings are less volatile than the earnings of Enbridge and Union, and such reduced volatility can be attributed, in part, to weather normalization. The Commission Panel also notes Dr. Booth's testimony that "I think they (sc Enbridge and Union) are probably happier not having weather normalization. Otherwise they would have proposed it" (T5: 639). The Applicant submits that the existence of the RSAM account is not a factor that should play a role in the determination of its allowed return on equity or its capital structure. Dr. Booth confirmed in his opening statement that weather risk should not affect the return on equity (TGI/TGVI Submissions, p. 14, para. 46 and 47).

5.1.2 Coverage Ratios and Credit Ratings

The pre-tax interest coverage ratios for the major gas distribution companies in Canada are set out below:

PRE-TAX INTEREST COVERAGE RATIOS
FOR MAJOR CANADIAN UTILITIES

Company	1995	1996	1997	1998	1999	2000	2001	2002	2003
Enbridge Gas Distribution	2.0	2.6	2.6	2.1	2.2	2.2	2.8	2.7	2.7
Gaz Metro	2.6	2.6	2.7	2.7	2.4	2.7	2.5	2.9	2.9
Pacific Northern Gas	2.1	2.7	2.6	2.3	2.3	2.3	2.3	2.5	2.3
Terasen Gas	1.8	2.0	2.3	2.3	2.3	1.9	1.8	2.0	2.0
Union Gas	2.2	2.3	2.4	2.0	1.8	2.0	1.9	2.1	2.1

Source DBRS (Exhibit B-1, Tab 2, Schedule 2)

TGI's interest coverage ratio for 2004 was 1.99 (Exhibit B-28)

TGI's Medium Term Note ratings for the years 1994, 1999 and 2004 are set out below:

Rating Agencies	**1994**	**1999**	**2004**
DBRS	A	A	A
Moody's	-	-	A2
CBRS/S&Ps	B++	A (low)	BBB (unsolicited)

Source: Exhibit B-3, Vol. 1, Appendix 2.1

On June 26, 2003, Standard & Poors downgraded TGI's rating from BBB+ to BBB. In the first quarter of 2004 TGI terminated Standard & Poors' engagement to provide credit ratings in order to manage costs. However, S&P elected to continue to publish unsolicited credit ratings on TGI debt. On December 19, 2005, Moody's lowered TGI's senior secured rating from A1 to A2 and TGI's senior unsecured rating from A2 to A3 (Exhibit B-27). Both Moody's and S&P are of the view that the low common equity component in the capital structure of TGI results in a weak financial profile. TGI submits that the December 2005 downgrading demonstrates the need for an increase to the common equity and return on equity for TGI (TGI/TGVI Reply Submissions, p. 27).

In its credit rating report on TGI dated June 22, 2004, DBRS makes the following comments on TGI from a credit analyst's (and thus bondholder's) perspective:

> "The company benefits from a supportive regulatory regime,"
>
> "The regulatory environment within which the company operates provides a relatively high degree of financial stability."
>
> "Key financial ratios are expected to continue to fluctuate within a narrow band in line with changes in working capital requirements, however, this does not pose any credit implications."
>
> "Terasen Gas has historically had the lowest allowed ROEs relative to all other gas distribution utilities in Canada. This has resulted in generally weaker financial ratios relative to its Canadian peers," and
>
> "The use of the taxes payable method of taxation (typical of rate-regulated utilities) has resulted in an unrecorded future income tax liability of $215.8 million as at December 2004. The recovery of this liability in future rates depends on regulation" (Exhibit B-5, Appendix 1.2).

The Commission Panel notes these comments by DBRS. First, the interest coverage ratios are stable and are unlikely to pose any credit implications in the future. Second, the lowest allowed returns, when combined with the lowest equity component relative to all other gas distribution utilities in Canada, have resulted in the lowest interest coverage ratios in Canada.

The Commission Panel accepts that if TGI is downgraded by one of the rating agencies to a non-investment credit that it could limit the number of investors willing to hold TGI debt securities. For that reason, investors may be reluctant to hold debt that is just one notch above BBB-. A credit rating below an S&P BBB- is considered "junk" (T3: 263-265). Therefore, TGI's credit rating would fall to non-investment grade (junk) status if S&P downgrades TGI by only two notches. In the December 19 Announcement, Moody's states:

> "TGI's rating considers the support provided by TGI's regulatory environment which limits TGI's exposure to commodity price and volume risks as well as pension funding costs and insurance costs by operation of numerous deferral mechanisms including Commodity Cost Reconciliation Account (CCRA), Midstream Cost Reconciliation Account (CCRA) and the Revenue Stabilization Adjustment Mechanism (RSAM). However, the rating also recognizes that the deemed equity and allowed ROE permitted by the regulator are among the lowest in Canada which contributes to TGI's weak financial metrics relative to its global peers" (Exhibit B-27).

The Applicants submit that TGI's hedging agreements require that collateral be posted if its rating falls to non-investment grade, which could trigger significant and sudden liquidity requirements. TGI's gas purchase agreements require that collateral be posted if the counterparty has reasonable grounds for insecurity, which could be triggered by a downgrade to non-investment grade (TGI/TGVI Submissions, p. 25, para. 85; T3: 265).

Dr. Booth believes that because bond rating agencies are concerned with accurately predicting the credit quality of a firm's debt, they take a conservative approach because of "asymmetry of risk" and sometimes over react (Exhibit C2-6, pp. 76-77). Moreover, Dr. Booth submits that S&P's decision to impose harsher credit standards has had no impact on spreads or presumably marketability of future debt issues, and notes that spreads have almost all declined since end of 2002 (Exhibit C2-6, p. 78). During the Oral Phase of Argument, TGI advised that there has been no determinable change in the market following the Moody's downgrade (T7: 984). The JIESC submits that the ratings are the agency's view of the utility, and that a more important view is the markets view as evidenced by the spreads.

The spreads of TGI with comparators including Enbridge and Union are provided at Exhibit C2-11, Exhibit C2-11 and BCUC IR No. 1, 32.1.1.2. TGI's 30-year bonds trade at spreads that are approximately 15-20 basis points higher than Enbridge and at spreads that are similar to Union's. In Reply Argument, TGI submits that TGI bonds trade at approximately 30 basis points higher than Enbridge; however, the trade spreads indicated on BCUC IR No. 1, 32.1.1.2 are 20 basis points and the estimated spreads for a new 30 year issue are approximately 30 basis points. TGI then submits that the "30 basis point spread" reflects a "particularly accommodating point in the interest cycle for TGI bonds" (TGI/TGVI Reply Submissions, p. 20).

Dr. Booth's view is that the S&P and the Moody's ratings for Terasen are out of line with what the market feels is the correct rating. During the Oral Phase of Argument, the JIESC also notes that both the Moody's and DBRS ratings are "A" ratings (T7: 978).

The Commission Panel also notes the submissions of TGI that from the perspective of independent parties, who can see there has been a change, the downgrades suggest the business risks and the financial risks of TGI have increased (T7: 980).

5.1.3 Access to Capital Markets and Financing Flexibility

The JIESC observes that TGI was able to raise 30 year debt in 2005 on reasonable terms. The Applicant's Treasurer Mr. Bryson states:

> "I think the point that I want to leave on this is that obviously one of the key standards that a fair return on equity and capital structure has to meet is the ability to raise financing even in adverse conditions. And I think that was acknowledged by this Commission in the 1999 ROE decision. And what I'd like to submit is that the ability to issue 30-year bonds once every five or ten years does not provide evidence that that test is being met" (T2: 154).

Mr. Bryson states that in 2005 at least seven BBB rated companies were able to issue 30 year debt (T2: 127).

The Commission Panel accepts the need for a utility to be able to access capital markets under most circumstances at reasonable rates.

Commission Determinations

The Commission Panel concludes that the appropriate capital structure range for consideration of TGI is in the range of 35 percent to 38 percent and that given the effect of deferral accounts in reducing the risk of TGI, the appropriate equity component for TGI is 35 percent. Given the preferred shares in the capital structure of all other Canadian gas distribution utilities, the equity component of TGI will remain the lowest in Canada for gas distribution utilities.

While the Commission Panel accepts the submissions of the JIESC that since utilities have the lowest business risk of just about any sector they should have the highest debt ratios, it nevertheless concludes that an increase to the capital structure of TGI is supported by post-1994 changes to the capital structure of TGI and by comparisons to the approved capital structures of comparable risk utilities. Credit rating downgrades by S&P and Moody's are relevant and also support a need for a change to the capital structure.

The Commission Panel requires TGI to file within 30 days of this decision a document setting out how and when it will implement this change to its capital structure in compliance with the ring-fencing conditions approved by the Commission on page 49 of the KMI Decision.

5.2 TGVI

The Applicants apply for a 40 percent common equity ratio for TGVI.

TGVI is also in an increasingly competitive environment. Ms. McShane says that TGVI faces higher risk than any of the major mature gas distribution utilities, and is more comparable to the smaller mature utilities and the greenfield gas distributors in the Maritimes (Exhibit B-1, p. 20). In particular, Ms. McShane views TGVI to be somewhat less risky than either of Enbridge Gas New Bruswick or Heritage Gas and to be in the same business risk class as Gazifiere Inc. and Natural Resource Gas. Ms. McShane also views TGVI to have higher business risk than FortisBC (Exhibit B-3, Vol. 2, IR 1.45.3). Ms. McShane provides the allowed common equity ratios of these utilities, which have a range from 40 percent to 50 percent and recommends a common equity range for TGVI of 45-50 percent.

The business circumstances of TGVI have changed since Ms. McShane's evidence was filed. TGVI has not sought a thicker common equity ratio or a higher return on equity as a result of the new circumstances, but submits that the circumstances have changed the business risks and provide further evidence of the reasonableness of the capital structure and return on equity that is being sought by TGVI.

The Applicants note that TGVI has the same allowed common equity as Enbridge, has no preferred shares, and is allowed approximately the same level of equity as Enbridge. Further, that the risk profiles of TGVI and Enbridge are not remotely similar (TGI/TGVI Submissions, p. 32).

Dr. Booth did not file evidence related to TGVI. The JIESC submits that there is no justification for changing the capital structure of TGVI at this time and that it does not make sense to do so.

Commission Determinations

The Commission Panel concludes that the appropriate common equity component in the capital structure of TGVI is 40 percent.

The Commission Panel requires TGVI to file within 30 days of this decision a document setting out how and when it will implement this change to its capital structure in compliance with the ring-fencing conditions approved by the Commission on page 49 of the KMI Decision.

6.0 RETURN ON EQUITY

6.1 The Applicants' Methodology

This Section considers the appropriate return on equity for a benchmark low-risk utility, and applies its determination in that regard to the return on equity for TGI and TGVI.

The Applicants introduce the evidence of Kathleen McShane (Exhibit B-1, Tab 2). Ms. McShane says that a fair return is one that provides a utility with the opportunity to:

1. earn a return on investment commensurate with that of comparable risk enterprises;
2. maintain its financial integrity; and,
3. attract capital on reasonable terms.

According to Ms. McShane these criteria give rise to two separate standards, the capital attraction standard and the comparable returns, or comparable earnings, standard. Ms. McShane states that the two standards require the use of three tests used to develop her recommended fair return on equity for a benchmark low-risk utility:

- *Equity Risk Premium (ERP)* test, which is a generic term for a methodology that estimates the cost of equity as the sum of a directly observable yield on a security such as a government or corporate bond and a premium to compensate for the additional equity risk assumed by the investor;

- *Discounted Cash Flow (DCF)* test, which measures the equity investors' expected return as the dividend yield on a stock or group of stocks plus the expected growth in dividends in the long term; and

- *Comparable Earnings (CE)* test, which measures the experienced returns on book equity of firms that are of similar risk to the utility for which the regulator is setting the fair return (Exhibit B-1, Tab 2, lines 720-734).

6.1.1 <u>ERP Test</u>

Ms. McShane uses three methodologies to derive her equity risk premium as follows:

- Risk-Adjusted Equity Market
- Historic Utility
- DCF based

<u>Risk-Adjusted Equity Market</u>

Ms. McShane uses the period 1947-2004 to examine the average risk premium experienced in the Canadian, US and UK markets as follows (Exhibit B-1, Tab 2, Schedule 8):

	Stock Return	**Bond Return**	**Risk Premium**
Canada	12.1	6.9	5.3
United States	13.2	6.3	7.0
United Kingdom	14.9	8.9	6.0

Ms. McShane uses the arithmetic average that is the sum of each year's return divided by the number of years in the study. Ms. McShane addresses the issue of high bond returns in recent years by substituting her estimate of current long bond yields (5.25 percent) rather than historic average returns. From this she develops an indicated Canadian equity market risk of 6.75 percent, being the mid-point of a range of 6.25 percent to 7.25 percent. Ms. McShane applies a relative risk adjustment factor (beta) of 0.65, which she derives by developing "raw" betas from Canadian data which exclude Nortel. She then adjusts her "raw" beta using a formula used by major commercial suppliers of betas, which gives two-thirds weight to a stock's own beta and one-third weight to the market mean beta of 1.0. Thus, she arrives at a benchmark utility equity risk premium of 4.0 percent (Exhibit B-1, Tab 2, lines 1577-1968).

<u>Historic Utility Equity Risk Premium</u>

In Schedule 16 of her evidence, Ms. McShane observes actual utility equity (arithmetic average) risk premiums as follows:

1956-2004	Canada – gas and electric	4.4%
1947-2004	US – gas	6.0%
1947-2004	US – electric	5.0%

From which she determines that an appropriate historic utility equity risk premium for a benchmark low-risk utility to be in the range of 4.25-5.0 percent or approximately 4.75 percent (Exhibit B-1, Tab 2: lines 1985-2000).

DCF-Based Equity Risk Premium Test

Ms. McShane compares the estimated DCF cost of equity of seven US gas utilities over the corresponding 30-year U.S. Treasury yield on a monthly basis for the years 1993-2004 (Exhibit B-1, Tab 2, Schedule 18). This test indicates an average risk premium over the period of 4.2 percent. Since the corresponding bond return is 6.0 percent, Ms. McShane increases the observed premium to 4.7 percent to reflect her forecast yield on a 30-year (Canadian) government bond of 5.25 percent. At the same time, she tests the relationship between the spreads between U.S. long-term A-rated utility and 30-year U.S. Treasury yields and determines a utility risk premium of 4.3 percent. Ms. McShane settles on a mid-point of 4.5 percent for her DCF-based ERP test (Exhibit B-1, Tab 2, line 2140).

Financing Flexibility Allowance

To each of the three risk premiums developed by her tests, Ms. McShane adds a Financing Flexibility Allowance of 50 basis points. This allowance is intended to cover three aspects:

- flotation costs;
- a cushion for unanticipated capital market conditions; and
- a recognition of the fairness principle.

Ms. McShane's ERP test results are summarized as below (Exhibit B-1, Tab 2, p. 83):

Risk-Free Rate	5.25%
Equity Risk Premium	4.0-4.75%
"Bare-Bones" Cost of Equity	9.25-10.0%
Financing Flexibility Allowance	0.50%
Return on Equity	9.75-10.5%

6.1.2 DCF Test

Ms. McShane describes "the Discounted Cash Flow approach as proceeding from the proposition that the price of a common stock is the present value of the future expected cash flows to the investor, discounted at a rate that reflects the riskiness of those cash flows. If the price of the security is known (can be observed), and if the expected stream of cash flows can be estimated, it is possible to approximate the investor's required return (or capitalization rate) as the rate that equates the price of the stock to the discounted value of future cash flows."

Due to the dearth of quoted utility companies in Canada and analysts' forecasts thereof, Ms. McShane applies her test to a sample of 14 relatively low-risk U.S. gas and electricity utilities that were included to serve as a proxy for a Canadian low-risk benchmark utility (Exhibit B-1, Tab 2, Appendix C). To determine investors' growth expectations, Ms. McShane uses both Value Line (an independent research firm) forecasts of earnings growth as well as I/B/E/S (the major data base that provides long term consensus forecasts) consensus forecasts of utility equity analysts. Ms. McShane found no evidence of upward bias in the I/B/E/S consensus forecasts; indeed, she cites studies which find that investment analysts' forecasts serve as a better surrogate for investors' expectations than historic growth rates.

In her first application of the DCF model, Ms. McShane applies a constant growth DCF model to her sample which results in a DCF cost of equity of 8.8 percent (Exhibit B-1, Tab 2, Schedule 20). Her second application of the DCF model uses analysts' forecasts for five years and a normal growth in the U.S. economy of 5.5 percent per annum thereafter, which gives a result of 9.7 percent (Exhibit B-1, Tab 2, Schedule 22).
Ms. McShane estimates an indicated "bare-bones" required return on equity in the range of 8.8-9.7 percent or approximately 9.25 percent. To her "bare bones" required return Ms. McShane adds 50 basis points. This is the same amount as that added to her ERP test, but arises for different reasons. Ms. McShane finds a "disconnect" between the DCF return investors expect to earn on the current market value of their common equity investments and what they expect the utility to earn on the book value of their investments. To mitigate this problem, she augments her DCF result by 50 basis points (Exhibit B-1, Tab 2, line 2393).

6.1.3 Comparable Earnings Test ("CE")

Ms. McShane describes the CE as "arising from the notion that capital should not be committed to a venture unless it can earn a return commensurate with that available prospectively in alternative ventures of comparable risk. Since regulation is a surrogate for competition, the opportunity cost principle entails permitting utilities the opportunity to earn a return commensurate with the levels achievable by competitive firms facing similar risk."

To select a sample of Canadian companies of reasonably comparable investment risk to a benchmark low-risk utility, Ms. McShane takes all 432 companies on the Toronto Stock Exchange ("TSX") in Global Industry Classification Standard sectors 20-30 (being Industrials, Consumer Discretionary and Consumer Staples). From this list she removes companies which, in the period 1993-2003 had i) missing or negative common equity (368 companies); ii) paid no dividend in any year (21 companies); and iii) thinly traded companies, companies with betas > 1.0, companies with returns with a standard deviation of +/- -1 from average, ranked high risk or speculative, or unrated (17 companies) to arrive at her sample of 17 low-risk Canadian industrials

(Exhibit B-1,Tab 2, Appendix D).

Ms. McShane chooses the period 1993-2004 on the grounds that it covers an entire business cycle and should be representative of a future normal cycle. Ms. McShane assesses the possible need to adjust the results of her CE tests based on a review of the 17 companies' bond ratings, stock ratings and adjusted betas. Accordingly she adjusts the results of her CE tests which had indicated average levels of returns on book equity in the 13 to 13.5 percent range, down to "no less than 13 percent" (Exhibit B-1, Tab 2, line 2540).

6.1.4 Summary

To arrive at her indicated return on equity for a benchmark low-risk utility Ms. McShane applies an "indicative" weighting of 75 percent to her market based tests (ERP and DCF) and 25 percent to CE. As Ms. McShane points out "the answer is not going to come out to four places. Cost of equity doesn't lend itself to that level of precision" (T4: 506). Her indicated return on equity for a benchmark low-risk utility is 10.5 percent, or a premium of 5.25 percent over her estimate of a long Canada bond of 5.25 percent (Exhibit B-1, Tab 2, line 2573).

Ms. McShane addresses the ROE for TGVI as follows:

> "In my opinion, to equate TGVI to the benchmark low risk utility, an allowed common equity ratio of no less than 45-50% would be required (compared to the range of 35-40% for Terasen Gas). Terasen Gas is proposing a 40% common equity ratio for TGVI. I view the proposal as reasonable; however, the difference between the proposed 40% and the indicated range of 45-50% (mid-point of 47.5%) requires an incremental equity risk premium relative to the benchmark low risk utility return. Applying the same approach as detailed in Schedule 29 for Terasen Gas, the difference between the proposed 40% common equity ratio and a 47.5% common equity ratio warrants an incremental equity risk premium for TGVI relative to the benchmark low risk utility of 60-120 basis points (mid-point of 90 basis points). Thus, the 75 basis point incremental equity risk premium proposed for TGVI is reasonable" (Exhibit B-1, Tab 2, pp. 21-2).

6.2 The Intervenors' Methodology

The Intervenors filed the evidence of Dr. Booth, CIT Chair in Structured Finance and Professor of Finance at the Joseph L. Rotman School of Management at the University of Toronto (Exhibit C2-6). Dr. Booth uses the Capital Asset Pricing Model ("CAPM") to derive his estimate of the MRP, and tests the result with a DCF test of U.S. utilities followed by Standard & Poors.

6.2.1 <u>MRP Test</u>

Dr. Booth uses the period 1956-2004 to determine that the Canadian market risk premium of equities over long-term bonds has averaged (on an arithmetic basis) 2.70 percent. Extending the period examined back to 1924 produces a Canadian market risk premium of 5.21 percent. Dr. Booth estimates the current market risk premium to be 4.5 percent.

Dr. Booth examines the betas for utilities based in Canada for a number of five-year periods ending 1984 to 2004, but finds the data distorted by a number of factors, including the market crash of 1987 and the technology boom and bust of 2000 and 2001. Accordingly, for beta he estimates a reasonable range for normal market conditions going forward to be 0.45 to 0.55, which would imply a risk premium in the 2.025 percent to 2.475 percent range, which he adds to his long Canada bond yield forecast of 5 percent to produce an estimate in a range of 7.0 to 7.5 percent.

In addition to his "Classic CAPM" estimate, Dr. Booth uses a two factor CAPM model, which adjusts for estimation problems in the CAPM by directly incorporating the risk of long Canada bonds through a term or interest rate risk premium. The result of this second test produces an estimation of the fair return of 7.25 percent. Dr. Booth places equal weight on both CAPM estimates and took the average (7.25 percent) as being a reasonable estimate. To this estimate he adds a 50 basis point flotation cost allowance to produce a best estimate of 7.75 percent for a 275 basis point utility risk premium (Exhibit C2-6, p. 60).

6.2.2 <u>Other Tests</u>

Dr. Booth did not perform any other test to determine a fair return on equity. He did however, examine the DCF estimates for U.S. utilities covered by Standard & Poors for the period 1978-2004 from which he estimates an average return on equity of 10.17 percent from which he deducts the average U.S. Treasury of yield of 7.97 percent to determine a 220 basis point U.S. utility risk premium (Exhibit C2-6, Appendix C).

6.3 Discussion

Considerable evidence was before the Commission Panel as to the most suitable methodology to determine a fair return on equity for a benchmark low-risk Canadian utility. Much of the evidence comprises detailing the shortcomings of each of the methodologies in general and of the witness's applications of the concepts in particular.

The evidence is that up to the 1960s the principal methodology to determine fair rates of return was CE, as, according to Dr. Booth, the DCF method and the ERP method which was derived from the CAPM, were developed in the 1960s. By the 1980s all three methodologies were in use in Canada. In the early 1990s capital markets in Canada fell into considerable turmoil, causing DCF and CE to give unreliable results, which resulted in the ERP becoming the main, if not the sole, methodology used by regulatory bodies in Canada to establish fair rates of return. The concept became embedded in Canadian regulatory methodology with the adoption by many regulatory bodies of the AAM whereby an individual utility's return on equity could be adjusted each year by reference to the change in the Risk Free cost of capital (namely the forecast long Canada bond yield). The DCF and CE methods have never managed to restore themselves to favour in regulatory bodies' eyes with the result that in Canada's most recent generic cost of capital hearing, neither method was accorded any weight by the AEUB in its determination of a generic return on equity. In the United States the DCF and CAPM methods got their start in the 1970s and have survived nearly unchanged as the primary rate of return methods, with the DCF the virtual default method in practically all U.S. regulatory jurisdictions [Exhibit B-3E (Vol. 4), Appendix 74.1].

In the words of Ms. McShane: "I believe that … none of the tests is so superior (sic) to the others that it should be discarded in favour of just using one or two tests … Each test should be viewed as providing some perspective on what a fair return is" (T3: 377).

The Applicants in their submission argue that "A fair and reasonable return is not an arithmetic exercise; no approach is the determination of a fair and reasonable return is perfect. Although the use of a simple test may be appealing in its simplicity, it must be realized that the concept of a fair return is not that simple … TGI and TGVI submit that the Commission should consider all three approaches and give weight to each …" (TGI/TGVI Submissions, p. 35, para. 119).

6.3.1 ERP

Conceptually, the ERP methodology has a great deal of appeal to a regulator. It is derived from the CAPM, which was described in Exhibit B-21 being Chapter 7 of *Financial Theory and Corporate Policy* by Copeland and Weston. It requires the derivation of a risk free rate; an observed risk premium, being the difference between returns on common stocks and government bonds; and a factor known as beta, which is the coefficient of a portfolio or stock's volatility compared to the market as a whole. The Applicants outline the following shortcomings of the CAPM as it is applied to the derivation of an ERP:

Risk-Free Rate

The theoretical CAPM assumes that the risk-free rate is uncorrelated with the return on the market. However, the application of the model typically assumes that the return on the market is highly correlated with the risk-free rate, that is, that the equity market return and the risk-free rate move in tandem.

Similarly, an ROE formula that is predicated on a close tracking between the allowed return and the risk-free rate assumes the risk-free rate and the return on the market are highly correlated. The theoretical CAPM calls for using a risk-free rate, whereas the typical application of the model in the regulatory context employs a long-term government bond yield as a proxy for the risk-free rate. Long-term government bond yields may reflect various factors that render them problematic as an estimate of the "true" risk-free rate, including:

- the yield on long-term government bonds reflects the impact of monetary and fiscal policy;
- yields on long-term government bonds may reflect shifting degrees of investors' risk aversion; and
- long-term government bond yields are not risk-free; they are subject to interest rate risk (Exhibit B-1, Tab 2, Appendix A, p. 2).

Equity Market Risk Premium

The equity market risk premium is typically measured largely by reference to historic data. There are a wide range of views on what constitutes an appropriate period for estimating the historic risk premium, on what constitutes the appropriate averaging technique, and on whether various time-specific or country-specific outcomes diminish the reliability of history as a predictor of the future risk premium (Exhibit B-1, Tab 2, Appendix A, p. 3).

A decade by decade review of Canadian historic risk premiums shows a wide range of realized risk premiums, which would indicate the desirability of using longer rather than shorter periods to measure the premiums, as follows:

Time Period	Stock Returns	Bond Returns	Risk Premiums
1940s	10.0%	3.9%	6.0%
1950s	17.0%	0.4%	16.5%
1960s	10.8%	2.9%	7.9%
1970s	12.1%	6.1%	6.0%
1980s	13.1%	13.7%	-0.6%
1990s	11.6%	11.8%	-0.2%
1995-2004	11.2%	10.9%	0.2%
1947-2004 i)	12.0%	6.9%	5.3%
1956-2004 ii)	10.7%	8.0%	2.7%

i) used by Ms McShane
ii) used by Dr Booth (Schedule 1)

In addition, certain problems exist in Canada but not in the United States when it comes to measuring historic risk premium data. The achieved equity market risk premiums in Canada have been reduced by the performance of the government bond market. The change in Canada's fiscal performance over the past decade, leading to the recent low levels of interest rates, indicates that the historic returns on long-term Government of Canada bonds overstate likely future bond returns, and therefore understates the future equity risk premium (Exhibit B-1, Tab 2, Appendix A, p. 4).

The Canadian equity market is less liquid, less diverse and less populous than the U.S. equity market. The performance of the Canadian equity market as the "market portfolio" has been unduly influenced by a small number of companies (Exhibit B-1, Tab 2, Appendix A, p. 4).

Canadian equity data were "backcast" in 1976 upon the creation of the TSE 300 back to 1956. Accordingly, data prior to 1956, and to a lesser extent data between 1956 and 1976, may be less consistent (T6: 926).

Beta

Impediments to reliance on beta as the sole relative risk measure, as the CAPM indicates, include:

- the assumption that all risk for which investors require compensation can be captured and expressed in a single variable;
- the only risk for which investors expect compensation is non-diversifiable equity market risk; no other risk is considered (and priced) by investors; and

- the assumption that the observed calculated betas (which are simply a calculation of how closely a stock's or portfolio's price changes have mirrored those of the overall equity market) are a good measure of the relative return requirement.

Use of beta as the relative risk adjustment allows for the conclusion that the cost of equity capital for a firm can be lower than the risk-free rate, since stocks that have moved counter to the rest of the equity market could be expected to have betas that are negative (Exhibit B-1, Tab 2, Appendix A, p. 5).

6.3.2 DCF

Dr. Booth points out the shortcomings of the DCF methodology. At page 58 of his testimony he states "It is generally accepted that analysts' earnings forecasts are biased high…This conflict of interest has been most evident in the Internet and Technology fiascos of the late 1990s, when prominent analysts issued strong buy recommendations on the way up and kept them in place on the way down and got sued in the process" (Exhibit C2-6, p. 58).

6.3.3 CE

In Appendix B of his evidence, Dr. Booth identifies five basic problems with the earned rate of return, namely:

- It is an accounting rate of return.
- It is an average not a marginal rate of return.
- It is earned on historic accounting book equity that does not reflect what can be earned on investments today.
- It is based on non-inflation adjusted numbers.
- It varies with the firms selected in the "comparable earnings" sample (Exhibit C2-6, Appendix B).

6.4 Commission Determinations

6.4.1 Two Standards

The Commission Panel accepts the relevance of two separate standards namely the capital attraction standard and the comparable returns standard in establishing a fair return on equity for a benchmark low-risk utility. One standard does not trump the other, neither is one subsumed by the other. Accordingly, the Commission Panel will seek to give weight to each of the three methods placed before it in determining a suitable return for a benchmark low-risk utility.

6.4.2 Relevance of Other Board Decisions

All parties refer in their evidence and their submissions to decisions of other regulatory boards in Canada concerning fair returns. The JIESC warns of the danger of circularity resulting from a regulatory board "relying on what other boards have done." The JIESC continues:

> "On the other hand, one cannot totally ignore the immense amount of effort that has gone into determining fair returns by the NEB, in its generic ROE proceeding, and the AEUB, in its recent generic ROE and capital structure hearing.
>
> The AEUB hearing is the most recent and largest generic ROE hearing ever held in Canada. It went for 33 hearing days, involved 11 utilities, and heard from six expert witness panels.
>
> The AEUB and the NEB decisions should not be applied blindly by this Commission. However, they should be considered carefully, as should evidence of market acceptance of the allowed returns, and the acceptability of their awards to investors." (JIESC Submission, pp. 7-8)

At the November 2005 consensus risk free rate for 2006 of 4.79 percent the returns allowed for 2006 under current mechanisms are as follows:

BCUC – Terasen Gas Inc.	8.29%
NEB – Generic	8.89%
AEUB – Generic	8.93%
Ontario*	8.71%
Newfoundland	8.77%

* October 2005 Consensus
Source: Exhibit B-26

The Commission Panel's view is that it holds generic hearings into a fair return on such an infrequent basis, that there is little danger of circularity should it consider the returns allowed in other jurisdictions to ensure that the return it allows for 2006 is in line with returns allowed to benchmark low risk utilities in other jurisdictions.

6.4.3 Globalization

The Applicant states that since 1994 "Globalization of capital markets means that Canadian utilities are competing for capital with alternative investments world-wide. Globalization of capital markets provides Canadian investors opportunities for higher returns at similar risk levels than available in the domestic market. The returns allowed for Canadian utilities need to recognize that Canadian investors' opportunities are not limited to domestic investments" (Exhibit B-1, Tab 2, p. 5).

Dr. Booth submitted a monograph propounding the thesis that globalization or diversification reduces risk and market risk premium in both markets (Exhibit C2-6, Appendix D).

Dr. Booth, under cross-examination, states, "I generally believe that the US estimates both for the market risk premium and the US estimates from US regulated gas and electric utilities are higher than they would be for Canada. … I would say that they're too high, which means that you cannot take them directly and apply them in Canada. … I would say they're indicative, but my personal opinion would be that they are too high" (T6: 820).

During cross-examination Ms. McShane stated "And so there are a couple of different points: one, that there are opportunities (sc for investors to commit capital globally) and two, that in measuring the risk premium, we need to look beyond Canadian data" (T4: 424).

The Commission Panel agrees with this bifurcation. On the first issue the Commission Panel agrees that while it is now possible for Canadian investors to commit their entire retirement savings capital offshore, there is no evidence that they have been in a huge hurry to do so. Canadian investors face a considerable foreign exchange risk when investing offshore and the Commission Panel does not believe that they set this risk aside on the grounds that, in a perfect world, it should be capable of being hedged or otherwise diversified away.

The Commission Panel is not convinced that the Federal Government's relaxation of foreign content rules in retirement portfolios should be a reason to increase the equity return of a benchmark low-risk utility.

As to the second issue, the Commission Panel is prepared to accept the use of historical and forecast data of U.S. utilities when applied as a check to Canadian data; as a substitute for Canadian data when those data do not exist in significant quantity or quality; or as a supplement to Canadian data when Canadian data give unreliable results. The Commission Panel bases this view on the fact that the U.S. and Canadian economy and capital markets are closely integrated.

6.4.4 Market to book ratios and acquisition premiums

In his evidence, Dr. Booth addresses the issue of market to book ratios of utility companies as follows:

> "This process is akin to someone investing in a savings account where a judge has to determine the correct savings rate each period that can be withdrawn from the fund. The important implication is that if the judge (regulator) is successful then the savings will always be worth their original investment. This is the meaning of the basic result in finance that fair means that the market to book ratio equals one. The only thing different about utilities, as compared to the savings example, is that there is some very minor business risk" (Exhibit C2-6, p. 74).

In Schedule 30 of his evidence, Dr. Booth graphically tracks the market to book ratios of a number of utility holding companies in Canada over the period. In addition, he observes the premiums paid by companies to acquire utility companies or utility assets and reaches the conclusion that regulatory bodies have been overly generous in their allowed returns on equity. In particular the Intervenors point to the acquisition of the shares of TI by KMI at an estimated market to book ratio of 2.7 to 1 to demonstrate that the Commission's formulaic approach to setting returns on equity has been overly generous and demonstrates that no upward revision to the existing ROE is warranted. Indeed, they argue that the Commission Panel accept Dr. Booth's recommendation, which would lower the benchmark return on equity.

Market to book ratios are a function of a stock's price divided by the book value of a share of its common equity. A stock's price is a function of what the market will pay for it and is either expressed by analysts and investors as a multiple of earnings or in a utility's case as the yield on its dividend. In neither case has a regulatory body any degree of control over the quantum of either the multiple or the actual dividend paid (McShane, T3: 139). Evidence before the Commission Panel is that market to book ratios of utilities (especially in the U.S.) have been below parity in the past. The Commission Panel agrees with Copeland and Weston (see Section 6.3.1 above) that all investors select efficient portfolios and that the market is simply the sum of all investors' individual holdings. Accordingly, the price paid for a utility share will vary over time depending on the changes in individual risk tolerances. The proper application of the CAPM model should remove the possibility of over generous returns, but over time will not prevent the market from valuing a utility's stock at prices which are both greater than and lower than its book value.

So far as concerns acquisition premiums, the Commission Panel has addressed the Kinder Morgan acquisition elsewhere in this Decision. So far as concerns other acquisitions the Commission Panel is mindful of the AEUB Panel's decision:

> "The Board agrees with the Applicants that there are a number of factors impacting market-to-book ratios of utility holding companies and that one has to be cautious making inferences regarding the regulated utilities. The Board also agrees that there may be strategic factors affecting the price that is paid to acquire a utility.
>
> …The Board also recognizes that, in some cases, a premium might be paid for regulated assets in anticipation of significant future growth in rate base, to achieve geographic diversification or to obtain a foothold in a new market. However, parties are also aware of the constraints placed on regulated utilities with respect to affiliate transactions, particularly those with unregulated affiliates.
>
> In the absence of such strategic factors, the Board would not expect a prudent investor to pay a significant premium unless the currently awarded returns are higher than that required by the market. The Board acknowledges the views of some parties that payment of a premium over

> book value for a regulated utility indicates that the recent ROE awards may have been higher than required by the market. The Board is not aware of the strategic factors that may have affected the price paid to acquire Alberta utilities in recent years. Nevertheless, the experience regarding the market-to-book values of utilities and the experience … in recent years gives the Board some comfort that its recent ROE awards have not been too low" (Exhibit A3-1, p. 28).

The Commission Panel agrees with the AEUB that acquisition premiums may result from a number of strategic factors which are unrelated to the establishment of a fair return for a benchmark low-risk utility. The Commission will continue its practice of allowing utilities subject to its jurisdiction, to earn a fair return on the value of their investment in property, the value of which does <u>not</u> include a premium on acquisition.

6.4.5 <u>ERP</u>

It is clear the ERP methodology is the "gold standard" for Canadian regulators and the Commission Panel will give primary weight to its application and results. In doing so, however, the Commission Panel will need to apply judgment to the evidence before it.

<u>CAPM Method</u>

Risk Free Rate

For the purposes of establishing a return on equity, the Commission Panel accepts the consensus 30-year bond yield estimate for 2006, of 5.25 percent proposed by Ms. McShane. In Section 3 of the Decision, the Commission Panel discusses the methodology it should follow in effecting the transition of its present AAM to that which it now finds appropriate.

Arithmetic vs. Geometric Average

The Intervenors introduced the concept of the use of a geometric, rather than an arithmetical average to calculate the total returns on stocks and bonds (Exhibit C2-6, Appendix E, p. 1-3). The Applicant advocates the use of the arithmetic average, citing Ibbotson Associates "the expected equity risk premium should always be calculated using the arithmetic mean" (Exhibit B1, Tab 2).

The Commission Panel notes that the AEUB in its Generic Cost of Capital decision stated:

> "In the Board's view, when a forecast is based on the historic average, the arithmetic average MRP represents the best estimate of the short-term return and the geometric average represents the best estimate of the long-term return. The Board has not been persuaded that it should change its practice of using the arithmetic average. Consequently, the Board will maintain its

practice of using the arithmetic average rather than the geometric average" (Exhibit A3-1, p. 19).

Accordingly, the Commission Panel accepts the use of the arithmetic average for the purpose of determining the MRP in this hearing.

Market Risk Premium (MRP)

The Commission Panel observes that the evidence before it consists of the following average Market Risk Premium percentages:

		Canada	**US**
Applicant	1947-2004	5.3	7.0
Intervenor	1956-2004	2.70	4.65

and that both witnesses make adjustments to these results to arrive at their recommendations. In the Commission Panel's view a MRP of 5.8 percent is appropriate, given the Canadian experienced premiums since the Second World War, adjusted upwards in part to recognize both the fact that bond returns will most likely decrease in future years, and in part to recognize U.S. returns. Dr. Booth's two-factor model is not helpful in assisting the Commission Panel in determining an appropriate MRP.

Beta

The Commission Panel agrees with the evidence that the estimation of betas using actual five-year data ending December 31, 2004 (five years being the typical period for calculating betas) would give unreliable results given the technology boom followed by the bust in the years 2000 and 2001. Both witnesses were obliged to make considerable adjustments to arrive at recommended betas, Ms. McShane to her 0.60 to 0.70 and Dr. Booth to his 0.45 to 0.55. The Commission Panel believes that an appropriate estimate of beta or the relative risk factor of a benchmark low risk factor versus the overall equity market is 0.50. The Commission Panel is hopeful that such adjustments will not be necessary since the five-year data no longer include the technology boom/bust.

Historic Utility Risk Premium Test

The Commission Panel believes that this test avoids the estimation of a beta and thus suffers from one less shortcoming than the MRP test. On the basis of Ms. McShane's evidence that utility risk premiums in Canada over the period 1956 to 2004 were 4.4 percent, the Commission Panel is prepared to give weight to this number in arriving at its ERP.

DCF-Based Equity Risk Premium Test

The Commission Panel believes that Ms. McShane's sample of seven U.S. A-rated pure-play gas distribution companies, which indicates an average risk premium of 4.2 percent, is too small to use other than as a check on her other findings.

Financing Flexibility Adjustment

Both Ms. McShane and Dr. Booth add a Financing Flexibility Adjustment of 50 basis points to their ERP test results. In Ms. McShane's view the adjustment is necessary to cover flotation costs; a cushion for unanticipated capital market conditions and recognition of the fairness principle (Exhibit B-1, Tab 2, line 2160). Dr. Booth added a 50 basis point flotation allowance (Exhibit C2-6, p. 50). Both witnesses agree that the ERP test produces a bare bones cost of capital which should result in a market to book ratio of one. In Ms. McShane's words, "At a minimum, the financing flexibility allowance should be adequate to allow a utility to maintain its market value, notionally, at a slight premium to book value, i.e., in the range of 1.05-1.10. At this level, a utility will be able to recover actual financing costs, as well as be in a position to raise new equity (under most market conditions) without impairing its financial integrity" (Exhibit B-1, Tab 2, p. 82).

Dr. Booth observes that flotation costs can be calculated using the constant growth model and that the allowance could vary depending on a firm's dividend payment ratio and the ability to expense certain issue costs for tax purposes. He does, however, note at page 50 of his evidence "Note that with 5% issue costs, the idea is that the stock should sell at a market to book ratio of 1.053, so that it will net out to book value on any new issue. With utility market to book ratios vastly in excess of 1.052 it is difficult to rationalize any flotation cost allowance, since it is unlikely that there will ever be any dilution" (Exhibit C2-6, Footnote 19).

He concludes "However, I normally add 50 basis points as a cushion to the direct estimates in line with this (sic) practice of many Boards" (Exhibit C2-6, p. 50).

The Commission Panel notes that this issue received some attention during the AEUB generic hearing, but that it was not enough to convince the AEUB to change the 50 basis point flotation cost allowance used in recent decisions (Exhibit A3-1, p. 29).

The Commission Panel tends to agree that it is difficult to rationalize any flotation cost allowance since there was little, if any, evidence placed before it of utilities trading at market to book ratios, which would justify a flotation cost allowance addition to their return on equity. Elsewhere in this decision the Commission Panel addresses market to book ratios and the need to establish a fair rather than lowest possible return. Accordingly, the Commission Panel will not automatically add a 50 basis point surcharge to whatever return it deems appropriate, but will exercise its judgment each time.

6.4.6 DCF Test

The Commission Panel notes that the DCF test is the most widely used test by regulatory bodies in the United States. Of the three methodologies before it, the DCF test is the only one to use current and prospective data to derive its results. The major criticism of the DCF method is that it relies on analysts' forecasts, which may be biased upwards. The Commission Panel does not find Dr. Booth's comments helpful in that his observations mostly cover U.S. technology analysts and the scandal on Wall Street concerning inappropriate analyst behaviour in an investment banking milieu. The Commission Panel finds that Dr. Booth's use of DCF estimates for U.S. Utilities covered by Standard & Poors, which included "multi-utilities" and energy marketing firms, should not be used as representative of U.S. utility returns. The Commission Panel is more persuaded by Ms. McShane's evidence which compares Value Line and I/B/E/S forecasts and finds no upward bias in the latter. Accordingly, the Commission Panel will give weight to Ms. McShane's first DCF Test, which yielded an indicated return of 8.8 percent. The Commission Panel agrees that this is a "bare bones" cost of equity, to which the addition of a "pure" flotation allowance of 25 basis points is required.

6.4.7 Comparable Earnings

Ms. McShane continues her practice of including in her evidence a study of the returns on book equity earned by a sample of low risk Canadian industrials in the period 1993-2004. This would suggest that low risk companies in Canada are earning an average of approximately 13 percent on their book equity.

On cross-examination, Dr. Booth agreed that some of the "problems" with the CE test also appear in the process of setting rates under regulation, notably that both use an accounting rate of return; it is an average, not a marginal, return; it is based on historic book equity; and based on non-inflation adjusted numbers. This leaves the sample selection itself. The Commission Panel recognizes that the sample selection can lead to very different results, which is why regulatory bodies are reluctant to re-embrace Comparable Earnings.

Dr. Booth reminded the Commission Panel that the last jurisdiction in Canada to use Comparable Earnings used to adjust the results as follows:

> "And Dr. Cannon tended to be the board (sc OEB) witness and he would do comparable earnings with market-to-book adjustments. And stretching my memory, but Ms. McShane I think estimated correctly that you'd look at rates of returns and try to work out what these rates of returns from non-regulated first would be if they had to have a market to book ratio of 1.5 or 1.2, which was sort of the target for regulated firm" (T6: 935).

The Commission Panel believes that there is not enough evidence before it to determine if such an adjustment is merited or how it might be accomplished. The Commission Panel is of the view that for these reasons it can give little or no weight to Ms. McShane's CE test results. However, the Commission Panel is not convinced that the CE methodology has outlived its usefulness, and believes that it may yet play a role in future ROE hearings.

6.4.8 Conclusion

In the Commission Panel's view, the suitable return on equity for a benchmark low-risk utility is 9.145 percent, assuming a 30-year long Canada bond yield of 5.25 percent, for a premium of 3.895 percent.

6.5 Impact of the Commission Panel's Determination

6.5.1 Impact on TGI

The Commission Panel determines that TGI is the benchmark low-risk utility. For 2006 TGI's ROE will be 8.80 percent viz 9.145 minus (.75*(5.25-4.79), on an equity component of capital structure of 35 percent, which the Commission Panel earlier determined to be appropriate. Based on Exhibit B-13, the Commission Panel believes the impact on TGI's 2006 revenue requirement will be a net increase of $1.9 million over TGI's approved 2005 revenue requirements, as follows:

	$ million
Increase in capital structure to 35%	4.742
Decrease in ROE to 8.80% from 9.03%	(2.842)
	1.900

6.5.2 Impact on TGVI

The Commission Panel determines that a suitable premium to TGVI over the benchmark low-risk utility ROE is 70 basis points. For 2006 TGVI's ROE will be 9.5 percent on an equity component of capital structure of 40 percent, which the Commission Panel earlier determined to be appropriate. Since TGVI was earning 9.53 percent in 2005, the net impact on TGVI's revenue requirement in 2006 will be approximately $1.7 million.

6.5.3 Other B.C. utilities

Other B.C. utilities whose ROE will be automatically affected by the Commission Panel's determination, effective January 1, 2006, include:

	Benchmark	**Premium**	**2006 ROE**
FortisBC	8.80	0.40	9.20
Pacific Northern Gas – W	8.80	0.65	9.45
Pacific Northern Gas – NE	8.80	0.40	9.20
BC Hydro (1)	8.80	0.00	8.80

(1) on a post-tax equivalent basis

Views of Commissioner Milbourne

I have had the opportunity of reading the determinations and reasons of the majority of the Panel in final draft form.

With the exception noted below, I respectfully dissent from my colleagues' findings with respect to the Capital Structure and Return on Equity for TGI and TGVI. I do not find that the totality of evidence before the Panel, and the authorities cited, make a persuasive case for any change from the status quo.

I concur with their findings in Section 3 with respect to the Annual Adjustment Mechanism. This change, if adopted for changes in long Canada bond yields above and below 6 percent would accordingly raise the allowed ROE for 2006 from 8.29 percent to approximately 8.60 percent for the Low Risk Benchmark Utility.

IN THE MATTER OF
the Utilities Commission Act, R.S.B.C. 1996, Chapter 473

and

Application by
Terasen Gas Inc. ("TGI") and Terasen Gas (Vancouver Island) Inc. ("TGVI") ("the Companies")

To Determine the Appropriate Return on Equity ("ROE") and Capital Structure to be Used in Setting the Rates of the Companies Commencing January 1, 2006

and

To Review and Revise the Automatic Adjustment Mechanism Used in Calculating the ROE Allowed in Rates for Public Utilities Regulated by the BC Utilities Commission
("the Application")

BEFORE: R.H. Hobbs, Chair
R.J. Milbourne, Commissioner March 2, 2006
A.J. Pullman, Commissioner

O R D E R

WHEREAS:

A. On July 22, 2004, TGI wrote to the Commission requesting that the Commission convene a hearing to review return on equity and capital structure. By Order No. G-88-04 the Commission determined that a hearing was not warranted at that time but concluded that such a review would be appropriate in the Fall of 2005 in time for implementation January 1, 2006; and

B. By Application dated June 30, 2005, the Companies submit that: 1) the allowed returns on equity of both Companies should be increased to an appropriate level, 2) the common equity component in the capital structure of both Companies should be increased to properly reflect the risks of the Companies, and 3) the current ROE adjustment mechanism should be reviewed and revised to provide the Companies with a fair and adequate return on equity in future years; and

C. By Order No. G-69-05, the Commission established a Procedural Conference to be held on Wednesday, August 3, 2005 in Vancouver, B.C.; and

D. In a letter dated August 25, 2005, the Joint Industry Electricity Steering Committee ("JIESC") requested that the Chair decide not to sit on the Panel to avoid compromising the unbiased appearance of the proceeding and the procedural fairness all parties are entitled to expect; and

…/2

E. By Letter No. L-67-05 dated August 5, 2005, the Commission Panel defined the scope of the proceeding, determined that other utilities would not have the same status as other Intervenors in the proceeding, and established an approved Regulatory Timetable including an Oral Public Hearing to review the Application to commence on Monday, November 14, 2005; and

F. By Letter No. L-81-05 dated September 29, 2005, the Commission denied the request by the JIESC that the Chair should not sit on this matter; and

G. An Oral Public Hearing was held in Vancouver commencing on November 14, 2005 and ending on November 18, 2005; and

H. Written Argument was filed by the Companies on December 5, 2005 and by the Intervenors on or before December 20, 2005. Reply Argument was filed by the Companies on January 5, 2006 and an Oral Phase of Argument was held on January 17, 2006; and

I. The Commission Panel has determined that a change to the Capital Structures of the Companies, the Returns on Equity allowed a low-risk benchmark utility, and the utility-specific equity risk premium for TGVI is in the public interest.

NOW THEREFORE the Commission orders as follows to be effective January 1, 2006:

1. The appropriate common equity component allowed in the capital structure of TGI is 35 percent.

2. The appropriate common equity component allowed in the capital structure of TGVI is 40 percent.

3. The approved return on equity for the benchmark low-risk utility is 9.145 percent assuming a 30-year long Canada bond yield of 5.25 percent. For 2006 this results in an approved return on equity for TGI of 8.80 percent.

4. The approved return on equity for TGVI is 70 basis points greater than the benchmark low-risk utility return, namely 9.5 percent.

5. Other B.C. utilities whose returns on equity are established relative to that of the benchmark low-risk utility may adjust their rates accordingly subject to Commission approval.

DATED at the City of Vancouver, in the Province of British Columbia, this 2nd day of March, 2006.

Dear Sirs:

Re: Return on Common Equity for a
Low-Risk Benchmark Utility for the Year 2007

Pursuant to the Commission's Decision dated June 10, 1994 regarding Return on Common Equity and Order No. G-35-94, and as amended by Order No. G-80-99, Order No. G-109-01 and Order No. G-14-06, the Commission has determined that the current ROE automatic adjustment mechanism results in an allowed return on common equity of 8.37 percent for a low-risk benchmark utility in 2007. The calculation and other documentation in support of this finding are attached.

The appropriate ROE in 2007 for individual utilities will incorporate the risk premium for each utility relative to the low-risk benchmark.

Yours truly,

Calculation of Allowed 2007 Rate of Return on Common Equity
For A Low-Risk Benchmark Utility
(Per Commission Order No. G-35-94,
Amended by Order No. G-80-99, Order No. G-109-01 and Order No. G-14-06)

A forecast of long-term Canada bonds is developed based on the Consensus Economics forecast of 10-year bonds (step 1) and the observed spread between 10- and 30-year bonds over a defined period (step 2). This establishes a forecast yield for long Canada bonds (step 3).

1.	Ten Year Canada Bond Yield – end of February, 2007 (Consensus Economics, November 2006 Consensus Forecast)	4.1%	
	Ten Year Canada Bond Yield – end of November, 2007 (Consensus Economics, November 2006 Consensus Forecast)	4.2%	
	Average of 3 and 12 Month Forecasts	4.15%	
2.	Add average yield spread between 10-year and 30-year bonds as reported in the Financial Post for all trading days in October, 2006.	0.069%	
3.	Equals forecast yield on long-term Canada bonds		4.219%

As per Commission Order No. G-14-06, the approved benchmark return on equity (ROE) is 9.145 percent assuming a 30-year long Canada bond yield of 5.25 percent. Where the forecast yield is greater or less than 5.25 percent, a sliding scale adjustment raises or lowers the benchmark ROE by 75 percent of the change in the forecast yield on long-term Canada Bonds (step 4). The unrounded allowed ROE in percentage terms is rounded to the nearest 2 decimal places (step 5).

4.	Unrounded allowed ROE based on sliding scale adjustment: 9.145 – (0.75 * (5.25 – 4.219))	8.372%
5.	Allowed ROE	8.37%

Approval of 2005 Revenue Requirements, 2005-2024 System Development Plan and 2005 Resource Plan, FortisBC BCUC G-52-05 2005 Decision

IN THE MATTER OF

the Utilities Commission Act, RSBC 1996, Chapter 473, as amended

and

An Application by FortisBC Inc.
for Approval of 2005 Revenue Requirements,
2005-2024 System Development Plan and 2005 Resource Plan

BEFORE: L.F. Kelsey, Commissioner and Panel Chair
P.G. Bradley, Commissioner May 31, 2005

O R D E R

WHEREAS:

A. On November 26, 2004, FortisBC Inc. ("FortisBC") submitted its 2005 Revenue Requirements Application, which also included its Transition Plan and 2005 Capital Plan ("Submission 1"). On the same date, under separate cover, FortisBC also filed its 2005-2024 System Development Plan ("Submission 2"). On December 21, 2004, FortisBC submitted its 2005 Resource Plan ("Submission 3"); and

B. In Submission 1 FortisBC requested approval of a 2005 Revenue Requirement of $184,388,000 and a general rate increase of 4.4 percent; and

C. On December 14, 2004, the Commission issued Order No. G-111-04, establishing a series of Workshops, a Pre-hearing Conference, and approving an interim rate increase of 3.7 percent, effective January 1, 2005, subject to refund with interest calculated at the average prime rate of the principal bank with which FortisBC conducts its business; and

D. A Pre-hearing Conference was held on January 21, 2005 in Kelowna, B.C. to discuss the major issues to be examined, and the steps and timetable for an Oral Public Hearing. Registered Intervenors and FortisBC made their submissions for consideration by the Commission; and

E. Order No. G-14-05 dated January 24, 2005, set out an amended Regulatory Timetable and Issues List and established an Oral Public Hearing to commence on March 21, 2005 in Kelowna, B.C.; and

…/2

F. By letter dated January 27, 2005, FortisBC requested a revision to the Regulatory Timetable and process to include a Negotiated Settlement Process ("NSP"). The Commission issued Letter No. L-9-05 dated January 28, 2005, rejecting the request for an NSP because it was concerned that FortisBC and its predecessors have gone for many years without a detailed review of the utility operations in an oral public hearing process; and

G. On March 10, 2005, FortisBC filed a revised 2005 Revenue Requirements Application ("Submission 4") reflecting the impact of updated 2004 actual energy sales and financial results. In Submission 4 FortisBC sought approval for a revised 2005 Revenue Requirement of $179,980,000 and a general rate increase of 4.1 percent, effective January 1, 2005; and

H. On March 18, 2005, FortisBC filed a second revised 2005 Revenue Requirements Application ("Submission 5") primarily reflecting the impact of updates to 2004 power purchase incentive adjustments and 2005 income tax expense. In Submission 5 FortisBC sought approval for a revised 2005 Revenue Requirement of $179,250,000 and a general rate increase of 3.6 percent, effective January 1, 2005; and

I. The Oral Public Hearing proceeded as scheduled in Kelowna, B.C. on March 21 through March 24, 2005. During the Oral Public Hearing, on March 22, 2005, FortisBC filed a third revised 2005 Revenue Requirements Application ("Submission 6") incorporating a correction to the 2004 Actual and 2005 Forecast Mid-Year Rate Base. In Submission 6 FortisBC sought approval for a revised 2005 Revenue Requirement of $179,991,000 and a general rate increase of 4.1 percent, effective January 1, 2005; and

J. Written Final Arguments and Reply Arguments were completed on April 29, 2005; and

K. The Commission Panel has considered Submissions 1 through 6 and all of the related evidence and arguments.

NOW THEREFORE the Commission orders as follows:

1. FortisBC is directed to file complete financial schedules showing:

   (a) The requested 2005 Revenue Requirement of $179,991,000 as per Submission 6;
   (b) All adjustments set out in the Decision issued concurrently with this Order; and
   (c) The final resultant 2005 Revenue Requirement and general rate increase.

   The Commission approves the final resultant 2005 Revenue Requirement and general rate increase consistent with all adjustments set out in the Decision issued concurrently with this Order.

2. If the final general rate increase is less than the 3.7 percent general rate increase granted on an interim refundable basis as per Order No. G-111-04, then refunds should be made to customers as soon as practicable, with interest calculated at the average prime rate of the principal bank with which FortisBC conducts its business. FortisBC is directed to file all relevant refund calculations with the Commission.

…/3

3. If the final general rate increase is greater than the 3.7 percent general rate increase granted on an interim refundable basis as per Order No. G-111-04, the additional monies will be recovered through a rate rider based on forecast consumption for the period July 1, 2005 to December 31, 2005. FortisBC is directed to file all relevant rate rider calculations with the Commission.

4. FortisBC is also directed to comply with all other determinations and instructions set out in the Decision that is issued concurrently with this Order.

DATED at the City of Vancouver, in the Province of British Columbia, this 31st day of May 2005.

1.0 INTRODUCTION

1.1 Background and Historical Context

In 1986 UtiliCorp United and UtiliCorp BC applied to the British Columbia Utilities Commission ("Commission") to acquire a reviewable interest in West Kootenay Power and Light Company Ltd. Following an extensive review, that application was approved by the Commission. The West Kootenay Power and Light Company Ltd. name remained for some time, was subsequently changed several times, eventually to become Aquila Networks Canada (British Columbia) Ltd. ("Aquila(BC)") (the "Utility").

In October 1998, as part of its Preliminary 1999 Revenue Requirements and Incentive Mechanism Review Application, the Utility applied for an Order that a Negotiated Settlement Process ("NSP") be implemented. Commission Order No. G-123-98 approved that application. Following negotiations with Intervenors, wherein a settlement was reached, Commission Order No. G-134-99 approved the November 22, 1999 Settlement Agreement for the period beginning January 1, 2000 and ending December 31, 2002. The terms of the 1999 Settlement Agreement required that the Utility institute an NSP and an Annual Review process to allow the public to examine the filed material, to submit other issues for determination by the Commission and to discuss all issues prior to the final rate application being made.

On November 15, 2002, the Utility requested that the 1999 Settlement Agreement be extended for a period of one year ending December 31, 2003, filing a Preliminary 2003 Revenue Requirements Application in support. Commission Order No. G-83-02 established a 2002 Annual Review and an NSP to determine rates for 2003. The proceedings were held in Penticton B.C. in January 2003. A Public Information Town Hall Meeting was scheduled for those parties not able to participate in the Annual Review. Commission Order No. G-10-03 approved the Negotiated Settlement as issued. This Settlement was a simple extension of the 2000-2002 rate adjustment mechanism approved by the November 22, 1999 Settlement Agreement. The Utility agreed at that time to provide a detailed revenue requirements application for 2004 that would contain a full analysis in support of any proposed rebasing of in the cost categories.

On November 19, 2003, the Utility filed a Preliminary 2004 Revenue Requirements Application with the Commission. Due to the impending sale of the Canadian business of Aquila(BC) to Fortis Inc. and the potential for restructuring, the Utility proposed a one-year extension of the current Settlement Agreement, which was due to expire on December 31, 2003 subject to certain changes as described in the Application. Further, the Utility proposed an NSP to determine the 2004 Revenue Requirements and the parameters of the Incentive Mechanism.

The Utility also requested that the 2003 Annual Review of its performance be scheduled prior to the NSP.

By Order No. G-6-04 the Commission approved an NSP to determine rates for 2004. Following negotiations, Commission Order No. G-38-04 approved the terms of the negotiated settlement agreement.

As contemplated in the Preliminary 2004 Revenue Requirements Application, on December 1, 2003, Fortis Pacific Holdings Inc. ("Fortis Pacific") applied pursuant to Section 54 of the Utilities Commission Act ("UCA") for an Order approving the acquisition of a reviewable interest in Aquila Networks Canada (British Columbia) Ltd. from Aquila Networks British Columbia Ltd. On the same date, Aquila Networks Canada (British Columbia) Ltd applied pursuant to Section 54(5) of the UCA for approval to register a transfer of 100 percent of its Common Shares to Fortis Pacific.

Following a written hearing, the Commission, by Order No. G-39-04 approved the acquisition by Fortis Pacific of a reviewable interest in Aquila Networks Canada (British Columbia) Ltd. The company was renamed FortisBC Inc ("FortisBC").

In response to a Commission information request during the acquisition hearing, FortisBC stated that it anticipated that it would file a general rate application in the fourth quarter of 2004 that would "set out in detail the plans for re-establishing the Utility on a stand-alone basis." FortisBC also stated that the rate application would "provide a basis for full public scrutiny of a more detailed plan including a definitive timetable, a forecast of proposed costs and an assessment of customer benefits, as well as a reasonable record for the Commission's consideration of matters relating to this issue."

1.2 FortisBC Filings and Procedural Summary

On November 26, 2004, FortisBC filed its 2005 Revenue Requirements Application with the Commission ("November Application") (Exhibit B-1). FortisBC applies for an Order, pursuant to the applicable provisions of the UCA including Sections 23, 45, 57, 60, and 61, approving the November Application for the purpose of setting rates and other ancillary matters. Included with this filing, and in compliance with Commission Order No. G-39-04, FortisBC submitted its Transition Plan outlining the steps being taken to move the utility to a stand-alone basis. FortisBC included its 2005 Capital Plan with its November Application and filed under separate cover its 2005-2024 System Development Plan (Exhibit B-2). It filed these plans to address high priority work needed to maintain and expand the electrical system to meet its obligation to provide reliable electricity service to its customers. FortisBC filed its 2005 Resource Plan (Exhibit B-4) in accordance with the Commission's Resource Planning Guidelines and the Commission's directives to utilities in this regard.

FortisBC's November Application requests approval of a general rate increase of 4.4 percent, reflecting principally an increased rate base, an increased cost of financing that rate base and a forecast increase in 2005 expenses, including operating and maintenance expenses and power purchases. The November Application included a request for an interim refundable general rate increase of 4.4 percent, effective January 1, 2005. The increase was based, in part, on a proposal to increase the equity risk premium of FortisBC from 40 to 75 basis points. In response to a Commission staff request, FortisBC determined that the general rate increase would equal 3.7 percent if derived on the basis of its existing equity risk premium of 40 basis points. On December 14, 2004, the Commission issued Order No. G-111-04 approving for FortisBC an interim rate increase of 3.7 percent, effective January 1, 2005, subject to refund with interest calculated for the refund period at the average prime rate of the principal bank with which FortisBC conducts its business. By this Order the Commission also established a series of Application Workshops and a Pre-hearing Conference.

The Commission held the Pre-Hearing Conference in Kelowna, B.C. on January 21, 2005, wherein the Commission Panel considered submissions by participants on finalizing the issues, process steps and regulatory schedule for the proceeding. As part of its consideration of process steps, the Commission Panel heard submissions by parties on whether certain issues would be appropriately reviewed by Technical Committees.

Following the Pre-Hearing Conference, on January 24, 2005 the Commission issued Order No. G-14-05, which set out an amended Regulatory Timetable and Issues. Commission Order No. G-14-05 established an Oral Public Hearing ("Hearing") to commence on March 21, 2005 in Kelowna, and specified that issues associated with the Load Forecast, Demand Side Management ("DSM"), Power Purchases, and Capital Additions would be reviewed by four separate Technical Committees as an adjunct to the Hearing. The Commission directed each Technical Committee to submit a report with recommendations to the Commission by Monday, March 14, 2005, one week prior to the commencement of the Hearing.

By letter dated January 27, 2005, FortisBC requested that the regulatory timetable and process be revised to include an NSP (Exhibit B-8). FortisBC indicated that on the condition that the NSP was successful it would defer its application for an increase to its equity risk premium until the fall of 2005 in anticipation of a Commission process regarding the return on equity adjustment mechanism at that time. FortisBC reported that its proposed revision to the regulatory timetable and process was supported by most Intervenors.

The Commission issued Letter No. L-9-05 on January 28, 2005 rejecting FortisBC's request for an NSP for 2005. The Commission was concerned that FortisBC and its predecessors have gone for many years without a detailed review of the utility operations in an oral public hearing process, while noting that in each of the last two settlements the participants agreed that an oral public hearing was timely and should occur the following year. At the request of FortisBC, and for reasons that are a matter of public record, oral public hearings did not occur. The Commission believed that it was timely to review the finances and revenue requirement of the new B.C.-based utility in an oral public hearing this year. The Commission commented that following such a detailed review and decision, it may then be timely to consider an NSP thereafter. The Commission also noted that successful work by the four Technical Committees would go a considerable distance to streamlining the Hearing.

On March 9, 2005, FortisBC filed the reports of the DSM and Load Forecast Technical Committees (Exhibits B-17 and B-18, respectively). Each Committee recommended that there would be no need to call hearing panels in their respective subject areas. On March 11, 2005, FortisBC filed the reports of the Capital Additions and Power Purchases Technical Committees (Exhibits B-20 and B-21, respectively). The Capital Additions and Power Purchases Technical Committees reported that the meetings were helpful, but recommended that these matters should be addressed at the Hearing.

On March 11, 2005, the Commission wrote to Registered Intervenors requesting that they indicate by March 16, 2005 whether or not they were supportive of the recommendations of the DSM and Load Forecast Committees that there is no need to call hearing panels in their respective subject areas (Exhibit A-14). The Commission indicated in its letter that it would consider no response to indicate support of the Committee recommendations. Out of those intervenors that did not participate in the work of these Committees, the Commission received one letter of support, from the B.C. Old Age Pensioners Association *et al.* ("BCOAPO"), and zero letters of no support. By letter dated March 17, 2005 the Commission accepted the recommendations of the DSM and Load Forecast Committees that there is no need to call hearing panels in the respective subject areas (Exhibit A-16).

On March 10, 2005, FortisBC filed a revised 2005 Revenue Requirements Application (the "Revised Application") (Exhibit B-19). FortisBC indicates that its Revised Application reflects the impact of updates to 2004 actual results on 2005 energy sales and revenue forecasts, and 2004 incentive adjustments. FortisBC reported that its Revised Application includes revisions arising from events subsequent to the November Application, such as FortisBC's Capital Tax appeal and changes to property tax assessment procedures. FortisBC's Revised Application sought approval of a 2005 Revenue Requirement of approximately $180.0 million, and a general rate increase of 4.1 percent, effective January 1, 2005.

On March 18, 2005, FortisBC filed a second revised 2005 Revenue Requirements Application (the "Second Revised Application") reflecting the impact of updates to 2004 power purchase incentive adjustments and 2005 income tax expense (Exhibit B-25). The Second Revised Application also reflects actual issue costs related to FortisBC's Series 04-01 Senior Unsecured Debentures equal to $2,091,000, which is less than the forecast of $2,150,000 in the initial Application. The Second Revised Application requests approval to defer and amortize the actual amount. FortisBC's Second Revised Application seeks approval of a 2005 Revenue Requirement of approximately $179.3 million, and a general rate increase of 3.6 percent, effective January 1, 2005.

The Hearing proceeded as scheduled in Kelowna on March 21 through March 24, 2005.

On March 22, the second day of the Hearing, FortisBC filed a third revised 2005 Revenue Requirements Application (the "Third Revised Application") (Exhibit B-26). FortisBC indicated that the Third Revised Application incorporates a correction to the 2004 Actual and 2005 Forecast Mid-Year Rate Base; namely that the Mid-Year Rate Base had been understated in the Second Revised Application by approximately $3.0 million in 2004 and $8.3 million in 2005. FortisBC states that the understatement of Rate Base was caused by the incorrect reduction of net additions to plant in service by the amount of new Contributions in Aid of Construction ("CIAC"). FortisBC's Third Revised Application seeks approval of a 2005 Revenue Requirement of approximately $180.0 million, and a general rate increase of 4.1 percent, effective January 1, 2005.

Following the Hearing, written argument was received by FortisBC on April 15, 2005 ("FortisBC Argument"). On April 22, 2005, the Commission received argument from Natural Resources Industries ("NRI", "NRI Argument"), Interior Municipal Electric Utilities ("IMEU", "IMEU Argument"), Mr. Alan Wait ("Mr. Wait", "Wait Argument"), Kootenay-Okanagan Electric Consumers Association ("KOECA", "KOECA Argument"), and BCOAPO ("BCOAPO Argument"). FortisBC filed its reply argument on April 29, 2005 ("FortisBC Reply Argument").

FortisBC adopted the convention in its written argument that its November Application, together with its Revised Application, Second Revised Application and Third Revised Application, would be collectively referred to as the "Application". The Commission uses the same referencing convention in this Decision unless it is necessary to refer to a specific filing, as appropriate.

FortisBC summarizes in its written argument that it seeks an Order of the Commission (FortisBC Argument, pp. 3-5):

- approving a 2005 Revenue Requirement of $179,991,000;
- approving the deferral of the cost of regulatory and related activities and the issue cost of the Series 04-1 Senior Unsecured Debentures in the amount of $2,091,000;
- approving the amortization of: the issue cost of the Series 04-1 Senior Unsecured Debentures in the amount of $2,091,000 over ten years commencing on January 1, 2005; the costs incurred in FortisBC's 2004 Revenue Requirements negotiated settlement process; and the costs of the 2005-2024 System Development Plan and 2005 Resource Plan, in an aggregate amount of $900,000 over five years commencing on January 1, 2005;
- approving the continuation of the current Demand Side Management and Power Purchase incentive mechanisms for 2005;
- approving the continuation of the flow through to customers of forecast and actual property tax, provincial water fees, and the Power Purchase expense related to the Brilliant contracts for 2005;
- approving the flow-through treatment of the costs of capacity block power purchases forecast for November and December 2005;
- approving an operating and Maintenance expense program with a forecast value of $36,173,000 and a sharing mechanism for expense above or below this amount;
- approving a cost of capital for rate making purposes that reflects a return on equity 75 basis points above that set by the Commission for a benchmark low-risk utility and a common equity ratio of 40 percent of total capitalization;
- acknowledging that the 2005 Capital Plan satisfies the requirements of Section 45 of the Utilities Commission Act and that specified capital projects are in the public interest;
- acknowledging that the 2005 Resource Plan meets the requirements of Section 45 of the Utilities Commission Act, and is in the public interest;
- acknowledging that the 2005 Demand Side Management ("DSM") Expenditures Plan meets the requirements of Section 45 of the Act, and is in the public interest;
- approving a change in the accounting treatment of certain PowerSense costs, such that the costs in the amount of $85,000 are charged to capital rather than operations;
- approving deferral and recovery in 2006 of higher income tax expense that will arise in 2005 if the new Capital Cost Allowance rates announced in the February 23, 2005 Federal Budget are not enacted prior to December 31, 2005; and
- approving a general rate increase of 4.1 percent effective January 1, 2005.

The following sections of this Decision address, in turn, the issues associated with the 2005 Revenue Requirements Application, the 2005 Capital Plan and 2005-2024 System Development Plan, and the 2005 Resource Plan.

2.0 2005 REVENUE REQUIREMENTS APPLICATION

2.1 Forecasts

2.1.1 Load Forecast

FortisBC describes its service area as experiencing population growth at an increased rate over the last several years. FortisBC observed that in 2004 the growth in energy consumption and the number of customer accounts has been significantly above the long term population growth rate in its service area. To account for these patterns of growth, FortisBC modified its load forecast methodology to decouple population growth from its forecast of energy consumption and customer accounts for the period 2004-2009. FortisBC anticipates that by 2009, energy consumption and customer growth rates will return to the long term rates of population growth. FortisBC normalized all temperature sensitive load data to eliminate the effect of temperature prior to conducting its load forecast and associated statistical analyses. In its November Application, FortisBC forecast a total gross load of 3,368 GWh, subsequently adjusted downward by 78 GWh to 3,290 GWh based on updates to 2004 actual data, and a revised industrial forecast (Exhibit B-1, pp. 4, 9; Exhibit B-19, p. 4). The components of this change are described in greater detail below. The following sections include a summary of the load forecast for each customer class in turn.

Residential

The Residential load forecast is comprised of a forecast of customer accounts and a forecast of use per customer.

FortisBC forecasts the growth rate in its customer accounts based on the long-term linear trend in population growth rates in its service area, augmented by adjustments that reflect actual and expected growth in the short-term. The short-term adjustments encompass the decoupling of the forecast from population growth, as described above. FortisBC forecasts 85,926 Residential customer accounts by 2005 year-end (Exhibit B-1, pp. 4, 10; Exhibit B-12, Q. 38.1, Q. 41.0).

FortisBC forecasts Residential use per customer based on a 19-year average annual decline rate between 1985 and 2003 of 67 kWh/customer. FortisBC indicates that possible explanations for this decline rate are the availability of more efficient electrical appliances and declining dependence on electricity as a primary source of energy for heating and cooling (Exhibit B-1, p. 4; Exhibit B-12, Q. 41.0).

Based on these components, FortisBC initially forecast a Residential load of 1,064 GWh. Subsequent to its November Application, FortisBC adjusted this forecast downward by 10 GWh, to 1,054 GWh, to reflect the impact of actual and normalized 2004 Residential energy consumption that was below forecast despite strong growth in Residential customer accounts (Exhibit B-1, p. 9; Exhibit B-19, p. 4).

General Service

FortisBC's General Service class includes commercial and small industrial customers, as well as schools, hospitals and recreation facilities. FortisBC indicates that it is more difficult to forecast energy consumption in this class because of the diversity in customer size and the lumpiness of load additions.

Applying the same methodology as it uses for the Residential class, FortisBC forecasts 10,306 customer accounts by 2005 year-end. FortisBC forecasts General Service use per customer based on a 25-year average annual incline rate of 26 kWh/customer (Exhibit B-1, pp. 5, 10; Exhibit B-12, Q.42.0). Based on these components, FortisBC initially forecast a General Service load of 570 GWh. Subsequent to its November Application, FortisBC adjusted this forecast downward by 24 GWh, to 546 GWh, to reflect the impact of actual and normalized 2004 General Service energy consumption that was below forecast despite strong growth in General Service customer accounts (Exhibit B-1, p. 9; Exhibit B-19, p. 4).

Industrial

FortisBC forecasts its Industrial load by estimating the annual energy consumption of Celgar, its single largest industrial customer, and adding this amount to a forecast of the remainder of Industrial load determined on the basis of the historical relationship of this portion of Industrial load to overall system load. FortisBC initially estimated Industrial load of 343 GWh, including Celgar load of 65 GWh based on recent Celgar projections, or nearly 20 percent of overall Industrial load. Subsequent to its November Application, FortisBC adjusted this forecast downward by 34 GWh, to 309 GWh, to reflect a new 2005 load forecast projection by Celgar of 31 GWh (Exhibit B-1, pp. 5, 9; Exhibit B-19, p. 4).

Wholesale

FortisBC's Wholesale class is comprised mainly of municipal electric utilities, with a corresponding composition of residential, commercial and industrial customers. Given that this load is largely sensitive to population growth trends, FortisBC forecasts Wholesale consumption based on the relationship between population growth trends and temperature normalized historical consumption in this class (Exhibit B-1, p. 6).

FortisBC initially forecast Wholesale load of 964 GWh. Subsequent to its November Application, FortisBC adjusted this forecast downward by 6 GWh, to 958 GWh, to reflect the impact of actual and normalized 2004 Wholesale energy consumption that was below forecast (Exhibit B-1, p. 9; Exhibit B-19, p. 4).

Irrigation and Lighting

FortisBC forecasts Irrigation load of 47 GWh based on a five-year average load, and assumes that this level will remain constant for the duration of the forecast period. Similarly, forecast Lighting load of 10 GWh is assumed to remain constant for the duration of the forecast period.

System Losses

FortisBC forecasts losses of 369 GWh on the basis that annual losses consistently amount to roughly 12 percent of historical net system load. FortisBC adjusted its forecast losses downward by 3 GWh, to 366 GWh, based on the updates to the load forecast of the respective customer classes described above.

Load Forecast Technical Committee

Commission Order No. G-14-05 specified that issues associated with the Load Forecast would be reviewed by a Technical Committee as an adjunct to the Hearing. The Committee comprised FortisBC and Commission staff as well as Registered Intervenors that expressed an interest to participate. The Commission directed the Load Forecast Technical Committee to submit a report with recommendations to the Commission one-week prior to the commencement of the Hearing (Exhibit A-4).

FortisBC filed the Report of the Load Forecast Technical Committee on March 9, 2005 (Exhibit B-18). The Committee considered several methodological issues in detail over the course of two meetings; most notably a review of the assumptions underlying the regression analyses for the Residential and General Service use per customer forecasts. Further detail of the issues discussed, and the undertakings completed by FortisBC in response, may be referenced in the Report (Exhibit B-18). Committee members concluded that there were no serious methodological concerns with the load forecast. Committee members were provided with the revised forecast, as summarized above, prior to the filing of the report. No concerns were raised about the revised forecast.

The Committee suggested that FortisBC improve upon the communication and transparency of the technical detail and associated calculation spreadsheets for the load forecast. The Committee recommended that there would be no need to call a load forecast panel at the Hearing. After canvassing comment from those Registered

Intervenors that did not participate in the Load Forecast Technical Committee, the Commission accepted this recommendation (Exhibit A-16). A load forecast panel was not called at the Hearing and no load forecast issues were otherwise addressed in the Hearing. No written submissions on the load forecast were received in argument by any party.

Commission Panel Determinations

The Commission Panel has reviewed the FortisBC Load Forecast and the Report of the Load Forecast Technical Committee. **The Commission Panel accepts the revised FortisBC gross load forecast of 3,290 GWh.**

The Commission Panel is mindful of the Technical Committee suggestion that FortisBC improve upon the communication and transparency of the technical detail and associated calculation spreadsheets for the load forecast. Accordingly, the Commission Panel encourages FortisBC to improve its efforts in this regard. The Commission Panel also encourages FortisBC to consult with its Wholesale customers to determine whether any other means exist to obtain a more rigorous and comprehensive load forecast for this customer class. In addition, the Commission Panel has some concern about whether FortisBC's load forecast adequately accounts for diverse regional characteristics that exist across its service area, particularly in light of its reliance on more general population trends in its load forecast methodology. The Commission Panel encourages FortisBC to investigate alternatives to its current load forecast methodology to determine whether any benefit can be gained by segmenting its load forecast by specific regions in its service area, as FortisBC would define them.

2.1.2 Power Purchase and Wheeling Forecast

In its November Application, FortisBC forecast Power Purchase and Wheeling expenses (including water fees) of $74.26 million (Exhibit B-1, Tab 7). Power Purchase expenses alone are forecast to be $62.44 million for 2005, compared to an estimated amount for 2004 of $60.39 million. FortisBC noted that the Power Purchase expense forecast contains uncertainty with respect to load volumes and resource uncertainty. The resource uncertainty is related to market purchases required to supply a small shortfall between its firm resources and forecast loads. In its Revised Application FortisBC reduced the Forecast Power Purchase Expense to $59.45 million as a result of a change in load forecasts. This change reduced total forecast Power supply costs (including wheeling and water fees) to $71.01 million (Exhibit B-19, and Exhibit B-26).

As discussed in the 2005 Resource Plan, FortisBC meets the majority of its needs through its own generation plants and from long-term power purchase agreements, as well as from BC Hydro's Rate Schedule 3808. The remaining amount (mainly for capacity at peak load periods) is acquired through spot market purchases or block purchases from TeckCominco ("Cominco"). In 2004 these purchases were made in advance of need through the purchase of blocks of capacity from Cominco and through the purchase of a call option from Avista Energy (Exhibit B-1, Tab 7, pp. 10-11). The 2005 forecast includes market purchases and Cominco block purchases for January and February (actual) and November and December (estimated). The estimated amount of block purchases from Cominco is for 25MW in November and 100MW in December at estimated prices of $65.20/MW and $65.40/MW, respectively. Spot Market purchases for capacity (with a small amount of energy) are purchased year round depending on whether spot market prices are better than under BC Hydro Rate Schedule 3808. However, in the year 2005 for the months of January and February, and November and December, when FortisBC may be forced to purchase from the market, the forecast prices are 113 mills/KWh (11.3 cents/kWh). These prices are based on the Avista Energy Report and adjusted for the most valuable hours in the block (Exhibit B-1, Tab 7, p. 12). FortisBC provided an example of how this calculation is made in Appendix 1 to Exhibit B-21.

In past years FortisBC forecasted that its shortfall would be made up by market purchases because it does not have a firm contract with Cominco. However, the company typically was able to enter contracts late in the year at below market prices. The resulting difference was shared 50-50 between the company and its customers. This arrangement has been criticized because it appeared that the block purchases, although not firm, were predictable.

For this application FortisBC is proposing that the block purchases for November and December be taken out of the incentive mechanism and be treated as flow-through expense (Exhibit B1, Tab7, p 11).

No intervenor expressed objections to the Power Purchase forecast.

Commission Panel Determinations

The Commission Panel approves the forecast Power Purchases expense of $71,010,000, as revised by Exhibit B-19. Approval of the Power Purchase expense mechanism is addressed in this Decision in Section 2.4: 2005 Incentive Sharing Mechanisms.

2.2 Common Equity Component and Return on Common Equity

FortisBC applies to the Commission for approval of a cost of capital for rate making purposes that reflects a common equity ratio of 40 percent of total capitalization and a return on equity of 75 basis points above that set by the Commission for a benchmark low-risk utility.

In support of this application, FortisBC filed expert evidence titled *Opinion on Capital Structure and Equity Risk Premium for FortisBC*, prepared by Kathleen C. McShane ("Ms. McShane") of Foster Associates Inc., an economic consulting firm (Exhibit B-1, Tab 5). Ms. McShane concluded that a 40 percent common equity ratio, representative of FortisBC's actual capital structure, is reasonable but should be viewed as the minimum necessary to provide adequate financing flexibility. Ms. McShane recommends that FortisBC be allowed an incremental risk premium of 50 to 100 basis points (a mid-point of 75 basis points) relative to that applicable to a low risk benchmark utility.

BCOAPO filed expert evidence titled *Business Risk, Capital Structure and ROE for FortisBC*, prepared by Dr. Laurence D. Booth ("Dr. Booth"), a professor of finance in the Rotman School of Management at the University of Toronto (Exhibit C5-5). Dr. Booth recommends that the current 40 percent common equity ratio be maintained, but that the current FortisBC incremental risk premium of 40 basis points should be reduced to zero rather than increased to 75 basis points.

The following sections summarize the evidence and submissions on these issues, and the Commission's determinations in this regard.

2.2.1 Direct Evidence of Ms. McShane

Ms. McShane's approach to assessing the appropriate capital structure and return on equity ("ROE") for FortisBC was based on: 1) evaluating the reasonableness of the actual capital structure that has been maintained by FortisBC in terms of its compatibility with the business risks of the utility; and 2) accepting the Commission's ROE for a benchmark low risk utility as a point of departure for estimating the equity risk premium for FortisBC at the proposed capital structure (Exhibit B-1, Tab 5, p. 3).

Ms. McShane's evidence is premised on the stand-alone principle and an assessment of the market, supply and regulatory business risks and financial risks faced by of FortisBC. In regard to the stand-alone principle, Ms. McShane comments that there is no reason that FortisBC's capital structure or the fair return on equity should change simply because the identity of the shareholder has changed, but should continue to be premised on the risks faced by FortisBC. Ms. McShane notes that each of the Fortis utilities is financed on a stand-alone basis, so FortisBC's credit will be assessed on its own business risks and ability to generate adequate cash flows (Exhibit B-1, Tab 5, pp. 4-5).

Business Risk

Ms. McShane assesses FortisBC's business risks while noting the following factors:

- FortisBC is a relatively small utility serving a generally rural service area;
- Major industries served by FortisBC include forestry/pulp and paper, agriculture and tourism;
- Population growth in its service area has been strong over the past decade;
- Economic growth in B.C., dependent on the strength of commodity prices and the strength of the US economy, is expected to continue to outpace that of the country as a whole;
- Recent NAFTA rulings in favour of the Canadian forest industry may ultimately be beneficial;
- Increased demand for B.C.'s exports, not just those of the forest products industry, is anticipated from the economies of the Pacific Rim;
- Long-term B.C. economic growth is expected to be at a somewhat lower rate than the country as a whole;
- FortisBC has significant heating load (in competition with natural gas), with approximately one-third of direct residential (and likely wholesale) sales for heating purposes;
- FortisBC has no rate-stabilization mechanism to dampen the effects of weather volatility;
- FortisBC competes to some extent with alternative suppliers of electric power, such as BC Hydro, given the customer choice available to wholesale and large industrial customers;
- Technological change is expected to increasingly create competitive alternatives;
- FortisBC generates 45 percent of its supply from its own hydroelectric plants, obtaining the remainder of its supply through long-term contracts and market purchases; and
- FortisBC has a power purchase incentive mechanism to mitigate its exposure to market price volatility (Exhibit B-1, Tab 5, pp. 7-13).

Ms. McShane assesses three factors associated with the regulatory component of FortisBC business risk: deferral accounts, performance-based regulation ("PBR") and depreciation expense. Ms. McShane states that, in contrast to many Canadian utilities, FortisBC has operated with few deferral accounts: it has no deferral account for short-term interest expense, it has no rate-stabilization mechanism to dampen the effects of weather volatility; and, while it has shared deviations from purchased power costs with customers, it has not operated with a pass-through mechanism for such costs (Exhibit B-1, Tab 5, p. 13).

In her discussion of the impact of FortisBC's PBR from 1996-2004, Ms. McShane notes that the Dominion Bond Rating Service ("DBRS") considers the regulatory environment in B.C. among the more progressive in Canada. In comparison to traditional cost of service ratemaking, Ms. McShane considers that the FortisBC PBR plan, which retains a link to actual costs and includes sharing, exposes the shareholder to a moderately higher level of business risk (Exhibit B-1, Tab 5, pp. 14-15).

Ms. McShane points out that the settlement agreement in the 2000 NSP included a PBR rate stabilization mechanism to limit rate increases to 5 percent or less, with a reduction in annual depreciation expense as necessary to achieve this end. In addition, the same agreement lowered the depreciation rate on transmission assets. Ms. McShane states that both factors have contributed to the free cash flow deficits currently faced by FortisBC (Exhibit B-1, Tab 5, p. 15).

Ms. McShane concludes that FortisBC faces above average business risk relative to its Canadian electric and gas peers, and relative to the low-risk benchmark utility.

Financial Risk

Ms. McShane defines financial risk as the additional risk incurred as a result of assuming debt, which results in the incurrence of additional fixed obligations that must be met before the equity investor is entitled to any of the operating income generated by the utility. Ms. McShane assesses capital structure ratios, interest coverage ratios and debt ratings as points of departure for analyzing the financial risk faced by FortisBC.

Ms. McShane calculates that the actual common equity ratio of FortisBC between 1999 and 2004 has averaged 40.1 percent. While slightly higher than the proposed 40 percent common equity ratio, it is nonetheless consistent with the maintenance of a roughly 60%/40% debt/equity capital structure for at least the last ten years (Exhibit B-1, Tab 5, pp. 16-17). Ms. McShane compares FortisBC's forecast common equity ratio to other Canadian electric utilities and concludes that it is in line with the allowed common equity ratios of other investor-owned electric utilities (Exhibit B-1, Tab 5, pp. 17-20).

Ms. McShane discusses FortisBC's interest coverage ratios as one factor that determines the level of its financial risk. Ms. McShane reports that the pre-tax interest coverage ratio in 2003 equaled 2.1 and that the average pre-tax interest coverage ratio for the five-year period ending 2003 was 2.1. Ms. McShane says that while the 2003 ratio of 2.1 is a material improvement from the ratio of 1.8 in 2002, the five-year average ratio is a deterioration from the previous five-year average ratio of 2.4 calculated over the period 1994-1998. Further, Ms. McShane offers the comparison that the 1999-2003 average ratio of 2.1 is less than the average ratio of 2.4 across other major Canadian electric utilities over the same period. Ms. McShane states that the declining interest coverage ratios of FortisBC reflect, in part, that its allowed returns on equity have generally declined more rapidly than its embedded debt costs (Exhibit B-1, Tab 5, pp. 20-21).

With respect to debt ratings, Ms. McShane reports that DBRS rates FortisBC debt BBB(high) with a "Stable" trend, and has consistently rated it such since 1996. Ms. McShane notes that this is the lowest DBRS rating of the investor-owned electric utilities in Canada. DBRS confirmed its ratings in June 2004 and provided a full evaluation of the company in November 2004. Ms. McShane summarizes the November 2004 DBRS report with the following points:

- The FortisBC financial profile has weakened in recent years due to a variety of factors including free cash flow deficits and low allowed ROEs;
- Relatively large anticipated capital expenditures over the next 4 years will contribute to large free cash flow deficits;
- The rate-stabilization mechanism on depreciation expense may keep cash flows weaker, but the projected free cash flow deficits could be reduced if this mechanism is eliminated;
- A key challenge to the financial profile remains a low interest rate environment; and
- Despite the free cash flow deficits, FortisBC's financial profile is expected to remain acceptable for the ratings.

Ms. McShane reports that the Moody's Investors Service ("Moody's") rated FortisBC Baa3 in November 2004, its first debt rating of the Company. Ms. McShane notes that the rating is premised on low business risk, a significant capital expenditure plan over the next four to five years, the need for rate increase to implement the plan, a low depreciation rate, a tight liquidity position, cash flow deficits and the need for equity infusions from the parent during the period of high capital expenditures. Ms. McShane states that a Baa3 is the lowest investment grade rating, providing little "cushion" should there be any deterioration in the business risk profile or financial parameters (Exhibit B-1, Tab 5, pp. 23-24).

Based on her assessment of FortisBC's business and financial risks, Ms. McShane concludes that a common equity ratio in the range of 40-45 percent is reasonable, compatible with its business risks and adequate to maintain a stand-alone rating of DBRS BBB(high). However, she notes that, given the forecast level of capital expenditures in the near to medium term and expected free cash flow deficits, a 40 percent common equity ratio should be regarded as the floor required to ensure adequate financing flexibility. Ms. McShane concludes that at a 40 percent common equity ratio, "FortisBC would be of higher investment risk than a benchmark Canadian utility, which requires the addition of an incremental equity risk premium to the equity return applicable to the benchmark low-risk utility" (Exhibit B-1, Tab 5, pp. 20-29).

Equity Risk Premium

As noted above, Ms. McShane accepts the Commission's ROE for a benchmark low risk utility as a point of departure for estimating the equity risk premium for FortisBC at the proposed common equity ratio of 40 percent. With this frame of reference, Ms. McShane calculates a range of equity risk premiums for FortisBC relative to a low-risk benchmark utility by estimating the risk differential as between, or as impacted by, PBR versus Cost of Service regulation, utility size, debt costs and relative costs of equity.

To assess the impact of PBR versus Cost of Service regulation, Ms. McShane utilizes a study prepared by the World Bank, which concluded that the difference between the asset (business risk) betas of energy utilities operating under rate of return regulation and price or revenue cap regulation was close to 0.40. Ms. McShane suggests that FortisBC has a risk position in the middle of the two extremes used in the World bank study, or a beta differential of 0.20. Using the Commission's market risk premium of 5.0 percent as reported in its 1999 Decision on Return on Common Equity for a Benchmark Utility, Ms. McShane concludes that the difference between PBR and Cost of Service regulation translates into a difference of 100 basis points (i.e. a 0.20 beta differential multiplied by 5 percent) (Exhibit B-1, Tab 5, p. 15).

To assess the impact of utility size, Ms. McShane utilized a study of historic returns and betas for companies of different sizes to compare the asset betas between a typical publicly-traded Canadian utility, defined by Ms. McShane as a Mid-Cap stock, and FortisBC, defined by Ms. McShane as a Low-Cap stock. Using the differential result of 0.14 and a market risk premium of 5.0 percent, Ms. McShane concludes that the size of FortisBC could justify it receiving an equity risk premium of 70 basis points (Exhibit B-1, Tab 5, p. 31).

To assess the difference between the debt costs of FortisBC and a low-risk benchmark utility, Ms. McShane assumed that a low-risk benchmark utility would be able to achieve a solid A rating on its debt. By comparing the 2002 average spread for a seven-year issue for Canadian utilities rated A(low)/A- or higher (95 basis points) to a FortisBC (Aquila(BC)) 2002 seven-year debt issue at 170 basis points above the benchmark seven-year Canada, Ms. McShane concludes that the difference in debt costs between FortisBC and a low-risk benchmark utility translates into an equity risk premium of 75 basis points (Exhibit B-1, Tab 5, pp. 32-33).

To estimate an equity risk premium for FortisBC using relative costs of equity, Ms. McShane compares the average beta of a group of A rated U.S. utilities, as proxies for the low-risk benchmark utility, to the average beta of a group of BBB rated U.S. utilities, as proxies for FortisBC. Ms. McShane concludes that the differential of 0.10 between the average betas of the two sample groups translates into an equity risk premium of 50 basis points if using a market risk premium of 5.0 percent (Exhibit B-1, Tab 5, pp. 33-35).

In sum, Ms. McShane concludes that a reasonable range for an incremental equity risk premium for FortisBC relative to the low-risk benchmark utility is in the range of 50-100 basis points, with a mid-point of 75 basis points.

2.2.2 Direct Evidence of Dr. Booth

Dr. Booth was asked by BCOAPO to provide an independent assessment of the appropriate common equity ratio and fair return for FortisBC, to assess its business risk and financial flexibility, and to make recommendations to ensure that rates are fair and reasonable. Dr. Booth indicates that his evidence is organized, in part, around: 1) a discussion of the business risk of FortisBC from a capital markets perspective, 2) a discussion of financial market access concerns and questions surrounding "rising" credit standards, and 3) a discussion about coverage ratios and how the capital market reacts to current financial metrics. The following is a brief summary of the evidence of Dr. Booth (Exhibit C5-5).

Dr. Booth considers the business risk of FortisBC to be low. Dr. Booth considers that FortisBC has little "generating" risk given that it is primarily reliant on hydroelectric generation and purchased power. Dr. Booth notes that electricity demand in FortisBC's service area is growing at a slightly higher rate than in B.C. generally, and that compared to electric utilities operating elsewhere in Canada, the regulatory regime in B.C. is stable. Dr. Booth asserts that the main impact of the FortisBC PBR is to provide an incentive to the company to operate more efficiently and earn a higher ROE, not to expose it to material risk. Further, Dr. Booth points to data on actual versus allowed ROE for FortisBC's regulated operations from 1986 through 2004 to conclude that after FortisBC moved to a PBR mechanism in 1996, the actual ROE has been above the allowed ROE (aside from 2002 when the failure to earn the allowed ROE was due to integration expenses and software write-offs). Dr. Booth notes that rather than the DBRS view that FortisBC has a consistent history of earning the regulated ROE, he would define the result rather as "over-earning." Dr. Booth sees "no reason for adding a bonus to the ROE for a system that already effectively enhances the company's ROE and does not increase its risk" (Exhibit C5-5, p. 22).

In association with his discussion of business risk, Dr. Booth provides evidence to show that he usually judges transmission operations as warranting a 30 percent common equity ratio and distribution 35 percent, while more recently, for example, the Alberta Energy and Utilities Board has awarded slightly higher common equity ratios of 33 percent and 37 percent, respectively.   In this context, and given his judgment of business risk, Dr. Booth judges the applied-for 40 percent common equity ratio as excessive.

Dr. Booth presents evidence on the degree to which FortisBC is compensated for its risk by utilizing the theoretical relationship between the risk of a firm with financial leverage to a firm without financial leverage plus a financial leverage risk premium. While recognizing that equating the effect of a higher common equity ratio and a higher allowed ROE is largely a matter of judgment, Dr. Booth determines that a higher ROE and common equity ratio awarded FortisBC (then West Kootenay Power) in a 1994 Commission decision is equivalent to 55 basis points above Terasen Gas Inc. ("Terasen Gas") (then BC Gas), the low-risk benchmark utility. Dr. Booth states that one implication of this is that it is important for the Commission to take into account all the ways that it manages the risk of FortisBC and to not double count the same risks in different areas. Dr. Booth judges that FortisBC is marginally riskier than Terasen Gas, but that this risk is more than offset by FortisBC's higher common equity ratio.

Dr. Booth comments on the debt rating implications of FortisBC being a very small electricity company issuing debt in the capital markets under its own name. Dr. Booth states that size is a factor in bond ratings, and it also affects the liquidity of the bond issue. He notes that the result is that smaller issuers tend to issue shorter term debt and have inferior bond ratings than large issuers, all else equal. Dr. Booth comments that the problems associated with the size of FortisBC, in combination with the significant growth in rate base that is anticipated as the utility refurbishes its generation, transmission and distribution plant, may pose capital market access problems. Dr. Booth notes, however, that this access problem could be mitigated with equity infusions from its parent, and ultimately recede as the rate base expansion is completed.

Dr. Booth presents some example calculations of interest coverage ratios to argue that it makes no sense to target a particular interest coverage ratio and allow a higher ROE simply because a company has a high embedded cost of debt. Dr. Booth argues that if the allowed ROE and deemed common equity ratios are considered fair, but the resulting interest coverage is considered too low because of high embedded interest costs and there are capital market access problems, then the solution is to allow or deem some preferred shares, rather than give the equity holder a bonus to the fair ROE or equity ratio.

Dr. Booth assesses the market to book ratio associated with the purchase price of Aquila(BC) by Fortis, as well as the ratios associated with other utility purchases, in comparison to a target ratio of 1.15. He notes his view that values above 1.15 indicate that the rates are too high and that the equity holders are getting a more than fair and reasonable return. Dr. Booth approximates that for the FortisBC purchase the market to book ratio based on total rate base equaled 1.38, while the market to book ratio based on equity (based on assuming debt and valuing it close to book value) equaled 1.96.

In sum, Dr. Booth asserts that the currently approved 40 percent common equity ratio and 40 basis risk premium are excessively generous. Dr. Booth is of the view that there are no grounds for increasing the generosity of these financial metrics, but rather that the elimination of the 40 basis points risk premium would be a conservative roll back.

2.2.3 Submissions

The following sections summarize various arguments and submissions of FortisBC and intervenors with respect to business risk, financial risk, and the equity risk premium.

Business Risk

FortisBC reiterates in its argument that its business risk is greater now than it has been in the past. Using Dr. Booth's frame of reference as a point of departure, FortisBC submits, with reference also to its Resource Plan, that its risk regarding its energy needs is much greater than it was in 1994; it is far more reliant on the market for energy in 2005 than it was in 1994, and the market is more volatile. FortisBC also states that it faces increasing competition from natural gas, its industrial customers have the opportunity to switch to third party supply, and residential use per customer has been steadily declining. FortisBC submits that these factors, combined with its increased reliance on a volatile market, are evidence of its increased business risk (FortisBC Argument, pp. 18-20).

BCOAPO submits that an October 2004 FortisBC presentation to DBRS (Exhibit B-4, Response to BCOAPO IR 88.1) stands in contrast to the conclusion of Ms. McShane that FortisBC faces above average business risk relative to it Canadian electric peers, and relative to the low risk benchmark utility in the B.C. context. BCOAPO submits that FortisBC has told the investment community that it is a low cost, low risk franchise with supportive regulation and no problems in accessing capital, referring in support to the following summary of the FortisBC presentation highlights provided by FortisBC in response to an information request (BCOAPO Argument, pp. 9-10):

- Vertically integrated regulated electric utility,
- Supportive regulation – a low cost, low risk franchise,
- Solid franchise history with strong economic fundamentals,
- Diversified customer base,
- 205MW low cost hydro and long term PPAs in rate base,
- Power purchase costs flow through – limited commodity risk,

- Growing regulated rate base, and
- Strong balance sheet and supportive shareholder.

Further, BCOAPO submits that comparing Ms. McShane's definition of business risk (of exposing the shareholders to the risk of under-recovery of the required return on capital) to the evidence that FortisBC's actual ROE has exceeded its allowed ROE in every year since 1996 (except 2002) would lead it to conclude that there has been no business risk attached to the operations of FortisBC (BCOAPO Argument, p. 11).

BCOAPO submits that FortisBC's industrial load has not had a significant risk impact on the Company. BCOAPO describes that there is little dependence on industrial customers when measured by revenues, and there is minimal bypass risk. Further, there is opportunity for load retention rates should such customers wish to leave the system. BCOPAO points out that no large customers have bypassed the system in the last five years, perhaps explained in part by the possibility of such customers having to reimburse FortisBC for stranded assets should they choose to buy supplies elsewhere (BCOAPO Argument, pp. 12-14). BCOAPO also submits that "what holds in the face of bypass risk also holds in an absolute sense: FortisBC's reliance on low cost hydro makes its generation risk minimal. In practice there is minimal risk of the power not being dispatched or the assets being stranded" (BCOAPO Argument, p. 19).

BCOAPO submits that the risk associated with residential load is limited. In particular, it submits that FortisBC has incremental residential heating load to begin with because its rate are competitive due to its low generating cost. Further, BCOAPO says that the Company has not requested any weather normalizing rate stabilization mechanism in the past ten years. It submits therefore that the company does not consider the impact of weather volatility on residential load to be a material risk (BCOAPO Argument, pp. 12-13).

In regard to the risk associated with market purchases and market volatility, KOECA submits that it is unlikely that higher power purchase costs in the future will result in reduced returns for shareholders given its expectation that the Commission will ensure that this risk will be passed on to customers to keep the Company healthy. Further, KOECA submits that FortisBC does not address how separate risk factors may partially negate themselves, pointing out in example that a decline in residential use per customer, if it leads to a reduction in total residential demand, "would partially compensate for the supposed risk associated with power purchases" (KOECA Argument, pp. 4-5). KOECA submits that if there is uncertainty about the correct methodology to apply to an evaluation of FortisBC's risk, it makes sense to seek "ground truth" by paying attention to the actual experience of the company (KOECA Argument, p. 5).

Financial Risk

FortisBC argues that its financial risk is greater than it has been in the past. Noting again that the financial risk of a utility can be captured in its capital structure ratios, interest coverage ratios and debt ratings, FortisBC reiterates that its 1999-2003 pre-tax interest coverage ratio of 2.1 is significantly less than the previous 5 year average of 2.4 observed between 1994 and 1998. Further, it notes that its debt rating was downgraded by DBRS in 1996 to BBB(high), lower than any other Canadian electric utility in the sample provided by Ms. McShane in her evidence (FortisBC Argument, pp. 21-22), and its Moody's debt rating is Baa3 is lower still, equivalent to a DBRS rating of BBB(low).

FortisBC argues that Dr. Booth's interest coverage ratio calculations, and the conclusions that he draws from them, are flawed and inaccurate. FortisBC submits therefore that this evidence should be rejected (FortisBC Argument, pp. 22-26). FortisBC submits that it was unable to access 30-year bonds in 2004, substantially due to its low interest coverages and being regarded as too high risk (FortisBC Argument, pp. 22, 25-26).

BCOAPO notes that Dr. Booth indicated in cross-examination by FortisBC Counsel that he accepts the interest coverage ratios calculated by FortisBC. However, BCOAPO quotes Dr. Booth as noting that the interest coverage ratios are all temporary timing phenomenon, "basically waiting until the debt costs roll out and wait until its capital expenditure program is completed" (BCOAPO Argument, p. 22).

BCOAPO comments on the cross-examination by Commission Counsel of both Ms. McShane and Dr. Booth as to the impact of an increase in the equity risk premium from 40 to 75 basis points on the five credit challenges identified by Moody's in its November 2004 report. Those five credit challenges are a $450 million capital expenditure plan over next 5-years, rate increases to support the capital expenditure plan, relatively low depreciation rates, a tight liquidity position, and free cash flow deficits requiring equity infusions from its parent. BCOAPO submits that the testimony as to the marginal or non-existent impact of an increase in the equity risk premium on these credit challenges further undermines FortisBC's case for an increase in the equity risk premium (BCOAPO Argument, p. 21).

FortisBC proposes to maintain its current capital structure, with a common equity ratio of 40 percent, noting that the BCOAPO expert also recommends a common equity ratio of 40 percent. Further, FortisBC notes that in their written arguments, intervenors either endorsed this capital structure or had no comment. FortisBC submits that the supporting evidence and the absence of argument against the proposed capital structure strongly support an Order of the Commission approving a capital structure which includes a common equity ratio of 40 percent (FortisBC Argument, p. 17; FortisBC Reply Argument, p. 4).

Equity Risk Premium

BCOAPO presents argument that questions the relevance and justification of Ms. McShane's analysis of the appropriate equity risk premium for FortisBC relative to the low-risk benchmark utility. BCOAPO asserts that Terasen Gas is the BCUC low risk utility given its 33 percent common equity ratio and the fact that it is not granted an equity risk premium above the BCUC automatic ROE. The BCOAPO argues that Ms. McShane refused to accept that Terasen Gas is the BCUC low risk benchmark utility (BCOAPO Argument, p. 16). BCOAPO comments that financial risk compounds business risk and a low common equity ratio indicates low business risk. BCOAPO questions that if Terasen Gas is not the low risk benchmark then it is reasonable to ask what the proposed 75 basis points equity risk premium is over. To illustrate this point, BCOAPO suggests that it may be, for example, that Terasen Gas and FortisBC are now of equivalent risk in which case there would be no reason for a risk premium for FortisBC over the Commission's low risk benchmark (BCOAPO Argument, pp. 16-17).

BCOAPO expands upon its argument in this matter by commenting on the DBRS BBB(high) debt rating of Fortis (which Ms. McShane equates with a Standard & Poors (S&P) rating of BBB) relative to the debt rating of a low-risk benchmark (which Ms. McShane equates with an A rating). BCOAPO submits that Ms. McShane's methodology of assessing the differentials between A and BBB rated utilities is flawed, in part because it does not account for the impact of FortisBC's size on its debt rating (and the related matter that spreads may include liquidity premiums for smaller issues). BCOAPO submits that "if FortisBC were simply a larger firm its bond rating would be higher even if its business risk is unchanged, so basing the analysis on bond ratings in part simply awards FortisBC a higher ROE simply because it is small." BCOAPO submits further that Terasen Gas, with its DBRS A and S&P BBB debt ratings, could fit within the same rating group as FortisBC in Ms. McShane's analysis (BCOAPO Argument, pp. 17-18).

FortisBC submits that FortisBC and Terasen Gas cannot be regarded as having similar debt ratings, as suggested by BCOAPO, in part because: 1) BCOAPO is proceeding on the incorrect premise that Terasen Gas is equivalent to a low risk benchmark utility, when Ms. McShane states that a low risk benchmark utility would be an A rated utility, which Terasen Gas is not; and 2) FortisBC has two ratings in the BBB category and is therefore rated lower than Terasen Gas (FortisBC Reply Argument, pp. 10-11).

With respect to utility size, FortisBC replies that it remains a small utility, unable to diversify its risks to the same extent as larger utilities whose assets, geography and economic bases are less concentrated (FortisBC Reply Argument, p. 12).

In its argument, IMEU submits that FortisBC acquired the utility approximately one-year ago understanding the risks and rewards of its investment. It is of the view that the purchase price that was struck, for a significant premium over book value, was based on this understanding. Therefore, IMEU submits that an increased risk premium is inappropriate and not justified in the short-term, a conclusion it states is also supported by the evidence on FortisBC's risk factors (IMEU Argument, pp. 5-12).

BCOAPO states that with a 40 percent common equity ratio Fortis paid about $734 million to acquire $377 million in equity earning the Commission's automatic ROE plus 40 basis points, which results in a ratio of almost twice book value. BCOAPO submits that this is an excessive, unfair market to book ratio, and that the correct regulatory response should be to reduce the premium, not increase it to 75 basis points (BCOAPO Argument, p. 21).

In response to the issue of the premium over book value, FortisBC submits that the price to regulated book value on its purchase (1.8) reflects also the amount paid for the majority of regulated assets/companies sold in Canada over the last 7 years. Further, it submits that because it is required to engage upon an extensive capital expenditure program over the next several years the premium it paid will effectively be reduced (FortisBC Reply Argument, p. 15).

FortisBC submits that the debt market problem and fair return on equity are not independent from each other because capital structure and ROE (as a function of business risk profile) factor into the willingness of the bond market to lend funds under reasonable rates and terms. FortisBC submits that an increase in the equity risk premium that is fully compensatory with its business and financial risks, along with an increase in the depreciation rate, will address the Company's inability to access the long-term bond markets (FortisBC Reply Argument, p. 14).

2.2.4 Commission Panel Determinations

The Commission Panel has considered the evidence of FortisBC and BCOAPO, and the arguments of all parties. The following discussion highlights the Commission Panel's observations and conclusions in this regard.

With respect to market demand components of business risk, the Commission Panel believes that the prospects for FortisBC residential demand are good given the strong growth prospects in the Okanagan service area, in spite of the penetration of natural gas for heating new residential construction. The Commission Panel is persuaded by the argument that residential heating demand is incremental and not a significant business risk as FortisBC defines it. The Commission Panel notes that because FortisBC is a capacity constrained utility, a reduction to the heating component of demand could actually serve to reduce its business risk. Yet, to the extent the penetration of natural gas for heating could be regarded as a material risk, and to the extent that such risk could have a detrimental impact on FortisBC's credit rating, an increase in the equity risk premium would serve to increase this risk all else equal. The Commission Panel does not agree that a reduction in residential use per customer (as one factor of total demand) is an indication of a net increase in business risk for FortisBC, particularly in light of increasing load growth in the FortisBC service area generally. The Commission Panel also agrees with the evidence that suggests, in general, that population and economic growth will remain strong in the FortisBC service area.

With respect to supply risk factors, the Commission Panel acknowledges that FortisBC does compete to some extent with alternative suppliers of electricity given the customer choice available to wholesale and large industrial customers. The Commission Panel notes, however, that there are strong constraints on the likelihood of municipalities opting for alternative suppliers, and that the industrial component of load is not large and also unlikely to opt for alternative suppliers. The evidence and argument bear this out. Further, the Commission Panel acknowledges that there is risk associated with market purchases and market volatility, but it does not agree that this risk has increased to any measurable extent for FortisBC. FortisBC obtains low-cost supply from its own generating plants and long term contracts, with the remainder of its supply obtained through market purchases. Market purchases, while an increased share, are still limited, and FortisBC has a power purchase incentive mechanism to mitigate its exposure to market price volatility.

The Commission Panel agrees with the evidence that characterizes the regulatory environment in B.C. as progressive, believing it as well to be a positive consideration in respect of the regulatory risk that FortisBC faces. The Commission Panel observes that the progressive regulatory environment in B.C. is noted as a strength in the DBRS credit rating evaluation of FortisBC. The Commission Panel does not agree with the view that the FortisBC's PBR plan is inherently more risky than a traditional cost of service regulatory framework, particularly given the various sharing mechanisms that are components of this plan and the demonstrable evidence that FortisBC's actual ROE has, with one exception, met or exceeded its approved ROE since 1996. The Commission Panel does not consider the evidence of actual ROEs consistently exceeding allowed ROEs to imply, in and of itself, any conclusion about changes in the level of business risk, higher or lower. Even so, the Commission Panel considers the question of whether a utility has been able to meet its revenue requirements as a useful test of the reasonableness of an allowed ROE. In the period since 1994 FortisBC has with one exception met or exceeded its revenue requirements.

FortisBC emphasizes its interest coverage ratios, arguing in part that current low interest coverages are a substantial cause of its inability to access the 30-year bond market in 2004, and in turn that this circumstance is the main driver of its application for an increase in its equity risk premium. FortisBC argues that its interest coverages are significantly lower than in the past by comparing its average interest coverage ratio of 2.1 over the five-year period, 1999-2003, to its average interest coverage of 2.4 over the previous five-year period, 1994-1998. The Commission Panel finds that this comparison is not substantively informative. While Ms. McShane states that the decline reflects, in part, that allowed ROEs have generally declined more rapidly than the embedded debt costs, neither she nor FortisBC have provided any other detailed rationale or context to explain the differences between the two five-year periods. The Commission Panel observes that the consistent DBRS rating of BBB(high)-Stable trend since 1996 largely spans both of the five-year periods used in the averaging calculations. Further, the Commission Panel notes that FortisBC's actual 2004 pre-tax interest coverage ratio is 2.32 and its average pre-tax interest coverage ratio for the period 2000 to 2004 is 2.16, both of which represent increases, respectively, from its 2003 ratio of 2.1 and its 1999-2003 average ratio of 2.1 (Exhibit B-12, Response to BCUC IR 12.5). FortisBC has not explained how these increases should be interpreted in the context of the evidence of decreases that it presents in evidence and in argument. FortisBC notes that the difference between the average interest coverage ratios of the two five-year periods is significant, a difference equal to 0.3. The Commission Panel notes that in FortisBC's initial 2005 application the estimated interest coverage ratio is 2.06, and declined to 2.01 on the basis of assuming a 40 rather than 75 basis points risk premium (Exhibit B-12, Response to BCUC IR 12.7). The difference of 0.05 between these two ratios could be regarded in this context as less than significant and relatively insensitive to changes in the equity risk premium. In addition, the Commission Panel agrees that low interest coverages could be considered a temporary phenomenon in light of FortisBC's planned capital expenditures over the next four years and low depreciation rates currently. The Commission Panel believes that, even to the extent that FortisBC's interest coverages could be regarded as too low, declining, or more than a temporary phenomenon, an increase in the equity risk premium is not the appropriate means to first consider for improving FortisBC's interest coverages. The following discussion elaborates on this.

BCOAPO referred in argument to cross-examination of both Ms. McShane and Dr. Booth by Commission Counsel as to the expected impact of an increase in the equity risk premium on each of the five credit rating challenges identified by Moody's in its November 2004 report. Those credit rating challenges are (Exhibit B-12, Response to BCUC IR 15.0):

- A significant $450 million capital expenditure plan to be implemented over the next 4-5 years;
- The possible need for rate increases in each of the next few years to implement the capital expenditure plan;
- A relatively low depreciation rate for rate-making purposes;

- A liquidity position that is tight for a Baa3 utility company; and
- Free cash flow that is expected to be negative for the next few years, necessitating equity infusions from its parent, as well as additional debt issuance.

The Commission Panel is of the view that both experts' testimony as to the limited or non-existent impact of an increase in the equity risk premium on these credit challenges diminishes the FortisBC argument that an increase in the equity risk premium will materially affect its credit rating and its ability to access the long-term bond market. FortisBC acknowledges in response to a Commission information request that while a change in its equity risk premium from 40 to 75 basis would be a positive consideration, it alone would not likely result in an increase in FortisBC's credit rating. In their November 2004 credit rating reports, both DBRS and Moody's emphasize the issues of FortisBC's free cash flow deficits and low depreciation rates. DBRS notes in one instance that higher depreciation rates could reduce FortisBC free cash flow deficits. The Commission Panel observes that DBRS maintained its FortisBC debt rating of BBB(high)-Stable trend despite its concerns.

The Commission Panel believes that it would be untimely and inappropriate to increase the equity risk premium in response to the credit challenges noted above without measures being taken to more directly address these credit challenges, particularly in light of the Commission Panel's views as to the business risk of FortisBC. To this end, and in alignment with the November 2004 evaluations of both DBRS and Moody's, the Commission Panel has directed FortisBC in this Decision to file its forthcoming study of depreciation rates with its next revenue requirements application, and to have the new rates form part of that application. Also, the Commission Panel notes that the rate stabilization mechanism on depreciation expense is no longer in effect.

The Commission Panel has concerns about the methodology used by Ms. McShane to determine an incremental equity risk premium for FortisBC. For example, the Commission has determined that Terasen Gas is a low risk benchmark utility in B.C., and to ignore this as a reasonable proxy in the analysis calls into question the entire framework, particularly in light of the reliance, in part, on utilities based in the US as proxies for the low-risk benchmark. Further, the Commission Panel agrees with the BCOAPO submission in regard to the impact of size on credit ratings, which calls into question the methodology of comparing the credit ratings across utilities as a means to determine an incremental risk premium, without controlling for the impact of size.

The Commission Panel notes that a fundamental test of the appropriateness of an allowed ROE is whether the utility has been able to attract equity capital. Evidence of this test has been met: the willingness of FortisBC to purchase the equity of Aquila(BC) and to pay a premium in so doing.

The Commission Panel approves the FortisBC application to maintain a common equity ratio of 40 percent and denies the FortisBC application to increase its equity risk premium from 40 to 75 basis points. The Commission Panel denies the BCOAPO recommendation to reduce FortisBC's equity risk premium from 40 basis points to zero on the basis that there is insufficient evidence in support of this recommendation.

2.3 2005 Revenue Requirements

2.3.1 Rate Base

A utility's rate base represents the net investment in assets necessary to provide service. FortisBC's Rate Base, as described in Exhibit B-1 at Tab 6, is comprised principally of Plant in Service, Accumulated Depreciation and Amortization, Deferred Charges and Credits, Allowance for Working Capital, and an Adjustment for Capital Expenditures (FortisBC Argument, p. 29).

FortisBC submits that its forecast mid-year rate base for 2005 of $598,105,000, as provided in Schedule 1 to the Third Revised Application (Exhibit B-26), be approved for purposes of establishing 2005 Revenue Requirements and setting rates to customers effective January 1, 2005 (FortisBC Argument, p. 30).

Rate Base costs include such items as cost of debt, cost of equity, income taxes, property and capital taxes, depreciation and amortization and Allowance for Funds Used During Construction ("AFUDC"). FortisBC seeks approval of forecast total Rate Base costs of $78,569,000 (Exhibit B-26, p.3; FortisBC Argument, pp. 31-38).

Commission Panel Determinations

The Commission Panel accepts the proposed mid-year rate base of $598,105,000 for 2005 subject to directions contained in this Decision that affect the components of rate base. Likewise, FortisBC should update its forecast Rate Base costs according to the relevant Commission Panel determinations elsewhere in this Decision.

2.3.2 Power Supply

The Commission Panel approves FortisBC's forecast Power Supply costs for 2005 of $71,010,000. This is discussed in Section 2.1.2: Power Purchase and Wheeling Forecast.

2.3.3 Operations and Maintenance Expenses and Capitalized Overheads

Forecast 2005 Operations and Maintenance ("O&M") Expenses, before and after capitalized overheads, increased significantly over the 2004 target levels that were part of the 2004 Negotiated Settlement Agreement approved by Order No. G-38-04. The following comparative schedule appears on page 1 of Exhibit B-66 and provides an overview and high level explanations of the major drivers for the increase.

	2004 Targeted O&M	2005 Forecast O&M	Increase/ (Decrease) over Targeted 2004 O&M	Increase due to Transition Plan	Increase due to Inflation	Other Increases
Total before capitalized overheads	$35,645,000	$39,569,000	$3,924,000	$1,158,000	$1,150,000	$1,616,000
Capitalized Overheads	($2,800,000)	($3,396,000)	($596,000)			
Total net of capitalized overheads	$32,845,000	$36,173,000	$3,328,000			

Of the total increase of $3,924,000, the portion caused by the Transition Plan activities, i.e. $1,158,000, is discussed in greater detail in Section 2.6, Transition Plan.

FortisBC states that the inflationary increase of $1,150,000 is the result of normal inflationary pressures on labour, materials and other costs. FortisBC indicates that of this amount, $500,000 is due to increases in benefits costs relating to medical, dental and vacation entitlements, $350,000 is due to wage increases for management and bargaining unit employees, averaging 2.5% to 3%, and $300,000 is the effect of non-labour inflation (i.e. 2%) on the 2005 budget (Exhibit B-66, pp. 1-2).

The amount of $1.6 million, identified as 'Other Increases', arises from additional activities planned in functional areas such as generation, transmission and distribution, and administration and general. The $1.6 million increase actually represents a net amount, which is comprised of various cost increases totaling $2.8 million that are offset by a $1.2 million decrease in insurance and vehicle lease costs. A significant portion (i.e. $1.6 million) of the 2.8 million cost increase is forecast to be spent in the transmission and distribution functional area. Increased activity for substation O&M, and transmission and distribution line maintenance is the major driver for the increase in this functional area and comprises $1.1 million of the $1.6 million. A further $850,000 of the total increase of $2.8 million is due to increased activity in internal audit and corporate governance and environmental, health and safety (Exhibit B-66. pp.2-5).

The increase in the amount of capitalized overheads is a direct function of capital activity, which increased for 2005.

Submissions

BCOAPO states that: "[they] are not in a position to review in detail the OM&A expenditures of the utility" (BCOAPO Argument, p. 25). Mr. Wait argues that the increase in the transmission and distribution expenses for 2005 appears to be excessive (Wait Argument, p.3). IMEU states: "[it] is also concerned that the impact of PBR settlements in past years has resulted in a loading up of costs which are being picked up in the 2005 Revenue Requirements for the Company" (IMEU Argument, p.18). IMEU asks the Commission to review closely the appropriateness of these significant increases through rebasing (IMEU Argument, p. 4).

FortisBC states that the Company has repeatedly expressed its position that base O&M targets have been too low and hence inappropriate on a go forward basis. The Company submits that a material portion of the proposed increase in O&M Expense for 2005 reflects FortisBC's reassessment of the overall level of O&M expense required to meet service obligations to its customers in the areas of customer service, transmission and distribution, and administration and general costs (FortisBC Argument, pp. 40-41).

Commission Panel Determinations

The Commission Panel has considered all the evidence and arguments and concludes that the proposed increases in forecast 2005 O&M Expenses, before overheads capitalized, over the approved 2004 target levels, appear to be reasonable and required. The Commission Panel fully supports FortisBC's strategic goals and specific objectives to meet and improve service obligations in various areas and in particular the areas of customer service and transmission and distribution (refer to Section 2.7 for a comprehensive discussion of customer service). The Commission Panel believes that FortisBC should be provided with the resources to allow it to achieve these goals and objectives. The inflationary increases of $1,150,000 are largely uncontrollable by the Company in the short term.

The Commission Panel approves for FortisBC the forecast 2005 O&M expenses, before capitalized overheads, of $39,569,000, subject to adjustments discussed elsewhere in this Decision. It is important to note that specific directives, as set out in Section 2.4.2 on the Operating Expense incentive mechanism, form an integral part of the approval for the above level of expenses. To be clear, the incentive mechanisms are designed to ensure that approved resources are in fact spent on planned programs and activities in 2005.

2.3.4 Pensions

FortisBC has three pension plans: the IBEW Pension Plan, the COPE Pension Plan, and the Fortis Retirement Income Plan ("FRIP"). The IBEW and COPE Pension Plans are defined benefit pension plans. The FRIP consists of a defined benefit provision and a defined contribution provision. Additionally, the Company also has a supplemental pension plan. At the end of 2004 the Pension Plan Funded status was a plan deficit of approximately $23 million (Exhibit B-12, BCUC IR 73.0).

The Company records its annual pension benefits costs on an accrual basis in accordance with the recommendations of CICA Handbook Section 3461 (Exhibit B-12; BCUC IR 73.1.1). The Company estimates the forecast 2005 pension expense to be $3,860,000 and pension funding to be $4,560,000; in 2005 funding will exceed expense by $700,000 (Exhibit B-80, p. 1). In general, the amount of pension expense and the amount of annual funding to the pension plans by the Company will not match in a given year. The difference between these two amounts is recorded as an increase or decrease in the Prepaid Pension Costs account in deferred charges (Exhibit B-12, BCUC IR 34.8). The additional $700,000 in excess of funding for 2005 results in a year end 2005 balance of $5,948,000 for deferred Prepaid Pension Costs account (Exhibit B-80, p. 1).

Commission Counsel questioned Mr. Meyers concerning the different pension costs reported in response to BCUC IR 34.8 and 73.4. Mr. Meyers explained that BCUC IR 73.4 reflected the updated actual year end financial statements for 2004. Also, Mr. Meyers acknowledged that the difference, which impacts 2005, is reflected in the revised applications (T5: 882).

Commission Panel Determinations

The Commission Panel accepts the Company's forecast 2005 pension expense, pension funding amount, and the Prepaid Pension Costs account balance of $5,948,000 at year-end 2005.

2.3.5 Other Post-retirement Benefits

Other post-retirement benefits are benefits to employees for extended health, group MSP, and life insurance. Generally Accepted Accounting Principles ("GAAP") require that all forms of post-retirement benefits be accounted for on an accrual basis as recommended in CICA Handbook Section 3461. The Company records its annual other post-retirement benefits costs on a cash basis, which is not in accordance with CICA Handbook

Section 3461. In the negotiated settlement for the 2000-2002 Revenue Requirements the parties agreed to a variance from GAAP to allow post-retirement benefits to be recorded on a cash basis. The negotiated settlement was approved by Commission Order No. G-134-99 (Exhibit B-12, BCUC IR 73.1-73.2).

For 2005 the Company proposes that the cash basis of accounting for other post-retirement benefits continue (Exhibit B-12, BCUC IR 73.1.2). Mr. Meyers explained in his testimony that the variance from GAAP was appropriate since the Company is required to fund pension expense, but not other post-retirement benefits. Also, the Company does not pay out cash for the other post-retirement benefits like it does for pension expense (T5: 884-886).

The Company estimates an expense of approximately $300,000 using the cash basis. If CICA Handbook Section 3461 were applied, the accrued expense would be $1,380,000. However, if the Company were to adopt the accrual basis prospectively beginning in 2005, the accumulated liability of $4,400,000 would also need to be amortized into expense. Amortization of the accumulated liability of $4,400,000 over approximately 14 years, based on the Expected Average Remaining Service Lifetime of the covered group, results in an additional annual amortization of about $320,000. In total the Company expects the total 2005 other post-retirement expense to be approximately $1,700,000 ($1,380,000 + $320,000) if Section 3461 were adopted. However, if the current variance from GAAP were continued, the Company estimates the accumulated liability to be $5,500,000 at December 31, 2005 (Exhibit B-12, BCUC IR 73.1.3).

Commission Panel Determinations

The Commission Panel notes that the other post-retirement benefits earned each year that were not expensed have already accumulated into a large future liability that continues to increase. However, full compliance and adoption of Section 3461 of the CICA Handbook in 2005 would result in a large rate increase. **The Commission Panel denies the request to continue to record other post-retirement benefits on a cash basis. The Commission Panel orders a variance from GAAP to require that the transition from the cash basis to accrual accounting for other post-retirement benefits be phased-in over a three-year period. For 2005 the Company will include in expense the current cost under the cash basis plus one-third of the accrued expense as if it were in full compliance with Section 3461 and the change were adopted prospectively beginning in 2005. Subsequently for 2006, the Company will include in expense the cost under the cash basis plus one-half of the accrued expense as if it were in full compliance. In the final transition year for 2007, the Company will include the full accrued expense and be in full compliance with Section 3461 of the CICA Handbook. In calculating the Company's 2005 and future revenue requirements, the portion of other post-retirement benefits expense not expected to be paid-out in cash is to be credited to rate base.**

2.3.6 Employee Stock Option Expense

The Company's stated in its response to BCUC IR 74.0 that the Company has not included employee stock option expense in the utility financial schedules in 2005 or in any other year. It also stated that all stock option expenses have been and will be borne by the parent company. However, on March 18, 2005 the Company filed a List of Errata. The Errata indicated that the previous response to BCUC IR 74.0 was in error. The Errata stated that the utility financial schedules contain $25,000 of employee stock option expense in 2004 and $40,000 in 2005 (Exhibit B-24, List of Errata: Item 4).

Commission Counsel questioned Mr. Meyers if the $40,000 in employee stock option expense was still in the application. Mr. Meyers stated that the expense was still in the application and was not aware of previous Commission decisions disallowing employee stock option expense (T5: 889-890). The Commission has disallowed employee stock option expense in the BC Gas Utility Ltd. 2003 Revenue Requirements Decision (p. 15) and in the Pacific Northern Gas Ltd. 2004 Revenue Requirements Decision (p. 47).

Commission Panel Determinations

The Commission Panel directs that the $40,000 employee stock option expense and its related tax effect be removed from the 2005 Revenue Requirements.

2.3.7 2004 Incentive Sharing Adjustments

Commission Order No. G-20-05 approved the 2004 Incentive Adjustments as based on preliminary 2004 financial results, for a total credit of $2,175,000. The Incentive Adjustments comprised a combination of operating, power purchase and DSM incentives. This credit amount is shared between customers and shareholders in accordance with the sharing formulas agreed to in the 2004 Negotiated Settlement Agreement. The customers' share is $1,469,000, which is carried forward and serves to reduce the 2005 Revenue Requirements. The remainder of $706,000 is to the shareholders' account.

FortisBC's Second Revised Application increased the approved customer share of the 2004 Incentive Adjustments from $1,469,000 to $1,791,000. The final total 2004 Incentive Adjustments are based on actual information contained in the audited 2004 financial statements.

Commission Panel Determinations

Further to the approval granted in Commission Order No. G-20-05, the Commission Panel approves the final net 2004 Incentive Adjustments of $1,791,000. This credit balance is to be carried forward and included in the determination of the 2005 Revenue Requirements.

2.4 2005 Incentive Sharing Mechanisms

2.4.1 DSM and Power Purchase Incentives and Flow-through Costs

FortisBC proposes to retain certain aspects of the existing sharing mechanisms for 2005. The Company states: "The Power Purchase Incentive and the Demand Side Management Incentive Mechanisms have been shown to be effective and desirable to customers and the Company. No changes are proposed to either mechanism for 2005." (Exhibit B-1, Tab 8, p. 30)

FortisBC is of the view that the DSM incentive has increased the Company's focus on meeting and exceeding the energy efficiency targets and therefore it proposes to retain the existing DSM incentive for 2005 (FortisBC Argument, p. 48). Further detail and submissions on the DSM Incentive Mechanism are summarized Section 2.5: 2005 Demand Side Management Expenditure Plan.

The Company also proposes to retain the existing power purchase incentive mechanism, under which (a) the full advantage of cost savings either currently embedded in contracts, or which are anticipated, are included in the Power Purchase Forecast, and are therefore to the full benefit of customers, and (b) variances, other than load variances, from the Revenue Requirements forecast are applied 65 percent to customer rates in the subsequent year (75 percent for variances in excess of $1,000,000) (FortisBC Argument, p. 49).

Furthermore, FortisBC proposes the continuation of flow-through treatment (i.e. customers assume 100% of the risk and benefit of variances between approved and actual amounts) for certain other costs over which it has limited or no control. Specifically, these costs are the differences between forecast and actual property taxes, provincial water fees, and the Power Purchase expense related to the Brilliant contracts for 2005. In addition to the continued flow-through treatment for the above items, FortisBC proposes to add a new flow-through item that seeks flow-through treatment for the costs of capacity block power purchases forecast for November and December 2005 (FortisBC Argument, p. 50).

Intervenors did not specifically comment on these Incentive Mechanisms and Flow-Through Costs.

Commission Panel Determinations

The Commission Panel approves the continuation of the existing Power Purchase Incentive and the DSM Incentive Mechanisms for 2005. The Commission Panel also approves for 2005 the continuation of the above proposed flow-through cost items as well as the flow-through for the costs of capacity block power purchases forecast for November and December 2005. In addition, the Commission Panel directs FortisBC to treat income taxes and the expensed portion of Cost of Debt as flow-through cost items in 2005.

2.4.2 Operating Expense Incentive

FortisBC is proposing a temporary asymmetrical sharing mechanism for 2005 with respect to O&M expenses. The Company states that: " Under this proposal, to the extent that 2005 O&M Expense, net of capitalized overheads, are lower than the forecast O&M Expense of $36,173,000 (Exhibit B-26), the variance will be shared equally with customers. Actual O&M Expense in excess of the forecast O&M Expense of $36,173,000 will be entirely to the account of the shareholder." (FortisBC Argument, p.50)

Submissions

NRI was initially concerned that FortisBC was still proposing a modified form of PBR for O&M for 2005. NRI goes on to state however, that: "On further consideration, we don't think that this is a significant issue." (NRI Argument, p. 2).

BCOAPO agrees with the general approach proposed by FortisBC with respect to the 2005 sharing mechanism (BCOAPO Argument, p. 7).

KOECA addressed the issue of PBR and the incentive mechanism extensively, during cross examination and in their Final Argument. KOECA states that it protested the inception of the previous PBR scheme because it believed it had serious flaws. KOECA goes on to point out that: "…there never has been a stated rationale for 50-50 sharing between the utility shareholders and the customers" and it submits that 50-50 sharing for cost savings is so rich for the company that it is compelled to cut services until there is a negative reaction (KOECA Argument, p. 3). KOECA states that: "The incentive system must be constructed so that there is little or no incentive for undesirable activity." (KOECA Argument, p. 3) It asks that the Commission set up a process immediately to determine what sharing ratio should appropriately be set for any incentive mechanism the company is allowed to use, from now on. It goes on to ask that in the meantime the Commission rule that a sharing ratio of 90-10 (in favour of the customers) be instituted (KOECA Argument, p. 4).

FortisBC argues that BCOAPO, IMEU, and KOECA are in effect seeking to re-write the rules of PBR long after the rules were agreed to by customers and the utility, after the results of each year have been finalized, and after the monies have long since been disbursed to the shareholder and customers. FortisBC also states that it is difficult to conceive of how the Commission could, by reducing the monies approved for O&M force FortisBC's shareholders to pay for improvements to customer service. Any forced cuts will only end up hurting customers. FortisBC encourages customers and the Commission to focus on the results of the utility's programs as reflected in objective measures of customer service levels (FortisBC Reply Argument, p. 19).

Commission Panel Determinations

The Commission Panel reviewed and considered the evidence on the proposed asymmetrical operating expense incentive mechanism. While the Commission Panel supports the concept of a sharing mechanism with respect to O &M Expenses in general, it does not agree that sharing should start with the "first dollar". The Commission Panel is of the view that it is management's normal responsibility to try to achieve a reasonable level of saving over budget amounts.

In the current circumstances, it is the Commission Panel's view that it is important to maintain a fair balance in terms of risk sharing between customers and shareholders, and that this generally implies sharing should occur for both positive and negative O&M expense variances.

The Commission Panel is of the strong opinion that only the cost savings from true productivity/efficiency improvements in business processes and procedures should be subject to sharing and that cost savings generated through deferral or cancellation of planned activities are not acceptable for sharing. The Commission Panel is confident that the Company will produce savings from productivity/efficiency improvements inasmuch as Mr. Hughes, President and CEO, testified that FortisBC is very focused on productivity and the management of operations and maintenance costs (T2:77).

Finally, the Commission Panel firmly believes that a very strong link needs to exist between the granting of O&M expense incentives to shareholders and the achievement of objective and measurable performance targets by the Company. **Consequently**, **the Commission Panel directs FortisBC to establish for 2005, an operating expense incentive mechanism with the following parameters:**

(a) The total variance for consideration will be calculated as the difference between the forecast 2005 O&M expenses, net of capitalized overheads, and the actual 2005 O&M expenses, net of capitalized overheads;

(b) **Favourable variances, which result from the deferral or cancellation of planned activities/programs and/or reductions to existing service levels, will not be eligible for the sharing mechanism. FortisBC is directed to record these type of favourable variances in a deferral account, whose disposition will be dealt with by the Commission at a future date;**

(c) **The initial $500,000 of a positive or negative variance [as determined by the conditions set out in (a) and (b)] will be shared on a flow-through basis, i.e. 100% to the customer's account;**

(d) **Both positive and negative variances in excess of the $500,000 "deadband" in (c) will be subject to sharing. The sharing ratio will be 60:40 to shareholders and customers, respectively;**

(e) **The sharing of an eligible favourable O&M expense variance in (d) will also be subject to the satisfactory achievement of FortisBC's performance targets (see following paragraph (f) for a detailed discussion). If the Company experiences an unsatisfactory result in any one or more performance targets, the Commission will determine at the 2005 Annual Review whether to disqualify FortisBC from sharing in an eligible favourable operating expense variance in 2005. The Commission will apply a high standard of review, as necessary; and**

(f) **In reference to (e) above, the Commission Panel further directs that within 60 days of this Decision, FortisBC is to file with the Commission, for review and approval, objective and measurable performance metrics and specific targets to be achieved in 2005. These performance metrics should be appropriate for the measurement of actual performance in the generation, transmission, distribution, and customer service functions of the Company (Commission Panel determinations with respect to Customer Service are set out in Section 2.7). For example, SAIDI, CAIDI could be considered appropriate performance metrics for certain functions.**

The following example (assuming a favourable variance) will serve to demonstrate the functioning of the above operating expense incentive mechanism.

Forecast 2005 O&M Expenses, net of capitalized overheads	$36,173,000 [1]	Exhibit B-66, p.1
Assumed actual 2005 O&M Expenses, net of capitalized overheads	35,104,000	
Gross Variance	1,069,000	Favourable
Less: Assumed favourable variance due to deferral of planned activity	200,000	to deferral account
Net Variance	869,000	Favourable
Less: $500,000 “Deadband”- 100% to customers	500,000	
Variance eligible for sharing	369,000	Favourable
Shareholder’s share @ 60%	221,400	
Customer’s share @ 40 %	147,600	

In the above example calculation, customers would effectively “recapture” $847,600 of the total favourable variance of $1,069,000.

2.4.3 Review of PBR

FortisBC intends to complete a comprehensive review of PBR with a view to engaging in stakeholder consultations by the fourth quarter of 2005. FortisBC says that it will propose implementation in 2006 at the earliest if a fair and workable mechanism can be determined (FortisBC Argument, p. 51).

KOECA argues that a PBR must be reviewed thoroughly, with all necessary evidence brought forward in an oral public hearing to determine whether PBR should be continued at all (KOECA Argument, p. 4). BCOAPO supports FortisBC’s proposal for stakeholder consultation, but believes it should be primarily aimed at identifying issues of concern and points of disagreement between all parties involved. BCOAPO submits that this should help establish a more focused and efficient Commission process for review of FortisBC’s PBR mechanism (BCOAPO Argument, p. 7).

Commission Panel Determinations

The Commission Panel agrees with FortisBC’s intentions and timeline to engage in stakeholder consultations to review its existing PBR mechanism. The Commission Panel directs FortisBC to complete its review of PBR prior to submitting its 2006 Revenue Requirements Application and to propose to the Commission its preferred process for review and implementation of its recommendations. The Commission will determine at that time an appropriate review process going forward.

[1] Subject to adjustments discussed elsewhere in this Decision.

2.5 2005 Demand Side Management Expenditure Plan

2.5.1 Application

FortisBC filed its planned 2005 DSM expenditures under Tab 10.1 of its Application. The planned expenditures are a one-year extension of FortisBC's 1999-2004 DSM Business Plan. As such, it is a one-year continuation of its existing resource acquisition strategy, programs and incentives. FortisBC proposes to file an updated DSM Potential Study by June 30, 2005 and to file a new DSM Business Plan, covering the period 2005-2014, by October 31, 2005. These latter proposals are a component of FortisBC's Resource Plan – Action Plan.

FortisBC's DSM plan is comprised of expenditures for programs in the Residential, General Service and Industrial sectors, as well as costs for Planning and Evaluation, including salaries, consulting fees for planning reviews, ongoing program monitoring, and periodic evaluation reports and training costs. Both the costs of the DSM Potential Study and the DSM Business Plan are included in the 2005 Planning and Evaluation costs. In sum, FortisBC has set out total 2005 DSM expenditures of approximately $1.8 million for forecast total 2005 savings of 19.1 GWh. At the time that FortisBC filed its Application, these amounts could be compared to 2004 forecast costs and savings of approximately $2.0 million and 21.0 GWh, respectively (for further detail, please refer to Exhibit B-1, Tab 10.1, pp. 5-11; Exhibit B-12, Response to BCUC IR 112.0-117.0; and Exhibit B-17, Report of the DSM Technical Committee).

FortisBC submits that its 2005 DSM Plan, filed in compliance with Section 45 (6.1)(c) of the UCA, is reasonable, prudent, and in the public interest, and therefore requests an Order of the Commission that the 2005 DSM plan meets the requirements of Section 45(6.2)(b) of the UCA and is in the public interest (FortisBC Argument, p. 57).

2.5.2 Demand Side Management Technical Committee

Commission Order No. G-14-05 specified that issues associated with DSM would be reviewed by a Technical Committee as an adjunct to the Hearing. The Committee comprised FortisBC and Commission staff as well as Registered Intervenors that expressed an interest to participate. The Commission directed the DSM Technical Committee to submit a report with recommendations to the Commission one-week prior to the commencement of the Hearing (Exhibit A-4).

FortisBC filed the Report of the DSM Technical Committee on March 9, 2005 (Exhibit B-17). The Committee considered a number of issues and concerns in detail over the course of two meetings. There was particular focus on the methodologies that FortisBC uses to forecast the costs and savings in its DSM Plan and to determine the cost-effectiveness of the component programs. FortisBC provided a detailed explanation, stepping through the calculation spreadsheets where appropriate, to the ultimate satisfaction of Committee members. The Committee agreed that a sensitivity analysis on input variables such as penetration rates would be a useful component of future filings and would improve the assessment of the cost-effectiveness of the various DSM programs. FortisBC intends to include sensitivity analyses in future DSM filings.

The Committee also highlighted a concern that the Terms of Reference for the DSM "2005 Energy Efficiency Potential Assessment", as included in Appendix D to Tab 10.1 of the Application, did not include any focus on capacity savings. In response, FortisBC updated the Terms of Reference for this study to eliminate the concern that capacity savings potential would not be addressed. The update to the Terms of Reference is included in Appendix One of the Report of the DSM Technical Committee (Exhibit B-17). FortisBC indicated that the cost of including a study of capacity savings would be re-allocated from other study components, leaving the total study costs of $24,000 unchanged.

The Committee recommended that the existing DSM Incentive Mechanism and DSM Incentive Committee continue for 2005. The Committee was of the view that there was no basis at present on which to rebase any DSM targets in advance of the comprehensive review of PBR that FortisBC intends to complete by the end of 2005 (refer also to FortisBC Argument, p. 51). The Committee recommended that there would be no need to call a DSM panel at the Hearing. After canvassing comment from those Registered Intervenors that did not participate in the DSM Technical Committee, the Commission accepted this recommendation (Exhibit A-16). No issues with respect to the DSM Plan were raised during the Hearing and no written submissions on the DSM plan were received in argument by any party.

2.5.3 Commission Panel Determinations

The Commission Panel has reviewed the FortisBC DSM Expenditure Plan and the Report of the DSM Technical Committee. **The Commission Panel approves the DSM Expenditure Plan as filed and acknowledges that this Plan meets the requirements of Section 45(6.1) of the UCA.**

The Commission Panel also accepts the recommendation of the DSM Technical Committee that the existing DSM Incentive Mechanism and DSM Incentive Committee continue for 2005. The Commission Panel is satisfied by the response of FortisBC to the other issues of concern raised by the Committee; namely, its intention to file appropriate sensitivity analyses in future filings and to include in its DSM potential study a focus on capacity savings potential. **The Commission Panel directs FortisBC to file its DSM potential study by June 30, 2005 and its 2005-2014 DSM Business Plan by October 31, 2005, the timelines proposed by FortisBC.**

2.6 Transition Plan

2.6.1 Introduction

Commission Order No. G-39-04 approved the acquisition by Fortis Pacific of a reviewable interest in Aquila(BC). The latter company became FortisBC after the acquisition.

Aquila(BC) and Aquila Networks Canada (Alberta) Ltd. ("Aquila Alberta") were affiliates of each other and operated on an integrated basis. The two organizations shared certain functions including, for example, executive management, customer call centre, most of the finance function, human resources, and legal services.

As part of Fortis Pacific's application to acquire a reviewable interest, the company represented that it would unwind certain of the shared functions between the B.C. and Alberta operations and establish and operate FortisBC on a stand-alone basis. Fortis Pacific submitted that establishing the utility on a stand-alone basis would allow it to effectively address customer service quality issues and operational improvements, focus the management's attention on the B.C. service area, and create a more transparent regulatory environment. The stand-alone entity would also have independent financing capacity in capital markets.

Commission Order No. G-39-04 directed Fortis Pacific and, as appropriate, FortisBC to file quarterly reports outlining planning activity, timetables and financial evaluation and impacts of their implementation. By the time the Oral Hearing commenced, the Company had filed two quarterly reports (Exhibit B-12, BCUC IR 123) and a detailed Transition Plan (Exhibit B-1, Tab 10.3). The quarterly reports and the Transition Plan illustrate FortisBC's intentions and progress to date on the changes being made in the areas of customer service and operations, and on setting up a stand-alone organization. FortisBC forecasts that the aforementioned activities will cause 2005 O&M expenses, before capitalized overheads, to increase by $1,158,000 (Exhibit B-66, p. 1). In 2005 FortisBC also expects to incur capital expenditures of $460,000 for the new call center in Trail, B.C. (Exhibit B-12, BCUC IR 124.1). The combined effect of these expenditures requires an increase of approximately $1.2 million in 2005 Revenue Requirements (Exhibit B-1, Tab 10.3, p. 13).

The following sections discuss the significant components of the FortisBC Transition Plan in greater detail.

2.6.2 Customer Service

Customer service is addressed separately in Section 2.7.

2.6.3 Establishment of a Stand-alone utility

During cross-examination, Mr. Hughes, President and CEO of FortisBC explained the advantages of operating a utility on a stand-alone rather than integrated basis. Mr. Hughes testified (T2: 82):

> "We believe that this stand-alone utility based in our B.C. service territory will not only produce improved customer service – why will it do that? Because it will have local knowledge, improved focus and greater responsiveness to trouble calls. But it will also, over time, produce lower costs. Let me give you a couple of examples: Lower employee turn-over, particularly in the call centre; lower building and rental costs; improved responsiveness to customer concerns and requests – for example, customer connection; and last and certainly not least, faster outage restorations."

Commission Counsel asked Mr. Hughes to provide hard evidence that demonstrates that lower costs come from a stand-alone utility (T2:114). Mr. Hughes replied:

> "Well, one of the first things I would point to, and between I think it was about 1992 and 2002 in Newfoundland Power with this model, essentially the O&M was flat. To run a utility over a period of that time with flat O&M obviously proves the value of the model. It's our experience from say Fortis (Ontario), Fortis – we changed that model and we saw a cost improvement. That was more integrated. We've seen it in many. If you go through those things I mentioned, what you will find if you look at the Fortis companies is that our cost performance improves, our customer satisfaction improves by adopting this model pre and post. In the last 15 years, Maritime Electric, you've seen the performance and cost performance." (T2:114-115).

To date, FortisBC has made significant progress toward creating the stand-alone entity. The Head Office has been established in Kelowna and the independent executive management team is mostly in place. FortisBC states that recruitment of staff includes a combination of internal reorganization, outside recruitment and transfers of skilled employees wishing to relocate. The Company also notes that no relocation and severance costs associated with the transfer of positions from Alberta are included in the 2005 Revenue Requirements (Exhibit B-1, Tab 10.3, p. 10).

FortisBC will have its own Board of Directors and it will include members from the service territory. The Board is expected to be in place by the end of 2005.

2.6.4 Field Services

FortisBC states that it intends to pursue two separate initiatives, both of which are aimed at improving customer responsiveness (Exhibit B-1, Tab 10.3, p. 12).

The first initiative is directed at reducing FortisBC's service restoration times. The Company is currently undertaking a comprehensive review with a view to establishing restoration targets applicable to all areas of its service territory. The review will be completed by the second quarter of 2005.

The second initiative is aimed at improving FortisBC's responsiveness to routine customer wait times for services such as new connections. FortisBC states that: "As in the case of restoration times, measurable targets will be established and regularly reviewed to ensure continued timely customer responsiveness on a consistent basis." (Exhibit B-1, Tab 10.3, p.12)

2.6.5 Submissions

BCOAPO opposes the $1.2 million increase in the 2005 Revenue Requirements that result from actions taken under FortisBC's Transition Plan. BCOAPO states that: "…it is not appropriate for it to require ratepayers to pay for the cost for restoring quality of service to levels that existed prior to the move to Calgary." (BCOAPO Argument, p.7) and "…that customers should not be required to bear the cost of improving customer service in the amount of $1.2 million…" (BCOAPO Argument, p. 25) It further argues that to the extent the $1.2 million is reflected in the O&M expenses, these expenses should be reduced accordingly (BCOAPO Argument, p. 25).

KOECA states: "…the Commission should not permit the company to subsequently be rewarded for restoring service levels which should never have been allowed to decline in the first place." (KOECA Argument, p. 2). KOECA argues that a way must be found to determine how much improvement the company must make before it can justify passing on service improvement costs to its customers. It further submits that: "The appropriate approach is to establish what service levels are now being targeted by the company and determine whether they were in fact already at that level in the past. If so, then the company should pay the entire cost of service restoration. If the company intends to provide service levels above those experienced in the past, then in fairness it should be able to recover costs for doing so, but only for the increment above past service levels." (KOECA Argument, p. 2).

IMEU submits is supportive of the efforts of FortisBC to focus on improving customer relations and customer service in the service territory, and to operate the utility in an efficient, safe and reliable manner. It is also pleased to see a locally managed stand-alone operation with a focus on customers and it states that: "…[the IMEU] particularly endorses the statement in FortisBC's argument that it believes that 'it [the stand-alone utility] will also produce the lowest possible costs for our customers over the long term'(Fortis Argument, Page 8)" (IMEU Argument, p. 2). Having made the above statements, IMEU continues to state several concerns, including its concern about the: "…increased costs being passed on to customers as a result of the transition of ownership from Aquila to FortisBC" (IMEU Argument, p.2).

2.6.6 Commission Panel Determinations

The Commission Panel has considered all the evidence and arguments related to this matter. The Commission Panel concurs that the largely one-time cost of moving many of the functions back to B.C. is appropriately an expense for the shareholder. However, it does not agree with Intervenors that the incremental ongoing or recurring costs associated with service improvement activities proposed in the Transition Plan should be borne by shareholders. In Section 2.3.3 the Commission Panel approved the forecast 2005 O&M expenses, before capitalized overheads (i.e. $39,569,000 subject to adjustments), which include the increase of $1,158,000 in O&M expenses related to the Transition Plan. **With respect to the establishment of the Trail Call Center, the Commission Panel also accepts the forecast 2005 capital expenditures of $460,000 and the associated increases in the 2005 Revenue Requirements.**

The targets applicable to service restoration times and customer wait times for services such as new connections should be filed with the Commission as per the Commission Panel's determinations set out in Section 2.4.2, paragraph (f).

FortisBC claims that a stand-alone utility will over time produce lower costs. The Commission Panel directs FortisBC to submit a report one year from this Decision that demonstrates the achievement of cost savings attributable to the stand-alone status of FortisBC. The Commission will determine the need for further reports on a prospective basis.

2.7 Customer Service

In its application to acquire a reviewable interest in Aquila(BC), Fortis Pacific provided evidence that "the conduct of FortisBC's business, including the level of service, either now or in the future, would be maintained or enhanced." (Exhibit B-1, Tab 10.3, p.3). FortisBC further states:

> "In addition to the intentions stated in the Application, multiple stakeholder and public consultations were conducted regarding the Acquisition and transition. During these consultations, the Company also stated its intention to, within a reasonable transition period: 1) improve the overall quality of service to customers; … " (Exhibit B-1, Tab10.3, p. 4)

The Commission, in considering the acquisition application, was mindful of the service level concerns as expressed by customers and the related undertakings of the Applicant. In Order No. G-39-04 approving the acquisition, the Commission made clear its expectations that:

> "… in due course and in a timely manner, steps will be taken to further consider and implement the plans and fulfill the commitments made in the presentations to stakeholders, in the Fortis Application and in the course of this public process." (Order No. G-39-04, Appendix A, p. 11)

With the amount of interest in and attention paid to customer service during the acquisition process, it is not surprising that customer service would be a topic of considerable focus for FortisBC and of much interest to Intervenors in this proceeding.

FortisBC addressed many customer service deficiencies under cross examination. The following is considered by the Commission Panel to be a representative sample of these deficiencies and FortisBC's view of them.

> "What's relevant is that the customer service level and the meter reading was just unacceptable. And we heard this very strongly from the customers." (T2: 103)

> "And another thing we found when we took over this utility and we made fairly good initial efforts to start changing it and we've still got a long way to go, is customer connections. The time from when a customer requested service in B.C. to when they were actually getting it, we felt was far too long." (T2: 116)

> "In principle, we are responding to customers -- what customers have been telling this utility for some time, and that is the level of dissatisfaction that they have with the customer service, the call centre, responsiveness, et cetera." (T2: 169)

> "Newfoundland Power in the early '90s was in a very similar situation as we see here in B.C. today. It was suffering from a very low customer service rating." (T3: 519)

In the course of the proceedings Intervenors were generally positive about to FortisBC's intentions and early progress with respect to improvements in customer service. IMEU's comments on the subject are, in the view of the Commission Panel, generally representative of Intervenor views:

> "The IMEU is supportive of the efforts of FortisBC to focus on improving customer relations and customer service in the service territory and has been generally impressed by the efforts of the new management of the Company to respond to customer concerns" (IMEU Argument, p. 2).

2.7.1 Metrics and Strategies

In Exhibit B-1 at Tab 10.2, FortisBC provides an informative overview of its views on customer service measurement and tracking. The Commission Panel is of the view that customer service may be measured as it occurs, in terms of objective measures of customer service activity, and after the fact, in terms of customer satisfaction response when surveyed. Typically, objective measures are an indication of performance in "real time", while survey responses measure reaction to performance after the fact and can lag actual performance by a considerable margin depending on the timing of the survey and the degree and nature of the interaction with the (in this case) service provider.

FortisBC indicated its intentions with respect to revising its approach to the measurement of customer service.

> "In general it seems more reasonable to directly measure things that are readily quantifiable, such as reliability, rather than measure them through qualitative questions in the survey. Going forward, it is intended that the customer survey tool be used to more accurately measure the quality and convenience of the customer's day-to-day interactions with the Company, and employ other metrics for strictly objective facets of customer service." (Exhibit B-1, Tab 10.2, p27)

FortisBC indicated that in addition to revising the survey questionnaire, it planned to establish metrics and key performance indicators for all departments for the purpose of linking departmental productivity levels in all areas to customer service. Some indicators that FortisBC believes are important to customers are (Exhibit B-1, Tab 10.2, pp 28-29):

- Billing Accuracy;
- Emergency response times;
- First call resolution;
- Commitment to follow-up;
- Tracking completion time for new service requests;
- Meter reading accuracy; and
- Field service complaints.

The following reflects the strategies that FortisBC is currently implementing, or intends to implement, believing that they will result in an improvement in customer service:

> "FortisBC plans to establish its own customer service functionality and is focused on strategies to improve service. These improvements include a more effective call centre, increased meter reading and billing accuracy, enhanced bill format and provision for in-person service. Also, improvements in field service delivery through more effective work processes and resource deployment will decrease wait times for services such as new connections and trouble call response. The Company intends to establish benchmarks to monitor its progress." (Exhibit B-1, Tab 10.3, p. 17)

FortisBC has identified that the costs of these initiatives, when netted against the forecast reduction in shared services cost from FortisAlberta, form the major part of the approximate $1.2 million increase in revenue requirements discussed in Section 2.6.1 (Exhibit B-1, Tab 10.3, p. 17).

2.7.2 Commission Panel Determinations

The increase in costs to support improvements in customer service has been approved elsewhere in this Decision. In defense of its O&M expense budget, FortisBC encouraged customers and the Commission to focus on the results of the utility's programs as reflected in objective measures of customer service levels (FortisBC Reply Argument, p. 19). The Commission Panel is concerned that although FortisBC indicates that it intends to establish benchmarks to monitor its progress in improving customer service, no specific objective measures have been identified by FortisBC as deliverables resulting from the increase in funding as requested and approved. In the view of the Commission Panel, it would be unreasonable under normal circumstances to approve an increase in funding in the absence of clear targets against which improved performance is expected and may be measured. However, in the circumstances, the Panel supports the need for substantial improvements in service and recognizes the need for urgency in undertaking the initiatives necessary to bring about these improvements.

Therefore, the Commission Panel directs FortisBC to file within 60 days of this Decision a comprehensive set of objective and measurable performance metrics showing respective performance at the beginning of 2005 (estimates where actual is not available) and targets for December 31, 2005 for service areas as follows:

1. **Billing Accuracy**
2. **Emergency response times**
3. **First call resolution**
4. **Commitment to follow-up**
5. **Tracking completion time for new service requests**
6. **Meter reading accuracy**
7. **Field service complaints**
8. **Call center**

Further, FortisBC is directed to report to the Commission by October 31, 2005, actual performance for each of the measures to September 30, 2005, and by January 31, 2006, actual performance for each measure to December 31, 2005.

2.8 Accounting Issues

2.8.1 Depreciation and Amortization Study

FortisBC's last formal depreciation study was undertaken in 1983 and a discussion paper on the service life of transmission and distribution assets was completed in 1999. The Negotiated Settlement Agreement for 2000-2002, approved by Commission Order No. G-134-99, included a reduction of depreciation rates (and therefore depreciation expense) for transmission and distribution assets from 35 years to 50 years, and a further offset to depreciation expense in the form of a Rate Stabilization provision. Neither change was based on an expert-prepared depreciation study examined by the Commission. Since 2000, depreciation rate changes have resulted in a lower annual depreciation expense of about $3.3 million. The Rate Stabilization Adjustment was utilized in 2001, which set-up a $3.1 million adjustment to offset accumulated depreciation (Exhibit B-12, BCUC IR 33.6-33.8; T5: 863-866; FortisBC Argument, pp. 36-38).

The DBRS credit rating report expressed that currently low depreciation rates are a challenge and it observed that the Company's current average depreciation rate appears low in comparison to other utilities (Exhibit B-12, BCUC IR 13.0, p. 2). Similarly, the Moody's credit rating report cites one of the Company's credit challenges to be the relatively low depreciation rate for rate-making purposes (Exhibit B-12, BCUC IR 15.0, p. 1).

Dr. Booth, expert witness for BCOAPO, stated that the depreciation rate should be based on the economic useful life of the assets and it shouldn't be fixed for other purposes (T4: 759). Mr. Meyers from FortisBC indicated that the Company expects to carry out a depreciation study later in 2005 and intends to perform depreciation studies on five-year intervals going forward (T5: 863). Mr. Wait argues that the depreciation rate for vehicles should be increased so that the difference between the vehicle sale value and depreciated value would be minimal (Wait Argument, pp. 3-4).

FortisBC proposes to conduct a depreciation and amortization study by an independent consultant during 2005, for submission with the 2006 Revenue Requirements application (Exhibit B-1, Tab 6, p. 9; Exhibit B-12, BCUC IR 33.6). The Company states that the depreciation study will address issues raised during the proceeding including disposition of the Rate Stabilization Account; different depreciation rates for the generation plants; and depreciation rates for fleet vehicles and computer software. FortisBC argues that it is inappropriate to make any changes to depreciation rates or methodology until a depreciation study is completed (FortisBC Argument, pp. 37-38).

FortisBC states that its policy is to record depreciation expense in the year after the assets are placed in service (Exhibit B-12, BCUC IR 29.1.2).

Commission Panel Determinations

The Commission Panel accepts that the currently approved depreciation rates should not be changed in 2005 until a formal depreciation and amortization study has been completed. The Commission Panel directs FortisBC to file a depreciation and amortization study as part of its next revenue requirements application. The next revenue requirements application will include a rate impact analysis for both with and without any depreciation and amortization rate changes.

2.8.2 Adjustment for Capital Expenditures

The Company calculates the Adjustment for Capital Expenditures on a quarterly weighted average instead of on a 13-month weighted average. The Company states that either method should provide similar results over the long term. The Company argues that should the Commission prefer that the Company move to a 13-month average for calculating the Adjustment for Capital Expenditures in the determination of rate base, the Company suggests that this change be introduced as part of the Company's 2006 Revenue Requirements application (FortisBC Argument, pp. 29-30; Exhibit B-12, BCUC IR 37.0; T5: 867-868).

Commission Panel Determinations

The Commission Panel agrees that the Company should continue to use the quarterly weighted average method to calculate the Adjustment for Capital Expenditures in 2005. The Commission Panel directs the Company to calculate the Adjustment for Capital Expenditures using the 13-month average method, commencing in 2006.

2.8.3 Allowance for Funds Used During Construction

AFUDC represents the cost of capital incurred by the Company while assets are under construction. The Company recognizes that customers should only contribute to assets that are "used and useful". Consequently, the Company deducts AFUDC from revenue requirements and adds it to capital costs, to be recovered through depreciation expense over the life of the asset (Exhibit B-1, Tab 8, p. 26).

The Company has calculated an AFUDC rate of 6.48 percent based on a return on equity of 9.78 percent and weighted average cost of debt of 6.66 percent (Exhibit B-1, Tab 8, p. 26; Exhibit B-12, BCUC IR 80.5 & 85.3).

The Company explained that AFUDC is calculated monthly on a project by project basis for projects with a forecast cost greater than $100,000 and expected to last more than three months duration. The Utility includes Construction Work in Progress ("CWIP") that attracts AFUDC in its rate base. Revenue requirements, including financing costs, are calculated on the mid-year rate base which includes CWIP. Revenue requirements are then reduced by AFUDC, to reflect the cost of financing the CWIP portion of rate base that is not used and useful. The Company stated that Terasen Gas and Pacific Northern Gas Ltd., both regulated by the Commission, do not include AFUDC as a reduction to revenue requirement and exclude CWIP subject to AFUDC from rate base. However the Company states that the net result of using either method should be the same (Exhibit B-12, BCUC IR 85.1-85.10).

The Company provided a reconciliation of the deduction of AFUDC in Schedule 3 to show that the Company has properly deducted AFUDC in calculating income tax expense (Exhibit B-79). Commission Counsel in cross-examination questioned the Company's use of including CWIP that attracts AFUDC in rate base and the practices of other utilities regulated by the Commission. Mr. Lee responded that the Company had no preference between the methodologies (T5: 873).

FortisBC argues that since 1990 it has included CWIP in the calculation of rate base, together with the corresponding deduction of AFUDC in the calculation of revenue requirements. FortisBC does not propose to change its current treatment, and believes that its current treatment better reflects the actual income tax and accounting treatment of AFUDC. If the Commission wishes to change the method of accounting for CWIP and AFUDC, FortisBC argues that the change should be applied prospectively beginning in 2006 as part of the Company's 2006 revenue requirement application (FortisBC Argument, p. 30).

<u>Commission Panel Determinations</u>

The Commission Panel accepts that the Company should continue to calculate CWIP and AFUDC using the current method in 2005. The Commission Panel directs FortisBC in its next revenue requirements application to review its current practice of including CWIP attracting AFUDC into rate base. The review should include a comparison of other electric and gas utilities regulated by the Commission, an analysis of the alternate methods, and a proposal by the Company on whether to continue or change its current AFUDC and CWIP methodology.

The Commission Panel directs the Company to recalculate its AFUDC rate based on the weighted average cost of debt from the Third Revised Application and the return on equity allowed through this Decision. The resulting approved AFUDC rate shall be applied to calculate the AFUDC amounts in 2005.

2.8.4 Capitalization of PowerSense Costs

FortisBC is proposing a change in the accounting treatment of certain PowerSense costs in the amount of $85,000, such that these costs are charged to capital rather than operations (Exhibit B-26, p. 4). The DSM Technical Committee discussed the reasons behind the request with only Mr. Wait expressing concern (Exhibit B-17, p. 3).

Mr. Wait argues that the $85,000 charge for DSM awareness should continue as an operating expense and not be capitalized. He expressed concern for capitalizing costs that do not have physical assets attached and the procedure would cost ratepayers more for ROE and equity (Wait Argument, p. 9). Currently the Company amortizes DSM (deferred energy management) costs over 8 years (Exhibit B-12, BCUC IR 34.1-34.3).

Commission Panel Determinations

The Commission Panel approves the change in accounting treatment of certain PowerSense costs as proposed by the Company. The Commission Panel directs that the upcoming depreciation and amortization study will address the appropriateness of the current amortization period for deferred DSM costs.

2.8.5 Deferred Charges

Net-of-tax Deferral Accounting

Currently, FortisBC treats DSM costs net-of-tax as directed in Commission Order No. G-55-95. All other deferred charges that have been recorded by the Company are on a gross of tax basis. At Transcript Volume 5, page 887, Commission Counsel questioned the appropriateness of recording all deferred charges on a net-of-tax basis. Mr. Meyers responded that, in his opinion, the net-of-tax treatment is appropriate to ensure proper matching of costs and benefits (FortisBC Argument, p. 59).

The Company proposes that deferred amounts related to the proposed 2005 O&M Expense and power purchase sharing mechanisms be recorded net-of-tax so that the associated income tax is correctly matched either to the customers or the shareholder (Exhibit B-12, Response to BCUC IR 34.5). The Company does not propose to extend net-of-tax treatment to other deferral accounts. The Company is of the position that any change in the treatment of deferred charges must apply on a prospective basis only, and should be made only after a full assessment of the impact has been completed (FortisBC Argument, pp. 59-60).

The Commission believes that a consistent treatment of deferral accounts is warranted to ensure proper matching of costs and benefits. **The Commission Panel directs that all deferred charges (excluding preliminary and investigative costs charges transferred to capital projects) be treated using net-of-tax deferral accounting commencing in 2005.**

Tax Rate for Net-of-tax Deferral Accounting

The Company currently books net-of-tax deferrals using the combined federal and provincial statutory tax rate including federal surtax. The 2005 combined statutory tax rate with surtax is 35.62 percent and 34.5 percent without surtax. Mr. Lorimer agreed that the federal surtax was deductible against the large corporation tax. In response to a question by Commission Counsel, Mr. Lorimer rationalized that the 35.62 percent tax rate was appropriate (Exhibit B-12, BCUC IR 34.1; T5 887-888).

In its calculation of the large corporation tax for 2005 the Company has included a federal surtax reduction to compute the net payable large corporation tax (Exhibit B-12, BCUC IR 81.5).

In 2005 the ability to apply the federal surtax to reduce large corporation tax effectively excludes the federal surtax in the combined corporate income tax rate. **The Commission Panel directs that the tax rate to use for net-of-tax deferral accounting is the net effective tax rate to the Company. For 2005 the appropriate tax rate to use for net-of-tax deferral accounting is 34.5 percent without the federal surtax.**

Cost of Regulatory and Related Activities

The Company requests approval for the deferral of the cost of regulatory and related activities. In Table 6.4B, Forecast 2005 Deferred Charges and Credits, the Company proposes to include in 2005 forecast deferral additions of $250,000 for the 2005 Revenue Requirements proceeding, $75,000 for the 2006 Revenue Requirements proceeding, and $150,000 for Other Regulatory proceedings (Exhibit B-1, Tab 6, p. 13).

The Company explained the Other Regulatory proceedings amount is a provision for expected and unexpected regulatory proceedings during the year. The Company anticipates the most significant costs would be for the 2005 Generic Return on Equity hearing plus intervention in proceedings of other utilities such as BC Hydro’s Rate Design hearing. The Company states that it is not possible to estimate costs with a reasonable degree of certainty until the scope and process of a proceeding has been determined (Exhibit B-12, BCUC IR 34.7).

The Commission Panel approves gross deferral account additions of $250,000 and $75,000 in 2005 for the 2005 and 2006 Revenue Requirements proceedings, respectively. The Company will file with the Commission upon completion of each of these two proceedings a review of the actual costs, a comparison of the costs from actual to budget, and a demonstration that the costs have been prudently incurred.

The Commission Panel denies the $150,000 provision for Other Regulatory proceedings to be included in rate base. The Commission Panel directs the Company to set-up a non-rate base short-term interest bearing deferral account for each regulatory proceeding that it proposes to seek cost recovery for. The account will collect actual costs incurred for each proceeding. At the conclusion of each proceeding the Company may apply for a prudency review of actual incurred costs for inclusion in rate base as a deferral account.

Series 04-1 Senior Unsecured Debentures Issue Cost and Amortization

FortisBC requests approval for the issue cost of the Series 04-1 Senior Unsecured Debentures in the amount of $2,091,000. The Company also requests amortization of the issue cost of the Series 04-1 Senior Unsecured Debentures in the amount of $2,091,000 over ten years commencing on January 1, 2005. The amortization period matches the 10-year term of the bond (Exhibit B-26, p. 3; Exhibit B-1, Tab 8, p. 18; Exhibit B-12, BCUC IR 23.1).

The Commission Panel approves the $2,091,000 issue cost of the Series 04-1 Senior Unsecured Debentures and the amortization over ten years commencing on January 1, 2005.

Amortization of the Costs Incurred for 2004 Revenue Requirement process

The Company requests amortization of the costs incurred in FortisBC's 2004 Revenue Requirements NSP over a one-year period (Exhibit B-26, p. 3; Exhibit B-12, BCUC IR 34.3).

The Commission Panel approves the amortization of costs incurred in FortisBC's 2004 Revenue Requirements NSP for a one-year period in 2005.

Costs and Amortization of the System Development Plan and Resource Plan

The Company requests the amortization of the costs of the 2005-2024 System Development Plan and the 2005 Resource Plan, in an aggregate amount of $900,000, over five years commencing on January 1, 2005 (Exhibit B-26, p. 3). The December 31, 2004 balances are $800,000 for the System Development Plan and $100,000 for the

Resource Plan (Exhibit B-12, BCUC IR 29.0, Table 1-B (2005)). The Company states that these planning activities are carried out at intervals of approximately five years, and are considered to be an ongoing, although intermittent, operating expense. Therefore, the Company proposes to include the amortization of costs in O&M expense (FortisBC Argument, p. 60).

The Commission Panel approves a five-year amortization for each of the System Development Plan and the Resource Plan costs. The Commission Panel determines that net-of-tax deferral accounting is to be used for deferred charges. Consequently, the System Development Plan and Resource Plan costs are not to be amortized to operating expense. Instead these costs are to be amortized to deferred amortization expense.

Capital Cost Allowance Rate Change Deferral

In its Revised Application, FortisBC incorporates changes to the 2005 Revenue Requirements to reflect capital cost allowance ("CCA") rate changes relating to new transmission and distribution assets announced in the February 23, 2005 Federal Budget (Exhibit B-19, p. 6). FortisBC requests approval of a deferral account and recovery in 2006 of higher income tax expense that will arise in 2005 if the new CCA rates announced in the February 23, 2005 Federal Budget are not enacted prior to December 31, 2005 (Exhibit B-26, p. 5).

The Commission Panel approves a deferral account and recovery in 2006 of higher income tax expense that arises in 2005 if the new CCA rates announced in the February 23, 2005 Federal Budget are not enacted prior to December 31, 2005.

2.8.6 Provision for Income Tax Audits

The Company has included an amount of $100,000 in its 2005 Revenue Requirements as a provision for income tax audits. The Company has been audited by the Canada Revenue Agency ("CRA") for the years up to and including 1998. The Company expects that it will be audited for the years subsequent to 1998 in the near future. The Company believes it is both reasonable and prudent to include this provision in its 2005 income tax expense. The Company indicated that a cumulative provision for income tax audits for the years 1999 to 2004 exists, in the amount of $350,000. FortisBC proposes this provision be retained pending an audit from CRA for these years. Any unused provision upon completion of the audits would be credited to the benefit of customers in calculating the following year's revenue requirement (FortisBC Argument, p. 33; Exhibit B-77, Undertaking U-44).

FortisBC confirmed that the accumulated provisions for tax audits have not been factored into the rate base calculations (Exhibit B-78, Undertaking U-45). IMEU argues that it does not believe that the provision for tax audit should be maintained. Also, IMEU submits that the $350,000 which has been collected from customers should be returned to customers in 2005 (IMEU Argument, 17).

FortisBC in its reply to IMEU believes that the Company's position is a prudent method of providing for the eventual costs of tax audits, and that its proposal to retain the provision and to dispose of any unused amounts upon completion of the audits be approved by the Commission (FortisBC Reply Argument, pp. 29-30).

Commission Panel Determinations

The Commission Panel directs the $100,000 provision for tax audit to be removed from the 2005 Revenue Requirements. The Commission Panel also directs that the cumulative provision of $350,000 for income tax audits already collected be returned to ratepayers in the 2005 test year.

2.8.7 Capital Tax Refund

FortisBC was reassessed for B.C. Capital taxes for the taxation years 1994 through 1998. The primary issues arising from the assessments arose from the netting of CIAC against book value and the netting of certain deferred charge credits against deferred charge debits for purposes of computing the Company's paid-up capital for capital tax purposes. The Company paid the reassessed amounts and appealed the reassessments. In early 2004, the Company, together with Terasen Gas, met with representatives from the B.C. Ministry of Finance to put forth its position on the calculation of the capital taxes. On February 11, 2005 the Company received notice that its appeal has been allowed by the Minister of Finance, and it is awaiting final reassessment (Exhibit B-12, BCUC IR 82.1).

The Company proposes that the capital taxes refund amount, including interest and net of related income taxes, be shared equally between the Company and its customers. The Revised Application includes a provision for one-half of the estimated B.C. Capital Tax refund of $908,000 applied on an after-tax basis, to reduce the 2005 B.C. Capital Tax expense by $292,000 (Exhibit B-19, p. 7). FortisBC argues that since the Company aggressively pursued the appeal, and in view of the fact that PBR is intended to provide incentives to the Company to find ways to reduce cost and to share these cost savings with the customer, it considers it reasonable that the refund be shared on a 50-50 basis (FortisBC Argument, p. 35).

Mr. Meyers agreed that capital tax was a flow-through cost borne by the ratepayers and that the ratepayers paid for the costs of pursuing the appeal. Mr. Meyers stated that the Company aggressively pursued the assessment and that the sharing of the benefit would continue to provide incentives to the Company to continue to appeal similar types of assessments. Upon further questioning from Commission Counsel, Mr. Meyers agreed that as a part of the Company's normal business operation it has an obligation to pursue the tax assessment to keep costs down. Commission Counsel also questioned why the Company was treating the refund on an after-tax basis for the flow-through to customers. Mr. Lorimer replied that the B.C. Capital Taxes, as opposed to the large corporation tax, was a tax deductible item in those years (T5: 843-846).

IMEU does not support the regulatory treatment of B.C. Capital Tax as proposed by the Company. IMEU submits it is completely inappropriate for the Company to be claiming any portion of any refund or positive assessment from the appeals of these tax matters. IMEU considers that, since the customers bore the full cost of the appeals and bore the full cost of the taxes paid during the period, the customers should be entitled to a full refund of the success of the appeals. IMEU notes that if the challenge were unsuccessful, yet prudently undertaken, the cost of the pursuit of the appeal would have been borne by the customers (IMEU Argument, pp. 3, 15-16).

BCOAPO does not support a sharing of the B.C. Capital Tax refund. BCOAPO notes that Mr. Lorimer admitted that FortisBC was not the only utility to appeal the capital tax assessment (T3: 516). BCOAPO argues there is no evidence that the efforts of FortisBC, rather than the efforts of other utilities, were responsible for the capital tax refund (BCOAPO Argument, pp. 25-26).

Commission Panel Determinations

The Commission Panel denies the proposed sharing of the B.C. Capital Tax refund. The Commission Panel directs the Company to include in 2005 the full after-tax refund amount without any sharing to the Company.

3.0 2005 CAPITAL PLAN AND 2005-2024 SYSTEM DEVELOPMENT PLAN

3.1 Introduction

In conjunction with its 2005 Revenue Requirements filing, FortisBC filed its 2005-2024 System Development Plan and its 2005 Capital Plan. FortisBC states that these plans are intended to comply with the requirements of Section 45 of the UCA (Exhibit B-1, Tab 1). Section 45(6) of the UCA states that “A Public Utility must file with the Commission at least once each year a statement in a form prescribed by the Commission of the extensions to its facilities that it plans to construct.” Section 45(6.1) requires that the utility file a capital expenditures plan for a period specified by the Commission in addition to plans for the acquisition of energy and plans for reducing the demands for energy.

In its November Application FortisBC stated that it was seeking an Order that its 2005 System Development Plan meets the requirements of Section 46(6) of the UCA and an Order that its 2005 Capital Expenditure Plan satisfies the requirements of Section 45(6.2)(a) and (b) of the UCA (Exhibit B-1, Tab 9, pp. 5-6). In its Second Revised Application FortisBC no longer sought an Order for the System Development Plan. In clarification, Mr. Macintosh stated that the Orders FortisBC is seeking are contained in the Second Revised Application and did not include an Order for the approval of the System Development Plan, but required an order approving the 2005 Capital Plan (T2: 67). Mr. Debienne stated that although they were not seeking approval, the System Development Plan needs to be considered when evaluating the Capital Plan (T3: 345).

3.2 2005-2024 System Development Plan

The System Development Plan is a long range planning document for capital expenditures on the transmission and distribution system. It considers a 20-year time frame for the transmission system and a 5-year time frame for the distribution system and was preceded by the 1998 Master Plan. Although the time frame for the report is 20 years, the majority of expenditures are anticipated to occur in the next five years. The total transmission and distribution capital forecast for the first five-year period is in excess of $400 million (Exhibit B-1, Tab 9, p. 19).

Inputs to the plan include the forecast growth for the Kootenay and Okanagan regions and assessments of equipment condition and maintenance plans. Each resulting project was assessed against criteria for safety, public impact, restoration time, thermal capacity, system effect of failure, and voltage. Some projects were given a mandatory designation for safety reasons (Exhibit B-2, pp. 2-4).

3.2.1 Bulk Transmission Plan

The following section discuses system deficiencies and/or changes from the 1998 System Plan. Although the most significant deficiencies were addressed by the 230 Kootenay Development project and the South Okanagan Supply reinforcement project, FortisBC has identified several other areas of concern.

One area of concern is the reliability of supply to the City of Kelowna. FortisBC identified that Kelowna will be exposed to a significant load loss from the coincident loss of circuits 72 and 74 or BC Hydro's 2L255 and 2L256 from Vernon. (Exhibit B-2, p. 10). With this occurrence Kelowna could experience a loss of two thirds of its load, with the remainder of load under rotating blackouts. FortisBC testified that the concern with these lines lies with the fact that they share common rights of way and could be subject to outage events such as forest fires or other common mode outages. It was also concerned about the exposure to Kelowna under conditions of maintenance outages. This condition is referred to as an N-1-1 condition. In the previous plan only a loss of one line was considered. However, according to Western Electricity Coordinating Council ("WECC") standards, when it is reasonable to assume a multiple element outage due to one cause a utility must consider the multiple element outage under N-1 contingency standards (T2: 265-267). The solution to this concern is to replace the 161 kV line with a 230 kV transmission line from Vaseux Lake Terminal to the Anderson Terminal in Penticton.

Other changes identified include the supply to the Boundary area and to Osoyoos as well as the need for additional Remedial Action Schemes for Vaseux Lake Terminal and Kelowna to prevent voltage instability in the Penticton/ Oliver and the Kelowna areas (Exhibit B-1, Tab 9, p. 18; Exhibit B-2, pp. 12, 13, 17, 29, 40).

3.2.2 Transmission and Distribution

FortisBC identified a significant number of sub-transmission and distribution projects required for growth and sustaining projects. These are listed in Appendix C of Exhibit B-2 on pages 2 and 3. Distribution projects are listed on page 4 and Telecommunications, Scada, and Protection projects are listed on page 5. All projects have been prioritized according to the criteria described above, and are listed on pages 6 and 7 of Appendix C.

3.2.3 Rate Impacts

FortisBC estimated that the Capital Plan would result in an average increase in rates of 4.8 percent per year for the first five years (Exhibit B-12, BCUC 92.3). As a result of further questions during the Technical Committee meetings FortisBC also estimated that the impact of all other cost components with the Capital Plan included is an average rate increase of 5.2 percent per year (Exhibit B-20, Appendix 1).

However Mr. Debienne stated that the results calculated in response to BCUC 92.3 were misleading because the table contained the Capital Expenditures for the System Development Plan in 2005 and then included the Capital expenditures for the entire company in the remaining years to 2010 (T2: 228). Mr. Debienne also stated that a more accurate representation of the impacts of the System Development Plan can be found in Appendix 1 to Exhibit B-20. While this Exhibit shows the rate impacts for all capital expenditures, the rate impact for the System Development Plan would be approximately two-thirds of that, or a cumulative impact of 20 to 25 percent over six years (T2: 231-232).

3.2.4 Submissions

Arguments from IMEU, BCOAPO, and NRI were generally supportive of the System Development plan and the possible improvements in reliability, but all expressed some concern for the rate impact. IMEU expressed some concerns about the completeness of the System Development Plan, but was encouraged by the Company's commitment to have an open dialogue on the Plan. Mr. Wait had specific comments on the Big White Project and the East Osoyoos Substation, the Boundary reconfiguration, and the lines 30, 32, and 37 (Kaslo, Crawford Bay, Lambert Terminal areas). He also suggested that the 230 kV line from Vaseux Lake to Penticton was not needed and should be delayed. In conclusion he wished to have the System Development Plan address the issues he raised.

FortisBC argued that the System Development Plan and the Capital Plan were developed to ensure that investments in the existing system are sufficient to maintain system integrity and reliability and to optimize the life of the company's assets (FortisBC Argument, p. 9). FortisBC believes the plans are efficient and that it has economized it to the extent possible. However it notes that it is continuing to do analysis to optimize the plan on a year to year basis. (FortisBC Argument, p. 12-13). Regarding the impact on rates, FortisBC acknowledges the impact and notes that for the next 6 to 7 years customers will see a rate bulge as the system is renewed, but in the long term customers will enjoy relatively low rates because of the low cost of generation. In comparison to other utilities, the cost of equipment will be the same, as the company uses the same material and practices as other utilities and that therefore the rates will be comparable to other utilities on that basis (FortisBC Argument, pp. 12-15).

With regard to the need for N-1-1 criteria for the City of Kelowna, FortisBC acknowledges that this is a change from previous criteria but believes it to be necessary because of the possible impacts on Kelowna (FortisBC Argument pp. 14-15).

3.2.5 Commission Panel Determinations

Although the Commission has not been requested to approve the System Development Plan, the Commission Panel has several comments. First, the Commission Panel commends the effort FortisBC has put forward in constructing the System Development Plan. The Commission Panel believes that FortisBC's thorough review of the needs of the system and prioritization of the identified projects will greatly assist future capital expenditures investment decisions. Second, the Commission Panel encourages FortisBC to treat this plan as a living document, to continue to consult with stakeholders, and to keep the inputs to the plan current as the plan evolves. With respect to the rate impacts of the System Development Plan, the Commission Panel is concerned that sustaining a rate increase of approximately 5 percent per year over the next six years may be difficult. Thus, the Commission Panel suggests that for the next capital plan review, and subsequently thereafter, FortisBC should develop alternate scenarios that envision a perhaps less efficient plan but which would involve delaying capital expenditures. The Commission Panel is not suggesting that these scenarios would be preferred, but that their cost impacts need to be known in order to make choices between lower rate increases and higher long term costs. The Commission Panel also notes that customers have enjoyed relatively lower rates than other utilities for a considerable period during the 1980's and 1990's when capital investment levels were much lower.

With respect to the appropriate reliability levels for the City of Kelowna, the Commission Panel notes that the criteria of N-1 is a minimum standard set by the WECC for bulk transmission systems and adopted by most utilities. The Commission Panel acknowledges that there are situations (particularly in large urban centers) where the consequence of a lower probability occurrence of an N-1-1 or N-2 event requires the N-1 standards to be exceeded. Each case is a judgment call and must be evaluated on its own merits. However it is common practice to have N-2 contingency levels for certain load centers in large urban centers (e.g. Vancouver and Victoria). **The Commission Panel accepts that an N-1-1 contingency level for Kelowna is appropriate at this time.**

3.3 2005 Capital Plan

3.3.1 2005 Capital Plan Summary

FortisBC is seeking an order that the 2005 Capital Plan, as setout in Tab 9 of Exhibit B-1, satisfies the requirements of Section 45 (6.2) (a) and (b) of the UCA. The 2005 Capital Plan contains expenditures of $49.4 million (AFUDC and loadings included) for which project approval has been previously received from the Commission. These projects are the Kootenay 230 kV System Development Project, the South Okanagan Supply Reinforcement Project, the Kelowna Area Upgrade and the Upgrade and Life Extension projects involving Unit 5 and Unit 6 at the Upper Bonnington power plant. (Exhibit B-1, Tab 9, p. 4).

As part of the Capital Plan FortisBC proposed that the following four criteria be used to determine if a project should be subject to a CPCN application:

1. the total project cost is $20 million or greater; or
2. the project is likely to generate significant public concerns; or
3. FortisBC believes for any reason that a CPCN application should proceed; or
4. after presentation of a Capital Plan to FortisBC stakeholders, a credible majority of those stakeholders express a desire for a CPCN application.

FortisBC argued that these criteria were consistent with Commission Order No. G-96-04 and directives regarding the British Columbia Transmission Corporation ("BCTC") (Exhibit B-1, Tab 9, p. 6).

FortisBC notes that the Big White Supply Project will be the subject of a Certificate of Public Convenience and Necessity ("CPCN") Application in 2005.

The 2005 Capital plan for Transmission, Stations, Distribution and Telecommunications is based primarily on the System Development Plan, while the 2005 Capital Plan for Generation is based on the Upgrade and Life Extension program as well as other capital sustaining requirements (Exhibit B-1, Tab 9, p. 5).

3.3.2 New Projects

Generation

By a December 8, 2004 letter, FortisBC advised the Commission that in keeping with its proposed CPCN criteria it did not intend to file a CPCN for the Lower Bonnington Upgrade and Life Extension Project. However on May 19, 2005 FortisBC submitted a CPCN application for this project. This project was originally delayed pending the outcome of an agreement with BC Hydro to clarify the entitlement benefits for an upgraded turbine. The subsequent agreement improved the actual benefits of the upgrade.

Transmission and Stations

Although there are numerous small sustaining capital projects, the main projects driving new capital are the Big White Supply project at a total cost of $24.5 million with $3.0 million in 2005; the Ellison Distribution source at a total cost of $8.25 million with $0.25 million in 2005; the Black Mountain distribution source at a total cost of $7.25 million and $0.25 million in 2005; and the new East Osoyoos source at $5.75 million with $0.25 million in 2005; and the Kettle Valley distribution source at a total cost of $7.65 million with $0.15 million in 2005.

Distribution Projects

The Commission Panel notes that the largest expenditure is for new connects ($4.5 million) with the remainder made up of a larger project with respect to the Creston upgrade to the Lambert Terminal project as well as a large number of smaller projects.

Telecom, SCADA, and Protection and Control Projects

The largest project in this category is the Distribution Substation Automation project with total expenditures forecast at $6.2 million dollars with $0.60 million in 2005. The remainder consists of a number of modest sustaining projects totaling $1.4 million.

CPCN Requirements

As discussed above, FortisBC has proposed that a number of criteria be used to guide FortisBC when applying for CPCN's. No intervenors commented on the CPCN criteria.

3.3.3 Commission Panel Determinations

The Commission Panel confirms that the 2005 Capital Plan satisfies the requirements of Section 45(6.2)(a) and (b) of the UCA.

With regard to the CPCN Criteria, the Commission Panel is in general agreement with FortisBC's assessment of the appropriate criteria to guide the Company and the Commission when applying for CPCN's. However FortisBC has missed an important distinction with respect to the BCTC application. BCTC has acknowledged that the Commission has the authority to designate any projects it deems necessary for a CPCN application, regardless of the criteria. **In exercising this prerogative the Commission will be guided by the suggested criteria. However, in practice the Commission intends to review each year's capital filings and will determine with reasons which projects will require CPCNs.**

The Commission approves all capital projects listed in Tab 9 of Exhibit B-1, except for the following projects, for which the Commission Panel directs FortisBC to submit CPCN applications.

1. **Big White Supply:** As FortisBC suggests, this project is required because its total cost will exceed $20 million and because of public concerns with respect to routing and capital cost recovery.

2. **East Osoyoos Source:** This is required because of uncertainty with respect to the timing of this project and alternative solution. In addition, there seems to be some uncertainty regarding the supply from Bentley substation.
3. **Kettle Valley Distribution Source:** As with (2) above, there appears to be some uncertainty with regard to the best solution for the Boundary area. The Commission Panel is of the view that allowing public comment on the proposed solution would be of value.
4. **Distribution Substation Automation:** This is required because it is not clear to the Commission Panel what the possible risks and benefits are associated with the project, what precedent it may set for future projects, and if FortisBC is selecting the appropriate technology.

The Commission Panel invites FortisBC to withdraw its May 19, 2005 CPCN application for the Lower Bonnington Upgrade and Life Extension Project.

4.0 2005 RESOURCE PLAN

4.1 Background

The Commission's mandate to direct and evaluate the resource plans of energy utilities is intended to facilitate the cost-effective delivery of secure and reliable energy services. The Commission's Resource Planning Guidelines (the "Guidelines") outline a comprehensive process to assist utilities in the development of such plans. The Commission requires that any resource plans filed under Section 45(6.1) of the UCA be prepared in accordance with its Guidelines.

The Commission requires consideration of all known resources for meeting the demand for a utility's product, including those which focus on traditional and alternative supply sources, and those which focus on conservation of energy and DSM. Resource planning is intended to facilitate the selection of cost-effective resources that yield the best overall outcome of expected impacts and risks for ratepayers over the long run. The process aids in defining and assessing market-based costs and benefits, while also entailing the assessment of tradeoffs between other expected impacts that may vary across alternative resource portfolios. Such impacts may be associated with objectives such as reliability, security of supply, rate stability and risk mitigation, or specific social or environmental impacts. In sum, a resource planning process that assesses multiple objectives and the tradeoffs between alternative resource portfolios is key to the development of a cost-effective resource plan for meeting demand for a utility's service (Guidelines, pp. 1-2).

On December 21, 2004 FortisBC filed its Resource Plan as Volume 3 of its 2005 Revenue Requirements Application. FortisBC prepared and filed its Resource Plan in response to the Commission's directive to utilities to file such plans as contemplated by Section 45(6.1) of the UCA. FortisBC states that its Resource Plan is consistent with the Guidelines.

4.2 2005 Resource Plan Summary

FortisBC's 2005 Resource Plan is a study of its load and resource Requirements over the period 2005-2024. It summarizes its Resource Plan objectives as to reliably meet customer load requirements, in agreement with stakeholder expectations, with existing and new resources if needed, with minimum rate and environmental impacts and with the guidance of the B.C. Energy Plan.

FortisBC's long-term firm requirements and its current planning in this regard establish the initial frame of reference for its Resource Plan. FortisBC's hydroelectric generation plants are expected to supply approximately 214MW of firm capacity and 1,569GWh of energy in 2005, or roughly 30 percent and 50 percent of its capacity and energy requirements, respectively. FortisBC has long-term purchase agreements for additional firm resources with the Columbia Power Corporation/CBT Power Corporation ("CPC/CBT"), for 149MW of capacity and 984GWh of energy through 2056, and with BC Hydro under the PPA, for 200MW of capacity and associated energy through 2013. The total of its long-term firm resources currently supply about 98 percent of its energy needs and about 76 percent of its capacity requirements (Exhibit B-4, pp. 5, 19). FortisBC assessed its load and resource balance through 2024 with its existing and planned resources. Its planned resource additions include its Upgrade and Life-Extension program, Upper Bonnington Re-Powering, and purchase options from local existing and planned resources such as Cominco and the CPC/CBT Brilliant Expansion. The results of its study indicate that with existing owned resources and supply contracts, FortisBC will be able to meet almost all of its energy requirements until 2013 when the 200MW BC Hydro PPA potentially expires. FortisBC notes that there will continue to be a small capacity-related energy shortfall during peak winter periods, growing only slightly to 2013 given that the energy take under the BC Hydro PPA can increase as load grows.

FortisBC's current strategy for acquiring additional resources includes the purchase of capacity-related energy from the market with a combination of short-term advance purchases of capacity and/or energy blocks as well as purchases from the spot market. FortisBC states that it favours capacity purchases because they allow peaking energy to be supplied from BC Hydro under the PPA and because they do not involve any surpluses. FortisBC has regarded this as a more cost-effective strategy than securing long-term firm resources to meet peak demands because it minimizes over-purchases of energy, with the consequent risk that the sell-back of un-needed energy will be at a lower price. Further, FortisBC is constrained from exporting when taking energy from BC Hydro under the PPA. FortisBC acknowledges that while it views its current strategy as cost-effective, it faces the risk of fluctuating power purchase expenses given the exposure to market volatility, as well as reliability risk associated with the market's ability to supply its peaking needs (Exhibit B-4, pp. 19-20). FortisBC's resource planning allowed it to review this strategy in view of expected load growth over the planning horizon. It also allowed FortisBC to investigate the impact if the BC Hydro PPA is not be renewed after 2013, given the significant annual shortfalls in capacity and energy that would occur under this scenario.

FortisBC's Resource Plan presents a comprehensive set of Case Scenarios to assess various strategies to maintain its Load and Resource balance over the 2005-2024 planning horizon. FortisBC models one set of three cases under which it pursues its existing market strategy, while considering separate scenarios wherein the BC Hydro PPA continues until 2024 with no new firm resources added (Case A-1), the BC Hydro PPA ends in 2013 and no new firm resources are added (Case A-2), and the BC Hydro PPA ends in 2013 and is replaced with a new firm resource (Case A-3). FortisBC models a second set of three cases under which it pursues a new market strategy and assumes the BC Hydro PPA continues, while considering separate scenarios wherein no new firm resources are added (Case B-1), a 75MW Peaking Plant is added in 2008 (Case B-2), and a BC Clean Resource (Biomass Plant) is added in 2010 (Case B-3). And finally, FortisBC models a third set of three cases under which it pursues a new market strategy and assumes the PPA ends in 2013, while considering separate scenarios wherein the BC Hydro PPA is replaced with a new 250MW firm resource (Case C-1), a 75MW Peaking Plant is added in 2008 and the BC Hydro PPA is replaced with a new 250MW firm resource (Case C-2), and a BC Clean Resource (Biomass Plant) is added in 2010 and the BC Hydro PPA is replaced with a new 250MW firm resource (Case C-3).

There are a number of assumptions common to the analysis of each Case, including common discount rates (nominal 8, 10, and 12 percent values), common Load and DSM forecasts and, where relevant, common forecast market prices for electricity based on a forecast of Mid-C index values for the 2005-2024 period. FortisBC's Resource Plan considers Load and DSM forecasts consistent with the forecasts provided in support of its 2005 Revenue Requirements Application. While it assumes a constant DSM forecast over the time period of its Resource Plan, FortisBC addresses uncertainty in the factors underlying its load forecast, such as economic and population growth rates, by incorporating a High and Low load forecast. The High forecast assumes a 25 percent increase in the annual load growth rate, while the Low forecast incorporates a 20 percent reduction in the annual load growth rate (Exhibit B-4, pp. 22-30, 59).

In contrast to the existing market strategy modeled in the A-Cases, under which the shortfall between firm resources and requirements is met with short-term monthly or one-year ahead purchases (aside from roughly 75MW of purchases in the spot market), the new market strategy pursued under the B Cases is characterized by meeting the shortfall with medium-term three to five year energy block purchases (again, with roughly 75 MW of spot market purchases). FortisBC modeled the new market strategy as a test of the protection it affords against market volatility risk and reliability risk under the expectation, in part, that this strategy is less susceptible to price shock risk. Medium-term block purchases are considered an effective hedge against price shock because if prices rise the sell-back price of surpluses rises accordingly, offsetting increased costs.

In sum, the modeling of each Case allows FortisBC to assess the incremental cost and rate impacts associated with moving to a new market strategy, losing the BC Hydro PPA, building a peaking plant resource, or building a BC Clean energy resource. FortisBC assessed the sensitivity of its modeling results to changes in discount rates, variations in market prices and the degree of exposure to market price volatility, as well as changes to the assumptions regarding the relative amounts of energy purchased in the spot market in the relevant Cases.

FortisBC concludes, in part, that:

- The existing market strategy under the expected load forecast is the lowest-cost portfolio under the scenario that the BC Hydro PPA continues until 2024 (Case A-1);
- The existing market strategy would continue to be the lowest-cost portfolio if it is not possible to renew the PPA (Case A-2), but the exposure to the market under this scenario would likely be unacceptable, notwithstanding the uncertainty about the viability of the market at that time, and would require the addition of a new long-term firm resource;
- If the PPA is replaced by a new long-term firm resource, the impact on power purchase costs are expected to be significant, an estimated five percent levelized rate impact;
- The new market strategy, while more costly, could be justified with an extreme rise in market prices of approximately six times, but only marginally justified with a moderate rise of about three times, considering also the possibility of price decreases and the benefits of improved reliability;
- A more detailed study of the new market strategy would be required in order to more fully assess the trade-off between increased cost and offsetting risk, and to optimize the new strategy in this regard;
- Adding a BC Clean resource would entail significant cost increases and may not be desired, while other options, such as purchasing “green tags”, could be economic and will be investigated;
- The peaking plant resource, as an alternative to short-term market purchases, is not recommended due to its increased cost; and
- These conclusions are supported under reasonable variations in load forecast, discount rates and market prices.

All told, on the basis of its Resource Plan FortisBC concludes that additional long-term firm resources are not needed until when and if the BC Hydro PPA expires, potentially in 2013. Further, FortisBC states that it should consider reducing its exposure to short-term market purchases (FortisBC Argument, p. 53).

FortisBC proposes the following Action Plan based on its conclusions (Ex. B-4, p. 74; FortisBC Argument, p. 53-54):

1. The Company will begin discussions with BC Hydro, with a view to gaining certainty regarding the status of the PPA beyond 2013.

2. The Company will conduct a more detailed study of a much shorter time frame than was assessed in this Resource Plan study, approximately five years, to optimize a new market strategy that provides more protection from market volatility and improved reliability. FortisBC comments that modeling the market is a complex undertaking and involves a variety of possible strategies and products that could be purchased. It contemplates that it may be possible that some combination of medium term purchases from Cominco and peaking purchase from others can provide a similar level of protection from market volatility and improved reliability at lower cost than the energy block purchases that were simulated in this Resource Plan.

3. The Company will update and file its DSM Potential Study and complete a new DSM plan covering the period 2005-2014, investigating whether a more aggressive program is more cost-effective.

4. The Company proposes to update its Resource Plan on a bi-annual basis. FortisBC states that it is essential that with the dependence on the market to meet some of its requirements, the Company needs to detect shifts in load growth and market trends as soon as possible in order to make the necessary adjustments to its resource plan.

5. The Company will investigate options other than addition of a new long-term firm clean resource for complying with the B.C. Energy Plan.

4.3 Submissions

FortisBC refers in argument to the following two issues raised in respect to its Resource Plan (FortisBC Argument, p. 54):

- Finalizing the PPA with BC Hydro for long term firm resources; and
- The proposed strategy to reduce exposure to market prices.

FortisBC is of the view that while there is risk associated with finalizing an agreement with BC Hydro, successful negotiations can be concluded prior to 2013 when the PPA is due to expire, FortisBC is optimistic that it won’t be a protracted negotiation given its prior experiences of working with BC Hydro (FortisBC Argument, p. 55).

FortisBC refers to its extensive analysis of the new market strategy to conclude that there is a reasonable likelihood of financial benefits to the customer by moving to a strategy that lessens exposure to the spot market. Because it recognizes that such a strategy is very sensitive to market factors, FortisBC proposes to conduct a more detailed study over a shorter time frame than was necessitated in its Resource Plan in order to optimize a strategy that provides more protection from market volatility and improved reliability (FortisBC Argument, pp. 55-56).

FortisBC submits that its Resource Plan is reasonable and prudent, meets the requirements of Section 45(6.2)(b) of the UCA, and is in the public interest (FortisBC Argument, p. 56; FortisBC Reply Argument, p. 28).

4.4 Commission Panel Determinations

The Commission Panel has reviewed the FortisBC Resource Plan, and all of the associated evidence adduced over the course of the hearing. **The Commission Panel accepts the Resource Plan, and component Action Plan,**

determining that it is reasonable and prudent, and that it meets the requirements of Section 45(6.2)(b) of the UCA and is in the public interest.

The Commission Panel has some concerns about the methodological framework that underpins the Resource Plan to the degree that the approach to explicitly account for uncertainty is not especially sophisticated. In one example, the Commission Panel determined that the conclusions of the Resource Plan are not robust to the impact on the new market strategy from changes to the sell back price of surplus energy. The Commission Panel appreciates that FortisBC recognizes that its Resource Plan could be improved in general with greater attention to sensitivity analysis, and in particular with a detailed study of a new market strategy over a shorter time horizon. The Commission Panel encourages FortisBC, both in the next iteration of its resource planning study and in the forthcoming study of a new market strategy, to provide a more comprehensive treatment of the uncertainty in its planning parameters. Besides expanding upon its sensitivity analyses, FortisBC could explore the potential of a simulation analysis, with the use of distributions around key input variables where possible, as a means to improve its accounting of uncertainty in its resource planning study.

With reference to FortisBC's proposed Action Plan, the Commission Panel supports the initiative to begin discussions with BC Hydro, with a view to gaining certainty regarding the status of the PPA beyond 2013. The Commission Panel recognizes that the results of the Resource Plan indicate that a sufficient window of time exists over which FortisBC can gain certainty on the status of the PPA before needing to consider other resource options. The Commission Panel requests that FortisBC file a status update on the progress of negotiations with BC Hydro at the same time as it files its next revenue requirements application, or sooner as applicable. The Commission Panel also requests that FortisBC file at that time a status update on the progress of its detailed study of a new market strategy, including preliminary results as relevant. As noted earlier in this Decision, the Commission Panel directs FortisBC to file its DSM potential study by June 30, 2005 and its 2005-2014 DSM Business Plan by October 31, 2005, the timelines proposed by FortisBC.

FortisBC proposes to update its Resource Plan on a bi-annual basis. In light of the results of the 2005 Resource Plan, the Commission Panel accepts this timeline for the next iteration of the Resource Plan, anticipating then that FortisBC will file an updated plan at the same time it files a 2007 Revenue Requirements application. However, the Commission Panel does not approve FortisBC's proposed timeline as a matter of policy in this instance. The Commission Panel will determine the timeline for any resource planning updates on a prospective basis with its review of future Resource Plans.

DATED at the City of Vancouver, in the Province of British Columbia, this 31st day of May 2005.

IN THE MATTER OF
the Utilities Commission Act, R.S.B.C. 1996, Chapter 473

and

Application by Pacific Northern Gas Ltd.
(PNG-West and Granisle)
for Approval of 2006 Rates

BEFORE: L.A. Boychuk, Panel Chair
and Commissioner

August 16, 2006

O R D E R

WHEREAS:

A. On November 30, 2005, Pacific Northern Gas Ltd. (“PNG”, “PNG-West” and “Granisle”) filed for approval of its 2006 Revenue Requirements Application (the “Application”) to amend its rates on an interim and final basis, effective January 1, 2006, pursuant to sections 89 and 58 of the Utilities Commission Act (the “Act”); and

B. The Application proposes to increase delivery rates to all customers, except Methanex Corporation (“Methanex”) and West Fraser-Kitimat (“West Fraser”), as a result of decreases in cost of service and decreased deliveries to most customer classes. Methanex and West Fraser have contracts in place that provide for fixed demand charges over the term of the contracts; and

C. Methanex closed its methanol/ammonia complex in Kitimat in November 2005 and the Methanex contract terminated effective March 1, 2006 (“Methanex closure”). PNG’s 2006 margin forecast includes fixed demand charges for January and February 2006 under the terms of the Methanex contract; and

D. In its Application PNG forecasts a 2006 revenue deficiency of approximately $5.2 million, which is mainly due to a reduction in revenues of approximately $10.4 million resulting from the Methanex closure. This revenue reduction is partly offset by PNG crediting to its cost of service $5.6 million from the contract termination payment of $23.3 million that Methanex paid to PNG on February 28, 2006; and

E. Following consideration of submissions on the review process for the Application the Commission, by Order No. G-134-05 dated December 16, 2005, scheduled an Negotiated Settlement Process (“NSP”) for the review of the PNG Application and established a Regulatory Timetable as proposed by PNG and supported by the BC Old Age Pensioners Organization et al. (“BCOAPO”); and

…/2

F. Order No. G-134-05 also approved for PNG an interim refundable rate increase in the delivery rates for all classes of customers as filed in the Application effective January 1, 2006, except Methanex and West Fraser. That Order also approved permanent Gas Supply Cost Recovery Rates for sales service customers effective January 1, 2006. The Order also approved the PNG-West company use rate of $0.305/GJ as an interim rate effective January 1, 2006; and

G. The Negotiated Settlement discussions were held in Vancouver on March 13 to 15, 2006 and a proposed Settlement Agreement that would reduce PNG's revenue deficiency to $4.091 million was circulated on March 31, 2006 to the Intervenors and PNG for comments; and

H. Following a review of the comments on the proposed Settlement Agreement, the Commission Panel considered that a further process should be established to review and consider Item 1, "Methanex Termination Payment" of the proposed Settlement Agreement. Accordingly, by Order No. G-40-06 dated April 7, 2006, the Commission approved a BCOAPO request for an additional round of information requests and established a timetable for information requests, information responses, submissions by PNG, Intervenor submissions and a PNG reply; and

I. By Letter No. L-19-06 dated May 17, 2006, the Commission Panel sought further specific written submissions from those parties who had submitted written argument based on the evidentiary record established in this proceeding. Letter No. L-19-06 contained Commission Panel questions and established a timetable for written responses by PNG and BCOAPO to questions relating to their submissions, the filing of a response by BCOAPO and Mr. Childs and a reply by PNG. The Commission Panel indicated that it would consider the additional submissions based on the evidentiary record for this proceeding prior to making a decision on PNG's Revenue Requirements Application and the proposed Settlement Agreement; and

J. The Commission Panel reviewed the submissions made by PNG, BCOAPO and Mr. Childs, the proposed Settlement Agreement for PNG-West and the letters of comment received from the Intervenors. The Commission Panel determined that in view of the position of BCOAPO, the Commission Panel did not have a proposed Settlement Agreement before it for approval and it therefore was not in a position, as outlined in Order No. G-66-06 dated June 9, 2006 and the attached Reasons for Decision, to render a decision without further process, including a decision in relation to Item 1 of the proposed Settlement Agreement; and

K. By Order No. G-66-06 the Commission Panel also concluded that before establishing a further process, the views of parties must be obtained in an effort to establish the most effective and efficient process possible at that stage. Order No. G-66-06 established a timetable for the filing of comments by BCOAPO and other registered intervenors and PNG reply comments, including submissions on appropriate steps and timing for either an oral and/or written hearing process, the issues to be considered, confirmation of the issues that may have been resolved during the NSP, and the nature of any evidence to be filed and justification therefore; and

L. The Commission Panel reviewed the submissions made by PNG, BCOAPO and Mr. Childs and, by Order No. G-77-06 dated June 28, 2006, closed the evidentiary record and established a timetable for the filing of Argument with PNG's Argument required by July 7, 2006, Intervenor Argument by July 17, 2006 and PNG Reply Argument by July 24, 2006; and

…/3

M. The Commission Panel has considered the Application, the evidence adduced in relation thereto, the submissions and Written Argument, all as set forth in the Reasons for Decision attached as Appendix A and issued concurrently with this Order.

NOW THEREFORE pursuant to Sections 58, 60 and 61 of the Act the Commission orders as follows:

1. The Commission approves for PNG its Application subject to the required adjustments set out in the attached Reasons for Decision.

2. Since the approved rates are less than the interim rates that have been in effect since January 1, 2006, PNG is to inform its customers of the final rates by way of a Customer Notice and provide a method for refunding excess payments back to customers.

3. PNG is to file permanent Gas Tariff Rate Schedules that are in accordance with the terms of this Order and Reasons for Decision.

4. PNG is to file a complete set of detailed schedules contained under Tab Rates and Tabs 1 to 5 of the Application that reflects the adjustments required by this Order and Reasons for Decision, by September, 8, 2006.

DATED at the City of Vancouver, in the Province of British Columbia, this 21st day of August 2006.

BY ORDER

Panel Chair and Commissioner

Attachment

An Application by Pacific Northern Gas Ltd.
(PNG-West and Granisle)
for Approval of 2006 Rates

REASONS FOR DECISION

1.0 THE APPLICATION

On November 30, 2005, Pacific Northern Gas Ltd. ("PNG", "PNG-West" and "Granisle") filed for approval of its 2006 Revenue Requirements Application (the "Application") to amend its rates on an interim and final basis, effective January 1, 2006, pursuant to sections 89 and 58 of the Utilities Commission Act (the "Act"). The Application proposed to increase delivery rates to all customers, except Methanex Corporation ("Methanex") and West Fraser-Kitimat ("West Fraser"), as a result of decreases in cost of service and decreased deliveries to most customer classes. Methanex and West Fraser have contracts in place that provide for fixed demand charges over the term of the contracts.

Methanex closed its methanol/ammonia complex in Kitimat in November 2005 and the Methanex contract terminated effective March 1, 2006 ("Methanex closure"). PNG's 2006 margin forecast includes fixed demand charges for January and February 2006 under the terms of the Methanex contract. In its Application, PNG forecast a 2006 revenue deficiency of approximately $5.2 million, which is mainly due to a reduction in revenues of approximately $10.4 million resulting from the Methanex closure. This revenue reduction is partly offset by PNG crediting to its cost of service $5.6 million from the contract termination payment of $23.3 million that Methanex paid to PNG on February 28, 2006.

On February 17, 2006 PNG revised the Application to reflect 2005 year-end actual results and to include updates to customer counts, use per account and reclassification of customers, which reduced the 2006 revenue deficiency to $4.034 million (Exhibit B-10). On March 9, 2006, PNG advised the Commission and Registered Intervenors that the Commission's decision to increase the 2006 benchmark low-risk utility return on equity to 8.80 percent by Order No. G-14-06 dated March 2, 2006, would increase PNG's allowed return on common equity under the Commission's automatic adjustment formula from 8.94 percent to 9.45 percent and increase PNG's 2006 revenue deficiency to $4.435 million (Exhibit B-13).

2.0 THE REGULATORY PROCESS

PNG had discussions regarding the review process for the Application with the BC Old Age Pensioners Organization et al. ("BCOAPO") and staff of the Ministry of Energy, Mines and Petroleum Resources, who were the active intervenors in the review of the PNG 2004 and 2005 revenue requirements applications (the "Parties"). By letter dated December 13, 2005, PNG advised the Commission that the Parties were of the view that the Application should be subject to a Negotiated Settlement Process ("NSP") and provided a draft Regulatory Timetable for information requests, information responses, a 2005 year-end update to the Application and NSP discussions commencing the week of March 13, 2006 (Exhibit B-2). The draft Regulatory Timetable did not include a provision for Intervenor evidence and related information requests and responses. On December 14, 2005 BCOAPO filed a letter of support for a NSP and PNG's proposed Regulatory Timetable (Exhibit E-1).

By Order No. G-134-05 dated December 16, 2005 (Exhibit A-1), the Commission approved for PNG an interim refundable rate increase in the delivery rates for all classes of customers as filed in the Application effective January 1, 2006, except Methanex and West Fraser. Order No. G-134-05 also scheduled an NSP for the review of the PNG Application and established a Regulatory Timetable for information requests and information responses with NSP discussions to commence on March 13, 2006 as proposed by PNG and supported by BCOAPO.

During the course of this process, the Commission also received numerous letters of comments and form letters expressing concern about the proposed rate increase and a petition containing over 4,000 signatures (Exhibit C11-4) that also opposed the Application.

3.0 THE PROPOSED SETTLEMENT AGREEMENT

The NSP discussions were held in Vancouver on March 13 to 15, 2006. The following Intervenors participated: BCOAPO, Robin Austin, MLA-Skeena, Mayor Talstra of Terrace, Neil Helland and counsel for the Haisla Nation. Following the conclusion of the negotiations, a proposed Settlement Agreement that would reduce PNG's revenue deficiency to $4.091 million was circulated to those who participated in the settlement discussions. By letter dated March 28, 2006, PNG advised the Commission that the final copies of the proposed Settlement Agreement and letters of comment would be forwarded to the Commission for review and made public on March 31, 2006. PNG's letter asked the Commission to issue an order approving the proposed Settlement Agreement on an interim or permanent basis by April 7, 2006 to coincide with the Gas Supply Cost Recovery Rates that were approved effective April 1, 2006. The letter also advised that "one of the parties may be making a request to have one matter dealt with by the Commission that would not change the overall 2006 cost of service agreed to for the PNG-West division". The proposed Settlement Agreement included Bill Comparison Tables for residential and small commercial customers, which indicated that the proposed rates for delivery charges and gas supply cost recovery rates effective April 1, 2006, would be less than the rates that prevailed at the end of 2005.

Letters of comment on the proposed Settlement Agreement were received from the BCOAPO, the Haisla Nation, Robert W. Childs, Mayor Talstra of Terrace, Robin Austin, MLA-Skeena and the Kitimat Chamber of Commerce. In its letter of comment dated March 29, 2006, BCOAPO advised that it did not accept the proposed Settlement Agreement and in particular Item 1 which "represents the fundamental gist of the agreement in that it purports to transfer the entire shortfall arising from Methanex leaving the PNG-West system to the residential and small commercial customers". BCOAPO stated that it did not have any objection to the remainder of the proposed Settlement Agreement and had no objection to PNG's request to have the rates that would arise from the proposed Settlement Agreement approved on an interim basis, pending resolution of the allocation of the Methanex revenue shortfall. In the letter, BCOAPO expressed its position as follows: "[It] is BCOAPO's position that the question of the proper allocation of the revenue shortfall arising from Methanex leaving the PNG-West system should properly be addressed by a Commission panel and should not be the subject of a negotiated settlement." BCOAPO also expressed the view that an oral hearing and a full 2006 Revenue Requirements proceeding was not necessary. It suggested that the issue could be resolved in a written hearing process with an additional round of information requests to PNG-West to ensure that all necessary and appropriate evidence is before the Commission.

Robert Childs' comments were similar to those of BCOAPO, except that he recommended that "the 06/01/01 Interim Rates remain in effect until a Final Commission Ruling is made". The Haisla Nation accepted PNG's commitment to work with the Haisla Nation and took no position on the remainder of the proposed Settlement Agreement. Mayor Talstra in his letter of comment dated April 5, 2006, found the proposed Settlement Agreement to be acceptable provided that the new rates, including gas supply costs charges remain in effect throughout 2006. In his letter dated April 6, 2006, Robin Austin did not agree with PNG's proposal that the lost revenue from the Methanex contract should be downloaded to residential and commercial customers and requested a written hearing to resolve this issue. The Kitimat Chamber of Commerce in its email dated April 6, 2006 protested PNG's increased delivery charges and asked for the review process to continue.

By letter dated April 3, 2006, PNG requested that the Commission approve rates arising from the proposed Settlement Agreement on either a permanent basis or on an interim basis pending review of the issue raised in BCOAPO's letter of comment dated March 29, 2006. In support of its request that the Commission approve the 2006 NSP rates on a permanent basis, PNG cited previous Commission decisions on the allocation of revenue reductions to PNG's customers and suggested that by allocating the revenue reduction to the remaining customers, the Commission would carry out its statutory duty consistent with past practice. PNG further submitted that allocating any of the remaining revenue deficiency to PNG's shareholders would contravene section 59(5)(b) of the Act. PNG recommended that the Commission issue an Order on April 7, 2006 reconfirming its past practice and approving the NSP 2006 rates on a permanent basis. In the alternative, PNG submitted that should the Commission decide to conduct a hearing as requested by BCOAPO, then the BCOAPO "has effectively become the applicant in this situation" and should be directed to file evidence upon which all parties should be given an opportunity to issue information requests to BCOAPO.

By letter dated April 4, 2006, BCOAPO commented on PNG-West's brief review of past Commission decisions and submitted that the question of how section 59 of the Act should be applied in PNG-West's current situation is a matter that requires determination by the Commission after hearing submissions from appropriate parties. BCOAPO agreed that the record was "essentially complete". While it did not propose to adduce further evidence, BCOAPO did request further Commission process on the main issue, including a round of information requests to ensure that relevant information, which was not included in the formal record but referred to in the course of the NSP by PNG, became part of the public record.

The BCOAPO letter concluded with the comment: "In BCOAPO's submission, its suggested process would result in a more focused and efficient consideration of the main issue than that proposed by PNG-West in its April 13, 2006 letter".

The Commission reviewed the proposed Settlement Agreement for PNG-West and the letters of comment received. It accepted the BCOAPO request for a further process. By Order No. G-40-06, the Commission established a process to review and consider Item 1, "Methanex Termination Payment", of the proposed Settlement Agreement. Order No. G-40-06 provided for an additional round of Intervenor information requests to PNG-West and set a filing deadline for Intervenor requests of April 18, 2006 with a PNG information response deadline of April 24, 2006. The Commission did not agree with PNG-West's characterization of BCOAPO as an effective applicant in this situation and, accordingly, the Commission did not direct BCOAPO to file evidence. Order No. G-40-06 also set a timetable for submissions related to Issue 1 with a PNG filing deadline of April 28, 2006, followed by Intervenor submissions of May 4, 2006 and a PNG Reply of May 9, 2006.

4.0 SUBMISSIONS ON ITEM 1 OF THE PROPOSED SETTLEMENT AGREEMENT

PNG filed its submission on April 28, 2006. PNG stated in its April 28, 2006 submission that: "…there is a statutory obligation upon the Commission to fix rates that permit PNG the opportunity to recover all of its costs of providing service, including the fair rate of return on common equity approved for PNG by the Commission. Rates that are insufficient to enable a utility to recover its cost, including a fair and reasonable return, are unjust and unreasonable under the Utilities Commission Act". PNG cited as the leading case authority ***Hemlock Valley Electrical Services v. British Columbia (Utilities Commission)*** (1992), 66 B.C.L.R (2d) 1 (C.A.) which, in turn, is based on the Supreme Court of Canada's decision in ***British Columbia Electric Railway Co. Ltd. v. Public Utilities Commission of BC***, [1960] S.C.R. 837 (***"Hemlock Valley"* and *"B.C. Electric"***, respectively). In PNG's view these decisions focus on what are now substantially the provisions found in subsections 59(1), (4), (5) and 60(1) of the Act (PNG April 28, 2006 submission, paragraphs 4-12).

PNG also referred to the Commission's findings in the 2002 PNG Revenue Requirements Decision with respect to a 2002 revenue reduction from the methanol plant shutdown in 2001 and a new negotiated agreement with Methanex (the "2002 Decision"). The 2002 Decision noted that the allocation of the revenue deficiency from Methanex to the other customers is consistent with previous actions of the Commission. The 2002 Decision also found that rates to all customer classes remained affordable at that time (PNG April 28, 2006 submission, paragraph 17).

The BCOAPO filed its Reply Argument on May 4, 2006. BCOAPO agreed that ***Hemlock Valley*** and ***B.C. Electric*** are applicable to the regulation of utilities in British Columbia; however, it submitted that the Commission must consider how these decisions should be applied to a utility in PNG's situation. BCOAPO quotes from the judgment of Mr. Justice Martland in ***B.C. Electric*** which states in part, "The rate to be imposed [under what is now section 60 of the Act having regard to what are now subsections 59(5)(a) and (b) of the Act] shall be neither excessive for this service nor insufficient to provide a fair return on rate base. There must be a balancing of interests." BCOAPO further submitted that ***Hemlock Valley*** and ***B.C. Electric*** must be considered in the light of ***ATCO Gas & Pipelines Ltd. v. Alberta (Energy & Utilities Board)***, 2006 SCC 4 ("***ATCO***"). BCOAPO argues that the Supreme Court in Canada in ***ATCO*** "…has appropriately set out a balance between shareholders and ratepayers in the allocation of the revenue requirement shortfall that the utility faces" and urges the Commission to follow the approach in ***ATCO*** (BCOAPO May 4, 2006 submission, paragraphs 27-38).

BCOAPO concluded its submission as follows:

> 45. For all these reasons BCOAPO submits that approval of Item 1 of the Settlement Agreement would result in rates to residential customers which are not just and reasonable.
>
> 46. The Commission should not approve Item 1 of the Settlement Agreement.

Mr. Childs also filed a submission on Item 1. He expressed the view that the remaining customers should not be solely responsible for the revenue shortfall arising from the Methanex closure. At the end of his submission, he made the following suggestions:

> (1) PNG recover 100% of their audited costs to physically supply gas to customers.
>
> (2) The rest of the Methanex closure shortfall should be shared equally between the PNG shareholders and the remaining customers, provided that the gas delivery charge does not exceed:
>
> (i) the existing proposed average increases in Hydro, ICBC insurance rates or property taxes.
> (ii) the cost of inflation by more than 100%.

PNG filed its Reply Submission on May 9, 2006. It noted that with the exception of Item 1, all other aspects of the proposed Settlement Agreement had been agreed to by the Parties. PNG took issue with a number of the factual assertions made by the BCOAPO, distinguished ***ATCO*** on the basis that ***ATCO*** did not involve the setting of just and reasonable rates and submitted that ***Hemlock Valley*** and ***B.C. Electric*** remain the governing law, noting that ***Hemlock Valley*** was cited with approval recently in ***TransCanada Pipelines Ltd. v. Canada (National Energy Board)***, [2004] FCA 149.

PNG also took issue with Mr. Childs' submissions relating to the interpretation of sections 59 and 60 of the Act and submitted that a number of Mr. Childs' submissions were inaccurate or irrelevant. PNG concluded its Reply as follows:

> 25. To allocate any of the net revenue deficiency resulting from the termination of the Methanex contract to PNG's shareholders, as advocated by BCOAPO and Mr. Childs, would result in rates that do not permit PNG to recover its costs of providing service and would therefore contravene sections 59 and 60 of the Utilities Commission Act.
>
> 26. PNG reiterates its request that the Commission approve the March 15, 2006 Settlement Agreement in its entirety, including Item 1.

By Letter No. L-19-06, the Commission Panel sought further specific written submissions from those parties who had submitted written argument based on the evidentiary record established in the proceeding. Letter No. L-19-06 contained Commission Panel questions and requested that PNG and BCOAPO, as appropriate, file further written responses that relate to their written submissions, by Monday, May 29, 2006 and that BCOAPO and Mr. Childs, if he so wished, file a response by Friday, June 2, 2006, followed by a PNG reply by Wednesday, June 7, 2006. The Commission Panel indicated that it would consider these additional submissions based on the evidentiary record for the proceeding prior to making a decision on PNG's Revenue Requirements Application and the proposed Settlement Agreement.

5.0 RESPONSES TO LETTER NO. L-19-06 AND SUBMISSIONS

PNG, BCOAPO, and Mr. Childs all responded to the questions in Letter No. L-19-06 within the times provided. The Commission Panel only intends to refer here to certain answers of BCOAPO and the PNG reply to those answers. In response to Question 1 ["Is it the fact that parties have agreed to all aspects of the proposed Settlement Agreement, but for Item 1, that brings ***Hemlock Valley*** into operation?"], BCOAPO's response was "No". It stated that Item 1 was "clearly the major [d]river of the proposed revenue requirement increase" that other items were secondary and that by agreeing to those other items the Parties could avoid a full hearing into all aspects of the Application and focus on the major issue. Significantly, BCOAPO stated that "…the evidentiary record in this proceeding is not sufficient to allow the Commission to make an appropriate apportionment between the remaining ratepayers and PNG's shareholders of the revenue deficiency resulting from Item 1". It submitted that evidence with respect to the appropriate return on equity risk premium for PNG post-Methanex and on the methodology for determining an appropriate allocation of the revenue deficiency is now required (BCOAPO Response, May 29, 2006, pp. 1 and 2).

In partial response to Question 5 in Letter No. L-19-06 ["…the Commission remains unclear and seeks clarification related to the level of apportionment that BCOAPO suggests would be appropriate, the principles or methodology BCOAPO suggested should be applied, and the evidentiary basis on the record of this proceeding upon which BCOAPO relies to allow the Commission to do so."], after stating its position that there is no proposed Settlement Agreement before the Commission for approval, BCOAPO submitted that once the Commission has made its decision on Item 1, the NSP should reconvene and:

> If a Settlement Agreement is reached it would then be presented to the Commission for approval. If no Settlement Agreement is reached the matter would then proceed to an appropriate hearing or, alternatively, it would be open to PNG to amend its application.

The BCOAPO once again submitted in its response to Question 5 that there is an insufficient evidentiary record before the Commission to make a decision (BCOAPO Response May 29, 2006, p. 2) and in paragraph 1 of its response dated June 2, 2006, BCOAPO reiterated its position that there is no proposed Settlement Agreement before the Commission at this time.

In its Reply Submission dated June 6, 2006, PNG addresses BCOAPO's most recent submissions on the absence of a settlement and the need for further evidence and process. In paragraph 7 of its Reply under the heading **"BCOAPO's Shifting Position"**, PNG provides the following summary of the BCOAPO position prior to May 29, 2006**:**

> 7. Prior to its May 29, 2006 filing, BCOAPO's position can be summarized in its own words as follows:
>
> (a) BCOAPO "does not accept Item 1 of the Negotiated Settlement Agreement", <u>but</u> "does not have any objection to the remainder of the proposed Negotiated Settlement Agreement."
>
> (March 29, 2006 letter, page 1)
>
> (b) "it is BCOAPO's position that the question of the proper allocation of the revenue shortfall arising from Methanex leaving the PNG-West system should properly be addressed by a Commission panel."
>
> (supra, page 2)
>
> (c) "BCOAPO is prepared to cooperate in expediting the resolution of this issue. It does not believe that an oral hearing is necessary; certainly a full 2006 Revenue Requirement proceeding is not necessary."
>
> (supra, page 2)
>
> (d) "BCOAPO submits that this issue can appropriately be resolved in a written hearing process, provided that parties are given an opportunity to address an additional round of information requests to PNG-West to ensure that all necessary and appropriate evidence is before the Commission."
>
> (supra, page 2)
>
> (e) "BCOAPO agrees that the record in this proceeding is essentially complete. It would not propose to adduce further evidence. However, it is requesting a limited round of information requests, simply for the purpose of ensuring that relevant information, which is not included in the formal record but which was referred to in the course of settlement negotiations by PNG is a part of the record."
>
> (April 4, 2006 letter, page 2)"

At paragraph 9 of its June 6, 2006 Reply, PNG comments as follows:

> "It is disingenuous for BCOAPO to have asked the Commission to make a decision with respect to Item 1 pursuant to this written proceeding after telling the Commission it has no objection to the remainder of the Settlement Agreement, and to then turn around and say it is not in a position to make "meaningful submissions" to the Commission with respect to Item 1, that the Commission now needs to embark on some further process to determine this issue and that after

> the Commission makes a decision the settlement process should "reconvene" taking into account the Commission's decision…".

In PNG's submission, no further information is needed for the Commission to make a decision on Item 1 and BCOAPO's relative risks theory to apportion the revenue deficiency has no merit (PNG's June 6, 2006 Reply, paragraphs 10-14).

In the "Conclusion" of its June 6, 2006 Reply, PNG requests a timely decision by the Commission without additional process noting that six months have passed since PNG filed its Application and it has credit facilities that are maturing on July 24, 2006.

In its Reasons for Decision and Order No. G-66-06, the Commission Panel found that BCOAPO's submissions made it clear that there was no agreement before the Commission Panel to approve. The Commission Panel stated that it was not prepared to impose a settlement on the parties in this proceeding, which would be the effective result if it accepted the PNG submissions on the proposed settlement.

The Commission Panel also determined that it was not in a position to decide the Application, including Item 1 of the proposed Settlement Agreement, without further process. In an effort to establish an effective and efficient process, the Commission Panel requested submissions from all Parties related to appropriate steps and timing for either an oral and/or written hearing process, the issues to be considered, confirmation of the issues that may have been resolved during the NSP, and the nature of any proposed evidence to be filed and a justification for such evidence.

On the basis of BCOAPO's May 29 and June 2, 2006 submissions, it appeared that Item 1 and now Item 17, "Return on Equity and Capital Structure" of the proposed Settlement Agreement are the aspects of the Application which, in BCOAPO's view, remain in dispute. In an effort to limit the issues and any additional evidence to be adduced in this proceeding, the Commission Panel sought to confirm whether any or all other aspects of the Application continue to be accepted by the NSP participants as set forth in the document styled "Negotiated Settlement Agreement" and dated March 15, 2006.

The Commission Panel noted that there had been ample opportunity for all parties to develop an evidentiary record and that it did not consider it appropriate at that late stage to embark upon a further and more extensive examination of the issues that should have been properly developed by that time. The Panel, therefore, indicated that it would require a detailed explanation of the nature of any further evidence proposed and a justification for such evidence. By Order No. G-66-06, the Commission Panel requested that BCOAPO and any other Registered Intervenors provide comments on the nature and extent of the further process by Friday, June 16, 2006 and that PNG provide reply comments by Monday, June 19, 2006.

6.0 SUBMISSIONS IN RESPONSE TO COMMISSION ORDER NO. G-66-06

BCOAPO, Mr. Childs and PNG filed submissions in response to Order No. G-66-06 and the Commission Panel's request.

In BCOAPO's view, there were two separate but related issues related to Item 1 of the proposed settlement agreement:

1. the proper regulatory treatment of the revenue requirement shortfall from the loss of Methanex; and
2. the appropriate application of the Commission's decision with respect to (1).

BCOAPO considered that the issue of the proper regulatory treatment of the revenue shortfall arising from the loss of Methanex is a legal question requiring a Commission decision with respect to the statutory requirements of the Act as judicially interpreted and considered in the light of PNG's present situation. BCOAPO did not believe that it could usefully add anything further to the submissions already before the Commission on this issue. BCOAPO stated that "once the commission's decision has been issued, the remaining issues could be easily resolved …".

BCOAPO advocated an oral hearing to address the two separate but related issues arising with respect to Item 1. BCOAPO stated that it would be prepared to call evidence on the appropriate allocation of the Methanex revenue shortfall at such a hearing and would be prepared to respond to information requests, if the Commission so required, and that it should be open to PNG to file such further evidence as it considered appropriate on this issue. BCOAPO attempted to justify its request to file this evidence by stating that "what is presently before the Commission does not appropriately address this issue".

With respect to any issues that may have been resolved during the NSP, BCOAPO's position was that "final resolution of any of these issues is dependent on the Commission's decision with respect to the appropriate regulatory treatment of the Methanex revenue shortfall".

Mr. Childs submitted that a written hearing process would be more appropriate and expedient and that it should include an initial round of written negotiating positions by PNG and participating intervenors followed by a second and final round of revised negotiating positions, as appropriate. He also proposed a number of issues to be considered in this process.

PNG also proposed a written process based on the evidentiary record established to date. PNG submitted that there is an extensive evidentiary record before the Commission on which the Commission can make a decision with respect to the Application.

In the Reasons for Decision attached to Order No. G-77-06, the Commission Panel noted that there have been three rounds of information requests to date and opportunities for submissions. The Commission Panel further noted and that BCOAPO had not previously requested that it be allowed to file evidence when given the opportunity to do so when the Commission Panel sought submissions to establish a process to consider Item 1 of the proposed settlement document. The Commission Panel also observed that while BCOAPO had requested the opportunity to file further evidence, it had not explained or provided any substantive justification for the introduction of new evidence to the extent required by Order No. G-66-06.

Having received no submissions in response to its request in Order No. G-66-06 that could assist the Commission Panel to understand the nature and extent of evidence that BCOAPO considered would be helpful in the decision-making process, the Commission Panel concluded that no further evidence was necessary and that the further process to consider the Application would be a written process consisting of Argument by PNG, Intervenor Argument and PNG Reply Argument.

In the Reasons accompanying Order No. G-77-06, the Commission Panel rejected PNG's alternate proposal which would have allowed PNG to simply confirm that its applied-for cost of service for rate making purposes was that set out in the regulatory schedules attached to the proposed settlement document. The Commission Panel's purpose in so doing was to avoid the possibility of improperly narrowing the scope of argument. The Commission Panel also again refused to adopt the approach advocated by BCOAPO that would result in an advance ruling on the issue of the proper regulatory treatment of the revenue requirement shortfall from the loss of Methanex (Order No. G-77-06, Appendix A, p. 5 of 6).

By Order No. G-77-06, the Commission closed the evidentiary record and established a timetable for the filing of Argument with PNG's Argument required by July 7, 2006, Intervenor Argument by July 17, 2006 and PNG Reply Argument by July 24, 2006.

7.0 ARGUMENT FILED IN RESPONSE TO ORDER NO. G-77-06

7.1 PNG ARGUMENT

PNG filed its Argument on July 7, 2006 and requested approval of its 2006 revenue deficiency as set out in the proposed settlement document of $4.091 million, rather than the revised revenue deficiency of $4.435 million contained in the updated Application (Exhibit B-13). PNG's Argument addressed its 2006 Revenue Requirements by topics of Cost of Service, Rate Base, Deferral Accounts, Gas Deliveries and Margin Forecasts, Customer Rates and Just and Reasonable Rates. PNG's Argument also included summary regulatory schedules for the Cost of Service Comparison, Utility Income and Return, Utility Rate Base, Income Taxes, Common Equity and Return on Capital.

7.1.1 Cost of Service

<u>Operating, Maintenance, General and Administrative Expenses</u>

Operating, Maintenance, General and Administrative Expenses, excluding the company use gas costs, have increased to $13.997 million in 2006 from $13.539 million under the NSP 2005 settlement ("NSP 2005"). Operating expenses (net of transfers to capital and company use gas costs) are $212,000 higher than 2006 primarily due to the salary adjustment provisions of a three-year collective agreement that was effective November 1, 2004. Maintenance expenses are expected to be $39,000 higher in 2006, which PNG described as being consistent with actual costs from 2001 to 2005. Administrative and general expenses in 2006 are budgeted to be about $207,000 higher than 2005 mainly due to increased labour and employee benefits costs offset by a reduction in PNG's share of the Commission's administrative costs.

<u>Other Cost of Service Items</u>

A net decrease of $159,000 has occurred in 2006 from NSP 2005 related to transfers to capital, property taxes, depreciation, amortization and other income. PNG notes that a significant increase in property taxes has been offset by lower depreciation expense, higher transfers to capital and a substantial increase in the shared service cost recoveries from Pacific Northern Gas (N.E.) Ltd. ("PNG (N.E.)").

Income Tax Expense and Return on Rate Base

The revenue requirement for income taxes, return on common equity, short-term and long-term debt interest and preferred share dividends has decreased by $1,252,000 to $14.620 million in Test Year 2006 from $15.872 million in NSP 2005. The decrease is due to lower income tax rates, lower depreciation expense and lower return on common equity.

The return on common equity of $4,959 million for 2006 compared to $5,857 for NSP 2005 is due to increases in the allowed rate of return on common equity offset by decreases in rate base (PNG Argument, p. 18). PNG is requesting a risk premium of 65 basis points above the low risk benchmark utility and a deemed common equity component of 40 percent. For years PNG's allowed risk premium was 75 basis points which was reduced to 65 basis points in the PNG 2004 Revenue Requirement Decision. PNG submits that a 65 basis point relative risk premium is the minimum acceptable level having regard to PNG's risk profile. PNG anticipated it would be able to access the debt market in mid-2006 and achieve and maintain an equity component of 40 percent but with it being later in the year and its actual equity component being above 40 percent, the actual return on equity will be lower than forecast.

7.1.2 Rate Base

PNG's forecast mid-year 2006 rate base has decreased to $131.2 million from $133.5 million in NSP 2005. PNG performed a review of its transmission system to determine which facilities are required to provide safe, reliable and efficient service to its remaining customers following the closure of the Methanex plant. PNG determined that it could deactivate compressor stations R2 and R4, a 10 inch loop (52.8 miles in length), a 6 inch lateral to Kitimat (32.97 miles in length) and a Methanex meter and regulating station. These assets have in-service dates of 1968-69 and 1981-82 with an original cost of $15.581 million and a depreciated value on December 31, 2005 of $5.05 million.

PNG is seeking Commission approval to transfer the net book value of $5.05 million of these assets from plant in-service to a non-rate base interest bearing deferral account effective January 1, 2006. PNG is also requesting that the account be amortized on a monthly basis over 10 years commencing January 2006. PNG is also seeking approval that a notional account be set up as described in Exhibit B-1, Tab Application, page 7 to record the risk-weighted foregone return and if the plant is returned to service then the unamortized deferral account balance and the risk-weighted foregone return will be added back to plant in-service.

7.1.3 Deferral Accounts

Information on PNG's deferral accounts is found in Exhibit B-10, Tab 2, pages 10 to 12 with a subsequent correction made to reduce the amortization expense from $928,000 to $901,000. The amortization expense for the deactivated facilities is forecast to be $668,000 in 2006. A depreciation adjustment credit deferral amortization of $658,000 for over-depreciated assets is described in Exhibit B-10, Tab 2, page 11 with background information provided in Exhibit B-10, pages 2 to 3.

By letter dated October 4, 2005 PNG applied to the Commission for approval to record the contract termination payment of approximately $23.3 million in an interest bearing deferral account to the benefit of customers. The amount to be amortized each year is to be proposed in the annual revenue requirements application and is subject to approval by the Commission. This treatment was accepted in the 2005 NSP.

PNG is proposing to amortize the termination payment over the 44-month period from March 2006 to October 2009 to coincide with the original expiry date of the Methanex contract. PNG is seeking Commission approval to amortize $5.553 million of the contract termination payment in 2006 rates.

PNG is also seeking Commission approval to amortize the customers' $169,855 after tax share of the income trust application hearing costs at 20 percent per year commencing in 2006.

7.1.4 Gas Deliveries and Margin Forecasts

PNG forecasts deliveries to its customers for 2006 that are lower than the volumes used in the 2005 NSP. The 2006 volumes are about 25.7 TJ lower than 2005 NSP with 25.4 TJ of the volume decrease due to the Methanex closure. The total decrease in margin of approximately $10.8 million in 2006 compared to NSP 2005 is primarily due to the decrease in the Methanex margin of about $10.4 million. The remainder of the volume and margin decrease is mainly due to declines in use per account. The use per account of residential customers has decreased to 82.4 GJ in 2006 compared to 84 GJ in NSP 2005. The small commercial use per account is forecast to decrease to 361.3 GJ in 2006 from 366.3 GJ in NSP 2005. PNG attributes the decline in residential/small commercial use per account to high gas commodity costs and the current economic conditions in PNG's service area. The deliveries to small industrial customers are forecast to be slightly higher in 2006 by 14,000 GJ compared to NSP 2005. However, due to changes in the composition of the class, the 2006 margin is expected to decrease by $47,600 from NSP 2005. The Methanex contract terminated at the end of February 2006 and PNG recorded the Methanex margin for January and February 2006 under the small commercial class. The small commercial class is forecast to have a decrease in deliveries of 14,000 GJ in 2006 compared to NSP 2005 but a decline in margin of $78,000. The 2006 deliveries to West Fraser are expected to decrease by 175,000 GJ in 2006 compared to NSP 2005 but the margin is expected to increase by $42,000. Deliveries to Alcan for 2006 are expected to be at historical levels, which results in a decrease in volumes of 32,000 GJ for 2006 and a decrease in margin of $52,000 compared to NSP 2005.

7.1.5 Customer Rates

PNG is seeking Commission approval to adjust its 2005 customer rates to recover the 2006 revenue deficiency of $4.091 million. PNG is also seeking Commission approval of a 2006 RSAM (Revenue Stabilization Adjustment Mechanism) rate rider of $0.301/GJ to replace the interim rate rider of $0.26/GJ effective January 1, 2006. PNG is also seeking approval of its company use gas forecast and estimated cost, which would result in a permanent Company Use Gas Cost Rate of $0.185/GJ effective January 1, 2006 in place of the $0.305/GJ interim rate.

PNG provided a rate comparison table for residential Rate Schedule ("RS") 1 class and the small commercial class RS 2 class that shows the components of delivery charges and gas commodity charges for December 31, 2005 and the applied-for rates for January 1, 2006, April 1, 2006 and July 1, 2006. Based on the 2006 forecast use per account of 82.4 GJ for residential and 361.3 GJ for small commercial, PNG calculates the annual bill using the applied-for delivery charge and gas commodity rates. The following table reproduces the PNG rate comparison table for the total delivery charge, commodity cost and annual bill.

	($/GJ)			
Customer Class	Dec. 31/05	Jan. 1/06	Apr. 1/06	Jul. 1/06
Residential (RS 1)				
Delivery Charge	$7.355	$8.602	$8.602	$8.602
Commodity Charge	$9.608	$9.895	$8.245	$7.475
Total Gas Rate	$16.963	$18.497	$16.847	$16.077
Annual Bill using 82.4 GJ	$1,398	$1,524	$1,388	$1,325
Small Commercial (RS 2)				
Delivery Charge	$6.280	$7.337	$7.337	$7.337
Commodity Charge	$9.651	$9.873	$8.223	$7.458
Total Gas Rate	$15.931	$17.210	$15.560	$14.795
Annual Bill using 361.3 GJ	$5,756	$6,218	$5,622	$5,345

PNG estimates that the termination of the Methanex contract will result in about a $100 per year increase in delivery charges for residential customers.

PNG is also seeking Commission approval of revised rate structures for its RS 4, RS 5 and RS 6 customer classes as shown in Exhibit B-1, Tab Application, pages 48 to 52 with the following modifications that were discussed during the NSP process in March 2006:

a) A monthly fixed charge of $125 is to apply to the RS 4 customer class instead of no monthly fixed charge as originally proposed by PNG.

b) The tariff for the RS 6 seasonal off-peak customer class would extend the off-peak period to include November and March subject to PNG adding a provision to its tariff providing PNG with the right to curtail service in November and March to meet the gas requirements of its year round firm customers.

7.1.6 Just and Reasonable Rates

PNG's submissions regarding the Commission's obligation to fix rates that permit PNG the opportunity to recover all of its cost of providing service (including the fair rate of return on common equity approved for PNG by the Commission are based on subsections 60(1) and 59(5) of the Act and are set out in PNG's submissions dated April 28, May 9, May 29 and June 6, 2006 concerning Item 1 (Methanex Termination Payment) of the proposed Settlement Agreement. PNG adopts and relies on those submissions for the purposes of its final argument.

PNG argues that the revenue shortfall arising from the termination of the Methanex contract does not represent any specific costs of providing service but simply is the extent to which PNG's overall cost of providing service exceeds forecast margin recovery now that Methanex has terminated its contract. PNG submits that disallowing recovery of any portion of the revenue deficiency would be an arbitrary disallowance of PNG's forecast 2006 costs without evidentiary or legal basis for such a disallowance.

PNG submits that it has taken all reasonable and prudent steps to reduce its costs. It points to the major internal reorganization which included closing down of over-the-counter service offices and restructuring its head office when Methanex shut down for one year starting on July 1, 2000. PNG also submits that it has reduced its 2006 costs by:

- deactivating facilities in response to the Methanex closure and earning a short-term interest rate return on the unamortized balance of those facilities rather than a rate base rate of return. The deactivation is expected to reduce property taxes by $300,000 per year starting in 2007.

- using a 40 percent deemed equity component rather than its significantly higher actual common equity component.

- seeking and obtaining approval to reduce its share of Commission costs in 2006 from $323,000 to $70,303.
- by removing employee bonuses from pensionable earnings in calculating pension benefit costs resulting in a reduction of $74,000 in the applied-for 2006 company benefits.
- a unilateral lump sum credit of $200,000 applied to 2006 cost of service.

In PNG's submission, the Application, as summarized in the schedules attached to its Argument, based on the information responses and submissions filed subsequent to the conclusion of the NSP settlement discussions, fully support a Commission finding that the 2006 rates applied for by PNG are just and reasonable.

7.2 BCOAPO ARGUMENT

BCOAPO filed its Argument on July 17, 2006 and states that the key issue in this proceeding is whether the Act, particularly section 59, as interpreted by the Courts, requires the Commission to allocate all of the revenue requirement shortfall arising from the closure of the Methanex Kitimat plant to ratepayers. BCOAPO states that it is PNG's position that it does, while BCOAPO's submission is that it does not. BCOAPO refers to its submissions on this legal issue in its May 4, 2006 Reply Argument. BCOAPO comments that if it was possible to reach agreement on this issue that was acceptable to the Commission then other issues would likely have been resolved along the lines suggested in the proposed Settlement Agreement.

BCOAPO states that its concern is not solely with the impact on ratepayers in 2006 but the continuing impact to allocate all of the Methanex revenue requirement shortfall to ratepayers and the increased impact when the deferred Methanex termination payments end in 2009. BCOAPO submits that this issue has to be addressed now particularly in light of the impact of the Supreme Court Decision in ***ATCO***. In BCOAPO's view, the Commission must decide on the basis of legal arguments before it whether the responsibility for the Methanex revenue requirements shortfall should be for: a) PNG's ratepayers; b) PNG shareholders; or c) some combination of the two. BCOAPO acknowledges that this third option involves some determination by the Commission of the appropriate allocation. In the absence of specific evidence on this issue, BCOAPO submits that a 50/50 split would not be inappropriate. BCOAPO states that once that decision is made, given Commission Order No. G-77-06 and for the purpose of establishing PNG's 2006 revenue requirements, all aspects of the proposed Settlement Agreement other than Item 1 can consider to be accepted by BCOAPO.

With regards to Item 17 of the proposed Settlement Agreement, BCOAPO accepts that PNG's return on equity for 2006 has been established by the Commission. BCOAPO refers to its previous submissions and states that it takes the position that the level of return on equity, particularly with respect to the risk premium has to be taken into account in determining the proper allocation of the Methanex revenue requirement shortfall.

7.3 CHILDS ARGUMENT

Mr. Childs filed his Argument on July 17, 2006 which discusses rate affordability and suggests that the Commission Decision on the Application:

i) Start with a 50/50 apportionment between PNG's shareholders and customers of the Methanex shortfall on net margin of $4.8 million as outlined in Item 1 of the proposed Settlement Agreement.

ii) Alternatively, use a 50/50 apportionment of the net revenue deficiency of $4.091 million as outlined in the proposed Settlement Agreement. Mr. Childs considered this alternative to be more realistic, more fair and would take into account PNG's $709,000 of cost reductions.

7.4 PNG REPLY ARGUMENT

PNG filed its Reply Argument on July 24, 2006. PNG submits that apart from the issue of recovery of the revenue deficiency arising from the termination of the Methanex contract, neither BCOAPO nor Mr. Childs have taken any issue with PNG's applied-for 2006 revenue requirements. PNG notes that both BCOAPO and Mr. Childs persist in the assertion that the revenue shortfall arising from the termination of the Methanex contract can somehow be divorced from the cost of providing service. In PNG's view, a disallowance of any of the revenue shortfall would simply be a disallowance of an equal amount of PNG's costs.

PNG states that the proposed 50/50 split of the Methanex revenue shortfall between customers and the shareholders advocated by BCOAPO and Mr. Childs is arbitrary, has no evidentiary basis and would have a significant adverse effect on PNG and its customers. As an example, PNG states that it is very unlikely that it would be able to comply with its financial covenants under its operating/risk management lines of credit.

PNG submits that the BCOAPO makes a contradictory argument when it acknowledges that PNG's return on equity for 2006 has been established by the Commission but then should be effectively reduced in 2006 because the revenue shortfall arising from the termination of the Methanex contract is a risk for which the shareholders had previously been compensated. PNG argues that this assertion by BCOAPO has no merit for the reasons outlined in paragraphs 8 to 14 and paragraphs 12 to 14 of PNG's May 9, 2006 and June 6, 2006 reply submissions, respectively. PNG states that BCOAPO provided no substantive response to PNG's submissions on this matter despite multiple opportunities to do so and that PNG's marginally higher risk premium merely acknowledges that PNG's industrial load exposes PNG to a greater risk of being uncompetitive compared to other utilities. It says the risk premium never compensated nor did the Commission intend to compensate PNG's shareholders for the regulatory risk that the Commission would unilaterally set rates at levels insufficient to recover PNG's cost of service.

PNG notes that Mr. Childs accepts PNG's 2006 return on equity but continues to submit that PNG's rates should be set on some notion of customer "affordability" rather than in reference to PNG's cost of service. PNG states that "affordability" is not a test under the Act or the relevant case law. PNG argues that to the contrary, in exchange for the obligation to provide safe and reliable service, the Act requires that rates be fixed to provide the utility with the opportunity to recover its reasonably incurred costs, which are necessary to provide that service. PNG notes that there is no evidence in this case that PNG's applied-for rates are unaffordable and the applied-for April 1, 2006 rates are lower than the rates that were approved and in effect on December 31, 2005.

In conclusion, PNG submits that there is a statutory obligation upon the Commission to fix rates that permit PNG the opportunity to recover all of its costs of service including the fair rate of return on equity already approved by the Commission. PNG states that the leading case authority is ***Hemlock Valley*** which is substantially based on ***B.C. Electric***. PNG submits that rates which are insufficient to provide a utility the opportunity to recover its costs of providing service including the fair rate of return on equity are unjust and unreasonable under the Act. PNG states that it will be impossible to recover its costs of providing service, if as BCOAPO and Mr. Childs advocate, PNG is not allowed to recover the revenue shortfall resulting from the termination of the Methanex contract in its customer rates.

8.0 COMMISSION DETERMINATION

After a considerable amount of process and submissions subsequent to having established a negotiated settlement process to consider PNG's 2006 Revenue Requirements Application ("2006 RRA"), the Commission Panel is in a position to render a decision on PNG's Application and the issues related thereto, particularly those raised by BCOAPO and Mr. Childs in their various submissions.

Following a review of the submissions allowed by Order No. G-40-06 related to Issue 1 (Methanex Termination Payment) of the proposed settlement document dated March 15, 2006, the Commission Panel by Letter No. L-19-06 dated May 17, 2006,endeavoured to seek further submissions on issues raised by parties This included further submissions related to the application of ***Hemlock Valley***, the relevance of "affordability" and the authority of the Commission to reduce rates, the principles or methodology and evidence that the Commission could use to determine an appropriate allocation of the revenue deficiency as requested by intervenors, and the precedential aspect of this Decision in respect of future revenue shortfalls related to the loss of Methanex.

In view of the responses received to Letter No. L-19-06, further process, and ultimately a different process, was required to consider PNG's 2006 RRA.

The Reasons that follow will focus on two predominant issues raised by parties which, based on the proposed settlement document, have been termed: "Item 1 - Allocation of Revenue Deficiency"; and "Item 17 - Return on Equity and Capital Structure". Consideration of these items will be followed by the Commission Panel's determinations related to various elements of PNG's 2006 RRA as outlined in PNG's July 7, 2006 Argument which, the Commission Panel notes, do not appear to be in dispute.

I. Item 1: Allocation of the Revenue Deficiency

BCOAPO reiterates in its July 17, 2006 Argument that the key issue in this proceeding is the "legal question" of whether the Commission is required to allocate to ratepayers all of the revenue requirement deficiency arising from the closure of the Methanex plant.

The arguments related to this issue are most fully discussed in BCOAPO's May 4, 2006 Reply Argument and PNG's May 9, 2006 Reply Submission which are summarized in section 4.0 of these Reasons for Decision.

Relevant Statutory Provisions and Case Law

These arguments raise the question of the proper interpretation, in the light of relevant judicial decisions, of sections 59 and 60 of the *Act*¸ specifically 59(5) and 60(1)(b) which establish the requirement that the Commission set just and reasonable rates. Pursuant to subsection 59(5), a rate is "unjust or unreasonable" if the rate is:

(a) more than a fair and reasonable charge for service of the nature and quality provided by the utility,

(b) insufficient to yield a fair and reasonable compensation for the service provided by the utility, or a fair and reasonable return on the appraised value of its property, or

(c) unjust or unreasonable for any other reason.

Paragraph 59(4)(a) states that it is a question of fact, of which the commission is the sole judge, whether a rate is unjust and unreasonable, and section 60 provides that:

60(1) In setting a rate under this Act or the regulations

(a) the commission must consider all matters that it considers proper and relevant affecting the rate,

(b) the commission must have due regard to the setting of a rate that

(i) is not unjust or unreasonable within the meaning of section 59.

PNG submits that allocating any of the remaining deficiency to PNG's shareholders would contravene paragraph 59(5)(b) of the Act, whereas BCAOPO submits that the question of how section 59 of the Act should be applied in PNG's unique and current situation is a matter that requires Commission determination.

The Commission Panel agrees with both BCOAPO and PNG that the decisions of ***Hemlock Valley*** and ***B.C. Electric***, both of which have considered sections 59 and 60 or similar predecessor provisions of the Act, are applicable to the regulation of utilities in British Columbia.

The Commission Panel, however, does not consider that the ***ATCO*** decision, which dealt with the question of whether the Alberta Energy and Utilities Board had the authority to allocate to ratepayers a portion of the gain on the sale of a utility asset, is particularly germane. Although the Supreme Court of Canada in that case commented that "the rate-setting process is a speculative procedure in which both the ratepayers and the shareholders jointly carry their share of risk related to the business of the utility (see MacAvoy and Sidak, at pp. 239-39)", the issue before the Court (as well as that considered in the text referenced at para. 37, p. 9 of BCOAPO's May 4 filing) related to the risk associated with utility assets. The Commission Panel does not consider that the ***ATCO*** decision goes so far as to "set a balance between shareholders and ratepayers in the allocation of the revenue requirement shortfall that the utility faces", as suggested by BCOAPO (May 4, 2006 filing, para. 39, p. 10).

In ***B.C. Electric***, which was considered and applied in ***Hemlock Valley***, Mr. Justice Martland of the Supreme Court of Canada discussed (at p. 856) what are now paragraphs 59(5)(a) and (b) and commented that:

> "Clearly, as between these two matters there is no priority directed by the Act, but there is a duty imposed upon the Commission to have due regard to both of them. The rate to be imposed shall be neither excessive for this service nor insufficient to provide a fair return on the rate base. <u>There must be a balancing of interests.</u> In my view, however, if a public utility is providing an adequate and efficient service (as it is required to do by s. 5 of the Act), without incurring unnecessary, unreasonable or excessive costs in so doing, I cannot see how a schedule of rates, which, overall, yields less revenue than would be required to provide that rate of return on its rate base which the Commission has determined to be fair and reasonable, can be considered, overall, as being excessive. …". (emphasis added)

The issue of the appropriate balancing of the interests of the utility on one hand and its customers on the other, was also addressed by the Court in ***Hemlock Valley*** (at p. 21) when it stated that:

> "the proper balancing of interests which the Commission carried out was done and completed when it settled the rate base, fixed the rate of return and determined the costs of operation allowable for rate-making purposes."

In ***Hemlock Valley***, the Commission had attempted to balance the interests of the utility and its customers when it allowed a rate increase for the utility, but directed that it be phased in over three years to avoid or lessen "rate shock". The Court overturned the Commission decision's to phase in the rate increase (which did not compensate the utility for deferring recovery of its cost of capital), reasoning that to do so would preclude the utility from earning the rate of return found by the Commission to be the fair and reasonable return on equity.

BCOAPO, however, suggests that ***Hemlock Valley*** was not intended to apply to a utility in PNG's unique situation and essentially submits that the allocation of the revenue shortfall to ratepayers would in this instance be unjust and unreasonable. BCOAPO suggests that ***Hemlock Valley*** and ***B.C. Electric*** apply to a "normal" utility, but they do not apply where ratepayers are being asked to cover a revenue requirement shortfall arising from a risk for which shareholders had previously been compensated, nor where there was substantial risk of a utility losing customers as a result of the proposed increase in rates (BCOAPO May 4, 2006 filing, paras. 29/30, p. 7).

Commission Panel Analysis and Findings

The Commission Panel acknowledges that ***Hemlock Valley*** did not deal with a situation involving the loss of a significant customer. Nor arguably does it apply until the point where the Commission has made a finding or determination on a utility's cost of service. The Commission Panel notes that, relying upon ***B.C. Electric*** and the utility counsel's submissions, the Court in ***HemlockValley*** commented (p. 21) that:

> "The Utilities Commission Act empowers the Commission to determine what is a fair and reasonable rate of return upon the appraised value of the property of regulated utilities, but, <u>having done so</u>, requires the Commission to set rates so as to allow recovery of a rate which permits an opportunity to earn that return." (emphasis added)

In this context, therefore, the Commission Panel considers ***Hemlock Valley*** to be most useful in terms of reaffirming the principles discussed in ***B.C. Electric***.

In any event, the Commission Panel considers that it is in this instance bound by the requirements upon the Commission established by the Act and by the manner in which PNG is and has been regulated.

The Commission Panel agrees with BCOAPO that PNG is unique, particularly in view of its heavy reliance on a small number of industrial customers, and also agrees with PNG that the utility has higher business and financial risks than a low-risk benchmark utility.

However, although PNG is unique, it is and has been regulated by the Commission under the Act on a traditional cost of service basis. What this means is that this utility, which is a virtual monopoly provider of natural gas in its service area, is permitted under the Act to recover the reasonable and prudent costs of providing its services in exchange for the obligation to provide safe and reliable service. One of the regulator's tasks, therefore, is to balance the need for the Utility to recover its reasonable and prudent costs with the need to ensure that ratepayers are charged fair and reasonable rates. Rates charged to customers are based on costs incurred by the utility to provide service. If the Commission finds certain costs to be imprudent or unreasonable, it will disallow such expenditures and reduce proposed rates accordingly.

The statutory obligation to approve rates which will afford a fair compensation for the services rendered and provide the utility with a fair and reasonable return was articulated by Mr. Justice Locke in ***B.C. Electric***, (at pp. 846 and 848):

> "In my opinion the true meaning of the relevant sections of the *Public Utilities Act* is that a utility is given a statutory right to the approval of rates which will afford to it fair compensation of the services rendered and that the quantum of that compensation is to be the fair and reasonable rate of return upon the appraised value of the property of the company referred to in s. 16(1)(b) [ss. 59(5)(a) and (b) and 60(1)(b)(i). …
>
> The obligation to approve rates which will provide the fair return to which the utility has been found entitled is, in my opinion, absolute, which does not mean that the obligation of the Commission to have due regard to the protection of the public, as required by s. 16(1)(b) [ss. 59(5)(a) and (b) and 60(1)(b)(i)], is not to be discharged. It is not a question of considering priorities between "the matters and things referred to in Clauses (a) and (b) of subsection (1) of s. 16 [now ss. 59(5)(a) and (b)]. The Commission is directed by s. 16(1)(a) [now s. 60(1)(a)] to consider all matters which it deems proper as affecting the rate but that consideration is to be given in the light of the fact that the obligation to approve rates which will give a fair and reasonable return is absolute." [emphasis added]

The Commission Panel considers, therefore, that it is required, by virtue of sections 59 and 60 of the Act to allow the utility to recover its reasonable and prudent cost of service, to be determined on the basis of its 2006 RRA and the evidence adduced in this proceeding.

As noted by PNG, the revenue deficiency arising from the termination of the Methanex contract does not represent any specific costs of providing service. It is simply the extent to which PNG's overall costs of providing service exceeds forecast margin recovery from PNG's customers now that Methanex has terminated its contract. A revenue deficiency (or surplus) simply dictates whether an increase (or decrease) in rates is required. The Commission Panel, therefore, does not consider the revenue deficiency, in the context of cost of service regulation, to be a separate line item that, in and of itself, is capable of adjustment or reduction.

The Commission Panel, therefore, finds that to allocate any of the net revenue deficiency resulting from the termination of the Methanex contract to PNG's shareholders, as advocated by BCOAPO and Mr. Childs, would result in rates that do not permit PNG to recover its costs of providing service and would, therefore, contravene sections 59 and 60 of the Act. The Commission Panel agrees with PNG that the allocations proposed by BCOAPO and Mr. Childs would simply be an arbitrary disallowance of PNG's forecast costs, without any evidentiary or legal basis having been established for such a disallowance.

Given the statutory obligations imposed upon the Commission, there is simply no principled basis before the Commission Panel in this proceeding to allow it to appropriately deviate from the statutory requirement to allow the utility to recover its prudent and reasonable cost of providing service, and certainly there is no evidence to support an allocation or to select a specific allocation of the revenue deficiency, other than to the utility's customers.

The Commission Panel finds that PNG's proposed method of allocating a revenue deficiency resulting from the loss of the Methanex contract to be appropriate.

More specifically, the Commission Panel also accepts PNG's proposal, discussed at pages 44 and 45 of the Application (Exhibit B-1), to allocate the revenue deficiency based on customer class gross margin and to treat small industrial sales and transportation service customers as one customer class when allocating the revenue deficiency.

Other arguments raised by BCOAPO and Mr. Childs and concerns expressed by many other intervenors and interested persons relate to affordability of rates and PNG cost control.

The Commission Panel notes BCOAPO's comment that for some time now PNG's residential rates have been either barely competitive or uncompetitive with electricity rates and PNG's response that the rate impact to other customers is "modest and manageable" when comparing the rates payable effective April 1, 2006 with the rates that were in effect December 31, 2005. The Commission Panel agrees with BCOAPO that PNG's comparison is not particularly supportive of PNG's position given the fluctuations in commodity prices during this period.

The Commission Panel, however, agrees with PNG that "affordability" is not a test under the Act or the relevant case law and that it is a vague, relative and potentially shifting concept. The Commission Panel notes the comments of Mr. Justice Rothstein of the Federal Court of Appeal in ***TransCanada Pipelines Ltd. v. Canada (National Energy Board)***, [2004] F.C.A. 149 (at para. 43):

> "While I agree with the appellant that the impact on customers or consumers cannot be a factor in the determination of the cost of equity capital, any resulting increase or decrease in tolls may be a relevant factor for the Board to consider in determining the way in which a utility should recover its costs. It may be that an increase is so significant that it would lead to "rate shock" if implemented all at once and therefore should be phased in over time. It is quite proper for the Board to take such considerations into account, provided that there is, over a reasonable period of time, no economic loss to the utility in the process. In other words, the phased in tolls would have to compensate the utility for deferring recovery of its cost of capital. <u>In the end, where a cost of service method is used, the utility must recover its costs over a reasonable period of time, regardless of any impact those costs may have on customers or consumers"</u> (see *Hemlock Valley Electrical Services Ltd. v. British Columbia Utilities Commission et al*., [1992] 12 B.C.A.C. 1 at 20-21 (C.A.)) [emphasis added].

Furthermore, the Commission Panel finds that there is no evidence before it in this proceeding which would allow it to determine that the rates proposed by PNG are not affordable or, conversely, to determine what a more appropriate "affordable" rate would be and how that could be achieved.

It is evident though that increases in the delivered cost of gas do impact PNG's residential and commercial customers (PNG May 9, 2006 filing, para. 24, p. 7) and the Commission Panel accepts PNG's submissions and assurance that the Utility has responded by taking all reasonable and prudent steps to reduce its costs as a result of the loss of margin from its industrial customers. PNG states that "customer impacts" are always considered when the cost of service is established in the sense that customers have an interest in ensuring that the utility's costs are reasonable and not overstated and that such impacts are reflected in the cost of service that was considered during the NSP and was reflected in the proposed settlement document and now PNG's July 7, 2006 Final Argument.

The Commission Panel notes the actions and efforts which PNG has taken to reduce its costs in the past when it faced a reduction in revenue from industrial customers and the steps taken to reduce its 2006 costs as outlined in its Application and at page 9 of its April 28, 2006 filing. The Commission Panel also notes PNG's assertion that there are no material maintenance capital expenditures which could be eliminated without endangering PNG's obligation to provide safe and reliable service to its customers. **The Commission Panel accepts that PNG has taken all prudent steps to manage and reduce its costs and that there are no unnecessary or unreasonable costs in the 2006 cost of service.**

It goes without saying that it is incumbent upon a regulated gas utility, and particularly so in this era of rising natural gas prices and the potential further loss of customers, to make best efforts to control and, where possible, reduce costs and the Commission Panel accepts that PNG has and will continue to do so.

The Commission Panel nevertheless remains concerned that PNG's rates are becoming less competitive and is mindful of the concerns expressed by a considerable number of interested parties earlier in this proceeding, including comments concerning the precarious state of the economy of the northwest and the difficulties faced by industrial commercial and residential customers alike (including Robin Austin, MLA, April 6, 2006 Submission and Exhibits C11-3 and C11-4 (Petition); Terrace & District Chamber of Commerce, Exhibit C7-1; Mayor Talstra, City of Terrace, Exhibit C8-2; Kitimat Chamber of Commerce, Exhibit C13-1).

The Commission Panel notes that PNG conducts detailed monthly reviews of its financial and operating results. PNG suggests, therefore, that it would be in a position to determine whether lower customer rates would improve cost recovery and prevent PNG's recoverable margin from declining (PNG May 29, 2006 Response, Question 4, p. 7) and that PNG would, in such case, make an appropriate application to the Commission to reduce customer rates.

The Commission Panel therefore anticipates that PNG will continue to carefully monitor loss of load and decreases in volumes and margin and to be in a position to take steps as it considers appropriate and as discussed in its May 29, 2006 Response to Letter No. L-19-06, Question 4, and/or to report to the Commission on this subject in its next RRA.

II. Item 17: ROE and Capital Structure

PNG requests that the Commission set PNG's return on common equity using a 65 basis points risk premium above the low risk benchmark utility and a deemed common equity ratio of 40 percent. PNG's allowed ROE is derived from the Commission's Automatic Adjustment Mechanism which is used to calculate the ROE for a low-risk benchmark utility and a utility-specific risk premium for each utility. The Commission's March 2, 2006 Decision related to the application by Terasen Gas Inc. and Terasen Gas (Vancouver Island) Inc. to determine the Appropriate Return on Equity and Capital Structure and to Review and Revise the Automatic Adjustment Mechanism revised the 2006 ROE for a low-risk benchmark utility to 8.80 percent. On March 9, PNG subsequently revised its Application to include a ROE of 9.45 percent to reflect the revision in the ROE for a low-risk benchmark utility (Exhibit B-13).

The Commission Panel notes that PNG's risk premium was reduced by 10 basis points to 65 basis points in the Commission Decision dated July 29, 2004 regarding PNG's 2004 RRA.

The Commission Panel in this proceeding has heard no persuasive evidence that PNG's risk premium should be further reduced and certainly no evidence or submissions to suggest a specific appropriate reduction. **Therefore the Commission Panel approves an ROE for PNG for 2006 of 9.45 percent based on a 40 percent equity component.**

PNG's proposal to issue $25 million of long-term debt and to lend $8 million to PNG (N.E.) is approved for 2006 ratemaking purposes. PNG's requested long-term effective debt rate of 6.74 percent is approved for 2006 ratemaking purposes. PNG's proposed 6 percent short-term debt rate on the positive short-term

debt component of the capital structure for 2006 is approved. PNG is to record the difference between the 6 percent debt rate and the actual short-term interest and expenses in the short-term interest rate deferral account.

In its response to Letter No. L-19-06, BCOAPO stated that "the evidentiary record in this proceeding is not sufficient to allow the Commission to make an appropriate apportionment of the revenue deficiency between the remaining ratepayers and PNG's shareholders. BCOAPO submitted that evidence with respect to the appropriate return on equity risk premium for PNG post-Methanex and on the methodology for determining an appropriate allocation of the revenue deficiency is now required. However, in its 2-page response dated June 16, 2006 to Commission Order No. G-66-06, BCOAPO did not, as had been requested, provide a detailed explanation of the nature and extent of any further evidence proposed and a justification for such evidence to assist the Commission Panel to understand what was required and how it would be helpful in the decision-making process.

Although the Commission Panel closed the evidentiary record for this proceeding, this does not preclude the appropriate ROE for PNG from being subject to further review. BCOAPO, Mr. Childs or any other party is entitled to raise this issue, and any other related issues, and to present appropriate and relevant evidence for the Commission's consideration in the review associated with PNG's next RRA.

As well, BCOAPO had raised, in the context of Item 1, the following question: "Is what PNG is requesting a fair return on the rate base, taking into account its history and present circumstances?" (May 4, 2006, para. 33, p. 8) because in BCOAPO's view PNG has in the past obtained an approved ROE, which included a significant equity risk premium for which the potential loss related thereto has now largely occurred. In response, PNG took issue with what it termed BCOAPO's assertion that allocating the revenue shortfall to other customers would effectively amount to an over-recovery of costs by PNG.

The Commission Panel notes PNG's response that its higher risk premium, which is now 65 basis points above the equity risk premium for the low risk benchmark utility, represents approximately $340,000 of additional annual return to PNG's shareholders and that the net margin loss from the termination of the Methanex contract in 2006 would be approximately $4.8 million (PNG May 9, 2006 filing, para. 12, p. 4).

The Commission Panel does not consider that allocation of a revenue deficiency resulting from the Methanex contract at this time and in these circumstances will result in an over-recovery for PNG.

III. Other RR Items

Neither BCOAPO nor Mr. Childs has taken issue with any of PNG's other applied-for cost of service items as presented in the proposed settlement document or PNG's July 7, 2006 Final Argument.

1. Load Forecast *(Gas Deliveries and Margin Forecasts)*

The load forecasts appear reasonable and the Commission Panel accepts them as filed and updated by PNG.

2. Rate Redesign

PNG is proposing to redesign the rate structure for Commercial Interruptible (RS 4), Small Industrial Sales (RS 5), and Seasonal Off-Peak (RS 6) customers by eliminating a monthly charge based on minimum consumption volumes in favour of a basic monthly charge unrelated to volume for the RS 5 and RS 6 customers.

For RS 5 Small Industrial customers, PNG is proposing a monthly fixed charge of $410. For RS 6 Seasonal Off-Peak Customers it is proposing a monthly fixed charge of $125, to apply only in the off-peak months of March to November. A delivery charge equal to twice the large commercial firm sales delivery charge will apply to any deliveries to the RS 6 customers during the peak winter months of December to February.

PNG is proposing no basic monthly charge for interruptible customers (that is a basic monthly charge of zero), arguing (primarily) that fixed pipeline assets are built to serve firm customers. Moreover, there would be no minimum monthly charge for interruptible customers.

The impact of the proposed change will be quite beneficial to small volume customers (decreases of 1.2% for RS 4 customers and of 12% and 14% respectively for RS 5 and RS 6). The change will be detrimental but less noticeably so for medium and large volume customers in each class, increasing the bills by 0.1% to 2.4% depending on the class (Exhibit B-4, Response to BCUC IR 1 8.1 and Exhibit B-11, Response to BCUC IR 2 33.1 to 33.4).

The Commission notes that there were no submissions about this issue following the proposed Negotiated Settlement, which adopted monthly fixed charges as follows:

RS 4 Commercial Interruptible -	$125 per month
RS 5 Small Industrial Firm -	$410 per month
RS 6 Seasonal Off-Peak -	$125 per month during off-peak.

The Commission Panel accepts PNG's proposal to eliminate the monthly charge based on minimum consumption volumes in favour of a basic monthly charge effective January 1, 2006. The Commission Panel directs PNG to include a monthly charge of $125 for the RS 4 Commercial Interruptible customers effective January 1, 2006.

<u>Extend Seasonal Off-Peak Period to include November and March</u>

PNG is also proposing to extend the seasonal off-peak period to include November and March (Exhibit B-1, p. 52). PNG confirmed that if the system peak day occurred in the months of November or March it would be able to meet its firm load. PNG also confirmed that, if the change is approved, the revised tariff will contain a condition allowing them to curtail seasonal customers in November and March if necessary to meet firm customer demand (Exhibit B-11, Responses to BCUC IR 2 35.2 to 35.4).

The Commission Panel finds the change proposed by PNG to be reasonable and to be one which poses no threat to the supply reliability for firm customers. **The Commission Panel accepts PNG's proposal to extend the seasonal off-peak period, subject to PNG's commitment to include a tariff provision allowing curtailment of seasonal off-peak customers in November and March effective January 1, 2006.**

3. Rate Base

The Commission Panel approves the deactivation of compressor stations R2 and R4, a 10 inch loop (52.8 miles in length), a 6 inch lateral to Kitimat (32.97 miles in length) and a Methanex meter and regulating station.

The Commission Panel approves PNG's request to transfer the net book value of $5.05 million of the facilities which it will deactivate from plant in service to a non-rate base interest bearing deferral account and to amortize that account on a monthly basis over 10 years commencing January, 2006. The Commission approves the accounting treatment of the deactivated facilities as proposed by PNG (Exhibit B-1, Tab Application, pp. 6-7). PNG's foregone return proposal is not accepted at this time, however, PNG may apply for Commission approval to record the foregone return should the deactivated facilities be reactivated and the merits of that application will be considered at that time.

The Commission Panel approves PNG's 2006 forecast capital additions as set out in the February 17, 2006 Update (Exhibit B-10). PNG is to file a report with the Commission by 2006 year-end detailing the activities taken in respect of the Arden Valley Rehabilitation project and all associated costs incurred with this project.

4. Deferral Accounts

Subject to the adjustments required in these Reasons for Decision, the Commission Panel approves the applied-for Deferral Accounts.

5. Recapitalization Application Hearing Costs

The Commission Panel notes that in the July 29, 2004 Decision related to PNG's 2004 RRA, the Commission was of the view that the costs associated with the regulatory review of the associated January 30, 2004 Recapitalization Application should be shared between the ratepayers and the shareholders and allowed PNG to recover Commission and Intervenor Recapitalization Application costs billed to the Utility by the Commission. However, in its Decision dated September 9, 2005, the Commission noted, at p. 48, that one of the approvals sought by PNG, in paragraph 1 of its subsequent Recapitalization Application dated December 17, 2004, was subject to the condition "that no costs associated with this [recapitalization application] and no transactions costs, including amalgamation and securities issuance and redemption costs, related to the foregoing transactions shall be recovered through customer rates" ("PNG's proposed condition"). In this proceeding, PNG was asked to confirm that PNG's 2006 revenue requirements and the proposed rates do not contain any costs related to the Recapitalization Application and, if not, to explain why not (BCUC IR No. 1.25.3, p. 53). In response, PNG indicated that it had "recorded all of the 2005 income trust application hearing costs in the BCUC proceedings deferral account pending obtaining all of the approvals required for the conversion to proceed" and that "PNG's share of the 2005 [recapitalization application] hearing costs will remain in that account until all of the approvals are obtained to enable PNG to commence the conversion process".

The Commission Panel notes that during the course of this proceeding PNG indicated that it was evaluating the efficiency of raising capital under an income trust structure for a proposed "KSL Project" and confirmed that it could give no assurances that the recapitalization under an income trust ownership structure will occur (PNG April 24, 2005 filing, Q. 4.2 and 4.3, pp. 5-6).

In the circumstances, the Commission Panel does not consider that it is bound, beyond the July 29, 2004 Decision related to PNG's 2004 RRA, to allow PNG to recover or share these costs between the ratepayers and shareholders as set out in that Decision. Rather, based on PNG's subsequent proposed condition as noted and as approved in the September 9, 2005 Decision and, given the status of the approved recapitalization under an income trust structure and the circumstances related thereto, the Commission Panel considers that the costs associated with the subsequent Recapitalization Application should perhaps more properly be to the sole account of the shareholders as reflected in PNG's proposed condition. **The Commission Panel denies PNG's request to amortize the customers' $169,855 after tax share of the second Recapitalization Application hearing costs at 20 percent per year commencing in 2006. For greater certainty, this amount may remain in the deferral account, subject to review of the appropriate recovery of these costs in the next RRA.**

6. Cost of Service

The Commission Panel finds that PNG's 2006 operating, maintenance, general and administrative expenses, and other cost of service items to be prudent and reasonable and appropriate to ensure the safe and efficient operation of its system. The Commission Panel approves for 2006 PNG's requested transfer to capital rate of 19.3 percent.

The Commission Panel approves the cost pools subject to allocation by PNG to PNG (N.E.) as set out in the Application. The Commission Panel accepts that PNG's allocation of Account 728 costs to PNG (N.E.) is appropriate and that relative rate base is the appropriate allocator.

PNG's request to revise the interim company use gas cost rate of $0.305/GJ to a permanent rate of $0.185/GJ is approved, effective January 1, 2006.

7. Customer Rates

The Commission Panel approves PNG's 2006 revenue requirement as set out in PNG's July 7, 2006 Argument, pages 18-23, subject to the required adjustment for amortization of Recapitalization Application hearing costs. PNG's proposal to amortize the Methanex termination payment of $23.3 million over the 44-month period from

March 2006 to October 2009 is approved which results in a credit of approximately $5.6 million from the Methanex contract termination payment to the 2006 cost of service. PNG's request to make the permanent RSAM rate rider $0.301/GJ effective January 1, 2006 (Exhibit B-10, p. 7) is approved.

IV. Conclusion

PNG is to file regulatory schedules and an amended summary of Rates and Bill Comparison Schedules based on PNG's Application, as revised, and the adjustments contained in these Reasons.

The Commission will accept, subject to timely filing, amended Gas Tariff Rate Schedules in accordance with these Reasons.

PNG is to comply with all directions contained in these Reasons.

Glossary of Terms

Basis point	One-hundredth of a percentage point, used in reference to interest rates or rates of return on equity
Beta	A measure of the systematic risk of a security, which estimates the extent to which a stock's price fluctuates more or less than average when the market fluctuates
Billing determinants	Calculated values used in allocating a revenue requirement between tollpayers. Billing determinants account for both volumes and distance
Bond rating	A quality rating assigned by credit rating agencies as an indication of creditworthiness
Book value	The amount at which an item appears in the books of account and financial statements
Business risk	The risk attributed to the nature of a particular business activity (as distinct from financial risk). For pipelines, it typically includes supply, market, regulatory, competitive, and operating risks
Capital Asset Pricing Model (CAPM)	A method used to estimate the cost of equity capital by comparing the return and risk characteristics of an individual company's shares with the market average
Capital attraction standard	The aspect of the fair return standard that requires that the return of a regulated utility permit incremental capital to be attracted to the enterprise on reasonable terms and conditions
Capital structure	The way in which a business is financed; generally expressed as a percentage breakdown of the types of capital employed
Comparable earnings test	A comparison of the returns earned by companies with similar investment risk to that of the regulated utility's operations
Comparable investment standard	The aspect of the fair return standard that requires that the return of a regulated utility be comparable to the return available from the application of the invested capital to other enterprises of like risk
Competitive risk	The business risk that results from competition for customers at both the supply and market ends of a pipeline system

Cost of service	The total cost of providing service, including operating and maintenance expenses, depreciation, amortization, taxes, and return on rate base
Cross subsidization	The provision of financial support to a company's non-regulated operations by its regulated operations, or vice versa
Deemed capital structure	A notional capital structure used for rate-making purposes that may differ from a company's actual capital structure
Depreciation	A non-cash expense charged against earnings to write off the cost of an asset during its estimated useful life
Discounted Cash Flow (DCF)	A method used for estimating the cost of common equity based on the expected dividend yield of the company's shares and the expected future dividend growth rate
Economic resources	That portion of the technical resources that can be developed economically under anticipated economic conditions
Embedded cost of debt	The weighted-average historical cost of long-term debt outstanding
Equity Risk Premium (ERP)	A family of methods used for estimating the cost of common equity that includes the CAPM and ECAPM; it is based on the premise that an investment in common equity carries greater risk than an investment in either debt or preferred shares and, therefore, requires a higher return, or premium, over that required for bonds or preferred shares
Fair return standard	A standard that should be examined when setting the return allowed to a company; it is comprised of the comparable investment, financial integrity and capital attraction standards
FFO interest coverage	A financial ratio calculated as the funds from operations over gross interest incurred before subtracting capitalized interest and interest income
FFO to total debt ratio	A financial ratio calculated as the funds from operations over long term debt (including amount for operating lease debt equivalent) plus current maturities, commercial paper and other short-term borrowings
Financial integrity standard	The aspect of the fair return standard that requires that the return of a regulated utility enable the financial integrity of the regulated enterprise to be maintained

Financial risk	The risk inherent in a company's capital structure; financial risk increases as the proportion of debt increases in relation to shareholders' equity
Flow-through tax methodology	A method of estimating income taxes payable for a period based on taxable income as opposed to accounting income
Funds from operations (FFO)	The net income from a company's continuing operations plus depreciation, amortization, deferred income taxes, non-cash items, and interest expense
GH-6-96	NEB Proceeding on facilities application for the Sable Offshore Energy Project and the Maritimes & Northeast Pipeline Project (Reasons for Decision dated December 1997)
Group 1 companies	In 1985, for financial regulatory purposes, the Board divided the pipeline companies under its jurisdiction into two groups: Group 1 companies with extensive systems; and Group 2 companies with lesser operations
Interest coverage	The number of times that net income for a given year, before interest expense and income taxes, covers the annual interest expense
Investment risk	The total of a company's business risk and financial risk
K&V ATWACC Methodology	The specific ATWACC-based methodology used by Drs. Kolbe and Vilbert to estimate cost of capital
Market-to-book ratio	The ratio of the market price of a common share to its book value
Market risk	The business risk that stems from the overall size of the market and the market share that a pipeline is able to capture
Netback	The price that a producer of natural gas receives, based on the downstream market price less any charges for delivering the gas to market
Operating risk	The risk to the income-earning capability that arises from technical and operational factors
Pro forma	Describes a presentation of data, typically financial statements, where the data reflects the world on an 'as if' basis; for example, financial statements that are adjusted to reflect a projected transaction

Rate base	The amount of investment on which a return is authorized to be earned; it typically includes plant in service plus an allowance for working capital
Regulatory risk	The risk to the income-earning capability of the assets that arises due to the method of regulation of the company
Revenue requirement	The total cost of providing service, including operating and maintenance expenses, depreciation, amortization, taxes, and return on rate base
Return on rate base (return)	The return that a regulated company is authorized to earn on its approved rate base
RH-1-2001	NEB Proceeding on TransCanada's 2001-2002 Mainline Tolls and Tariff Application (Reasons for Decision dated November 2001)
RH-1-2002	NEB Proceeding on TransCanada's 2003 Mainline Tolls and Tariff Application (Reasons for Decision dated July 2003)
RH-1-70	NEB Proceeding for Mainline's tolls effective 1 January 1970 (Reasons for Decision dated December 1971)
RH-2-2004	NEB Proceedings on TransCanada's 2004 Mainline Tolls and Tariff Application (Phase I Reasons for Decision dated September 2004; Phase II Reasons for Decision dated April 2005)
RH-2-94	NEB Multi-Pipeline Cost of Capital Proceeding (Reasons for Decision dated March 1995)
RH-2-94 Formula	Formula used to determine the rate of return on common equity for certain NEB-regulated pipelines, established in the RH-2-94 Proceeding, as amended to eliminate rounding
RH-3-2004	NEB Proceeding on TransCanada's North Bay Junction Application (Reasons for Decision dated December 2004)
RH-4-2001	NEB Proceeding on TransCanada's 2001-2002 Mainline Fair Return Application concerning cost of capital for the Mainline (Reasons for Decision dated June 2002)
RH-R-1-2002	NEB Proceeding on TransCanada's Review Application of the RH-4-2001 Decision (Reasons for Decision dated February 2003)
Supply risk	The risk that the physical availability of natural gas could affect a pipeline's income-earning capability

Tariff	The terms and conditions under which the services of a pipeline are offered or provided, including the tolls, the rules and regulations, and the practices relating to specific services
Technical resources	Natural gas resources estimated by having regard for the geological prospects in an area or basin and anticipated technology. They are the sum of cumulative production (portions already produced), reserves (portions discovered, but not produced) and future resources (portions still undiscovered), with all given as marketable volumes. Marketable volumes for the future resources are determined by applying the recovery factors and surface losses applicable to pools discovered in the past
Test Year	A 12-month period used for rate-making purposes
Toll	The price charged by a pipeline company for the use of its facilities
Tolls Task Force	A joint industry task force initiated by TransCanada; its membership is comprised of a wide cross-section of the natural gas industry, including representatives of the producing, marketing, brokering and pipeline segments of the industry, provincial governments, LDCs, and industrial end-use customers
Ultimate potential	The sum of resources that have been discovered (including gas that has already been produced) and undiscovered resources that are expected to be discovered by future drilling
Utilization rate	A rate determined by dividing system throughput by pipeline design capacity, expressed as a percentage

Chapter 1

Introduction

1.1 Background

TransCanada PipeLines Limited (TransCanada) owns and operates the Mainline natural gas transmission system (Mainline), which is a high pressure natural gas transmission system that extends from the Alberta border across Saskatchewan, Manitoba, Ontario, through a portion of Quebec and connects to various downstream Canadian and international pipelines. In addition, the Mainline's integrated system includes contractual entitlements to transport natural gas on the Great Lakes Gas Transmission Company (GLGT) system from Emerson, Manitoba to St. Clair, Michigan; on the Union Gas Limited (Union) system from Dawn, Ontario to Parkway, Ontario and to Kirkwall, Ontario; and on the Trans Québec & Maritimes Pipeline Inc. (TQM) system from St-Lazare to St-Nicolas and East Hereford, all located in Quebec. Figure 1-1 shows a map of the Mainline's integrated system.

Prior to 1995, the Board generally approved pipeline tolls on an annual cost of service forward test year basis. During that period, the Mainline's cost of capital was typically examined every year as part of an annual cost of service tolls application.

In the fall of 1994, the Board held the Multi-Pipeline Cost of Capital Proceeding (RH-2-94). In the RH-2-94 Decision,[1] the Board approved a rate of return on common equity (ROE) for a benchmark pipeline, based primarily on the Equity Risk Premium (ERP) methodology. The ROE for the benchmark pipeline was set at 12.25 percent for the 1995 Test Year. The Board also adopted a formula for adjusting the ROE on an annual basis (RH-2-94 Formula).

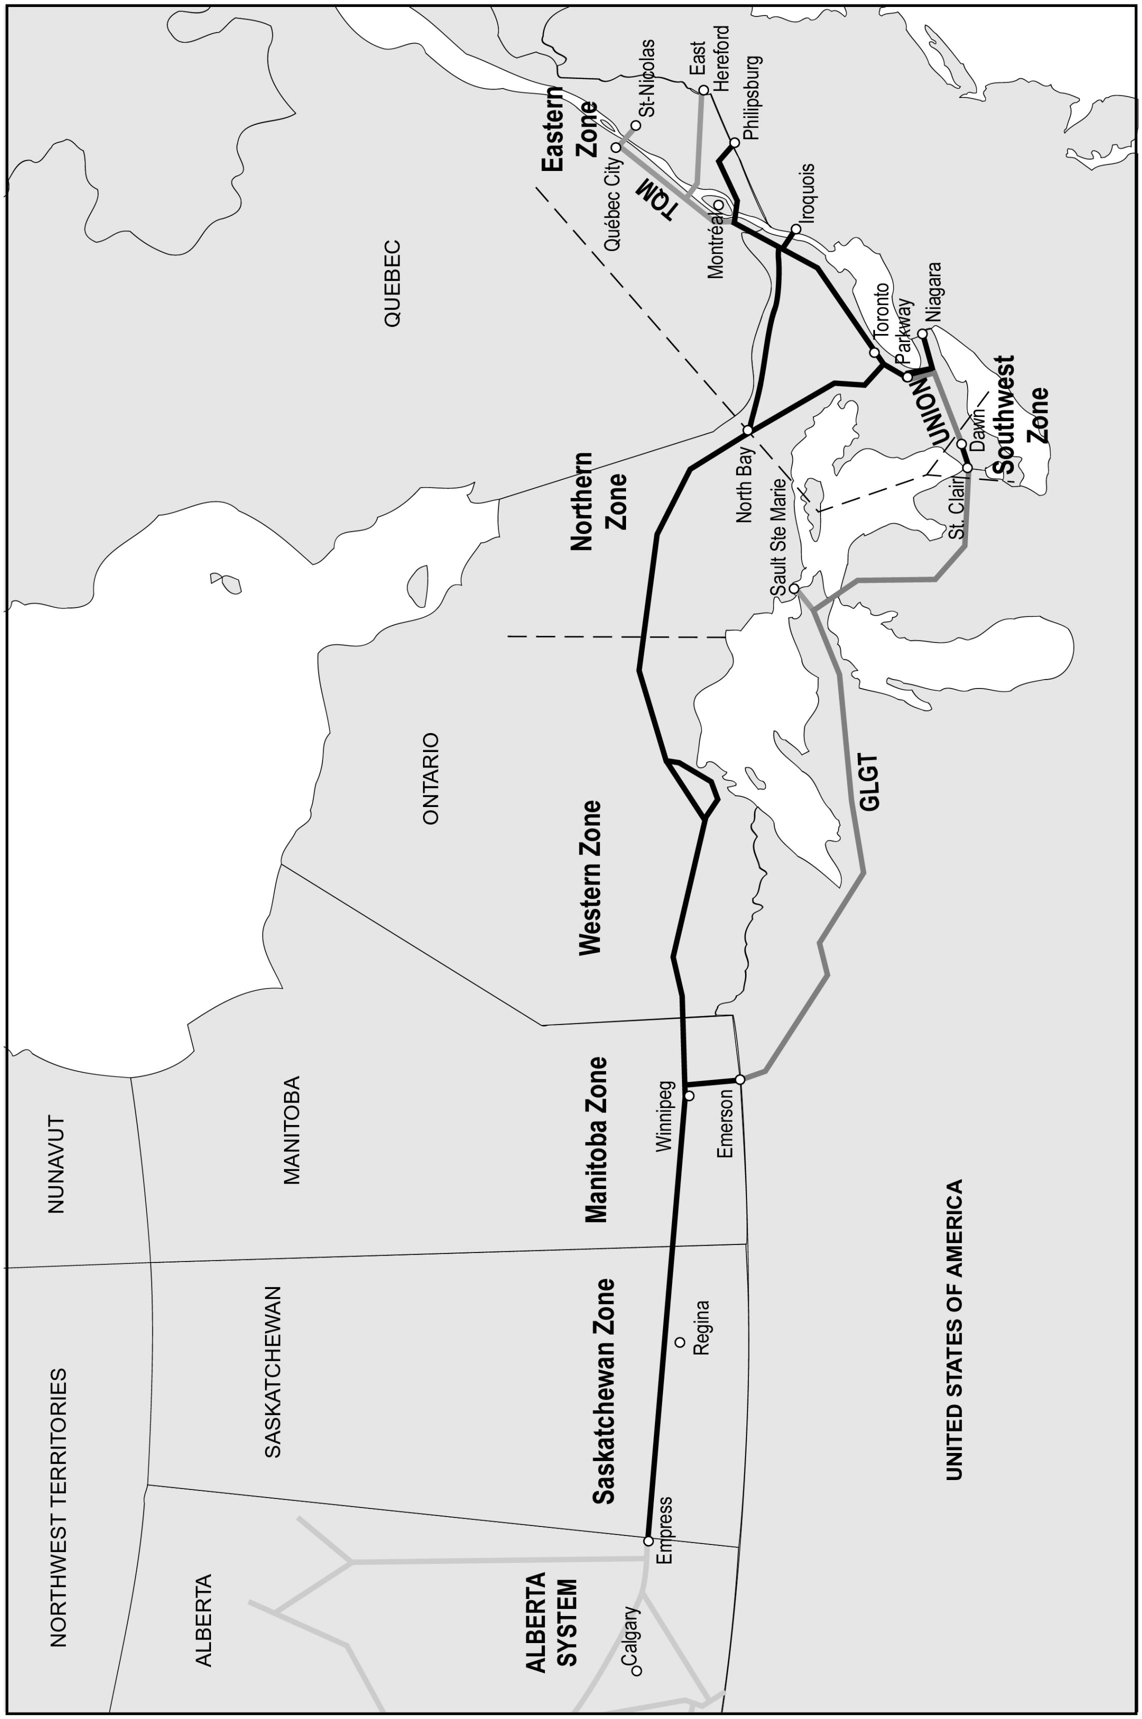
The ROEs resulting from the RH-2-94 Formula have been as follows: 11.25 percent in 1996; 10.67 percent in 1997; 10.21 percent in 1998; 9.58 percent in 1999; 9.90 percent in 2000; 9.61 percent in 2001; 9.53 percent in 2002; 9.79 percent in 2003; 9.56 percent in 2004; and 9.46 percent in 2005.

The RH-2-94 Decision stated that:

> The Board is of the view that the rate of return on common equity for the benchmark pipeline is appropriate for all of the pipelines subject to this proceeding. The Board is cognizant of the linkage between the rate of return on common equity and the pipelines' capital structures and has determined that any risk differentials between the pipelines can best be accounted for through

1 National Energy Board RH-2-94 Reasons for Decision, TransCanada PipeLines Ltd. et al. (Cost of Capital), March 1995 [hereinafter RH-2-94]

Figure 1-1
TransCanada Mainline



> adjustments to the common equity ratios rather than by making company-specific adjustments to the benchmark pipeline's rate of return on common equity.[2]

The Board decided that the overall business risk of TransCanada's Mainline, Foothills Pipe Lines Ltd. (Foothills), Alberta Natural Gas Company Ltd (now the TransCanada BC System) and TQM were such that a similar common equity ratio could be given to these four pipelines. The Board confirmed the Mainline's common equity ratio of 30 percent, which had been in place over the previous 15 years, except for 1982 and 1983 when a common equity ratio of 28 percent was deemed. The Board also indicated that given the then current cost rates, it was appropriate for TransCanada to maintain preferred shares in the Mainline's capital structure.

During the 1996-1999 period, the Mainline's tolls were approved by the Board based on the terms of the Incentive Cost Recovery and Revenue Sharing Settlement. That incentive agreement was a negotiated settlement between TransCanada and its stakeholders and incorporated a deemed common equity component of 30 percent and the ROEs resulting from the RH-2-94 Formula.

For the 2000 Test Year, the Board approved tolls for the Mainline, based on a one-year negotiated settlement, which incorporated the RH-2-94 Formula ROE on a deemed common equity component of 30 percent.

For 2001 and 2002, the Mainline's tolls reflected the terms of the two-year Mainline Service and Pricing Settlement. That settlement established a toll methodology and tariff provisions to be applicable for 2001 and 2002, and the components of the revenue requirement (other than cost of capital) to be used in the calculation of final tolls for 2001. The Board considered the 2001-2002 settlement in the RH-1-2001 Proceeding.[3]

In its 2001-2002 Fair Return Application, TransCanada sought review and variance of the RH-2-94 Decision. TransCanada proposed that the Board determine the Mainline's cost of capital for 2001 and 2002 utilizing an After-Tax Weighted-Average Cost of Capital (ATWACC) methodology. TransCanada sought approval of an ATWACC of 7.5 percent, adjusted in each of 2001 and 2002 for the difference between the market cost of debt and the embedded cost of debt of the Mainline. Alternatively, TransCanada requested that the Board establish an ROE of 12.50 percent on a deemed equity component of 40 percent. In the RH-4-2001 Decision,[4] the Board declined to adopt the ATWACC methodology and decided that the ROE resulting from the RH-2-94 Decision should continue to apply to the Mainline. The Board also concluded that the level of business risk facing the Mainline had increased since 1995 and approved an increase in the Mainline's deemed common equity ratio from 30 percent to 33 percent, effective 1 January 2001.

---

2 RH-2-94, *supra*, note 1 at p. 6

3 National Energy Board RH-1-2001 Reasons for Decision, TransCanada PipeLines Ltd. (Tolls and Tariff), November 2001 [hereinafter RH-1-2001]

4 National Energy Board RH-4-2001 Reasons for Decision, TransCanada PipeLines Ltd. (Cost of Capital), June 2002 [hereinafter RH-4-2001]

On 16 September 2002, TransCanada applied for review and variance of the RH-4-2001 Decision and related Orders (Review Application). The Review Application was made on the grounds that the Board, in rendering the RH-4-2001 Decision, committed errors that raised doubts as to the correctness of the Decision. TransCanada submitted that the RH-4-2001 Decision resulted in prejudice or damage to the Mainline and its investor, TransCanada, by imposing an unfair return; prejudicing the ability of the Mainline to attract capital from TransCanada; placing the company at a competitive disadvantage; and prejudicing its ability to invest in the Canadian pipeline industry, including the Mainline and northern pipelines.

Also on 16 September 2002, TransCanada filed the Mainline's 2003 Tolls and Tariff Application, in which it requested that the 2003 return for the Mainline be determined by the Board in accordance with its disposition of the Review Application.

On 20 February 2003, the Board issued its RH-R-1-2002 Reasons for Decision,[5] in which it dismissed TransCanada's Review Application on the ground that the Review Application had not raised a doubt as to the correctness of the Board's RH-4-2001 Decision.

TransCanada sought leave to appeal the Board's RH-R-1-2002 Decision to the Federal Court of Appeal on 21 March 2003. Leave to appeal was sought on questions concerning the correctness of the legal test applied by the Board in establishing TransCanada's return and whether the Board fettered its discretion by basing the Mainline's ROE on the RH-2-94 Formula methodology. On 21 May 2003, the Federal Court of Appeal granted TransCanada's application for leave to appeal the Board's RH-R-1-2002 Decision.[6]

On 26 January 2004, TransCanada filed its 2004 Tolls and Tariff Application (2004 Tolls Application) with the Board, seeking approval of tolls on the Mainline for the period 1 January 2004 to 31 December 2004. Among other things, TransCanada sought approval of a fair return for 2004 that reflected an ROE of 11 percent on a deemed common equity ratio of 40 percent, which is equivalent to an ATWACC of 6.9 percent.

The Board issued Hearing Order RH-2-2004 on 23 March 2004, establishing a two-phase oral public hearing to consider TransCanada's 2004 Tolls Application. Phase I considered all issues raised by the 2004 Tolls Application, with the exception of cost of capital. Phase I was held in Ottawa, Ontario from 14 June 2004 to 25 June 2004. The RH-2-2004 Phase I Reasons for Decision were issued on 10 September 2004.[7]

With respect to cost of capital, the Board indicated in Hearing Order RH-2-2004 that it would be inappropriate to initiate further procedural steps in respect of Phase II until after the release of the Federal Court of Appeal Decision regarding TransCanada's appeal of the Board's RH-R-1-2002 Decision.

---

5 National Energy Board RH-R-1-2002 Reasons for Decision, TransCanada PipeLines Ltd. (Review of RH-4-2001 Cost of Capital Decision), February 2003 [hereinafter RH-R-1-2002]

6 Federal Court of Appeal Docket No. 03-A-16, Order dated 23 May 2003

7 National Energy Board RH-2-2004 Reasons for Decision, TransCanada PipeLines Ltd. (Tolls and Tariff), September 2004 [hereinafter RH-2-2004 - Phase I Decision]

On 16 April 2004, the Federal Court of Appeal issued its reasons for judgment denying TransCanada's appeal.[8] On 20 April 2004, the Board sought comments from parties concerning the procedural implications of that Decision for Phase II of the RH-2-2004 Proceeding.

TransCanada advised the Board on 12 May 2004 that, in light of the Court of Appeal's Decision in *TransCanada v. NEB*, it would not seek variance from the RH-2-94 Formula for 2004. TransCanada also indicated that it maintained its 2004 Tolls Application concerning its applied-for capital structure, and it would therefore be seeking approval of the ROE stemming from the RH-2-94 Formula (9.56 percent for 2004) on 40 percent deemed equity. TransCanada filed related changes to its 2004 Tolls Application on 28 May 2004.

On 7 June 2004, the Board issued Order AO-1-RH-2-2004 setting out the procedure to be followed in Phase II, which was scheduled to commence on 25 October 2004 in Calgary, Alberta. As a result of TransCanada's decision not to seek variance from the RH-2-94 Formula for 2004, the Board removed "the appropriate rate of return on common equity (ROE) for the Mainline" from the Phase II List of Issues.

The issues that remained for the Board's consideration in Phase II were:

1. The appropriate capital structure for the Mainline;

2. The appropriate cost of debt for the Mainline, including any financial impact resulting from debt redemption; and

3. The appropriate effective date for any change to the Mainline's cost of capital.

The Canadian Association of Petroleum Producers (CAPP) filed a Notice of Motion on 4 June 2004, seeking a number of Board directions concerning the 28 May 2004 evidence of TransCanada.

After hearing from parties by way of written submission, the Board issued its ruling on CAPP's motion on 30 June 2004 (see Appendix I). The Board also issued Order AO-2-RH-2-2004, amending a number of dates in the Phase II Timetable of Events. The Board expressed the view that portions of TransCanada's evidence were not relevant to Phase II of the RH-2-2004 Proceeding, as the evidence suggested that the ROE for the Mainline in 2004 should be other than 9.56 percent. The Board directed that TransCanada file amendments to its evidence in such a way as to remove any direct or indirect inferences to an appropriate ROE other than 9.56 percent for the Mainline in 2004, by 15 July 2004.

On 13 July 2004, TransCanada sought an extension for the filing of its revised evidence, which was granted by the Board on 14 July 2004. TransCanada also requested that a number of other dates, including the start of the hearing, be amended. The Board issued Order AO-3-RH-2-2004 on 23 July 2004 and scheduled the Phase II Hearing to commence on 22 November 2004.

TransCanada filed its revised evidence on 29 July 2004. Unless otherwise noted, the information contained in these Reasons for Decision reflects TransCanada's revisions dated 29 July 2004.

---

8 *TransCanada PipeLines Ltd. v. National Energy Board et al.,* [2004] F.C.A. 149 [hereinafter *TransCanada v. NEB*]

On 4 August 2004, the Board received a letter from CAPP in which it expressed the view that TransCanada had not complied with the Board's direction of 30 June 2004. The Board responded to CAPP on 12 August 2004 (see Appendix II) by reiterating its 30 June 2004 ruling that it would not allow TransCanada, through its ATWACC or other evidence, to do indirectly that which TransCanada has chosen not to do directly (that is, seek review of the RH-2-94 Formula). The Board also expressed the view that TransCanada should be allowed to present its case as it relates to the issues to be addressed in Phase II in the manner it deems appropriate, so long as the rules of natural justice are respected.

The Board issued Order AO-4-RH-2-2004 on 23 September 2004, by which it approved a revised timetable of events proposed by CAPP on 21 September 2004 and agreed upon by TransCanada and other active parties. The commencement of the Phase II Hearing was delayed one week to 29 November 2004.

The filing date for intervenor evidence was 19 October 2004. CAPP was the only intervenor to file evidence with the Board. The CAPP evidence was the subject of a motion filed by TransCanada on 12 November 2004. TransCanada requested that the Board clarify the issues to be considered in Phase II of RH-2-2004 and the parameters for the conduct and disposition of the proceeding. On 19 November 2004, the Board heard the TransCanada motion orally and issued its ruling from the Bench (see Appendix III). Among other things, the Board noted that TransCanada was seeking to have the Board consider return using a different methodology than the traditional methodology. The Board ruled that TransCanada was free to submit evidence and argue that an alternative approach should be utilized in making the determinations to be made in Phase II but that it would not, prior to hearing all of the evidence, make a determination on which approach or approaches should be used. Also, the Board agreed with TransCanada that its evidence need not be limited to examining changes since 2001 and accepted that the impact of tolls on customers is not a relevant consideration in the determination of cost of capital.

The hearing commenced on 29 November 2004 and adjourned on 17 December 2004. It reconvened on 17 January 2005 and was completed on 4 February 2005. The hearing lasted 22 days.

1.2 Overview of the Application

As noted above, the cost of capital aspects of the 2004 Tolls Application were considered in Phase II. For information on the other aspects of the 2004 Tolls Application, and the Board's Decisions on these matters, refer to the RH-2-2004 – Phase I Decision, which was issued on 10 September 2004.

With respect to cost of capital matters, TransCanada's applied-for 2004 revenue requirement included an overall rate of return on rate base of 8.93 percent, which incorporates the RH-2-94 Formula ROE of 9.56 percent for 2004 on a deemed common equity ratio of 40 percent (an increase from 33 percent to be effective 1 January 2004) and an average cost of debt of 8.73 percent.

The average applied-for cost of debt reflected TransCanada's proposed redemption of the US$ 200 million 8.50% Debentures (8.50% Debentures) and the US$ 460 million 8.25% Junior

Subordinated Debentures (8.25% JSDs) in July 2004. TransCanada submitted that junior subordinated debentures (JSDs) have comprised approximately ten percent of the Mainline's total capitalization in the form of preferred securities since 1998 and proposed to replace this ten percent preferred component of the Mainline's capitalization with seven percent unfunded debt and three percent common equity. Further information on the JSDs appears in Chapter 3; information on the cost of debt appears in Section 8.1.

Chapter 2

Legal Framework for Determining a Fair Return

In addition to the matters set out in the List of Issues for this proceeding, the methodology that the Board ought to employ in order to determine an appropriate capital structure for the Mainline was also the subject of considerable discussion in the hearing.

Position of TransCanada

TransCanada submitted that, as a matter of law, the Board is required to determine the cost of equity capital for the Mainline for 2004 using the comparable investment, capital attraction and financial integrity standards, which together comprise the fair return standard. TransCanada cited the *Northwestern Utilities Limited v. City of Edmonton,*[9] *Bluefield Waterworks & Improvement Co. v. Public Service Commission of West Virginia et al.*[10] and *Federal Power Commission v. Hope Natural Gas*[11] cases as establishing this standard.

TransCanada argued that the fair return standard does not apply narrowly to either the rate of return on equity nor to the deemed equity component of a utility's capital structure; instead it applies to the total return on capital invested. Thus, in TransCanada's view, the Board's determination of a fair return on equity capital must involve consideration of evidence pertaining to the overall equity return. This is required by the fair return standard as articulated in *Northwestern Utilities (1929)*, and was endorsed by the Federal Court of Appeal decision in *TransCanada v. NEB*[12] and the Board in its RH-1-1970 Reasons for Decision[13].

While TransCanada's evidence pertaining to total return was primarily based on the ATWACC methodology (derived from the after-tax ROE and after-tax market cost of debt), TransCanada also discussed two other forms of total return: the total equity return (the dollar amount resulting from the product of the common equity ratio, the ROE and the rate base) and the rate of return on rate base (in this instance, calculated using after-tax ROE and before-tax embedded cost of debt).

TransCanada also expressed the view that the Board should approach its consideration of the evidence from a clean slate and not limit itself to the changes in business risk since it last assessed the Mainline's cost of capital (that is, in RH-4-2001, which pertained to the 2001 and 2002 Test Years).

12 *TransCanada v. NEB, supra* note 8

13 National Energy Board RH-1-70 Reasons for Decision, Trans-Canada Pipe Lines Limited (Tolls Application – Phase I), December 1971 [hereinafter RH-1-70]

Position of Intervenors

CAPP

CAPP argued that there were two distinct methodologies before the Board in this proceeding, the first being the Board's traditional framework and the other being the approach put forward by TransCanada, which focuses on a total return framework.

CAPP noted that the traditional framework was used by the Board in the RH-2-94 Reasons for Decision and was subsequently confirmed by the Board in RH-4-2001. CAPP favoured the Board's traditional approach, stating that such an approach involved a separate determination of a return on equity and of a capital structure. It argued that once the Board has followed its traditional approach, it simply produces an arithmetic result to arrive at the total return. CAPP expressed the view that there is no separate determination of a fair return and cited the Federal Court of Appeal in *TransCanada v. NEB* in support of this proposition.

The starting point under the traditional framework for establishing capital structure, in CAPP's submission, is an analysis of business risk, which typically looks at changes in business risk since the last time cost of capital was assessed. CAPP argued that the Board may also look at other factors such as the pipeline's financing requirements, the pipeline's size and its ability to access capital and that these factors are afforded some weight by the Board.

In CAPP's view, the RH-4-2001 Decision should serve as the baseline and the Board should assess what changes of significance, if any, have occurred since 2001. CAPP submitted that TransCanada should have to prove whether any such changes justify a change in capital structure. While the Board's findings should be limited to changes of significance since 2001, CAPP acknowledged that the Board could look at changes prior to 2001. However, CAPP reiterated the point that the most relevant evidence in this proceeding is that evidence which points to changes that have occurred since 2001.

CAPP argued that the capital structure could not be backed out of the total return and that the essence of TransCanada's total return comparisons approach is problematic because any actual comparative analysis involves businesses for which there is both return on equity information and capital structure information. CAPP argued that this approach is flawed because, to arrive at total return, one must make a finding on the return on equity, which is not an issue in this case, as TransCanada chose not to file an application for review of the ROE stemming from the RH-2-94 Formula.

Finally, CAPP submitted that what constitutes a fair return is a matter of opinion for the Board and not a matter of law or jurisdiction. In CAPP's view, the Board is entitled to bring its own judgment, experience and expertise to bear on the question of what constitutes a fair return.

IGUA

It was submitted by the Industrial Gas Users Association (IGUA) that this case was unusual because not all the elements of cost of capital were at issue. According to IGUA, the traditional methodology involves a separate determination of the return on equity and the equity ratio. The mathematical product of the return on equity and the equity ratio is then included as the equity return component of the revenue requirement and used to produce just and reasonable tolls.

IGUA referred to the RH-2-94 Decision, wherein the Board held that the capital structure set in that hearing would endure for an extended period of years, and more importantly, that the Board would consider a reassessment of capital structure on an individual basis, in the event of a significant change in business risk, in corporate structure or in corporate financial fundamentals. It argued that the re-examination mechanism established by the Board in 1994 has never been set aside in any subsequent decision and that it applies as a matter of principle today. IGUA contended that the traditional methodology that the Board applies calls for a party seeking a re-examination of capital structure to satisfy a significant change of circumstances test to obtain the relief that it seeks. IGUA further argued that this test exists and cannot be eliminated, without a motion to vary and set aside that feature of the RH-2-94 Decision, which has not been done in this case.

IGUA supported CAPP's suggestion that this case is simply an attempt to vary the Board's RH-4-2001 Decision and that TransCanada is trying to do indirectly what it could not do directly. IGUA submitted that in the RH-4-2001 Decision, the Board rejected the total return approach for determining the return component of just and reasonable tolls proposed by TransCanada, and also rejected that approach as a check for reasonableness on the traditional methodology.

Finally, IGUA argued that it is more appropriate for the Board to look at significant changes in business risk if the request for a change in capital structure occurs shortly after the last decision on the matter. A clean slate approach is only appropriate if the Board is dealing with a case that is occurring a substantial period of time after the ratios were initially established.

Coral

Coral Energy Canada Inc. (Coral) did not make submissions regarding which methodology the Board should employ in determining TransCanada's capital structure. Coral acknowledged that as a practical matter, it acceded to TransCanada's position that the Board should employ the clean-slate methodology but noted that this should not be taken as a concession that Coral had to do so or as disagreement with the submissions for CAPP or IGUA on that point.

Ontario

The Minister of Energy for the Province of Ontario (Ontario) raised a number of legal principles for the Board to consider in relation to TransCanada's application. Among them, Ontario submitted that the Act contains no provision that requires the Board to determine a utility's rate of return on capital; the Act requires only that all tolls be just and reasonable. Ontario cited the Federal Court of Appeal in *TransCanada v. NEB* in support of its submission that the Board's authority to determine just and reasonable tolls is not limited by any statutory direction; instead it is guided by its own judgment. Ontario also stated that customers and consumers have an interest in ensuring that the Mainline's costs are not overstated.

It was noted by Ontario that the Board has adopted a cost of service methodology, although it was open to the Board to choose one of many approaches. Ontario argued that, having chosen this approach, the Board must faithfully determine the Mainline's costs. In cost of capital proceedings, the Board is entitled to estimate the cost of capital, including the deemed equity level of the Mainline and the Mainline's overall return on capital, on the basis of the evidence before it and its own judgment.

Views of the Board

As discussed in Chapter 1, the Mainline's 2004 ROE has already been established through the application of the RH-2-94 Formula and is not at issue in this proceeding. Determining the appropriate capital structure for the Mainline is the central issue within this proceeding; however, the central legal issue is whether the Board is legally compelled to employ a specific methodology in arriving at its determination of an appropriate capital structure for the Mainline. The submissions of parties concerning the Board's legal obligations in establishing the Mainline's capital structure raised points relating to four factors: the Act's requirement for just and reasonable tolls; cost of service regulation; the fair return standard; and the methodology to be used to determine capital structure.

Just and Reasonable Tolls

Any consideration of tolls must commence with an examination of the Board's mandate as set out in section 62 of the Act:

> All tolls shall be just and reasonable, and shall always, under substantially similar circumstances and conditions with respect to all traffic of the same description carried over the same route, be charged equally to all persons at the same rate.

The methodology that the Board must employ in setting just and reasonable tolls is not prescribed by law, nor is there any statutory obligation requiring the Board to specifically consider and establish a rate of return for the companies it regulates. The Federal Court of Appeal in *TransCanada v. NEB* held that while the Board has, for the Mainline, traditionally applied a cost of service methodology from which just and reasonable tolls are derived, the Board may adopt a different methodology for determining tolls.[14] This finding affirms a similar principle found in two previous decisions of that same Court.[15]

---

14 *TransCanada v. NEB, supra* note 8 at paras. 29 and 30

15 The Court specifically affirmed its previous decision in *B.C. Hydro* (*infra* note 18) and, by doing so, also affirmed the same finding it made in *Trans Mountain* (*infra* note 16)

In *Trans Mountain Pipe Line Company v. National Energy Board et al.,*[16] the Federal Court of Appeal found that the method to be used and the factors to be considered in determining tolls:

> must be left to the discretion of the Board which possesses in that field an expertise that judges do not normally have. If, as it has clearly done in this case, the Board addresses its mind to the right question, namely, the justness and reasonableness of the tolls, and does not base its decision on clearly irrelevant considerations, it does not commit an error of law merely because it assesses the justness and reasonableness of the tolls in a manner different from that which the Court would have adopted.[17]

The broad authority of the Board was also set out in *B.C. Hydro and Power Authority v. Westcoast Transmission Company Ltd. et al*.[18] In that case, the Court noted that the regulatory system established by Part IV of the *National Energy Board Act* differs from the situation in *Northwestern Utilities (1929)* where there were specific statutory directions to the Public Utilities Board contained in the *Gas Utilities Act*. Thurlow C.J. in *B.C. Hydro* went on to state:

> There are no like provisions in Part IV of the National Energy Board Act. Under it, tolls are to be just and reasonable and may be charged only as specified in a tariff that has been filed with the Board and is in effect. The Board is given authority in the broadest of terms to make orders with respect to all matters relating to them. Plainly, the Board has authority to make orders designed to ensure that the tolls to be charged by a pipeline company will be just and reasonable. But its power in that respect is not trammelled or fettered by statutory rules or directions as to how that function is to be carried out or how the purpose is to be achieved. In particular, there are no statutory directions that, in considering whether tolls that a pipeline company proposes to charge are just and reasonable, the Board must adopt any particular accounting approach or device or that it must do so by determining cost of service and a rate base and fixing a fair return thereon.[19]

Cost of Service Regulation

It has been the Board's practice since its first rate hearing, RH-1-70, to utilize a forward test year cost of service approach to set tolls for the Mainline. This approach involves estimating the costs to be incurred by the Mainline over a future period, known as a test year. In order to recover its approved costs, the Board permits TransCanada to charge the Mainline's customers tolls. These tolls should provide TransCanada with sufficient revenue to recover the Mainline's prudently incurred costs, including its cost of capital, while at the same time "fairly allocating charges to users in relation to the costs and benefits of different services."[20]

The Federal Court of Appeal in *TransCanada v. NEB* noted that once the Board adopted the cost of service methodology "it had to faithfully determine the Mainline's costs based upon the evidence and its own sound judgment."[21] As the Court also pointed out, the largest component of the Mainline's costs is its cost of capital, which is included in the Mainline's cost of service.[22]

Rothstein J.A. in *TransCanada v. NEB* described the cost of capital to a utility this way:

> The cost of capital to a utility is equivalent to the aggregate return on investment investors require in order to keep their capital invested in the utility and to invest new capital in the utility. That return will be made in the form of interest on debt and dividends and capital appreciation on equity. Usually, that return is expressed as the rate of return investors require on their debt or equity investments.[23]

Under the Board's traditional approach, once the Board has established a rate of return on equity and debt, the two numbers are consolidated into a composite rate of return on capital, based upon the relative amounts of debt and equity in the capital structure. The Board constructs for each pipeline a capital structure, which reflects the amount of debt and equity the pipeline needs to finance its prudently incurred costs. This assessment is made with the assistance of expert evidence. In order to account for the greater or lesser risk attributed to an individual pipeline, the equity component of the capital structure is adjusted. The higher the risk attributed to a pipeline, the greater the required equity component of its capital structure. This is so, because equity serves as support for debt,

20 *TransCanada v. NEB, supra* note 8 at para. 5

21 *Ibid*. at para. 32

22 *Ibid*. at para. 5

23 *Ibid*. at para. 6

whose repayment is most often fixed. A higher level of equity provides comfort to debt lenders by improving the likelihood that their investment will be recovered in the event the corporation cannot meet its financial obligations.

Fair Return Standard

A number of parties cited case law, in addition to those cases already discussed in these Views of the Board, in their arguments regarding the determination of the cost of capital and the overall return. *Northwestern Utilities (1929)*, *Bluefield* and *Hope* are the leading cases with respect to the fair return standard. For ease of reference, the relevant passages are reproduced herein.

In *Northwestern Utilities (1929)* Lamont J. of the Supreme Court of Canada held that:

> The duty of the Board was to fix fair and reasonable rates; rates which, under the circumstances, would be fair to the consumer on the one hand, and which, on the other hand, would secure to the company a fair return for the capital invested. By a fair return is meant that the company will be allowed as large a return on the capital invested in its enterprise (which will be net to the company) as it would receive if it were investing the same amount in other securities possessing an attractiveness, stability and certainty equal to that of the company's enterprise.[24]

In *Bluefield*, the US Supreme Court stated:

> The company contends that the rate of return is too low and confiscatory. What annual rate will constitute just compensation depends upon many circumstances, and must be determined by the exercise of a fair and enlightened judgment, having regard to all relevant facts. A public utility is entitled to such rates as will permit it to earn a return on the value of the property which it employs for the convenience of the public equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties; but it has no constitutional right to profits such as are realized or anticipated in highly profitable enterprises or speculative ventures. The return should be reasonably sufficient to assure confidence in the financial soundness of the utility and should be adequate, under efficient and economical management, to maintain and support its credit

24 *Northwestern Utilities (1929), supra* note 9 at pp. 192-193

> and enable it to raise the money necessary for the proper discharge of its public duties. A rate of return may be reasonable at one time and become too high or too low by changes affecting opportunities for investment, the money market and business conditions generally.[25]

Finally, in *Hope,* the US Supreme Court stated:

> We held in *Federal Power Commission v. Natural Gas Pipeline Co.*, that the Commission was not bound to the use of any single formula or combination of formulae in determining rates. Its ratemaking function, moreover, involves the making of "pragmatic adjustments." And when the Commission's order is challenged in the courts, the question is whether that order "viewed in its entirety" meets the requirements of the Act. Under the statutory standard of "just and reasonable" it is the result reached not the method employed which is controlling. It is not theory but the impact of the rate order which counts. If the total effect of the rate order cannot be said to be unjust and unreasonable, judicial inquiry under the Act is at an end. The fact that the method employed to reach that result may contain infirmities is not then important. Moreover, the Commission's order does not become suspect by reason of the fact that it is challenged. It is the product of expert judgment which carries a presumption of validity. And he who would upset the rate order under the Act carries the heavy burden of making a convincing showing that it is invalid because it is unjust and unreasonable in its consequences.
>
> The rate-making process under the Act, i.e., the fixing of "just and reasonable" rates, involves a balancing of the investor and the consumer interests. Thus we stated in the Natural Gas Pipeline Co. Case that "regulation does not insure that the business shall produce net revenues". But such considerations aside, the investor interest has a legitimate concern with the financial integrity of the company whose rates are being regulated. From the investor or company point of view it is important that there be enough revenue not only for operating expenses but also for the capital costs of the business. These include service on the debt and dividends on the stock. By that standard the return to the equity owner should be commensurate with returns on investments in other enterprises having corresponding risks. That return, moreover, should be sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital. The conditions

25 *Bluefield, supra* note 10 at pp. 692-693

> under which more or less might be allowed are not important here. Nor is it important to this case to determine the various permissible ways in which any rate base on which the return is computed might be arrived at.[26] [citations omitted]

RH-1-70 was the first proceeding under Part IV of the Act in respect of tolls to be charged by TransCanada. In that Decision, the Board quoted extensively from, considered and relied upon these cases. The Board concluded as follows in respect of the framework for consideration of an appropriate rate of return for TransCanada:

> The Board is of the opinion that in respect of rate regulation, its powers and responsibilities include on the one hand a responsibility to prevent exploitation of monopolistic opportunity to charge excessive prices, and equally include on the other hand the responsibility so to conduct the regulatory function that the regulated enterprise has the opportunity to recover its reasonable expenses, and to earn a reasonable return on capital usefully employed in providing utility service. Further, it holds that to be reasonable such return should be comparable with the return available from the application of the capital to other enterprises of like risk. The Board accepts that, with qualifications, the rate of return is the concept perhaps most commonly used to project for some future period the ratio of return which has been found appropriate for the capital employed usefully by a regulated enterprise in providing utility service in a defined test period.[27]

In the RH-4-2001 Reasons for Decision, the Board set out what it viewed as the attributes which a fair return ought to have. One of the elements referred to was the appropriate balance of customer and investor interests. The Board went on to state that customer interest in rate of return matters relates most directly to the impact the approved return will have on tolls, and found this to be a relevant factor in the determination of a fair return.[28] In the RH-R-1-2002 Decision regarding TransCanada's application for review of RH-4-2001, the Board reiterated its view that the balance of interests between consumers and investors in the utility could be taken into account.[29] On appeal of this point, the Federal Court of Appeal in *TransCanada v. NEB* agreed with TransCanada's argument that the required rate of return on equity must be determined solely on the basis of the Mainline's cost of equity capital. The Court found that the impact of

26 *Hope, supra* note 11 at pp. 602-603

27 RH-1-70, *supra* note 13 at p. 7-5

28 RH-4-2001, *supra* note 4 at pp. 11-12

29 RH-R-1-2002, *supra* note 5 at p. 1

any resulting toll increases on customers is not a relevant consideration in that determination.[30] While consumers have an interest in ensuring that the Mainline's costs are not overstated and therefore may provide evidence, it must pertain to the costs of the Mainline. The Court noted that the Board could take increases in tolls into account in considering whether the tolls should be phased in over time to ameliorate any rate shock. The Court went on to find that there was no evidence that the Board took the impact on consumers into account in making its determination of the Mainline's return on equity[31] and the appeal was denied. The Board confirmed, in its 19 November 2004 ruling on a TransCanada motion (see Appendix III), that it would not give weight to any evidence pertaining to the impact of tolls on customers in making the determinations to be made in Phase II.

The Board is of the view that the fair return standard can be articulated by having reference to three particular requirements. Specifically, a fair or reasonable return on capital should:

- be comparable to the return available from the application of the invested capital to other enterprises of like risk (the comparable investment standard);
- enable the financial integrity of the regulated enterprise to be maintained (the financial integrity standard); and
- permit incremental capital to be attracted to the enterprise on reasonable terms and conditions (the capital attraction standard).

In the Board's view, the determination of a fair return in accordance with these enunciated standards will, when combined with other aspects for the Mainline's revenue requirement, result in tolls that are just and reasonable.

Methodology to Determine Capital Structure

The preceding discussion sets out the framework for the Board's consideration of the cost of capital issues. Different views were presented regarding which approach should be used in establishing the equity thickness, and to what determinations the fair return standard would apply.

IGUA argued that the RH-2-94 Decision includes a reassessment mechanism, based on criterion of significant change in business risk, which continues to apply. IGUA further argued that a motion to vary and set aside this feature of the RH-2-94 Decision was required but was not done in this case. In the Board's view, the wording in the RH-2-94 Decision established an expectation or desire on the part of the Board that

30 *TransCanada v. NEB, supra* note 8 at paras. 35-36

31 *Ibid.* at para. 37

the capital structure decision would endure for a period of years. The Decision further indicates that the Board would be prepared to consider a reassessment of capital structure in the event of a significant change in business risk, in corporate structure or in corporate financial fundamentals. In the Board's view, the wording of the RH-2-94 Decision was not an attempt to establish a standard that, if not met, would preclude an applicant from filing an application, but rather was an indication of when the Board believed it would be appropriate to reconsider the matter. Further, the Board determined in its rulings prior to the oral portion of this hearing that it would not limit the examination of the capital structure issues to any particular methodology. Thus, in the Board's view, a motion to vary the RH-2-94 Decision was not necessary.

TransCanada argued that the Board should make its determination on capital structure by examining the total return, as the Board must, as a matter of law, establish a fair overall return for the Mainline and it is to the overall return that the fair return standard applies. From that finding, the Board can determine the Mainline's equity component. Included in this approach is TransCanada's argument that the Board ought not to limit itself to examining changes in business risk since the last time the Mainline had its cost of capital assessed by the Board, in this case, in 2001, but rather should apply a clean-slate approach.

Many of the intervenors agreed that the Board is required to provide TransCanada a fair return, but disputed TransCanada's contention that the Board is obligated to look at the overall return when setting the Mainline's capital structure. Instead, the intervenors favoured the Board's traditional approach, wherein the Board first sets a return on equity and then undertakes an assessment of business and financial risks facing the pipeline. This type of assessment typically looks at how each component of business risk has changed since the last time business risk was assessed. The final step in this approach involves the establishment of a capital structure or a common equity ratio that, when combined with the ROE, will result in an overall return commensurate with the level of business risk facing the investment. Some intervenors referred to this as a purely arithmetic function.

While some parties seemed somewhat entrenched early on in this proceeding regarding whether it was proper for a party on the opposing side to present its case according to a particular methodology, most seemed to recognize, as the hearing progressed, that the law did not prohibit the other approach. The arguments tended to focus on which approach would be more appropriate for the Board to use in coming to a decision on capital structure. Other than establishing that the return awarded to the company must meet the fair return standard, the case law provides no assistance on how this must be done.

The Board agrees with CAPP and others that historically the Board has examined the elements that go into determining total return separately rather than looking at specific evidence regarding overall return. In the RH-2-94 Multi-Pipeline Cost of Capital Decision, the Board established the ROE for a benchmark pipeline to be applied to all pipelines in that hearing. It then determined that any risk differentials between the pipelines could be accounted for by adjusting the common equity ratio.[32] To do this, it started with an analysis of each pipeline's business risk and then examined factors such as financing requirements, the pipeline's size and its ability to access financial markets.[33]

In RH-4-2001, the Board considered but rejected TransCanada's ATWACC proposal. The Board held that its assessment of how the Mainline's business risk had changed since the consideration in the RH-2-94 Proceeding justified an increase in the Mainline's common equity ratio. The Board found in RH-4-2001, as it had in RH-1-70, that the determinations made were consistent with the legal principles set out therein, which included the fair return standard, and found that the decisions would result in a fair return for the Mainline.

The Board also agrees with TransCanada that the case law establishes that it is the overall return on capital to the company which ought to meet the comparable investment, financial integrity and capital attraction requirements of the fair return standard. However, this does not, in the Board's view, require that the Board make the necessary determinations solely by means of examining evidence on overall return.

Similarly, while it is open to the Board to look at changes in business risk since a previous decision to establish an equity thickness for the Mainline, it is also not restricted to this approach. When the Board utilizes the traditional methodology, it ensures that each element that goes into the determination of the overall return is reasonable. It then uses its judgment to ensure that the resulting return is a fair return in accordance with the legal requirements. To this extent, the return on capital is not simply an arithmetic determination of various elements. The Board must always apply its judgment to ensure the return on capital is fair.

In short, as indicated by the Federal Court of Appeal in *TransCanada v. NEB,* when the Board employs a cost of service methodology, it must faithfully determine the Mainline's costs based on the evidence and its own sound judgment.[34] Beyond that, the Board is not required in law to subscribe to any particular methodology.

---

32 RH-2-94, *supra* note 1 at p. 6

33 *Ibid*. at p. 25

34 *TransCanada v. NEB*, *supra* note 8 at para. 32

Thus, the Board is neither limited to considering evidence pertaining to significant changes since it last established the Mainline's capital structure, nor is it compelled to give weight to particular evidence pertaining to overall return. The Board must consider all the evidence placed before it, decide what weight that evidence should be given and apply its judgment in making the required decisions. In doing so, the Board must satisfy itself that these decisions are consistent with the Act's requirement for just and reasonable tolls and that, since the Mainline operates under cost of service regulation, the return on capital to the company meets the fair return standard. In this hearing, the Board must apply its judgment to satisfy itself that the approved common equity ratio, when combined with the Mainline's ROE of 9.56 percent, will result in a fair return on equity for TransCanada in 2004.

What weight a specific piece of evidence or methodology should be given is a matter of judgment. In the following chapters of these Reasons for Decision, the Board has summarized the evidence and position of parties and expressed views concerning the weight that such evidence ought to be afforded in making the various determinations to be made in Phase II.

Chapter 3

Junior Subordinated Debentures

TransCanada introduced junior subordinated debentures (JSDs) into the Mainline's capital structure in 1997. The JSDs were included as a cost-effective alternative to preferred shares, which had previously been part of the Mainline's capitalization. The last comprehensive cost of capital hearing for the Mainline that preceded the conversion of the preferred shares to JSDs was RH-2-94, which initially applied to the 1995 Test Year. In that Decision, the Board concluded that "given current cost rates, it is appropriate for TransCanada to maintain preferred shares in its capital structure at the present time."[35] In 1995, preferred shares represented 9.96 percent of the Mainline's capitalization.

Two tranches of JSDs were issued by TransCanada and both were fully allocated to the Mainline: an 8.75% US$ 160 million issue (8.75% JSDs) in 1997, which was redeemed in 2003; and an 8.25% US$ 460 million issue (8.25% JSDs) in 1998, which TransCanada proposed to redeem in 2004. TransCanada submitted that JSDs have comprised approximately ten percent of the Mainline's total capitalization in the form of preferred securities since 1998. It proposed to replace this ten percent preferred component of the Mainline's capitalization with seven percent unfunded debt and three percent common equity.

TransCanada requested that the Board approve the elimination of the JSDs from the Mainline's capital structure and provide explicit direction on how TransCanada is to replace the JSDs. TransCanada noted that while the Board cannot direct TransCanada to call the JSDs, it can determine whether the costs incurred by the utility can be included in the Mainline's revenue requirement and recovered in tolls.

Position of TransCanada

TransCanada cited several benefits that would result from the proposed changes to the Mainline's capitalization. The removal of the US dollar-denominated JSDs would result in a sizeable one-time foreign exchange gain to shippers, simplify the Mainline's capital structure and reduce the Mainline's future exposure to foreign exchange risk and to further changes in accounting or credit rating agency treatment.

According to TransCanada, the JSDs are neither common equity nor debt but they provide equity support to senior debt. As a result, the proposed redemption of JSDs and their partial replacement with senior debt would require an offsetting increase in common equity in the Mainline's capital structure. TransCanada suggested that credit rating agencies typically give hybrid securities like JSDs 30 percent to 40 percent equity credit. The proposed Mainline capital structure for 2004 would reflect this treatment, incorporating an increase of seven percent senior debt and an increase of three percent common equity. TransCanada contended that it was not

35 RH-2-94, *supra* note 1 at p. 25

appropriate to redeem the JSDs and replace them with a like instrument, as the marketplace for these securities does not exist in Canada at this time.

TransCanada submitted that developments in credit assessment and accounting standards required changes in the preferred component of the Mainline's capital structure. According to TransCanada, credit rating agencies are taking a more critical view of the credit support that hybrid securities, such as JSDs, provide to senior debt. Further, the Canadian Accounting Standards Board announced that JSDs would likely be classified as debt under Generally Accepted Accounting Principles (GAAP) by the end of 2004. TransCanada submitted that the credit supporting attributes of JSDs have weakened and that these instruments are no longer well suited for their intended purpose of providing credit support.

If the Board were to approve a 40 percent equity ratio for the Mainline, in TransCanada's view, no further adjustments to the deemed equity ratio to reflect the redemption of the JSDs would be required. However, if the Board determined that the appropriate capital structure should include less than 40 percent equity, then the Board should make a determination with respect to the equity credit warranted as a result of the JSDs' redemption. TransCanada suggested that if the JSDs are redeemed, the equity ratio of the Mainline should be increased from 33 to 36 percent regardless of any findings the Board may make on business risk. TransCanada viewed a capital structure (assuming redemption of JSDs) consisting of 36 percent common equity and 64 percent senior debt as a different characterization of the status quo.

It its initial application, TransCanada proposed to make the effective date for redemption of the JSDs 30 June 2004. However, TransCanada acknowledged at the end of January 2005 that the JSDs had not been redeemed. TransCanada argued that the Board could provide guidance on this matter, while not purporting to make a decision in respect of 2005.

In response to CAPP's contention that the retirement of preferred securities was factored into the RH-4-2001 Decision, TransCanada noted that the Decision makes no mention of preferred securities and pointed out that the three percent increase in common equity approved by the Board in RH-4-2001 was attributed to increased business risk.

Position of Intervenors

CAPP submitted that the JSDs were treated as debt by the Board in its RH-4-2001 Decision, and should continue to be treated as debt. CAPP further submitted that JSDs are interest-bearing instruments and are in substance debt. It argued that, although there is potentially a large one-time foreign exchange gain as a result of redeeming the JSDs, the replacement of the JSDs with a combination of debt and common equity is a more costly solution. Therefore, CAPP submitted that TransCanada should either leave the JSDs in place or replace them with a similar instrument. The terms and conditions of the replacement debt, in CAPP's view, is a matter for the prudent exercise of management judgment.

CAPP rejected TransCanada's contention that there is a ten percent preferred securities layer in the Mainline's capital structure and noted that the amount of JSDs in the Mainline's capital structure is a matter of arithmetic, based on the dollar value of JSDs that happen to be in the capital structure at any given time. CAPP noted that JSDs currently comprise approximately 8.5 percent of the Mainline's capitalization.

It was noted by CAPP that TransCanada did not seek approval from the Board when it redeemed the 8.75% JSDs in 2003, and that this redemption had an effect on the capital structure of the Mainline. CAPP further noted that TransCanada had intended to discuss this issue with the Mainline's Tolls Task Force (TTF) in due course, but chose to act unilaterally. CAPP took issue with TransCanada's position that the company was acting altruistically to the benefit of shippers in redeeming the JSDs in 2003. CAPP contended there was no urgency in making this change to capital structure, and the TTF should have been consulted. CAPP further suggested that the motivation for this action was to move the Mainline out of a pre-funded position, which benefited TransCanada.

CAPP indicated that JSDs rank behind senior debt both in terms of interest and any winding up of claims in a bankruptcy proceeding. CAPP pointed to a presentation where Standard and Poor's (S&P) had stated that the Mainline's capital structure is comprised of 33 percent common equity and 67 percent debt, in support of CAPP's view that S&P does not acknowledge equity credit for the JSDs. Further, CAPP submitted that the Board was aware of the Mainline's previous use of preferred shares but did not regard them as common equity and specifically set the Mainline's capital structure at 33 percent common equity and 67 percent debt, including the JSDs in the debt component, with no equity characteristics. CAPP contended that the Board recognized that within the debt class there were a variety of different types of debt, but all were classified as debt.

The fact that the JSDs had not been redeemed as of January 2005 made it difficult, in CAPP's view, to retroactively apply for their redemption. CAPP suggested that the benefits, if any, of a change to capital structure would have to be applied on a prospective basis.

IGUA and Coral endorsed the submissions of CAPP on the JSDs. Coral also suggested that the Board has the option of leaving it to TransCanada to manage the JSDs allocated to the Mainline or of approving TransCanada's request to replace the JSDs with senior debt and common equity. Coral submitted that the latter option would leave shippers worse off.

Ontario expressed the view that as redemption of the JSDs had not taken place during the 2004 Test Year, it would be improper for the Board to make any adjustment to the Mainline's deemed equity structure in respect of the JSDs for 2004.

Views of the Board

The Board is of the view that hybrid securities, like the JSDs, may provide credit support to senior debt. However, it appears that, as TransCanada has acknowledged, the credit support provided by the JSDs has declined since they were issued in the late 1990s. The Board notes there is no consensus amongst credit rating agencies regarding the precise amount of equity credit given to TransCanada's JSDs.

The Board notes that in the RH-4-2001 Decision, the JSDs were considered part of the Mainline's debt,[36] and that their cost rate was factored into the calculation of the overall cost of debt for the Mainline. The Board views coverage of all fixed charges, whether interest on debt or dividends on preferred shares, as equally important. Therefore, it is appropriate to treat all fixed income securities as forming part of the debt components of the Mainline's capital structure. This is accomplished by focusing on establishing the appropriate equity ratio for the Mainline, rather than making specific findings on the composition of the debt.

The Board notes that in the past, it has assessed the business risk of the pipelines it regulates and reflected these relative risks through the deemed common equity component of the pipelines' capital structures. For example, in the RH-2-94 Decision, the Board stated:

> The Board recognizes that the gas pipelines have some individual characteristics, described in its views above, which differentiate one from another. On balance, however, the Board is of the view that the overall business risks of TransCanada, Foothills, ANG and TQM balance out such that a similar common equity ratio can be given to these four pipelines. Accordingly, the Board approves a common equity ratio of 30% for TransCanada, Foothills, ANG and TQM.[37]

Also in RH-2-94, having set a common equity ratio of 30 percent for the Mainline, the Board approved the maintenance of preferred shares in the Mainline's capital structure, noting that:

> With respect to preferred shares, the Board concludes that, given current cost rates, it is appropriate for TransCanada to maintain preferred shares in its capital structure at the present time.[38]

In the Board's view, the issue related to preferred securities has been one of cost efficiency, not one of credit support, as the same common equity ratio was approved in RH-2-94 for pipelines of similar risk, regardless of whether the pipelines had preferred shares in their capital structures. Consistent with this view, the Board will, in this instance, set a common equity ratio that is appropriate when combined only with debt. Should hybrid securities form part of this debt and provide further support for senior debt, the Board would consider this reasonable so long as it is cost effective. The Board views the minimization of costs, including financing costs, as an objective of reasonable and prudent management.

36 RH-4-2001, *supra* note 4 at p. 59

37 RH-2-94, *supra* note 1 at p. 27

38 *Ibid*. at p. 25

While the Board notes TransCanada's submission concerning the potential for a large one-time foreign exchange gain to be realized through redemption of the JSDs, the Board is of the view that the long-term benefits to Mainline shippers are less certain, given uncertainty over the future cost rates of the securities that would replace the JSDs. TransCanada stated that its goals were to simplify the Mainline's capital structure, reduce its exposure to currency fluctuations and accommodate changes in accounting standards. The Board is of the view that these are all reasonable objectives, but that TransCanada can manage the associated risks without the Board providing an express direction in regard to the redemption or retention of the JSDs.

The Board is not prepared to direct that the JSDs be eliminated from the Mainline's capital structure. The JSDs are as cost effective as the rest of the Mainline's embedded senior debt, and therefore, the Board sees no reason to direct that they be removed from the Mainline's capital structure. The Board also notes that, although TransCanada's application was for the 2004 Test Year, the company did not redeem, although it could have redeemed, the JSDs in 2004. Therefore, for rate-making purposes, the JSDs should continue to form part of the Mainline's funded debt for 2004.

TransCanada has the discretion to redeem the JSDs or maintain them in the Mainline's capital structure. The Board will continue to treat the JSDs as part of the Mainline's debt. On a prospective basis, should the JSDs be redeemed, the Board anticipates that no changes to the Mainline's equity ratio would be warranted. As always, TransCanada's future decisions concerning the JSDs may be subject to scrutiny on the basis of prudence.

Decision

The 8.25% JSDs shall remain part of the Mainline's funded debt for the 2004 Test Year.

Chapter 4

Business Risk

The business risk of a pipeline is a key determinant in the analysis of an appropriate capital structure. In these Reasons for Decision, the discussion of business risk has been divided into an assessment of supply risk, market risk, regulatory risk, competitive risk and operating risk. The various forms of risk are related, and the boundaries between them are subjective. What one party may consider a source of market risk may be viewed by another as part of competitive risk. To avoid duplication, each concept is presented under only one form of risk, although it might have been discussed by parties under various forms.

4.1 Approach to Business Risk

Position of TransCanada

TransCanada submitted that the determination of capital structure must be made on the basis of all the evidence relating to the Mainline in 2004, not just changes since RH-4-2001. However, it acknowledged that in some areas, notably with regard to supply, changes since RH-4-2001 are relevant. TransCanada argued that the Board does not have to identify changes since 2001 or conclude that the Board was wrong in RH-4-2001 to grant TransCanada's request in this proceeding.

Position of Intervenors

CAPP contended that the relevant focus of this proceeding is to determine what of significance has changed since RH-4-2001 to justify a change in capital structure, since issues which arose prior to that had been dealt with in that proceeding. CAPP submitted that TransCanada's key messages related to business risk are the same as those which were presented in RH-4-2001. CAPP claimed that issues around supply, markets, competition and regulation have not raised the Mainline's business risk since 2001 and submitted that TransCanada has provided nothing to demonstrate any significant change since that time.

IGUA argued that the significant change of circumstances test identified in the RH-2-94 Decision should apply to this proceeding and contended that there is insufficient evidence to show a significant change since RH-4-2001.

Coral submitted that TransCanada has not made a case that there has been any meaningful change in its business risk since 2001 or that the Board misconceived the situation in its RH-4-2001 Decision.

Ontario argued that the changes in business risk since RH-4-2001 that were identified by TransCanada, that is, changes related to supply, market growth, development of liquefied natural gas (LNG) alternatives and the contractual underpinnings of the Mainline, have not materially increased since RH-4-2001.

4.2 Supply Risk

Supply risk is the risk that the physical availability of natural gas could affect the Mainline's income-earning capability.

Position of TransCanada

TransCanada argued that supply risk is a significant long-term issue because there is flat to declining supply from the Western Canada Sedimentary Basin (WCSB) and there is competition for that supply. The issue of competition for supply is also discussed in Section 4.5, Competitive Risk.

To explore what TransCanada viewed as a plausible range of natural gas supply and Mainline throughput outcomes, TransCanada prepared a throughput study which took into consideration scenarios for conventional and unconventional WCSB supply, Mackenzie Delta supply, western Canadian gas demand, export capacity expansions and allocation of available supply to ex-WCSB pipelines, including the Mainline. The throughput study initially consisted of three cases: Base, Low and High. Following information requests, the Alaskan-in and Distress cases were also added.

Conventional Supply

TransCanada stated that there is a high probability that conventional production has peaked or will peak in the next several years. TransCanada suggested that the sustainability of supply from the WCSB in the long term is primarily dependent on the ultimate potential and presented estimates of conventional economic resources ranging from 7 082 10^9m^3 (250 Tcf) for the Low Case to 8 498 10^9m^3 (300 Tcf) in the High Case. TransCanada's estimates for economic and technical resources are shown in Table 4-1.[39]

Table 4-1
TransCanada's Estimate of Conventional WCSB Ultimate Potential
10^9m^3 (Tcf)

	Base Case	**Low Case**	**High Case**
Technical Resources	8 527 (301)	7 620 (269)	9 405 (332)
Economic Resources	7 790 (275)	7 082 (250)	8 498 (300)

TransCanada argued that its main point of divergence with CAPP with respect to conventional supply was the plausibility of TransCanada's Low Case. TransCanada stated that the Low Case in the throughput study is primarily a low ultimate potential case and is not driven by a change in the natural gas price forecast from the Base Case. TransCanada asserted that CAPP's statement that the Low Case for conventional ultimate potential has a high probability of being exceeded

39 A definition of technical and of economic resources appears in the glossary of terms.

should be rejected because the ultimate potential used in the Low Case is well within the range of estimates of other organizations.[40] Based on recent WCSB performance and recent assessments of ultimate potential, TransCanada stated that outcomes at the low end of the plausible range of outcomes are more likely today than in 1995. Therefore, supply cases at the lower end of the range should be given serious consideration in an assessment of business risks.

Unconventional and Northern Supply

TransCanada submitted that both unconventional gas (expected to be comprised mainly of coalbed methane and tight gas[41]) and northern gas have higher risk profiles than conventional supply. As there is currently no significant Canadian unconventional production, future production levels represent a critical forecast uncertainty. Although these sources of supply are of higher risk than conventional sources, large volumes have been included in the Base Case. TransCanada noted that gas from the Mackenzie Delta is included in all throughput study cases even though the Mackenzie Valley Pipeline has not received regulatory approval.

While TransCanada viewed the probability of Alaskan gas coming on-stream as greater now than in the past, it submitted that there is still considerable uncertainty about whether that gas would flow on the Mainline. Further, TransCanada stated that there is a risk that LNG development may capture the market to which Alaskan gas would otherwise flow. Therefore, it viewed Alaskan gas as too speculative to include in any of the initial throughput study cases.

TransCanada claimed that its purchase of the remaining shares of Foothills was an option to increase the likelihood of TransCanada's involvement in the North. While it may directionally improve the probability that the Mainline captures northern gas, it does not increase the probability that an Alaskan pipeline will proceed.

Capacity Additions and Allocation of Natural Gas Supply

Once total supply was determined for each of the throughput study cases, natural gas demand in western Canada was deducted to arrive at an estimated volume available for export from the region. Next, TransCanada estimated any additional pipeline capacity additions necessary to keep overall pipeline utilization from western Canada at approximately 90 percent. In the Low, Base and High Cases, these additions totalled 9.9 $10^6m^3/d$ (350 MMcf/d), 15.6 $10^6m^3/d$ (550 MMcf/d) and 56.7 $10^6m^3/d$ (2.0 Bcf/d) respectively. The Alaska-in case assumed that a total of 83.6 $10^6m^3/d$ (2.95 Bcf/d) of new ex-WCSB export capacity would be in service by 2011-2012 to transport WCSB and northern gas. New pipeline capacity was assumed to come into service supported by 15 year firm contracts.

40 TransCanada cited: National Energy Board - Canada's Energy Future: Scenarios for Supply and Demand to 2025 (2003) and National Energy Board - Canada's Conventional Natural Gas Resources: A Status Report (April 2004); Canadian Energy Research Institute; and the Canadian Gas Potential Committee.

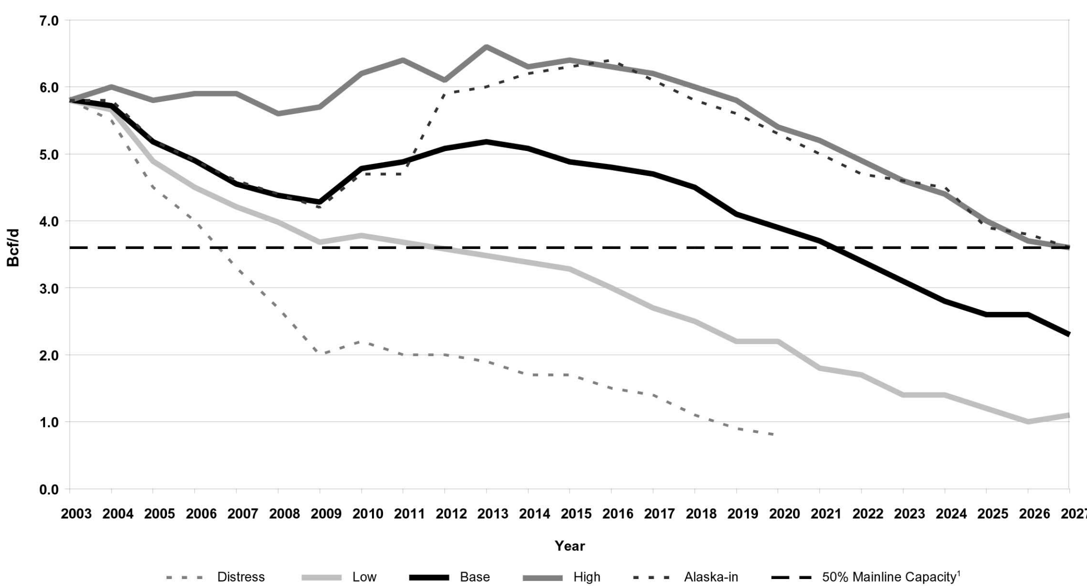
41 Coalbed methane is natural gas, primarily methane, found in most coal seams. The methane is created during coalification, the natural process that converts organic matter into coal over time. Tight gas is natural gas contained in low permeability reservoirs.

TransCanada allocated export volumes first to pipelines with firm contracts and then to the pipelines with the highest netbacks to western Canada. TransCanada applied historical utilization factors to set the upper limit of flow on each pipeline and then allocated the remainder of the supply to the Mainline. At the time that western Canadian export volumes begin to decline, throughput on all pipelines not protected by long-term firm transportation contracts was assumed to decline proportionally to the pipeline's share of ex-WCSB export volumes. TransCanada submitted that this assumption is likely to lead to higher assumed throughput on the Mainline than will actually occur given that it views the Mainline as the swing pipeline, attracting only throughput that does not have the option of flowing on other systems.

Results of Throughput Analysis

The resulting total western supply and Mainline throughput forecasts for selected years are presented in Appendix IV. The throughput forecasts for the entire period are also illustrated in Figure 4-1. In the Base Case, total supply available to the Mainline is expected to decline until northern gas commences flow in 2010 and then resume its decline after 2013. In the Low Case, supply available to the Mainline falls steadily over the forecast period.

Figure 4-1
TransCanada's Throughput Forecasts



1 The horizontal line in Figure 4-1 indicates 50 percent of Mainline capacity. The time at which throughput declines to 50 percent of capacity was raised by CAPP in this proceeding and relied on by TransCanada in RH-1-2002 as an indicator of the Mainline's economic life.

TransCanada argued that CAPP's throughput sensitivity, which removed the assumption that the Mainline offered the lowest netbacks and showed no additional capacity being built except in the High Case, resulted in unacceptably high utilization rates, with aggregate utilization out of the basin exceeding 96 percent in the High Case.

Changes in Supply Risk since RH-4-2001

Given the recent experience of little production growth despite high prices, TransCanada contended that supply risk has increased since RH-4-2001. TransCanada also submitted that forecasters are now expecting lower levels of peak production as well as lower ultimate resources. TransCanada pointed out that its Base Case WCSB peak production is now forecast to be 482 $10^6 m^3/d$ (17 Bcf/d) compared with 555 $10^6 m^3/d$ (19.6 Bcf/d) in its Base Case presented in RH-4-2001. TransCanada's economic ultimate potential estimates have also been reduced since RH-4-2001. Overall, the Base Case Mainline throughput for the year 2020 is now forecast to be 37 percent lower than it was at the time of RH-4-2001.

Depreciation and Supply Risk

TransCanada acknowledged that the Mainline's depreciation rate was increased in 2001 and 2002 as part of a negotiated settlement, and in 2003 through the RH-1-2002 Decision.[42] With respect to the suggestion that the higher depreciation rates approved since 2001 offset supply risk, TransCanada noted that depreciation does not provide any compensation for bearing the risk that the Mainline may not be able to recover its prudently incurred costs, including the return on investment, over its economic life. TransCanada agreed with the Board's statement in the RH-4-2001 Decision that depreciation expense is intended to allow recovery of capital over the economic life of the assets, while return on capital compensates for the risk that the economic life and other depreciation parameters may be wrong.[43]

TransCanada suggested that the assumption that goes into the determination of return is that the depreciation rate is set correctly, so that the return of capital will occur over the economic life of the asset. Accordingly, TransCanada submitted that setting the depreciation rate correctly does not compensate for a fundamental increase in business risk, although setting a depreciation rate that is either too high or too low affects business risk.

While TransCanada accepted that risk is higher if depreciation is assessed infrequently than if it is assessed frequently, it contended that regular assessment of the depreciation rates does not mitigate risk. TransCanada stated that even if the depreciation rate is correct, regular updates do not eliminate future uncertainty associated with it at present.

In addition, TransCanada suggested that there is a risk that the depreciation rate will not be changed when circumstances warrant. Further, TransCanada contended that even if the regulator were willing to allow higher depreciation rates in the case of a deterioration in the supply outlook, the compounding effect on tolls of lower throughput and higher depreciation rates may make tolls uncompetitive.

TransCanada acknowledged that the level of plant remaining undepreciated is potentially relevant to an assessment of business risk and there would not be any recovery risk left if the asset was fully depreciated. However, TransCanada suggested that there is considerable

42 National Energy Board RH-1-2002 Reasons for Decision, TransCanada PipeLines Ltd. (Tolls and Tariff), July 2003 [hereinafter RH-1-2002]

43 RH-4-2001, *supra* note 4 at p. 28

uncertainty concerning the level of plant remaining at the end of the assumed economic life and the amount of unrecovered capital could still be considerable at that point.

In addition, TransCanada contended that the depreciation rates set in the RH-1-2002 Decision are, if anything, conservative because they contain no allowance for negative terminal salvage costs and because the existing 25 year economic planning horizon is optimistic.

Position of Intervenors

CAPP acknowledged that TransCanada's Base Case forecast of total conventional supply was reasonable and reflective of current knowledge. CAPP considered the High Case as achievable under the right conditions. However, CAPP was of the view that, given current and anticipated levels of demand and correspondingly strong prices, as well as the decline experienced by various US basins, the possibility of conventional supply volumes being lower than TransCanada's Low Case was remote.

While CAPP agreed that views on supply have changed since RH-4-2001, CAPP stated that this does not by itself translate into increased business risk for TransCanada. CAPP submitted that the more rapid recovery of capital resulting from increased depreciation rates that were approved in RH-1-2002 for 2003, and agreed to in a negotiated settlement for 2001 and 2002, offset the change in supply and throughput outlook since RH-4-2001. CAPP stated that the Board identified two factors for shortening the capital recovery period in RH-1-2002: the potential for lower supply outcomes and the comparability with competitors' depreciation lives. Consequently, CAPP contended that shippers should not have to pay for the same supply risk twice, once through higher depreciation and again through higher return on capital.

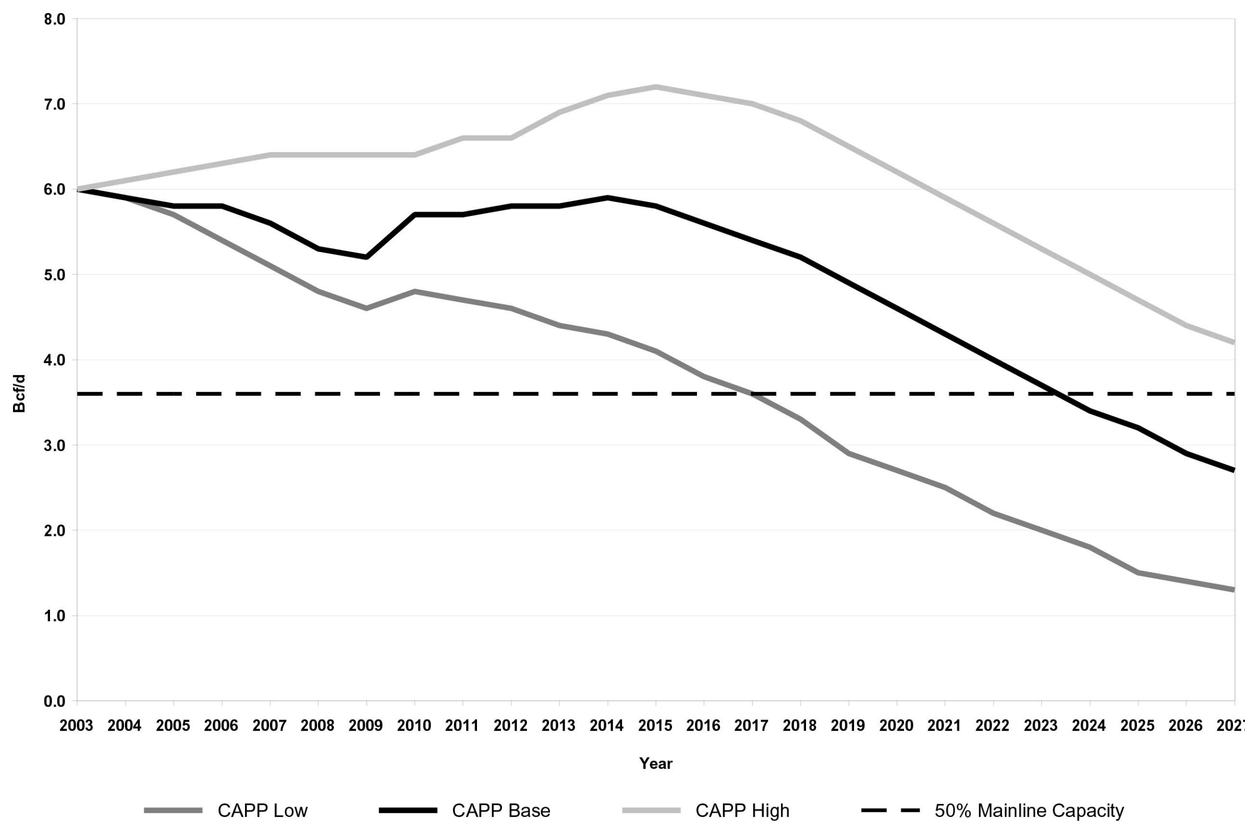
It was noted by CAPP that in the RH-1-2002 Decision, the Board stated its expectation that depreciation would be assessed regularly. CAPP suggested that if supply declines more rapidly than anticipated, depreciation rates could be increased in response. CAPP observed that as the pipeline depreciates, the level of capital remaining to be recovered declines, thereby reducing business risk.

CAPP also considered that the development of the North (Mackenzie Valley and Alaska), the development of unconventional gas and the shift to deeper parts of the WCSB are positive developments which indicate that the market is working and supply is responding.

CAPP did not view Alaskan gas as too speculative to consider in this proceeding but acknowledged that the timing of this gas coming on stream would depend on prevailing market conditions. CAPP further acknowledged that producers are working on many options with respect to the flow of Alaskan gas. CAPP contended that TransCanada's actions in regard to Alaska, including the purchase of Foothills, suggest that Alaskan gas should be given greater weight as upside potential since it, along with unconventional gas, represents a significant upside opportunity for which TransCanada is well positioned to compete. CAPP stated that Alaskan gas was included in the throughput study in 2001 and the probability of the Alaska pipeline proceeding and of Alaskan gas flowing through the Mainline is higher now than it was in 2001. CAPP argued that TransCanada had minimized this upside potential. However, CAPP submitted that its view of supply risk does not depend on the inclusion of Alaskan gas.

With respect to TransCanada's throughput study, CAPP contended that the assumptions that the Mainline offers the lowest netback, and that additional pipeline capacity will be added in all cases, result in conservative estimates of Mainline throughput. CAPP prepared sensitivities to TransCanada's Base, High and Low Cases, removing TransCanada's assumption that the Mainline offers the lowest netback. Volumes were allocated to each pipeline based on historical throughput, calculated using 2000/01, 2001/02 and 2002/03 data, and assuming that no additional capacity would be added except 14.2 $10^6 m^3/d$ (500 MMcf/d) in the High Case. All other assumptions were those used by TransCanada in its throughput study. The results are shown in Figure 4-2 and the resulting total western supply and Mainline throughput sensitivities for selected years are presented in Appendix IV. The horizontal line in Figure 4-2 indicates 50 percent of Mainline capacity. CAPP noted that the time at which throughput declines to 50 percent of capacity was relied on by TransCanada in RH-1-2002 as an indicator of the Mainline's economic life.

Figure 4-2
CAPP's Throughput Sensitivities



The dates at which the Mainline throughput reaches 50 percent of capacity under TransCanada's five cases and the three CAPP sensitivities are shown in Table 4-2.

1 Not available

Ontario argued that the probability of Alaskan gas flowing has increased and therefore the exclusion of Alaskan gas in TransCanada's throughput study was unreasonably negative. Ontario submitted that TransCanada's view of Alaskan gas being too speculative to consider in this proceeding was inconsistent with its action in other forums where it expressed more optimism.

4.3 Market Risk

Market risk has two aspects: the business risk that results from the overall size of the market and that which results from the pipeline's ability to capture market share. In these Reasons for Decision, the issue of market share is discussed under Section 4.5, Competitive Risk.

Position of TransCanada

While TransCanada stated that it is loss of market share due to competition, not shrinking demand, which drives its assessment of market risk, it did point out that projections of natural gas demand growth to 2015 are lower now than at the time of the RH-4-2001 Proceeding.

Position of Intervenors

CAPP suggested that the Mainline's market risk is low given that the North American gas market is growing and that much of that growth is in areas served by the Mainline. According to CAPP, expanding markets suggest the downturn in the Mainline's throughput over the last several years will prove only temporary.

Ontario argued that the possibility of uncertainty in demand growth in downstream markets was identified in RH-4-2001 and is not a new risk. Ontario pointed out that TransCanada is forecasting strong growth in natural gas markets.

4.4 Regulatory Risk

Regulatory risk is the risk to the income-earning capability of the assets that arises due to the method of regulation of the company.

Position of TransCanada

TransCanada expressed the view that the Mainline's regulatory risk has increased through the 1980s and 1990s with the evolution of the Board's policy on the certification of new pipelines. TransCanada contended that regulators' and policy makers' encouragement of greater competition and acceptance of the efficacy of market forces resulted in the approval of the Alliance Pipeline Ltd. (Alliance) facilities in advance of available supply and represented a fundamental change in the pipeline industry.

TransCanada maintained that, while it is true that the Mainline has not seen the costs of underutilization reflected in its earnings, if supply becomes inadequate or competitive alternatives become available, tolls may increase to the point where load is driven off the system and bypasses of the Mainline become economic. Regulators may be unable to mitigate the risk if tolls reach the point of driving load off the system. Further, TransCanada pointed to the Board's RH-1-2001 Decision, which stated that "some sharing of risk between TransCanada and its shippers may be appropriate if considered on a prospective basis",[44] in support of the view that there is no guarantee that the regulator will continue to employ a traditional cost of service model or that the Mainline will not be required to share in the costs of underutilization in the future. Additionally, the last decade has seen widespread use of negotiated settlements, many of which include features intended to substitute certain aspects of competitive markets for the traditional cost of service model.

With respect to CAPP's contention that regulatory risk may have declined since 2001 because TransCanada is no longer discussing a new regulatory model, TransCanada argued that no change in the regulatory model could have happened without regulatory approval and the proposal was never put before the regulator because of universal opposition.

Position of Intervenors

CAPP contended that there has been no substantial change in regulatory risk since 2001 and any minor regulatory uncertainty faced by the Mainline before 2001 was reflected in the RH-4-2001 Decision. If anything, CAPP asserted that regulatory risk has decreased because at the time of RH-4-2001, TransCanada and its stakeholders were discussing a new business and regulatory model for the Mainline. The uncertainty created by that discussion is now gone.

CAPP expressed the view that the NEB regulatory approach not only covers short-term regulatory risk, but also provides a long-term predictable and secure regulatory foundation for the Mainline while adapting to change in a prospective and balanced manner. CAPP suggested that the annual toll adjustments and predictable returns are the manifestation of a long-term bargain. Features such as cost of service revenue protection, deferral accounts, rolled-in pipeline costs for expansions and absence of volume or load factor risk limit the business risk faced by the Mainline due to regulatory uncertainty, as they have for the past 15 years or more.

Ontario also asserted that any regulatory changes were well known at the time of RH-4-2001 and there have been no developments since that time to increase the Mainline's regulatory risk.

---

44 RH-1-2001, *supra* note 3 at p. 14

4.5 Competitive Risk

Competitive risk refers to the business risk that results from competition for customers at both the supply and market ends of the pipeline system. While it directly affects business risk by providing customers with alternatives to ship or purchase natural gas, it also indirectly affects market and supply risk. In these Reasons for Decision, all aspects of risk associated with competition for customers are discussed as part of competitive risk.

For ease of reference, Figure 4-3 presents a map of selected Canadian and US pipelines referred to in this section and in Chapter 5 of these Reasons for Decision.

Position of TransCanada

According to TransCanada, the entry of new pipelines has resulted in increased business risk for the Mainline and in the actual realization of that risk. Further, TransCanada submitted that the Mainline has been affected to a greater degree than other pipelines because it has a smaller proportion of long-term contracts and those contracts have shorter terms; it has been denied tools to compete, including pricing discretion, term differentiated rates and changes to contract renewal policies; and it has the poorest netbacks. As a consequence of these factors, the contractual underpinning of the pipeline, in particular billing determinants, has weakened, as shown in Table 4-3.

Table 4-3
Mainline Contract and Throughput Information
(As of September 2004)

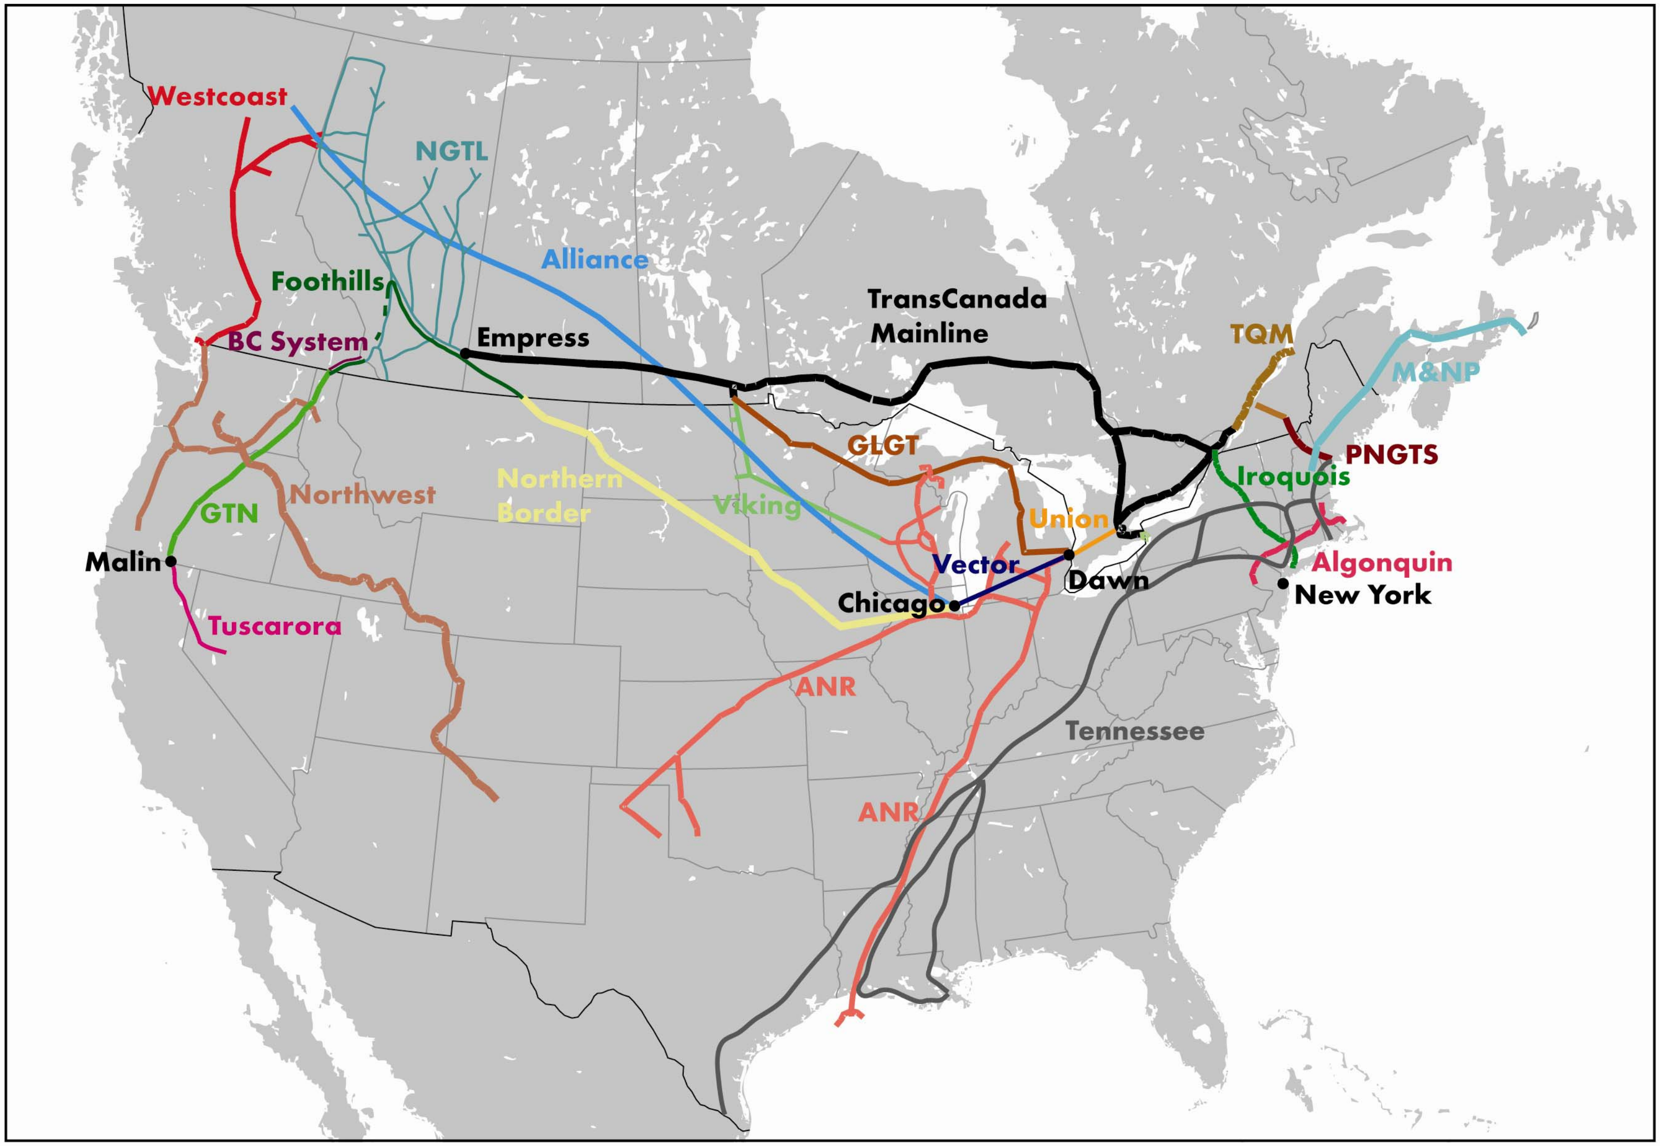
Figure 4-3
Selected Canadian and US Pipelines



TransCanada claimed that the Mainline offers, and will continue to offer, a relatively less attractive netback compared with other ex-WCSB pipelines because of its greater distance to market. In support of this view, TransCanada provided an analysis which forecast netbacks over the period 2003 to 2025 for the six export routes that TransCanada viewed as the most relevant (see Table 4-4). Given its perception that the Mainline's netbacks are the lowest, TransCanada sees itself as the swing pipeline, attracting only the residual WCSB supply that does not flow elsewhere under contract or cannot move to markets offering better netbacks because of capacity constraints. TransCanada stated that parties would contract on the pipeline that has the lowest transportation cost. When asked about the relatively greater decontracting that occurred on other pipelines in the 2004/2005 contract year, TransCanada clarified that the swing pipeline hypothesis referred to flows on the system and not necessarily contracting.

4 Calculated using a $0.16/GJ differential between the Eastern Zone and the Southwest Zone Tolls and difference in fuel cost as provided by TransCanada
5 Tennessee Gas Pipeline Company
6 Viking Gas Transmission Company
7 ANR Pipeline Company
8 Northwest Pipeline Corporation

In response to information requests, TransCanada provided netbacks on additional routes beyond the original six, but submitted that some of these routes were not meaningful since they were little used. TransCanada also contended that the competitiveness of Alliance and Northern Border Pipeline Company (Northern Border) should be evaluated by comparing the netbacks from the primary destination on these pipelines, the Chicago, Illinois region, rather than the netbacks from gas flowing further downstream.

TransCanada contended that it was appropriate to use the Dawn, Ontario price with the Eastern Zone toll since the Dawn price is broadly indicative of prices further east. TransCanada stated that even though prices at the Niagara and Iroquois (Waddington, New York) export points are generally higher than at Dawn, the market at those points is not particularly liquid.

To address criticism of the netback study, in its reply evidence, TransCanada provided netbacks for the original six routes, using the April 2004 price forecasts of Energy and Environmental Analysis Inc. This analysis showed three Mainline netbacks as being lower than netbacks on Alliance or Northern Border from Chicago or netbacks on Gas Transmission Northwest Corporation (GTN) from Malin, California.

TransCanada did not regard a substantial portion of its market as being captive, given that deliveries are increasingly being sourced in the Chicago area and only flow on the Mainline for a short distance. Further, TransCanada submitted that Alliance and Vector Pipeline (U.S.) (Vector) can be easily and inexpensively expanded and toll increases due to non-renewals on the Mainline make potential alternatives increasingly attractive and feasible.

Other factors that TransCanada viewed as affecting its long-term competitive position include its outstanding deferred tax balance arising from using flow-through tax methodology, which TransCanada asserts puts it at a competitive disadvantage compared with its US competitors; absence of provision for terminal negative salvage in its depreciation rates; and uncertainty around the approved depreciation rate, which TransCanada characterized as variability risk. With respect to the depreciation rate, TransCanada submitted that because of increased pipe-on-pipe competition and the maturity of the WCSB, the probability of setting the depreciation rate incorrectly is now greater than in the past.

Specific factors which TransCanada cited as increasing competitive risk since RH-4-2001 include recent open seasons on Vector and Union; a reduction in contract terms; expansion by Vector in 2002; and the increasing prospects for LNG projects in the Mainline's market areas. TransCanada submitted that LNG projects proposed for eastern Canada and the Northeast US are a new competitive threat to the Mainline, and as such, represent an increased business risk. TransCanada stated that, of the pipelines accessing the WCSB, only the Mainline faces competition from LNG directly in the markets it serves. At the same time, TransCanada expressed the view that LNG will be required to meet market demand and therefore it is advantageous for TransCanada to be involved in LNG development so it can influence where and how it enters its system. In the long term, TransCanada views it as beneficial for the Mainline to accept LNG into its system.

Position of Intervenors

CAPP submitted that the competitive issues TransCanada pointed to in this proceeding were the same as those raised in the RH-4-2001 Proceeding. These include: the swing pipeline concept and relative netbacks; alleged disadvantages related to long-term contracts on other pipelines; increasing use of short-haul transportation; potential expansion of competing pipelines; the risk that the Mainline will be unsuccessful in competing for supply; US pipelines' ability to discount; normalized versus flow-through tax treatment; and the risk that depreciation may not result in full cost recovery.

It was contended by CAPP that the Board took these factors, including the possibility of expansions of competing pipelines, into account in RH-4-2001 when it found that pipeline competition was the most significant change since RH-2-94. CAPP stated that issues associated with pipeline competition have not raised the Mainline's business risk since 2001. CAPP suggested that recent activities such as LNG and competition with Alliance and Vector are manifestations of the competitive dynamic that was already identified in RH-4-2001.

CAPP submitted that the swing pipeline argument is based on the attractiveness of the Mainline's netbacks compared with those of other pipelines, and argued that TransCanada's netback analysis is seriously flawed and unduly pessimistic. When netbacks from additional routes beyond the original six were analyzed, the Mainline's netbacks compared favourably with those of other pipelines and, for some destinations, the Mainline had the highest netbacks. For example, when the correct toll to Dawn was used, the Mainline was more competitive than routes using Alliance or Northern Border to that location.

CAPP noted that the netback study's conclusions are driven by assumptions regarding future market prices, which are inherently difficult to forecast. Different assumptions can lead to significantly different results. CAPP contended that the historical trends show the analysis to be unreliable, pointing to the difference between forecast and actual prices and the associated impact that differences in netbacks had in the rankings of the various routes, as shown in Table 4-4. For example, while TransCanada forecast that the route via the BC System and GTN to Malin would have the second highest netbacks in 2004, from January to July 2004, these netbacks were the second lowest. Further, CAPP pointed out that the differences between the netbacks from the various routes over the period to 2025 are not great. CAPP also suggested that the netback is not the only factor influencing the choice of market. In summary, CAPP submitted that the market or route that will occupy the swing position will change from time to time, as it has in the past.

It was pointed out by CAPP that the Mainline is not the only pipeline with an expiring long-term contract profile. Others include Northern Border, GTN and Northwest Pipeline.

CAPP contended that the Board has approved a number of changes since RH-4-2001, which reduce TransCanada's business risk. These include the increases in depreciation rates, the increase of the interruptible floor price to 110 percent of the firm toll, the approval of the Southwest Zone (all from RH-1-2002) and the approval of the North Bay Junction receipt and delivery point (RH-3-2004).[45] As well, TransCanada's revenue protections mitigate the business risk faced by the pipeline, including pipe-on-pipe competition, a risk which CAPP suggests has not changed since 2001.

With respect to terminal negative salvage and tax balances resulting from the flow-through methodology, CAPP noted that these factors had been raised by TransCanada as risks in previous proceedings.

CAPP argued that since TransCanada assumed that the eastern end of its system is full due to growing markets, the principal issues around competition are how much supply is available at the western end of the system and what is the risk of additional capacity being built that would draw supply from the Mainline. CAPP argued that the risk of bypass at the western end of the Mainline is not any greater than it was in RH-4-2001, since new facilities must be approved by the Board and are still subject to the economic feasibility test, which requires a demonstration of overall supply and market.

Coral had a number of concerns regarding the accuracy of TransCanada's netback study. Routes that showed the Mainline as more attractive were omitted. TransCanada used the Dawn price and the Eastern Zone toll when the applicable toll to Dawn is the lower Southwest Zone toll. Coral observed that the real market prices in the Eastern Zone are the prices at places like Parkway, Ontario, and the Iroquois and Niagara export points. Coral contended that the fact that the netbacks from the model were considerably less than the fuel cost forecasts used did not demonstrate that the Mainline is intrinsically uneconomic, but more likely indicate a problem with the model. The market price projections extending to 2025 were based on human judgments. The projections for 2005 are not consistent with current circumstances, in which the Mainline appears to be more economic and attractive to shippers than other pipeline options, including Northern Border and Alliance.

Coral argued that the Mainline's business risk is reduced because it has captive customers with inelastic demands and alternatives that are very expensive in the long run.

Ontario argued that the competitive risk from pipe-on-pipe competition, and specifically from Vector and Alliance, were dealt with by the Board in RH-4-2001 and have not materially changed since then. Ontario argued that the issue of future tax liabilities and negative net salvage have been known for a long time and do not change the Mainline's long-term business risk. Further, TransCanada has identified only two natural gas pipeline companies that are currently collecting negative net salvage in their rates. Ontario also argued that LNG has potential benefits to the Mainline as an additional source of supply and support for continued development of gas markets. Ontario stated that there was no basis to conclude that the development of LNG materially increases the business risks of the Mainline.

Like CAPP, Ontario raised the issue of enhancements to the Mainline's business risk since RH-4-2001, adding the deferral account for Repair and Overhaul Expenditures approved in

---

45 National Energy Board RH-3-2004 Reasons for Decision, TransCanada PipeLines Limited (North Bay Junction Application), December 2004

RH-1-2002 to the list of changes that CAPP had outlined. Ontario argued that TransCanada had failed to give appropriate weight to these enhancements in its 2004 Tolls Application.

Referring to the netback analysis, Ontario argued that having the highest costs does not necessarily mean that a pipeline has the worst netbacks, since market prices also determine netbacks. Ontario noted that the Mainline can be competitive at times.

4.6 Operating Risk

Operating risk is the risk to the income-earning capability that arises from technical and operational factors. TransCanada submitted that operating risks have not changed materially since RH-4-2001. CAPP agreed with TransCanada in that regard.

4.7 Views of the Board

As noted in Chapter 2, there was substantial discussion as to whether, in determining the appropriate capital structure for the Mainline, the Board should consider only changes in business risk since the last assessment or use a clean slate approach. As stated there, the Board is not limited to considering evidence pertaining to significant changes since RH-4-2001. In making its assessment of business risk, the Board has considered all of the evidence presented in this proceeding, including changes in risk since 2001 and an assessment of the appropriate weights assigned to each source of risk, given currently available information.

Supply Risk

The Board notes that there was general agreement among the parties that views on supply have changed since 2001. Further, there was general agreement that TransCanada's forecast of total conventional supply presented in its Base Case was reasonable and reflective of current knowledge. Overall, the Board is of the view that reasonable reliance can be placed on the range of conventional supply estimates presented during the hearing and that significant increases in WCSB conventional supply are unlikely. As a result, the Board finds that over the longer term, the Mainline will depend, in part, on the development of unconventional or northern supply, in order to maintain throughput. This dependence is greater today than was anticipated in 2001.

Unconventional supply, such as coalbed methane and tight gas, is more uncertain given its early stage of development. Although unconventional supply is expected to at least partially offset future declines in conventional production, the extent to which and when it will do so is uncertain.

Similarly, gas from both the Mackenzie Delta and Alaska may act to offset future declines in WCSB conventional production. However, as with unconventional gas, there are uncertainties. Although TransCanada has included Mackenzie Delta gas in all of its throughput cases, it is not clear when, or if, this gas will flow, and if it does, whether it will flow on the Mainline. Therefore inclusion of Mackenzie Delta gas represents a possible downside risk for the Mainline if, in fact, these volumes do not materialize.

While the development of Alaskan supply appears more likely now than it did in 2001, commercial arrangements have not yet been negotiated. Further, if the facilities are constructed, the earliest flows would be several years away and it is not clear that these volumes would flow in whole or in part through the Mainline. In this regard, producers have sent clear signals that they want options for delivery of Alaskan gas, and utilization of the Mainline is only one of these options. The Board agrees with those parties who stated that Alaskan gas represents a possible upside for the Mainline, as shown in the Alaska-in Case, which was provided in response to an information request. Nonetheless, the Board accepts as reasonable the exclusion of Alaskan gas from the three original throughput cases.

The Board finds the ultimate potential estimates used by TransCanada in its Base, Low and High Cases, as well as its projections of WCSB production and western Canadian natural gas demand, to be reasonable. In estimating the supply available for export from western Canada to various pipelines, TransCanada made assumptions with respect to relative netback prices, pipeline utilization rates, capacity expansions and allocation methodologies. While the Board does not necessarily accept all of the assumptions used by TransCanada in this analysis, the Board finds the main three cases to be plausible. The Board also agrees with TransCanada that the Low Case is important in an assessment of business risk since it falls within the range of plausible scenarios. Further, the Board accepts that it is not solely a base case that reflects business risk and potential impact on the Mainline's earnings, but possible variations from it. In this respect, earnings are more likely to be affected in a scenario similar to the Low Case, than in more positive scenarios.

Taking into consideration changed perceptions with respect to supply since RH-4-2001 and the greater reliance on unconventional supply, the Board is of the view that there has been some increase in supply risk to which the Mainline is exposed.

Market Risk

With respect to the risk associated with the overall size of the natural gas market, the Board acknowledges that projections of natural gas demand growth in North America are lower now than at the time of the RH-4-2001 Proceeding. However, market growth is still expected to be sufficiently strong that it is not a constraint to the utilization of the Mainline.

Consequently, the Board does not consider that there has been any change associated with the Mainline's risk related to the overall size of the market. The risk associated with the market share that the Mainline is able to capture is discussed under Competitive Risk in this section.

Regulatory Risk

The regulatory context for the Mainline is evolving, but the Board finds no reason to conclude that the Mainline's regulatory risk has increased. The regulatory model continues to provide the Mainline with a reasonable opportunity to recover its prudently incurred costs. Indeed, the Board notes, as an example, that the direction from the Board in the RH-1-2002 Decision emphasizing "the importance of performing depreciation studies on a timely basis and of ensuring that depreciation rates reflect up-to-date information"[46] would indicate a directional decrease in regulatory risk. While the Board acknowledges that regulators may be unable to protect the Mainline if tolls become uncompetitive, this has always been true and does not constitute a change in regulatory risk.

The Board is of the view that the discussions between TransCanada and its stakeholders about a new business and regulatory model around the time of RH-4-2001 had not increased the regulatory risk of the Mainline, nor has the termination of those discussions reduced regulatory risk.

The Board does not accept that the Mainline's current level of regulatory risk is higher simply because, in the RH-1-2001 Decision, the Board stated that some sharing of risk between TransCanada and its shippers may be appropriate if considered on a prospective basis. The same Decision indicated that consideration of some sharing of risk between TransCanada and its shippers should take into account the appropriate balance between risk and reward and the tools required to manage such risk. The Board also notes that the statements made in the RH-1-2001 Decision were made before the commencement of the oral portion of the RH-4-2001 Proceeding.

On balance, the Board finds that there has been no measurable change in regulatory risk.

Competitive Risk

While it may have been possible in 2001 to foresee, at least in part, the manner in which competition to the Mainline would unfold, the Board is of the view that the implications of this competition are becoming clearer. Although throughput has not declined on a volume/distance basis to the same extent as billing determinants, the Board accepts that the contractual

46 RH-1-2002, *supra* note 42 at p. 43

underpinnings of the Mainline have weakened since 2001. There is also potential for LNG to capture markets in eastern Canada that were previously considered to be captive to the Mainline. As well, markets downstream of Dawn have the opportunity to acquire, and have expressed interest in acquiring, gas at Dawn. These factors could decrease reliance on the Mainline.

The Board does not find TransCanada's swing pipeline hypothesis compelling and finds the netback study to be flawed. TransCanada omitted routes that were significant in terms of volume, most notably the use of the Mainline to Niagara. This route has higher flows than the route to Iroquois, a route which was one of the six originally included by TransCanada. Of the routes provided, the use of the Mainline to Niagara offered the highest netbacks in recent history and is forecast to offer the second highest netbacks of all routes considered in TransCanada's netback study (see Table 4-4).

In response to TransCanada's assertion that the competitiveness of the Mainline relative to Alliance and Northern Border should be evaluated by comparing the netbacks from the primary destination of the pipelines, the Board notes TransCanada's contention that the Mainline competes with these pipelines in eastern Canada. Therefore, the Board is of the view that comparing these competing routes into Dawn is a relevant consideration. In this regard, the Board notes that the Mainline's netbacks from Dawn are competitive both in TransCanada's forecast and in recent history. When the Southwest Zone toll to Dawn is used, the Mainline offers better netbacks to Dawn than routes using Alliance or Northern Border. While the Board accepts that there is currently no pricing point located in the Eastern Zone that is sufficiently liquid to provide reliable pricing information, the Board notes that the use of the Dawn price combined with the Eastern Zone toll tends to underestimate the netbacks available for delivery to the Eastern Zone.

The Board is aware that forecasting market prices 20 years into the future is an inherently uncertain exercise. The Board notes that among TransCanada's original six routes, the variation between the highest and the lowest netback routes is relatively small, such that there is considerable margin for error in ranking various routes.

While it is true that the Mainline's markets are generally more distant from the WCSB than those of other ex-WCSB pipelines, netbacks are dependent upon both transportation costs and the prices obtainable in the specific markets. Therefore, the Mainline's distance to market does not necessarily mean that it will offer the lowest netbacks. Although the Mainline may at times offer the least attractive netbacks, this is not consistently the case, as shown by actual data for 2003 and for the first half of 2004. Further, the Board is of the view that the greater level of recontracting that recently occurred on the Mainline than on some other ex-WCSB export pipelines is at odds with the swing pipeline hypothesis. Consequently, TransCanada's reliance on the swing pipeline hypothesis leads the Board to conclude that TransCanada has overestimated the competitive risk facing the Mainline.

The Board accepts that the issues of negative terminal salvage, and the Mainline's deferred tax balance under the flow-through tax methodology, have the potential to affect its competitive position. The Board is of the view that the importance of such factors increases in a more competitive environment. However, the Board notes that these are not new risks. Both have been known for a considerable length of time. Further, although not determinative, TransCanada's management has played a role in taking the Mainline to the position it is in today. The Board is of the view that negative terminal salvage is not a significant competitive factor given that it is an industry-wide issue with few pipelines currently collecting negative terminal salvage in their tolls. At this time, the Board is not persuaded that negative terminal salvage and deferred tax balances suggest an increase in the business risk of the Mainline.

In response to TransCanada's contention that the Mainline has been denied tools to compete, the Board notes that previous decisions are based on the specific circumstances pertaining to those proceedings. The Board also notes that most of the examples cited by TransCanada, such as term differentiated rates and changes to contract renewal policies, predate increased competition. An examination of Board Decisions since the level of competition has increased, in fact, shows that the Board has been responsive in making changes when circumstances warrant and in approving tools to compete. Examples of this include the increase in the Mainline's depreciation rate, the increase in the interruptible transportation floor price, the approval of the Southwest Zone, and the approval of the North Bay Junction receipt and delivery point.

Taking into consideration the further deterioration in the contractual underpinnings of the Mainline, the market interest in acquiring natural gas supply at Dawn and the prospects for LNG in the Mainline's market areas, the Board finds that, on balance, the Mainline's competitive risk has increased since RH-4-2001, although not to the extent suggested by TransCanada.

Operating Risk

The Board accepts the views of both TransCanada and CAPP that operating risks have not changed materially since RH-4-2001.

Depreciation and Business Risk

There was discussion during the hearing regarding the extent to which regularly adjusting depreciation rates to reflect current best estimates of economic life affects the risk faced by TransCanada.

The Board is of the view that there are two distinct aspects to risk as it relates to business risk and depreciation rates. The first is that the current best estimate of economic life, which is reflected in the depreciation rates, may ultimately prove to be wrong. Various business factors, including changes to supply or competitive forces, could alter the economic life of the Mainline. This possibility cannot be fully mitigated and therefore should be compensated through cost of capital.

The second aspect of depreciation-related risk is that the depreciation rates in use may not actually reflect the estimates of economic life that would be selected if assessed at that point in time. A company can mitigate the risk that the estimates in use are not current by bringing forward an application to reconsider its depreciation rates. The part of this risk that is mitigable should not be compensated through the cost of capital. Should it become apparent that depreciation rates do not adequately reflect current estimates of economic life, it is incumbent on the management of the company to seek to change depreciation rates, not to expect incremental compensation through the cost of capital.

Still related to the second aspect, there is a potential that a company's tolls may not incorporate sufficiently high depreciation rates because competitive factors would prevent such rates from being charged. This potential, if significant, is appropriately compensated through the cost of capital.

The assessment of cost of capital should assume that the depreciation rates reflect the best assessment of economic life of the pipeline. Consequently, resetting depreciation rates to reflect a new best estimate of economic life does not, by itself, reduce business risk from what it would be absent a change in the best estimate.

With respect to the argument that as rate base declines, business risk is reduced, the Board agrees that the total level of Mainline capital at risk decreases over time as the system is depreciated. The Board also accepts that there would be no capital recovery risk remaining should the system be fully depreciated. However, the Board is of the view that the business risk of the remaining assets does not decline simply because the rate base is becoming smaller.

In summary, in relation to the aspects of risk that cannot be mitigated, the Board does not consider that the changes in the Mainline's depreciation rates that were approved in RH-1-2002, in and of themselves, reduced the Mainline's business risk; the changes merely re-based the Mainline's depreciation rates to reflect current knowledge concerning economic life. The Board is of the view that there has been no change to the risk that the current best estimate of the economic life may ultimately prove to be wrong.

Overall Business Risk

The Board finds that, overall, the business risk to which the Mainline is exposed has increased since RH-4-2001, as a result of increases in supply risk and competitive risk.

Chapter 5

Comparable Investments

5.1 After-Tax Weighted-Average Cost of Capital Evidence

A company's ATWACC is the after-tax weighted-average cost of each source of capital included in its capital structure. It is also referred to as the Weighted-Average Cost of Capital (WACC) and is regularly used in capital budgeting as a discount rate for net present value analysis and the hurdle rate for internal rate of return analysis. Throughout the hearing, TransCanada also referred to ATWACC as the overall cost of capital and overall return on capital.

Position of TransCanada

TransCanada sponsored the evidence of Drs. Kolbe and Vilbert who used an ATWACC-based approach to estimate the cost of capital and appropriate deemed equity ratio for the Mainline. This evidence relied on estimated ATWACCs for two sample groups of companies, considered to be of similar risk to the Mainline. The specific approach used by Drs. Kolbe and Vilbert (K&V ATWACC Methodology) is described below.

After considering the views of its experts, TransCanada chose to apply for a deemed equity ratio of 40 percent, which, when combined with the RH-2-94 Formula ROE of 9.56 percent and an after-tax market cost of debt of 4.14 percent, results in an ATWACC of 6.3 percent. TransCanada expressed the view that an ATWACC of 6.3 percent would improve the relative financial position of the Mainline but that it would fall short of meeting the fair return standard, adding that an ATWACC of 6.9 percent would be more representative of a fair return. Assuming an ROE of 9.56 percent, an ATWACC of 6.9 percent implies a common equity ratio of approximately 51 percent.

Description and Justification for the K&V ATWACC Methodology

The K&V ATWACC Methodology is based on the premise that a sample of companies with levels of risk similar to the subject company should have a comparable overall cost of capital. Under this methodology, an appropriate group of sample companies is established and their average market-value capital structures over a specific time period is estimated. Then, each of the sample companies' cost of equity (ROE) and after-tax market cost of debt is estimated. These cost estimates are then combined with each company's capital structure to determine its ATWACC and subsequently, the average ATWACC of the sample. Finally, the equity ratio that results from holding the sample's average ATWACC constant, but substituting the Mainline's ROE, is calculated. A comparison between the Mainline and the sample's average implied equity ratio is made. As set out in more detail below, this was undertaken for two sample groups.

Drs. Kolbe and Vilbert submitted that it is the overall cost of capital that should be used to determine a fair overall rate of return to meet the fair return standard. Dr. Kolbe emphasized that the cost of equity varies not just with business risk, but also with financial risk, which in turn depends on the equity ratio. He acknowledged that the use of the K&V ATWACC Methodology as a regulatory approach is not under consideration in this application, as it was in RH-4-2001. However, Dr. Kolbe submitted that the Board cannot accurately interpret capital market risk-return evidence concerning the deemed equity ratio unless the interaction between the cost of equity and the capital structure is taken into account. In this context, Dr. Kolbe submitted that, if applied properly, the K&V ATWACC Methodology and the Board's traditional methodology of establishing an ROE and a deemed equity ratio should yield the same results.

It was suggested by Drs. Kolbe and Vilbert that there are multiple minimum-cost capital structures. They noted that interest expense from debt is tax deductible, but submitted that as a corporation takes on more debt, there are non-tax effects of debt that offset the tax benefits. These non-tax effects include a loss of management flexibility, the possibility of sending negative signals to investors, and costs and risks associated with financial distress. Dr. Kolbe expressed the view that both the research and empirical evidence indicate that there is no well-defined optimal capital structure within an industry and the range of capital structures over which the value of a firm in any industry is maximized is wide and should be treated as flat (that is, the ATWACC curve is flat over a broad middle range of capital structures).

Drs. Kolbe and Vilbert recommended that, in the future, the Board analyze the trade-off between capital structure and cost of equity explicitly and quantitatively rather than only subjectively and qualitatively.

Estimates of ATWACC and Implied Common Equity Ratios

As discussed above, the first step of Dr. Vilbert's analysis was to select two groups of sample companies and determine their average market-value capital structure. Since no companies involved exclusively in long-haul gas transmission exist in Canada or the US, Dr. Vilbert used a sample of Canadian Utilities and a sample of US gas local distribution companies (LDCs). Dr. Vilbert applied a series of screens intended to create samples whose primary business is as a regulated utility with business risk generally similar to the Mainline.

Then, for each sample, Canadian capital market data were used to estimate each of the sample companies' ROE and after-tax cost of debt. These cost estimates were then combined with each company's market-value capital structure to determine its ATWACC and the average ATWACC of the sample. Holding the sample ATWACC constant, Dr. Vilbert substituted the Mainline's ROE to calculate the implied equity ratio.

Drs. Kolbe and Vilbert submitted that the Canadian Utilities sample is an obvious benchmark group but noted that this group does not include many gas pipelines. Dr. Kolbe expressed the view that the general increase in competition for North American regulated industries and increased uncertainty due to the events of 11 September 2001 would tend to make current ATWACC estimates understate the true risk the sample companies face today. As well, he submitted that the Canadian gas LDCs, which are part of the Canadian Utilities sample, tend to be exposed to more short-term risk than the Mainline. However, he concluded that the overall Canadian Utilities sample is exposed to less long-term risk than the Mainline.

Dr. Kolbe submitted that the Mainline's overall cost of capital should be above that of the US gas LDCs sample. He contended that the Mainline has more long-term risk, although less short-term risk, than the US gas LDCs on average.

The estimated ATWACCs and implied common equity ratios at an ROE of 9.56 percent are summarized in Table 5-1. Dr. Vilbert estimated a deemed equity ratio range of 40 to 50 percent for his Canadian utilities sample (with a midpoint of 45 percent) and of 45 to 55 percent (with a midpoint of 50 percent) for his US gas LDCs sample. Dr. Kolbe submitted that TransCanada's requested deemed equity ratio of 40 percent was below what he would have recommended, which was in the range of 45 percent to 55 percent.

Dr. Vilbert presented a number of sensitivities in which he relaxed various assumptions, one at a time. These sensitivities included: using book-values weight; using a regression period ending October 2003; using different estimates of risk-free rates; using traditional single-factor beta regressions; removing the Merrill Lynch adjustment; using different estimates of Market Risk Premium (MRP); using a different cost of debt; and estimating the sample capital structure over the period ending May 2000. The outcomes of selected sensitivities are presented in Table 5-1. Dr. Vilbert contended that none of the sensitivities represent the best available estimate of the cost of capital for the Mainline.

Assumptions and Parameters

The following provides further details on the key assumptions and parameters employed by Drs. Kolbe and Vilbert in their estimation of each sample company's ATWACC.

Estimation of the Rate of Return on Equity

The estimated ROE of each sample company was an input in the estimation of its ATWACC. When estimating the market determined ROE for each of the sample companies, Dr. Vilbert used a risk positioning analysis, which is also known as Equity Risk Premium (ERP) analysis, and a Discounted Cash Flow (DCF) analysis. Dr. Vilbert expressed the view that, for both samples, the results of the DCF analysis are more variable and less reliable than those based upon the ERP analysis. He provided the results of the DCF analysis as a check on the results of the ERP analysis because it is a method that has been extensively used in the past. Dr. Vilbert also submitted that short-term risk-free rates have been driven below their historical averages. Therefore, Dr. Vilbert primarily relied on the results from the long-term ERP analysis in the determination of each of the sample companies' ROE.

Table 5-1
Estimated ATWACCs and Implied Equity Ratios

	ERP[1] Short-Term Rates				ERP Long-Term Rates			DCF[2]

3 Capital Asset Pricing Model
4 Empirical Capital Asset Pricing Model
5 Market Risk Premium

Equity Risk Premium Analysis

Under the ERP analysis, the cost of equity is estimated as the sum of a current risk-free interest rate (risk-free rate) and a risk premium. The risk premium is the amount of compensation that an investor requires over the risk-free rate in order to be compensated for the additional levels of risk associated with a specific security. The most common ERP model is the Capital Asset Pricing Model (CAPM), under which a security's risk premium is the product of an MRP and the security's beta. In the CAPM model, the risk-free rate and MRP are common to all securities and the variation in the ROEs of various securities is solely dependent on each security's beta. Beta is a measure of the systematic risk of a security. It measures the extent to which a stock price fluctuates relative to fluctuations in the market benchmark.

Dr. Vilbert also relied on a second ERP-based model, which is the Empirical Capital Asset Pricing Model (ECAPM). Dr. Vilbert submitted that empirical research has demonstrated that the CAPM tends to overstate the actual sensitivity of the cost of capital to beta and that the use of an ECAPM approach can reduce this overstatement. For the short-term benchmark version of his ECAPM ERP analysis, Dr. Vilbert used adjustment coefficients of 1, 2, and 3 percent. For the long-term benchmark version of his ECAPM ERP analysis, Dr. Vilbert used adjustment coefficients of 1 and 2 percent.

Dr. Vilbert estimated two versions of the ERP analysis based on a benchmark short-term risk-free rate and a benchmark long-term risk-free rate. His short-term benchmark version used a short-term risk-free rate of 3.30 percent and a short-term MRP of 6.5 percent. His long-term benchmark version used a long-term risk-free rate of 5.60 percent and a long-term MRP of 5.5 percent.

For the Canadian Utilities sample, Dr. Vilbert calculated betas using a two-factor model, in which betas are calculated from a regression that includes both the excess returns on the S&P/TSX Index (S&P/TSX) and the excess returns on a pure Government bond factor. Dr. Vilbert stated that the two-factor model adjusts, in part, for the extra sensitivity to interest rate changes of the returns of companies regulated on the basis of original cost rate base. He then adjusted the estimated betas according to the Merrill Lynch adjustment procedure to compensate partially for sensitivity to interest rate changes of companies regulated on the basis of original cost rate base.

Dr. Vilbert estimated the betas of the firms in the Canadian Utilities sample over a five-year period ending May 2000. Dr. Vilbert chose this time period due to the significant decline in the statistical relationship between the market return as measured by S&P/TSX and the companies' returns during the most recent five years. Drs. Kolbe and Vilbert acknowledged that there is not a match between the time period over which their capital structure and beta calculations were made, but submitted that this explicit violation would underestimate to a lesser extent the ATWACC of the Canadian Utilities sample than the use of more recent betas. They noted that very low or even negative betas would result if the most recent five years had been used.

For the US gas LDCs sample, Dr. Vilbert used betas estimated by *Value Line* for the most recent five-year period. Since the betas reported by *Value Line* are adjusted, he reversed the adjustment process to obtain unadjusted values. This was done because the US LDCs did not exhibit the statistically significant degree of interest rate sensitivity that the Canadian utilities did.

Discounted Cash Flow Analysis

Dr. Vilbert provided estimates of the cost of equity for each of the sample companies based on the DCF analysis. He expressed the view that DCF analysis is conceptually sound if its assumptions are met but can run into difficulty in practice because those assumptions are so strong and hence, so unlikely to correspond to reality. Dr. Vilbert expressed the view that the DCF model's strong assumptions make the DCF analysis inherently less reliable than the ERP analysis.

Estimation of the After-Tax Cost of Debt and Cost of Preferred Equity

Dr. Vilbert estimated the October 2003 yield on 'A' rated utility bonds to be 6.37 percent. Combined with the Mainline's estimated marginal income tax rate for 2004 of 34.99 percent, he arrived at a 4.14 percent after-tax market cost of debt for 'A' rated utilities. Dr. Vilbert set the cost of preferred equity equal to the after-tax market cost of debt. The same cost of debt and preferred equity was used for 'A' rated utilities for both samples.

Estimation of the Capital Structure

The capital structure for each sample company in the ERP analysis was estimated by using the market value of common equity, preferred equity and debt from the most recent five years of publicly available data. For the DCF analysis, the most recently reported market-value capital structures were used. Dr. Kolbe expressed the view that it would contradict economic theory to use book-value weights for the companies' capital structures. He submitted that the true beta depends on the market value of the firm's capital structure for both regulated firms and for unregulated firms. Thus, the measured beta of a regulated company sample will be lower when its market-to-book ratio is above one than when its market-to-book ratio equals one. Dr. Kolbe contended that with a market-to-book ratio over one, use of book-value weights can lead to a serious understatement of the company's true required ROE.

TransCanada's Response to CAPP's Evidence

In response to Dr. Booth's assertion (see Position of Intervenors below) that regulators fail when a regulated company does not display a particular market-to-book ratio, Dr. Kolbe submitted that regulators have no control over market values. Dr. Kolbe submitted that underlying Dr. Booth's evidence on the meaning of the market-to-book ratio is a simple model of stock price formation. He contended that if that model were valid, the implied true ROE of rate-regulated investments would be far too low, and in most cases lower than the benchmark 30-year Government bond interest rate used in the Board's RH-2-94 Formula. Dr. Kolbe submitted that the market-to-book ratio is not a reliable test of whether the returns on rate-regulated investments are reasonable. TransCanada's evidence showed that its market-to-book ratio was 1.98 as at the second quarter of 2003.

Position of Intervenors

CAPP expressed the view that an ATWACC-based methodology relies on an inextricable link between the ROE and capital structure. CAPP submitted that it is not possible for the Board to consider an ATWACC-based methodology because it would require consideration of the cost of equity, which is not an issue in this proceeding. For the same reason, CAPP did not present evidence concerning estimation of the cost of equity capital. CAPP argued that the ATWACC evidence presented in this hearing has the same problems that the Board discussed in the RH-4-2001 Decision.

CAPP sponsored the evidence of Dr. Booth, who indicated that it is a fundamental contradiction to use an ATWACC-based methodology in regulatory filings as it is a mirror image of shareholder value maximization. Dr. Booth recommended that the Board ignore this indirect approach and continue with the traditional methodology. Dr. Booth contended that book values rather than market values should be utilized in the determination of the Mainline's ROE. He stated that the market, not the Board, determines market values. From Dr. Booth's perspective, fair and reasonable rates imply that the regulated firm's market-to-book ratio should be around one. He expressed the view that accepting market-value weights significantly different from book-value weights would imply that regulation has failed.

IGUA submitted that the equity component of ATWACC is no more reliable as a regulatory tool, than ATWACC itself; that it was subject to all the flaws of ATWACC and should be rejected.

Coral expressed the view that the ATWACC analysis is fundamentally flawed by its reliance on market-value capital structures and that the comparative return analysis is meaningless as an indicator of the cost of capital. Coral submitted that for a regulated utility, whose earnings are a direct function of the book value of its assets, the market-to-book ratio is valuable in determining whether the utility is earning its cost of capital.

Ontario expressed the view that the ATWACC analysis is flawed and unreliable. Ontario submitted that the Board should give no weight to the deemed equity range expressed by Drs. Kolbe and Vilbert for the Mainline. Ontario highlighted several statements in Dr. Kolbe's written evidence in support of the view that financial theory on minimum-cost capital structure has deficiencies and shortcomings. Ontario also submitted that the analysis of Drs. Kolbe and Vilbert had insufficient data from companies exclusively involved in natural gas transmission.

Views of the Board

The Board accepts that ATWACC-based methodologies have theoretical merit, but is of the view that a number of empirical concerns limit their usefulness as a tool to assess cost of capital or the Mainline's appropriate deemed equity ratio.

The Board is cognizant of the fact that there are no companies involved exclusively in long-distance natural gas transmission, and the approach must therefore rely on sample companies that are not directly comparable. While the sample of Canadian Utilities is an obvious benchmark, the

Board notes that all firms in Dr. Vilbert's Canadian Utilities sample derive a portion of their revenues from unregulated activities. Since these activities are typically riskier than gas pipeline operations, the estimated cost of capital for these firms tends to overstate the cost of capital of their regulated operations, and indirectly that of the Mainline. In the Board's view, the evidence of Drs. Kolbe and Vilbert did not adequately address this concern.

The Board notes that the K&V ATWACC Methodology assumes a specific relationship between a company's ROE and capital structure through the reliance on the assumption that there is a broad range over which the ATWACC curve is flat. The Board has acknowledged in previous decisions that there is a relationship between ROE and capital structure, but has traditionally addressed this relationship qualitatively, rather than quantitatively.

The Board accepts that, over a certain range, the ATWACC curve may be flat or virtually flat. However, in the Board's view, the evidence does not persuasively demonstrate the breadth of this range. Therefore, the Board is of the view that caution should be applied in relying on ATWACC-based evidence from companies with capital structures significantly different from that which is deemed for the Mainline. In this regard, the Board notes that the average estimated level of common equity for the companies in the US gas LDCs sample differs significantly from the currently deemed ratio for the Mainline. Further, it also exceeds that estimated for most companies in the Canadian Utilities sample. In the Board's view, these differences in capitalization are likely reflective of material differences in business risk. Consequently, the Board places little reliance on the US gas LDCs sample, or on firms in the Canadian Utilities sample that exhibit significantly different equity ratios.

In addition, the Board notes that during the ATWACC estimation process, numerous adjustments were made, all of which result in an increase to the estimated ATWACC. As can be observed in Table 5-1, the impact of relaxing even a single assumption can be significant.

The Board has particular concerns with the inconsistent time periods over which the Canadian Utilities sample's betas were derived (five-year period ending May 2000) and the corresponding market-value capital structures were estimated (five-year period ending October 2003). The Board notes that Drs. Kolbe and Vilbert emphasized the importance of the fundamental relationship between a firm's true beta and market value capital structure. The Board is of the view that this empirical inconsistency weakens the application of the K&V ATWACC Methodology.

In the context of this application and evidence, the Board is of the view that due to the numerous adjustments and time period inconsistency of the estimation process, the K&V ATWACC Methodology does not yield cost of capital estimates that are determinative of an appropriate deemed equity ratio for the Mainline. While the Board accepts that the ATWACC-based evidence of Drs. Kolbe and Vilbert directionally supports an increase to the Mainline's common equity ratio, the evidence provides little insight on the appropriate magnitude of such an increase.

With respect to concerns expressed over market-to-book ratios, the Board does not expect regulated utilities to display a particular market-to-book ratio and recognizes that many different market forces can influence a company's market-to-book ratio. At the same time, the Board is of the view that market-to-book ratios are an indication of a company's financial health. The Board recognizes that TransCanada's market-to-book ratio reflects that of the consolidated entity, not that of the Mainline or of TransCanada's Canadian pipeline operations. Nonetheless, given that the majority of TransCanada's income comes from its Canadian regulated operations, while not determinative, the Board is of the view that TransCanada's market-to-book ratio of approximately two provides some indication that the current deemed equity ratio of the Mainline cannot be considerably below the appropriate level.

5.2 Other Comparable Investments

5.2.1 Comparisons to Alliance, M&NP, Enbridge and Westcoast

Position of TransCanada

TransCanada expressed the view that it should earn returns at least comparable to Alliance, Maritimes & Northeast Pipeline (M&NP) and Enbridge Pipelines Inc. (Enbridge) since it viewed all of these pipelines as being of lower risk than, although of comparable risk to, the Mainline. According to TransCanada, the returns of Alliance and M&NP provide real-world data demonstrating the level of return necessary to promote investment in pipeline infrastructure and are the best examples of investments of comparable risk to the Mainline. These pipelines also provide evidence of the returns necessary to meet the capital attraction standard. TransCanada submitted that the most meaningful comparators of alternative investments are the other pipelines that are regulated by the Board.

TransCanada noted that the Board said in its RH-4-2001 Decision that:

> The Board does not consider the evidence pertaining to comparisons of the Mainline with Alliance, M&NP and Enbridge to be particularly meaningful in establishing a fair return for the Mainline. The Board notes that TransCanada's evidence on relative business risk only considered certain factors and ignored several others. More importantly, the returns achieved by these pipelines reflect a different risk-reward environment and different circumstances. A more meaningful comparison would require a thorough assessment of the relative business risks of each pipeline as well as an

estimation of what each pipeline's cost of capital might be absent differences in circumstances.[47]

TransCanada submitted that it tried to address the Board's concerns discussed in the RH-4-2001 Decision and attempted to provide a more thorough assessment of the relative business risks of these pipelines and the Mainline based on publicly available data.

As noted in Chapter 2, TransCanada discussed three methodologies for comparing the total return of pipelines: ATWACC, total equity return and return on rate base, which is based on an after-tax ROE, and before-tax embedded cost of debt. The third methodology was only used to compare TransCanada's overall return on rate base of approximately 9.0 percent with 33 percent equity, or 9.1 percent with 40 percent equity, with the awards of the US Federal Energy Regulatory Commission (FERC), which have averaged 10.0 percent to 10.5 percent since 2002, when calculated on the same basis.

Table 5-2 compares the ATWACC for Enbridge, M&NP, Alliance and Westcoast Energy Inc., carrying on business as Duke Energy Gas Transmission Canada (Westcoast), based on data provided by TransCanada.

Table 5-2
Cost of Capital Information

	Equity Ratio (percent)	**Approved ROE** (percent)	**ATWACC**[1] (percent)
Mainline (at 40% equity)	40	9.56	6.3
Mainline (at 33% equity)	33	9.56	5.9
Enbridge[2]	45	13.0	8.1
M&NP	25	13.0	6.4
Alliance	30	11.3	6.3
Westcoast	31	9.56	5.8

1 The after-tax market cost of debt used by TransCanada to calculate the ATWACC was 4.14 percent for an 'A' rated utility.

2 As estimated by TransCanada.

The following discussion of comparisons to Alliance, M&NP, Enbridge and Westcoast also pertains to the Relative Business Risk of Pipelines analysis presented in Section 5.2.2 and the Comparative Investment analysis presented in Section 5.2.3 and will not be repeated in those sections.

Alliance

TransCanada stated that all aspects of the business risk of Alliance are similar to or lower than those of the Mainline, primarily because Alliance was supported by 15-year transportation

47 RH-4-2001, *supra* note 4 at p. 35

contracts at the time the pipeline commenced operation. Further, TransCanada submitted that Alliance's five-year renewal provisions, with accelerated depreciation in the last five years of the contracts if they are not renewed, serve to lower Alliance's business risk. As a result of having longer contract terms, TransCanada contended that Alliance has less exposure to competitive, market, regulatory and supply risks. TransCanada claimed that Alliance's supply and market risks are also reduced relative to the Mainline because Alliance offers higher netbacks than the Mainline.

TransCanada suggested that Alliance benefits from a higher overall depreciation rate and therefore a shorter depreciation period. TransCanada acknowledged that Alliance faces shipper default risk but viewed it as insignificant given the apparent creditworthiness of its firm shippers and its ability to require financial assurances from its shippers.

With respect to Alliance's construction cost risk, TransCanada argued that this was a mitigable risk and therefore should not receive compensation in the return. Further, those risks were borne and realized in the past. Since present return is not to compensate a utility for risks borne and realized already, TransCanada argued that the construction cost risk is irrelevant. It also noted that Alliance's lower return applied to actual capital costs so that Alliance's total return in dollars increased as a result of the construction cost overruns.

M&NP

TransCanada viewed the overall business risk of M&NP as lower than the Mainline, primarily due to its long-term contracts. It noted that when M&NP was approved, it was viewed as having the same business risk as other Group 1 pipelines, but that was prior to the approval of Alliance and Vector. TransCanada suggested that the supply risk which M&NP bears due to accessing a new supply basin is fully mitigated by the existence of 20-year backstop agreements with Mobil Canada Products Ltd. and Mobil Properties Ltd. so that M&NP has less supply risk than the Mainline.

According to TransCanada, M&NP's regulatory risk is less than the Mainline's because there is less risk of competing pipelines and because its return was set for a five-year period and was subsequently extended for two years. TransCanada submitted that M&NP's higher market risk is offset by the existence of long-term contracts. TransCanada further noted that depreciation rates are higher than for the Mainline.

Enbridge

While the Enbridge mainline operates with month-to-month nominations, TransCanada submitted that the impact of revenue variations is mitigated in the short term by the Transportation Revenue Variance provisions in the settlements Enbridge negotiated with its shippers between 1995 and 2004. TransCanada claimed that Enbridge's Transportation Revenue Variance offers greater revenue assurance than its own deferral accounts due to its automatic nature.

TransCanada noted that Enbridge's supply risk is reduced by the expectation of growing oil production but increased by exposure to the various environmental, economic, consultative and jurisdictional risks that impact new and expanded oil sands projects. It added that Enbridge also faces increasing pipe-on-pipe competition from Trans Mountain Pipe Line Company Ltd. and Express Pipeline Ltd.

Westcoast

TransCanada initially excluded Westcoast from its analysis of comparable investments and its comparative risk analysis but provided information in response to information requests. TransCanada expressed the view that the inclusion of Westcoast in this analysis would be circular since Westcoast's ROE is derived using the RH-2-94 Formula. TransCanada's position was that the inclusion of Westcoast, or any other company on the RH-2-94 Formula, would only lead to the conclusion that pipelines using similar methodologies tend to have similar returns. TransCanada also indicated that Westcoast was not a relevant comparator because its return was too low.

TransCanada contended that, although Westcoast agreed to the RH-2-94 Formula ROE on an equity thickness of 31 percent in its negotiated settlement for 2004 and 2005, it was because Westcoast's return was part of an overall settlement reflecting the best interests of the corporation, rather than being reflective of a fair return.

Position of Intervenors

CAPP

CAPP submitted that TransCanada's comparisons to Alliance, M&NP and Enbridge are inappropriate and should be given little weight. CAPP submitted that the comparisons to M&NP and Alliance primarily support a request for an increase in ROE, not equity thickness.

It was noted by CAPP that Alliance took risks that the Mainline does not face, including: incurring some capacity risk through a marketing affiliate; credit risk when shippers default, which has happened; interest rate risk with the return on equity locked in for 15 years; risk associated with locking in the depreciation rate for the long term; and construction risk, which was realized and reduced Alliance's ROE from 12 percent to 11.25 percent. While Alliance's lower return resulting from construction cost overruns was applied to the resulting larger rate base, the Mainline has had many cost overruns with no rate of return impairment.

Further, CAPP pointed out that Alliance's return on equity of 12 percent (before being reduced because of cost overruns under the construction risk incentive) was negotiated in 1996 when the return on equity resulting from the RH-2-94 Formula was 11.25 percent. It was filed with the Board when the RH-2-94 Formula ROE was 10.67 percent. CAPP noted that Alliance, at 30 percent, has a lower equity ratio than the Mainline.

CAPP submitted that at the time the capital structure was established, there were differences associated with M&NP that justified the higher return, including the requirement to access supply from a few fields with untested reserves. CAPP also pointed out that M&NP has 25 percent equity in its capital structure.

It was observed by CAPP that since 1995, Enbridge's return has been negotiated as part of an incentive agreement and the returns on equity cannot be looked at outside this context. Further, Enbridge's higher equity ratio reflects common carriage of an oil pipeline and related characteristics such as tolls designed on the basis of forecasts without deferral accounts.

CAPP viewed the Mainline as being of lower or similar risk to Westcoast and submitted that Westcoast's 31 percent common equity ratio was a valid benchmark.

Coral

Coral argued that both Alliance and M&NP fixed their allowed returns for an extended period at a level that reflected long-term bond yields at the time. Their return on equity included compensation for assuming the risk of locking in the rate. Since then, these pipelines have benefited because interest rates have dropped significantly. Consequently, the return on equity for these two pipelines is not comparable to the Mainline.

From Coral's perspective, in order to make them comparable, one should remove the premium for fixing the return on equity for the term of the agreement and adjust for changes in interest rates since that time. Coral described Alliance's ROE of 12 percent as 75 basis points above the RH-2-94 Formula return on equity at the time is was negotiated and 133 basis points above the RH-2-94 Formula ROE at the time the application was filed with the Board. Coral submitted that in the case of M&NP, evidence was filed, and accepted by the Board, which indicated that the ROE included a 75 to 100 basis points premium for locking in return on equity for five years.

When asked by Coral to adjust for a locking-in premium and changes in interest rates, TransCanada calculated the ATWACCs of Alliance and M&NP as 5.9 percent, the same as the Mainline at a 33 percent equity thickness. Coral further noted that, at the time Alliance set its ROE, it was only 75 basis points above the RH-2-94 Formula ROE, rather than the 133 basis points used in the above calculations. Using a 75 basis points differential would result in an adjusted ATWACC below 5.9 percent.

With respect to TransCanada's assertion that M&NP's regulatory risks are less than the Mainline's because the return on equity was set for five years and subsequently extended, Coral argued that Group 1 pipelines regulated by the Board do not have materially different regulatory risks simply because they are able to successfully negotiate rate of return with their shippers.

Coral noted that the Board last addressed Enbridge's equity component in RH-2-94. Since then Enbridge has been successful in negotiating settlements with its shippers. Coral submitted that Enbridge's success with its shippers does not reveal anything about the Mainline's cost of capital.

Ontario

Ontario argued that the Mainline and Westcoast have similar overall business risk, including access to WCSB supply, competition from new pipeline takeaway capacity, excess pipeline capacity and an increase in the number of shippers holding short-term contracts. In addition, Westcoast faces similar issues with respect to competition with US pipelines and concerns of the credit rating agencies. Ontario contended that since there is no material difference in business risk between Westcoast and the Mainline, both rely on the RH-2-94 Formula and Westcoast has settled on a deemed equity level of 31 percent for 2004 and 2005, there is no reasonable basis for increasing the Mainline's deemed equity thickness above 33 percent.

Ontario argued that TransCanada's lower risk ranking for Enbridge was without merit given the nature of the risks that this pipeline faces.

5.2.2 Relative Business Risk Analysis

Position of TransCanada

The Mainline was compared with a selected group of nine pipelines: three Canadian pipelines that are not subject to the RH-2-94 Formula (Alliance, M&NP and Enbridge); five pipelines in which TransCanada has an ownership interest (Northern Border, GLGT, GTN, Iroquois and Portland Natural Gas Transmission System (PNGTS)); and Vector.

To prepare the analysis, TransCanada rated each pipeline in five major risk categories, three short-term and two long-term, based upon its assessment of publicly available information. The weights applied to each category are shown in Table 5-3.

TransCanada defined short-term risk as one that affects variability of earnings year over year. For pipelines operating under a fixed forward test year methodology, the short term was defined as one year, whereas for pipelines operating under multi-year settlements, the short term was equivalent to the term of the settlement, regardless of its length. Everything beyond these periods was considered to be long term in this analysis. TransCanada stated that in the short term, the fundamental risk is that the achieved return will fall short of the expected return, but in the long term, the fundamental risk is that the utility will become uneconomic, resulting in a loss of all or part of the capital that has been invested. TransCanada also referred to the potential for the premature truncation of capital recovery as truncation risk. TransCanada assigned 75 percent weighting to the long-term risks and 25 percent weighting to what it considered to be the less significant short-term risks.

For each category of risk and for each pipeline, TransCanada assigned a risk ranking between zero and four and then calculated a total risk ranking for the pipeline given the weights selected. The resulting Business Risk Index for each pipeline was compared graphically and in tabular form with approved returns on capital (ATWACC). The tabular comparison is set out in Table 5-3. TransCanada argued that it is not appropriate to compare pipelines based on equity thickness alone since many pipelines have risk reflected in their return on equity rather than entirely in equity thickness. One component of TransCanada's ranking of long-term revenue and cost risk was its assessment of relative netbacks and its view of the Mainline as the swing pipeline (see Section 4.5, Competitive Risk).

TransCanada concluded from this analysis that there is a positive correlation between business risk and returns but that the Mainline has the highest business risk ranking and the lowest approved return on capital of the pipelines selected. Even if long-term risk was weighted at 50 percent, TransCanada contended that the analysis would still support a 40 percent equity thickness for the Mainline. A 25 percent long-term weighting would still show the Mainline's return as low relative to Alliance and M&NP.

Table 5-3
TransCanada's Comparison of Business Risk Index to the Approved Return on Capital

	Short-term Risks				Long-term Risks		Business Risk Index	ATWACC
	Revenue	Cost	Operating	Regulatory	Revenue and Cost	Operating		
Weights	15%	5%	5%	0%	70%	5%	100%	(%)
Mainline (40%)	0	1	0	1	4	1	**2.90**	**6.3**
Mainline (33% in 2003)	0	1	0	1	4	1	**2.90**	**6.0**
GLGT	3	4	1	1	3	1	**2.85**	**8.2**
Vector	3	2	1	1	3	1	**2.75**	**7.1**
PNGTS	1	4	1	1	3	1	**2.55**	**7.5**
Westcoast	1	2	1	1	3	1	**2.45**	**5.8**
Enbridge	0	3	0	1	3	1	**2.30**	**8.1**
Northern Border	2	4	1	1	2	1	**2.00**	**6.9**
GTN	2	3	1	1	2	1	**1.95**	**7.0**
Iroquois	1	4	1	1	2	1	**1.85**	**7.0**
M&NP	0	2	0	1	2	1	**1.55**	**6.4**
Alliance	0	0	0	1	1	1	**0.75**	**6.3**

TransCanada recognized the subjectivity of the analysis but submitted that it provides a transparent framework upon which to assess the relative risk factors. TransCanada also asserted that its analysis was more transparent and credible than CAPP's business risk analysis. TransCanada viewed CAPP's analysis as superficial and submitted that it suffered from the same criticisms that had been levelled by CAPP at TransCanada's analysis.

Addressing CAPP's criticism that TransCanada minimized the impact of differences between Canadian and US regulation and also minimized the failure of US pipelines to recover their allowed returns, TransCanada argued that US pipelines have more short-term earnings volatility, which is compensated through higher expected and achieved returns, but that there is no meaningful difference in long-term regulatory policy, which allows US pipelines a fair opportunity to recover their investment. TransCanada also submitted that actual returns provide some indication of exposure to short-term risk but no insight into how a pipeline is being compensated for its long-term risk. Further, in support of its use of allowed returns in this analysis, TransCanada contended that allowed returns are readily available, comparable and free of financial anomalies that cause variations in actual returns.

In response to intervenors' contention that the risk ranking of Vector in TransCanada's business risk analysis should not have been lower than that of the Mainline given Vector's exposure to capacity risk, negotiated rates and other risks, TransCanada stated that risks associated with Vector, as well as the factors that mitigate these risks, were taken into account. TransCanada suggested that the risk associated with the Mainline's low netbacks out of the WCSB outweighed Vector's long-term risks.

With respect to criticism of the authorized ROE that TransCanada used for Vector and PNGTS, TransCanada submitted that the correct after-tax ROE for PNGTS was actually slightly higher than the number TransCanada used. For Vector, TransCanada acknowledged that it used an ROE from an earlier period since it did not have the most recent number.

Position of Intervenors

CAPP

CAPP submitted that TransCanada's analysis is seriously flawed, largely subjective, and presents an inaccurate picture of relative risks. CAPP found the arbitrary distinction between short-term and long-term risk that TransCanada drew to be essentially meaningless and fundamentally a false dichotomy. CAPP submitted that risk realization over the long-term is nothing more than a yearly comparison of actual returns to allowed returns. CAPP contended that the weighting of risk should be greatest for the short-to-medium term rather than the long-term, since the present value of risk events that occur several years into the future is much less than the value of risk events occurring in the immediate future. Further, this effect, CAPP contended, is compounded by depreciation allowances that leave even smaller amounts at risk in future years.

CAPP suggested that TransCanada overstated its own risks and understated those of other pipelines. This, it suggested, is most obvious in the comparison with Vector, which TransCanada assessed as being less risky than the Mainline even though Vector has recourse rates designed to the pipeline's capacity, although it is not fully contracted; has negotiated rates below its maximum rates; offers discounts for 30 percent of its capacity; has a marketing affiliate that assumes the risks of some of the capacity; has deferred recovery of depreciation far into the future; and has had very low returns historically (ROE of 3.7 percent in 2002 and 3.5 percent in 2003). CAPP stated that other pipelines assess their own risk as higher than that portrayed by TransCanada. These pipelines include PNGTS, Iroquois and the US affiliate of M&NP, which shares some of the same risks with M&NP in Canada. Northern Border was also assigned a much lower rating of long-term revenue and cost risk by TransCanada than the Mainline even though it too has an expiring contract portfolio and draws from the WCSB. CAPP questioned the fact that TransCanada sees diversity of supply as a factor reducing risk for pipelines like Iroquois and Northern Border but not for the Mainline.

It was noted by CAPP that 70 percent of the weighting falls on a single factor, the long-term revenue and cost risk category, for which TransCanada assigned itself, and no other pipeline, the highest rating of four. In all other categories TransCanada viewed the Mainline as having little or no risk. CAPP stated that this long-term revenue and cost risk category dominates the final index rankings. If the ratings were reversed so that short-term revenue and cost risk had the 70 percent weighting and the long-term revenue and cost risk weighting was 15 percent, while others stayed the same, the Mainline's index score would fall from 2.9 to 0.7. CAPP suggested that this indicates the extreme sensitivity of the rankings to the assumed weights.

According to CAPP, TransCanada's assignment of risk is heavily influenced by its view of the Mainline as the swing pipeline. CAPP claimed that if the swing pipeline hypothesis is rejected, the ratings would collapse.

CAPP also submitted that TransCanada minimized the impact of differences in Canadian and US regulation. CAPP contended that Canadian pipelines face considerably less business risk than do US pipelines and that this affects both their financial performance and their risk profile. Factors that CAPP identified as increasing the risk of US pipelines include risk of underutilization, construction cost overrun risk, the risk of having to bear costs associated with negotiated rates and discounting, and less use of deferral accounts. CAPP also observed that in the US, the downside risk under regulation includes bankruptcy, which has happened at both the federal and state level.

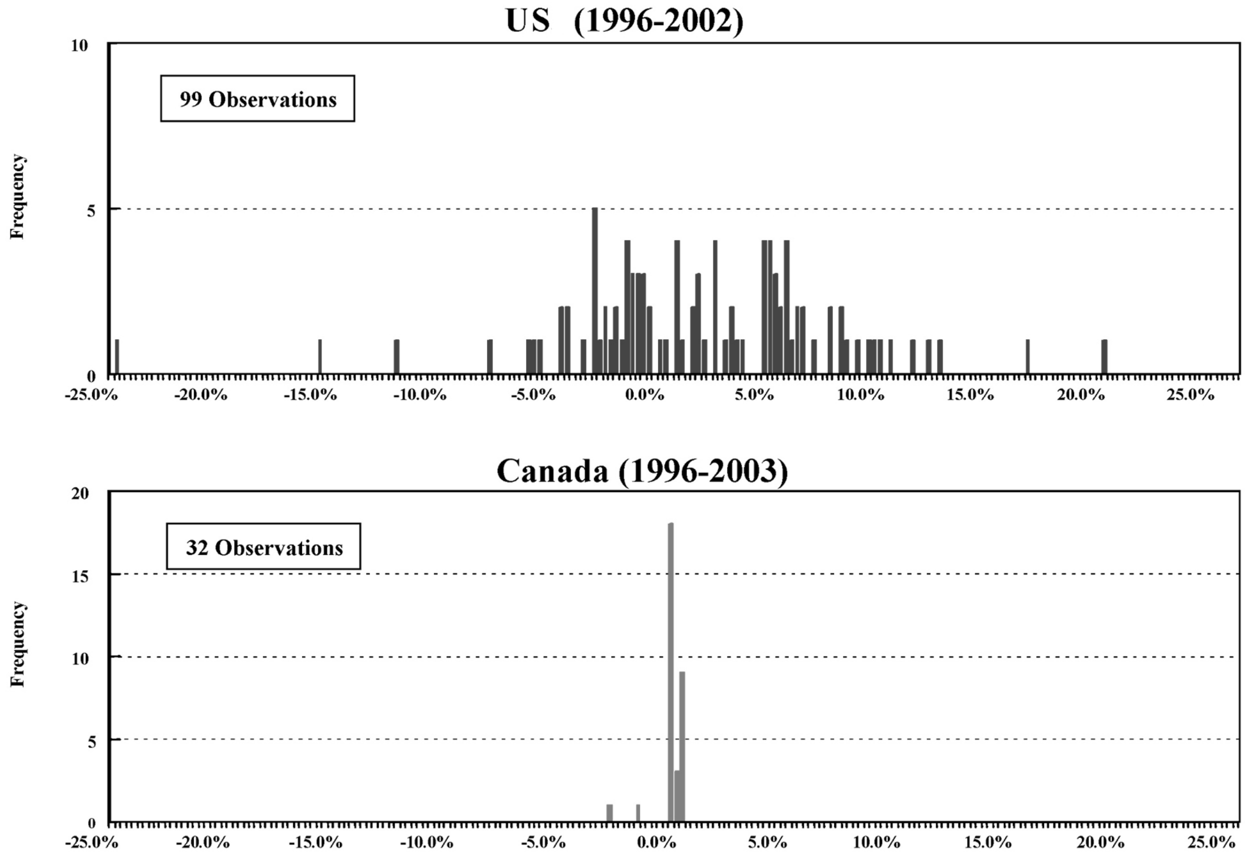
In support of its position on the difference between Canadian and US regulation, CAPP filed an analysis of authorized and earned returns for US and Canadian pipelines (see Figure 5-1). This showed Canadian returns slightly above but very close to authorized levels, while US returns varied widely from authorized levels, both positively and negatively, although skewed toward a positive variance. CAPP submitted that if the regulatory risk between the two systems were similar, one would expect to see a similar pattern between the two countries, which is not evident in the data. CAPP further observed that the statistical result for the US is consistent with regulatory policies that shift more risk to pipelines. With higher risk, one would expect to see the greater variability in excess returns and a greater average excess return as an inducement to accept more risk.

Other concerns expressed by CAPP were that TransCanada did not give proper weight to the failure of some of the pipelines to earn their allowed returns, which reflects the higher risk imposed on US pipelines; relied on inaccurate returns for Vector; and tended to overstate risk because the tendency of revenue and cost to move together was not taken into account. CAPP noted that TransCanada's risk categories were not compatible with the five risk factors assessed by the Board and raised concerns (discussed in Section 5.2.1 of these Reasons for Decision) about comparisons to Alliance, M&NP and Enbridge.

Coral

Coral argued that the relative business risk analysis was not appropriate or useful for a number of reasons. Coral suggested that TransCanada's use of the term short-term risk to describe earnings falling short of the expected return, and long-term risk to describe non-recovery of all or part of capital, does not describe the risks well since variability is a long-term phenomenon and, in principle, non-recovery risks exist even in the short term. Coral observed that parties tend to think of non-recovery risk as long term because in the short to medium term, they do not expect the Mainline to have difficulty recovering its costs. Coral asserted that TransCanada's position that non-recovery or truncation risk, with a 75 percent weighting, is three times more important than variability risk, with a 25 percent weighting, is not credible. Coral also argued that the decline in the outstanding rate base due to depreciation reduces investors' exposure to risk despite the potential for some error in the determination of the depreciation rate. This means that the heavy emphasis on non-recovery risk is excessive.

Figure 5-1
CAPP's Analysis of Actual Returns Less Allowed Returns for US and Canadian Pipelines



With respect to TransCanada's view that contract terms are a key determinant of business risk, Coral submitted that in the context of non-recovery risk many years in the future, it does not make a significant difference whether a pipeline's outstanding contract term is one year, three years, or six years. In this respect, Coral noted that the pipelines in the analysis, other than Alliance, are in similar circumstances to the Mainline.

In addition to the issue of weighting between long-term and short-term risks discussed previously, Coral suggested that the methodology appeared to be biased, citing an exaggeration of the Mainline's risks and the selection of routes in the netback analysis. Like CAPP, Coral disagreed with the rankings TransCanada assigned to the various pipelines and viewed them as arbitrary and subjective. Coral was sceptical about the value of the netback study, which was a factor in TransCanada's assignment of risk scores.

Lastly, Coral was of the view that the relationship that such a study should be looking for is between risk and the cost of capital, not risk and allowed return. Coral argued that one cannot assume that allowed returns reflect the true cost of capital for either the Canadian or US pipelines used in the analysis.

Ontario

Ontario also argued that the methodology and the analysis were flawed and the outcomes not meaningful. Ontario contended that the inclusion of six US pipelines compared with three Canadian pipelines led to a bias because of the higher risks and higher returns under the US regulatory regime. Until requested, the analysis did not include Westcoast even though that pipeline faces virtually the same business risks, including gas supply from the WCSB, pipe-on-pipe competition, and an increase in short-term contracts. Ontario noted that the information base was not the same for each of the companies since TransCanada had insider knowledge of some companies but not others.

5.2.3 Comparable Investments Available to TransCanada

Position of TransCanada

TransCanada noted that in the RH-4-2001 Decision, the Board gave little weight to evidence on comparable investments provided by TransCanada because it was limited, given confidentiality concerns, and of a nature that did not allow parties to test the claims made with respect to the relative business risk and cost of capital associated with those projects. In this proceeding, TransCanada attempted to provide additional information.

TransCanada suggested that, since it is the investor in the Mainline, the returns available to TransCanada from investing in other enterprises of like risk to the Mainline should be considered as a step in addressing the comparable investment standard. TransCanada provided evidence on alternative uses of capital available to TransCanada in the form of five US pipelines in which it has an interest, (GLGT, Iroquois, Northern Border, PNGTS and Tuscarora Gas Transmission) as well as four power projects (Curtis Palmer Hydroelectric Project, Sundance Power Purchase Agreement, ManChief Power Company, LLC and Bécancour Power Project). It also provided three pipeline investment alternatives available to third party investors (Enbridge, Alliance and M&NP). Each of these 12 investments was compared with the Mainline. This list did not include all of TransCanada's investments but only those which TransCanada considered to be of comparable risk to the Mainline. The list also excluded pipelines whose ROE is based on the RH-2-94 Formula or a similar methodology. According to TransCanada, the power investments included are characterized by long-term contracts with creditworthy counterparties. TransCanada views these contracts as being similar to cost of service methodology since most, if not all, changes in input costs flow through to customers.

With respect to US pipelines, TransCanada acknowledged that risks associated with US pipelines are not the same as the Mainline, but submitted that the difference in risk did not warrant the magnitude of the difference in allowed and achieved returns. In particular, it pointed to the difference between the returns of the Mainline and those of interconnecting pipelines carrying the same gas. TransCanada also noted that the differences in regulatory procedure between Canada and the US are not so great as to make these kinds of comparisons irrelevant and that when it comes to the element of risk that matters most to investors, namely long-term earnings and capital cost recovery, the regulatory regimes on both sides of the border have fundamentally the same design.

With respect to CAPP's position that a firm will have opportunities above its cost of capital but will benefit shareholders by investing in all projects which earn the cost of capital or above, TransCanada submitted that there are hidden costs associated with undertaking too many projects. Consequently, projects which are just at the cost of capital will turn into projects which do not earn their cost of capital.

TransCanada argued, in response to Coral's concern about TransCanada's comparable earnings information being a form of the comparable earnings test, that it did not provide this information to estimate the cost of capital, as a comparable earnings test does, but rather to demonstrate that TransCanada has alternative investments of comparable risk that offer higher rates of return.

TransCanada concluded that the comparisons with these investments support an increase in the equity ratio to 40 percent because these investments yield higher returns than the Mainline with similar or less risk.

Position of Intervenors

Intervenors raised a number of conceptual problems with the analysis and concerns about the specific information provided. CAPP stated that the investment opportunities available to TransCanada are irrelevant. A firm such as TransCanada will have multiple investment opportunities with comparable risk and with a range of returns above its required cost of capital. It should undertake all those which have a return exceeding its cost of capital. However, the returns of these investments do not determine the firm's cost of capital. Consequently, CAPP contended that while TransCanada may have better investment opportunities of comparable risk to the Mainline, this has nothing to do with a fair rate of return for the Mainline.

CAPP argued that since TransCanada's management works to ensure that its investments are earning above their cost of capital, these returns do not necessarily indicate the actual cost of capital. CAPP pointed out that the returns on these investments already form part of the broader market data that informs the tests for estimating the cost of capital. CAPP also noted that the cost of an acquisition is a factor in determining return expectations and would have influenced the return expectations of the projects that TransCanada identified in its analysis.

Even if these alternative investments were relevant, CAPP contended that TransCanada's power projects are riskier than the Mainline. CAPP stated that power risks, as identified in TransCanada's annual report, include plant availability, fluctuating market prices, regulatory risk related to restructuring of the electricity industry, risk associated with weather and risks related to uncontracted capacity. CAPP also observed that the power businesses lack the regulatory compact that the Mainline enjoys. Coral noted that there was no objective evidence on the record that the power businesses are of comparable risk.

CAPP contended that TransCanada had put this information forward primarily to support a higher return on equity, which was not at issue in this proceeding, rather than to address capital structure.

Both Coral and CAPP made the point that the sample of investments was selective. Coral raised concerns about the lack of earnings information including book returns on equity, capital structures and debt costs. Coral argued that the information provided was largely the owner's own forecasts of earnings. CAPP also expressed concern about the limited nature of the data due to confidentiality concerns.

Coral argued that it is inappropriate to use regulated firms when comparing the appropriate return of the Mainline with other companies because it makes the analysis circular. In doing so, the Board would be basing its decision with respect to the Mainline on what other regulators do. Coral contended that TransCanada's comparable investment information is actually a version of the comparable earnings test but without its rigour. Coral noted TransCanada's statement that the equity risk premium and the discounted cash flow cash flow analyses are market-based approaches such that stock prices adjust if authorized returns are too high or too low. Consequently, the circularity issue is not a concern using these approaches. However, with returns based on book values, as TransCanada's comparable investment information is, the circularity issue remains.

Lastly, both CAPP and Ontario submitted that there are major differences in US and Canadian regulatory frameworks that render the comparison with US pipelines inappropriate.

5.2.4 Views of the Board

Comparisons to Alliance, M&NP, Enbridge and Westcoast

The Board finds that comparisons with the returns of other pipelines of similar risk may be informative, provided that circularity concerns are properly addressed and that comparisons take into account differences in circumstances.

The Board finds that since the returns of Alliance, M&NP, Enbridge and Westcoast did not result from regulatory decisions following contested cost of capital hearings, their returns can be examined without raising concerns of circularity.

With respect to differences in circumstances, the Board notes that some of these pipelines' returns were set at a time when the cost of capital was higher than it is currently. Further, two of the pipelines, Alliance and M&NP, locked in their returns for a number of years. A higher return may be required for bearing the risk associated with locking in returns or rates over an extended period of time. TransCanada recognized this when it stated that generally a higher ROE would be required for locking in a return for 15 years rather than for five years. To make comparisons relevant, adjustments to the returns of these pipelines to reflect these different circumstances are warranted.

The Board does not agree with TransCanada's proposition that Enbridge is of comparable risk to the Mainline. The Board notes that it has traditionally viewed oil pipelines as riskier than gas pipelines, given oil pipelines' common carrier status supported only by monthly nominations, and because of operational complexities arising from the multi-product nature of their operations. None of the evidence presented by TransCanada supports the conclusion that the changed environment in which the Mainline operates has reduced or eliminated these differences in business risks. Further, even if these pipelines were of comparable risk, the Board notes that Enbridge's financial parameters have been determined through negotiation for the past decade and are reflective of the package agreed to for an oil pipeline at the time those settlements were negotiated, not of cost of capital for a gas pipeline in 2004. The Board gave no weight to the comparison with Enbridge.

The Board is of the view that Westcoast is of similar, albeit not necessarily identical, risk to the Mainline and that its recently agreed upon common equity ratio reflects current conditions. However, the Board notes that Westcoast's equity ratio is a result of a negotiated settlement that specifically states that no single component of the agreement should be considered as acceptable to Westcoast or any of the stakeholders in isolation from all other aspects of the agreement. Nonetheless, Westcoast's agreed upon equity ratio provides some evidence that the Mainline's current equity ratio is not considerably underestimated.

The Board does not agree with TransCanada's evidence suggesting that the Mainline faces more business risk than M&NP, noting that contracts can mitigate risks, but cannot eliminate them and that M&NP's backstop arrangements will expire in approximately 15 years. Further, the Board is of the view that TransCanada failed to adequately consider differences in circumstances facing M&NP. In the GH-6-96 Decision,[48] the Board concluded that M&NP can be viewed as having the same business risk as other Group 1 pipelines, but that it faces substantially different circumstances. The Board noted in that Decision that M&NP was a greenfield project, that its only sources of gas were new and untested fields, that it would be serving an untested market in Canada, and that it was facing significant competition for its anchor market in the US Northeast. The return of M&NP reflects these different circumstances. In addition, any comparison with M&NP must take into account that the return was locked in for a number of years. With respect to TransCanada's suggestion that M&NP's regulatory risk is lower because it is operating under a multi-year settlement, the Board does not accept that the existence of such a settlement has a measurable impact on regulatory risk.

The Board accepts that the level of risk faced by Alliance is sufficiently similar to the Mainline to make comparison relevant. However, when making comparisons, there is validity in adjusting Alliance's return to account for differences in circumstances. In particular, prior to comparing it with the Mainline, the return of Alliance should be adjusted to reflect the

48 National Energy Board GH-6-96 Reasons for Decision, Sable Offshore Energy Project and Maritimes & Northeast Pipeline Project, December 1997, at p. 15

different risk-reward relationship of the two pipelines and the cost of capital environment that existed at the time that Alliance's return was set. Unlike the Mainline, Alliance took on construction cost risk, locked in its return over an extended period of time, and took on some capacity risk. On the other hand, Alliance's long-term contracts tend to mitigate, in part, these additional risks. Comparison with Alliance's return ought to account for the different set of circumstances, including construction cost risk, whether such a risk was mitigable or not, and differences in the cost of capital and interest rate environment that prevailed at the time the return was set.

In summary, while the Board finds the comparisons with Alliance, M&NP and Westcoast informative and qualitatively useful, the different circumstances of these pipelines make it difficult to use these comparisons to arrive at a definitive equity ratio for the Mainline.

Relative Business Risk Analysis

The Board recognizes that TransCanada attempted to address, through its relative business risk analysis, the concerns expressed by the Board in its RH-4-2001 Decision about meaningful comparisons between pipelines. The Board finds the framework for TransCanada's relative business risk analysis to be transparent and systematic. As such, it helps guide and focus the discussion and is a convenient way of summarizing TransCanada's viewpoint. It also provides a useful mechanism for testing the sensitivity of various assumptions.

However, while the Board found the framework useful, it disagrees with some of the assumptions made in TransCanada's analysis, including the weights to be applied to various categories, the ratings assigned to various pipelines, the pipelines included in the analysis, and the returns used by TransCanada. With respect to the issue of the appropriate weights for short-term as opposed to long-term factors, the Board does not accept the implication of TransCanada's analysis that the factors that increase earnings variability in the short-term represent little or no risk in the long-term. The Board notes that the results of the analysis were highly sensitive to the assumptions made with respect to relative weights and the assignment of risk rankings.

With respect to comparisons with US pipelines, the Board's view is that these companies are different businesses operating in a different regulatory, policy and financial context. These differences limit the meaningfulness of direct comparisons between the returns of Canadian and US pipelines. The Board notes that US pipelines are subject to risks not borne by the Mainline, including, among others, risk of underutilization, construction cost overrun risks and risks associated with discounted and negotiated rates. As evidence of the regulatory differences between the two countries, the Board notes CAPP's evidence pertaining to earnings variability in the two countries (see Figure 5-1).

TransCanada acknowledged that risks associated with US pipelines are not the same as the Mainline, but contended that the difference in risk did not warrant the magnitude of the difference in allowed and achieved returns. While providing a framework for comparing various pipelines, TransCanada's relative business risk analysis did not adequately address differences in risk between US and Canadian pipelines. Accordingly, the Board gave little weight to the return evidence of US pipelines.

The Board notes that TransCanada's risk rankings of various pipelines were influenced by its views of the Mainline as the swing pipeline, a view that the Board did not find persuasive, as discussed in Chapter 4.

The Board also had serious concerns about the subjectivity and reliability of CAPP's risk rankings for various pipelines. Overall, the Board gave little weight to either TransCanada's relative business risk analysis or to that of CAPP; however, they were useful tools for examining the evidence and positions of the parties.

Comparable Investments Available to TransCanada

The Board agrees with intervenors that the earnings information for the group of pipeline and power investments selected by TransCanada for comparison does not provide information useful in assessing the cost of capital for the Mainline. However, the Board is cognizant of TransCanada's statement that this information was provided, not to estimate the cost of capital, but to demonstrate that TransCanada has alternative investment opportunities available that it considers to be of comparable risk.

The Board notes that the credit rating agencies and equity analysts view the power business as riskier than the Mainline, as acknowledged by TransCanada's witnesses. The Board does not accept that the power projects put forward by TransCanada as alternative investments are of comparable risk to the Mainline, even though the selected power investments may be of less risk than TransCanada's power investments as a group, or of power investments in general. In this regard, the Board finds it significant that, unlike the Mainline, these selected power investments are not subject to a regulatory compact which influences the risk-reward framework for an investment. Further, little or no information was provided regarding the way in which the power investments were financed. Consequently, the Board placed little weight on the information on power investments provided by TransCanada.

Conclusion - Other Comparable Investments

Overall, the comparisons with Canadian pipelines, the relative business risk analysis and the evidence pertaining to alternative investments available to TransCanada suggest that the current equity ratio of the Mainline is not considerably understated.

Chapter 6

Financial Integrity and Capital Attraction

Position of TransCanada

TransCanada indicated that there is a legal requirement for the Board to determine a return that is fair to the equity investor in the Mainline, and that will allow the Mainline to compete successfully for the capital necessary to fund its anticipated and potential requirements.

It was submitted by TransCanada that an overall return on capital (ATWACC) of 6.3 percent (deemed equity ratio of 40 percent, ROE of 9.56 percent, and after-tax cost of debt of 4.14 percent) would improve the Mainline's current financial integrity and, in turn, its ability to attract capital on a stand-alone basis. TransCanada expressed the view that the currently allowed return on capital for the Mainline does not meet the financial integrity standard. It contended that, at present, the Mainline can attract capital but only to maintain the going concern value of the asset (for example, to invest in maintenance capital). In that respect, TransCanada indicated that it will invest the necessary capital to maintain standards of safety and security on the Mainline at least at their current levels. It also suggested that on a stand-alone basis, the Mainline would attract capital at higher cost and on more restrictive terms and conditions than TransCanada.

TransCanada estimated the Mainline's capital expenditures to be $44 million in 2004, but submitted that the Mainline's ability to access capital markets in the short-term should not be the issue. TransCanada indicated that the Mainline's ability to access capital in the future depends upon the returns available to equity investors and the financial stability and creditworthiness that can be demonstrated by TransCanada to fixed income investors. TransCanada also discussed the importance of US capital markets and viewed the US as an important source of capital for future investments.

According to TransCanada, credit ratings provide an indication to suppliers, customers, and investors regarding the financial stability of a company. TransCanada suggested that credit ratings are a critical element in determining a company's ready access to the capital markets and that credit ratings and liquidity concerns have risen to the forefront of investor attention.

TransCanada indicated that it currently has a credit rating of 'A2 stable' from Moody's Investors Service (Moody's), 'A stable trend' from Dominion Bond Rating Service (DBRS) and 'A-/negative outlook' from S&P. TransCanada submitted that ratings agencies are demonstrating a growing concern with the weak financial profiles of Canadian utility companies and there have been several downgrades over the past three years reflecting these concerns.

TransCanada submitted that if regulatory bodies do not respond to the changes driven by competitive and market realities, Canadian utility companies will experience further credit erosion and, in turn, loss of financial flexibility. TransCanada contended that this erosion would result in its downgrade unless the Board increases the deemed common equity ratio of the Mainline.

In TransCanada's view, an increase in the Mainline's return on capital, through an increase in the equity ratio, is required to achieve appropriate coverage on an interest and cash flow basis. While noting that S&P and possibly Moody's now place greater reliance on other ratios, TransCanada maintained that an interest coverage ratio of 2.0 for the Mainline would not be sufficient to support an 'A' credit rating.

TransCanada indicated that S&P relies on three key global utility benchmark ratios: funds from operations (FFO) interest coverage; FFO to total debt; and debt to capital. However, TransCanada contended that S&P has a stated policy of placing greater emphasis on the two FFO ratios than on the debt to capital ratio. Table 6-1 summarizes the Mainline's various financial ratios from 1999 to 2003 and resulting ratios at various levels of common equity for 2004; namely FFO to total debt, FFO interest coverage, and interest coverage.

Table 6-1
Mainline Financial Ratio Summary

Historical Mainline Ratios

Year	1999	2000	2001	2002	2003
FFO to Total Debt [1] (percent)	8.9	9.3	9.9	10.8	12.3
FFO Interest Coverage (times)	1.99	2.06	2.13	2.21	2.40
Interest Coverage[2] (times)	1.54	1.67	1.71	1.86	1.91

Resulting 2004 Mainline Ratios at various Equity Ratios

Equity Ratio (percent)	33	34	35	36	37	38	39	40
FFO to Total Debt [1] (percent)	12.2	12.5	12.9	13.2	13.6	14.0	14.3	14.7
FFO Interest Coverage (times)	2.45	2.48	2.50	2.52	2.54	2.55	2.57	2.59
Interest Coverage without redemption (times)[3]	1.94	n.a.[5]	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.
Interest Coverage with redemption (times)[4]	1.93	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.	2.20

1 The Mainline's 2004 FFO to total debt ratios at various equity ratios were calculated using the appropriate FFO reported in TransCanada's response to NEB information request 4.1b, divided by one less the equity ratio and multiplied by the Mainline's capitalization of $8.274 billion as of 30 June 2004 reported in TransCanada's response to NEB information request 1.4.

2 The Mainline's interest coverage ratios for the years 1999 to 2003 were calculated using earnings before interests and taxes (EBIT) from TransCanada's Response to NEB information request 1.35(b) divided by the appropriate interest expense (including JSDs' interest) from TransCanada's response to NEB information request 2.3(a), as updated.

3 Assumes redemption of the 8.75% JSDs and 8.50% Debentures, as per TransCanada's response to NEB information request 2.2(f).

4 Assumes no redemption of the 8.75% JSDs and 8.50% Debentures, as per TransCanada's response to NEB information request 2.2(f).

5 Not available

The target level for each ratio varies depending on the rating level (for example, 'A' or 'BBB') and on the business profile score. The business profile score reflects varying levels of risk within a ratings level. TransCanada noted that S&P assigns a business profile score on a scale of one (lowest risk) to ten (highest risk) to each of the companies it rates in the utility and power sector. TransCanada indicated that its consolidated business profile score is a three and suggested that its power business, on a stand alone basis, would have a business profile score around a six. TransCanada acknowledged that the credit rating agencies and the equity analysts view the power business as more risky than the regulated Mainline. TransCanada also provided evidence stating that S&P expects TransCanada, on a consolidated basis, to maintain a minimum FFO to total debt ratio of 14 percent and an FFO interest coverage of 2.6. The S&P benchmark ratios that are relevant to the Mainline's likely business profile score appear in Table 6-2.

Table 6-2
S&P 'A' Rating Benchmark Ratios for 2004

	Business Profile Score	
	2	**3**
FFO to Total Debt (percent)	12.0 - 20.0	15.0 - 25.0
FFO Interest Coverage (times)	2.0 - 3.0	2.5 - 3.5

TransCanada indicated it is committed to maintaining an 'A' credit rating and expressed the view that if it were downgraded to a 'BBB' credit rating, its ability to access capital markets would be impaired. Its marginal borrowing costs would increase; the value of its outstanding debt would decrease; the amounts made available by lenders would decrease; and the debt term to maturity would decrease. TransCanada submitted that these changes would be exacerbated as several major institutional investors would be required to sell their debt holdings because they would be significantly overweighed in the 'BBB' credit rating category. It noted that institutional investors in Canada maintain investment guidelines that, among other things, restrict the amount of 'BBB' debt they can hold.

TransCanada submitted that the Board regulates the Mainline under the stand-alone principle, which requires the Board to consider the Mainline separately and distinctly from TransCanada. However, TransCanada acknowledged that the Board can and should consider relevant evidence about TransCanada and its credit metrics in reaching its decisions.

According to TransCanada, cross subsidization of Mainline credit is occurring at the consolidated level. To support this view, it referred to a report from S&P that suggested that TransCanada's Canadian pipelines' financial performance and business profile are more in line with a 'BBB+' ratings category, while the consolidated financial profile is rated 'A-'. TransCanada also submitted that the assessments of Moody's and DBRS support its position that the Mainline's current capital structure does not provide sufficient support to the financial integrity of the stand-alone entity.

As further evidence that the Mainline is subsidized by the consolidated entity, TransCanada stated that, over the last five years, it has been moving the capital structure of the consolidated entity towards 40 percent common equity. TransCanada submitted that its unregulated businesses are less leveraged than its regulated businesses, and it is the unregulated businesses that are allowing the consolidated entity to maintain its 'A-' rating.

Position of Intervenors

CAPP expressed the view that no significant changes have occurred in business risk or financial integrity that would justify an increase in the Mainline's deemed capital structure. CAPP submitted that the change in the Mainline's depreciation rate approved in the RH-1-2002 Decision increased the Mainline's cash flow and improved its financial integrity.

CAPP submitted that the Mainline has just as much, if not more, financial flexibility now as it had at the time of the RH-4-2001 Proceeding and there is no need to make changes to the Mainline's capital structure to improve access to capital, particularly since the rate base is declining. CAPP stated that the overall conditions in the bond market indicate that the spreads on corporate debt are tighter now than they were in 2001, such that utilities can access debt markets more easily.

It was suggested by CAPP that the most dramatic re-evaluation of credit standards has occurred as a result of S&P harmonizing credit ratings between the US and Canada following its acquisition of the Canadian Bond Rating Service. CAPP submitted that, as a consequence of this harmonization, S&P has employed a quantitative approach and taken standard ratios and judgments drawn from the US and applied them in Canada with little qualitative adjustment for the different institutional environment.

CAPP expressed the view that the Mainline has a good investment grade bond rating with its currently allowed ROE and common equity ratio and that an appropriate common equity ratio is one that, in conjunction with the allowed ROE, enables a pipeline to maintain its credit and attract capital. CAPP submitted that maintaining credit is not the same as maintaining a particular credit rating and that, in turn, there is no need to target a particular credit rating. CAPP suggested that a sale of TransCanada stock by institutional investors would only be triggered if more than one credit rating agency downgraded TransCanada to the 'B' credit rating range.

CAPP suggested that there is no evidence supporting the contention that the Mainline's capitalization is subsidized by TransCanada's non-regulated businesses. CAPP noted that the capital structure of a firm may be viewed in several ways, and that the common equity ratio in TransCanada consolidated was relatively stable in the 35 percent range over the 2001-2003 period. CAPP noted that the 33 percent deemed equity in the Mainline is not out of line with the figures for the consolidated firm.

With respect to TransCanada's contention that it has been moving the consolidated entity's capital structure towards 40 percent equity, CAPP noted that just prior to TransCanada's acquisition of GTN, the consolidated balance sheet included over one billion dollars in cash, and TransCanada reported a common equity ratio of 39.1 percent for the consolidated entity. This increase in the consolidated equity ratio, according to CAPP, was temporary while TransCanada was accumulating cash to fund its acquisition of GTN. On 1 November 2004, TransCanada closed the GTN deal, which was financed through a combination of cash and assumed debt, resulting in a consolidated common equity ratio of 34.8 percent on a pro forma basis, which was in line with what it had been since 2001.

CAPP also pointed to the RH-2-94 Decision, in which the Board indicated that it was not convinced that evidence regarding a consolidated equity ratio that is different from the deemed ratio necessarily indicates the existence of cross subsidization, and that the primary issue was whether or not there is an impact on debt costs.

Ontario contended that the Mainline's financial integrity remains strong, and that it has the ability to attract capital, if necessary. Ontario suggested that TransCanada's application relies excessively on the reports of credit rating agencies, and in particular S&P. Ontario noted that TransCanada was not downgraded in 2004 and submitted that there is no evidence that the company was in danger of a credit downgrade by S&P, DBRS, or Moody's.

Coral submitted that there is little difference between the capital structures of the non-regulated businesses, TransCanada's Canadian regulated pipelines, and the consolidated entity.

Views of the Board

The Board is of the view that the Mainline's financial integrity has improved continuously over the last five years, arising in part from higher depreciation rates and a higher common equity ratio. As shown in Table 6-1, the Mainline's key financial ratios have improved each year from 1999 to 2003. In the Board's view these financial ratios indicate that the Mainline has the ability to meet its current and future financial obligations.

While the Board must regulate the Mainline as a stand-alone entity, the Mainline accesses capital markets through its parent. Therefore, it is affected by TransCanada's credit ratings. The Board notes that, while there are some differences in opinion amongst the three credit rating agencies (DBRS, S&P, and Moody's) concerning TransCanada's financial integrity, the underlying message from these agencies is that, given the evolving nature of the business, TransCanada's Canadian regulated pipelines, including the Mainline, should lower their financial risk. The Board also notes the comment in a 2004 S&P published report to the effect that TransCanada's Canadian pipelines' financial performance and business profile are more in line with the 'BBB+' ratings category.

The Board does not consider it appropriate to set a specific credit rating target. However, the Board accepts that should credit rating agencies downgrade TransCanada below the grade Canadian institutional investors generally require for the majority of their holdings, it could increase the Mainline's cost of debt and equity capital, and limit the number of investors able to hold TransCanada's securities. Although the Mainline's declining rate base and associated revenue earning potential may mean that the maintenance of a high rating in the future will become increasingly challenging, at this time, the Board considers the maintenance of a strong financial position to be a prudent objective for the Mainline.

The Board is not persuaded that the Mainline is being subsidized by TransCanada's unregulated businesses. The Board acknowledges that there are several acceptable accounting approaches to present and compare the Mainline and consolidated capital structures. However, in order to assess whether cross subsidization is taking place, the Board considers it most appropriate to look at consolidated capital structures that exclude cash intended to fund large-scale acquisitions and include non-recourse debt of joint ventures. While the Board recognizes TransCanada's stated objective to move the equity ratio of the consolidated entity towards 40 percent, the Board is of the view that the Mainline is a low-risk pipeline, and need not be capitalized in the same manner as TransCanada's consolidated business. TransCanada has been diversifying into operations that are riskier than its pipeline operations, and its consolidated capital structure should reflect the consolidated risk, not that of the Mainline only.

Although the key financial ratios indicate that the Mainline's financial integrity has improved over the last five years, given the market's perception of the Mainline's level of prospective business risk, a reduction in financial risk, through an increase in its common equity ratio, is warranted in order to ensure that the Mainline continues to maintain its financial integrity and its ability to attract capital on reasonable terms and conditions.

Chapter 7

Capital Structure

For reasons summarized in previous chapters, TransCanada sought approval of a common equity ratio of 40 percent for the Mainline, while all active intervenors expressed the view that the Mainline's equity ratio should remain unchanged at 33 percent.

Views of the Board

As recognized by TransCanada in final argument, the determination of fair return is not an exact science. Although the law is clear as to the standards the Board must meet in setting a fair return (see Chapter 2), what weight a specific piece of evidence or methodology should be given is, as was stated by the Federal Court of Appeal in *TransCanada v. NEB,*[49] a matter of judgment.

In these Reasons, the Board has expressed its views in respect of the main elements of evidence and argument presented by TransCanada and the intervenors. Except in situations where the Board has indicated that it gave no weight to a particular element, the Board found all of the evidence presented relevant and useful. Indeed, in those instances where the Board stated that it gave limited weight to an element, this does not indicate that the element was of questionable or doubtful value, but illustrates the fact that in this proceeding, no single piece of evidence was determinative of the Board's decisions. Rather, it is the body of the evidence, that is, the combined effect of several factors, many of which were given limited weight individually, that guided the Board's judgment.

Having considered all the evidence presented, the Board is of the view that a capital structure comprised of 36 percent deemed common equity and 64 percent debt is most appropriate for the Mainline. In the Board's view, a 36 percent equity ratio recognizes the increase in business risk to which the Mainline is exposed.

In coming to this determination, the Board has explicitly considered the standards set out in Chapter 2 of these Reasons. As discussed in that chapter, it is the Mainline's overall return on capital, resulting from the combination of the Mainline's capital stucture, ROE and cost of debt (set out in Section 8.1), that must be examined in light of these standards. When examining the cost of capital for the Mainline, the Board is of the view that, since the Mainline's tolls recover the actual rather than the market cost of debt, establishing a fair total equity return is the paramount

49 *TransCanada v. NEB, supra* note 8 at para. 32

concern in this case when ensuring that a fair return on capital has been determined.

The Board finds that the overall equity return and overall return on capital resulting from the decisions in this hearing will ensure that the Mainline's returns meet the comparable investment standard. The returns will be in line with those of Canadian pipelines found to be of comparable risk. Further, the Board finds that the resulting risk-reward profile of the Mainline will not be out of line with that of other comparable investments presented in this hearing.

The Board is also of the view that a common equity ratio of 36 percent and the resulting overall return on capital will meet the financial integrity and capital attraction standards. Given the Board's assessment of the Mainline's business risk, the resulting Mainline financial ratios will be reflective of a strong credit rating for a low risk utility. With the resulting financial parameters, the Mainline will continue to maintain and even improve its financial integrity and its ability to attract capital on reasonable terms and conditions. In the Board's view, the Mainline's resulting level of financial risk will be commensurate with the level of business risk it faces.

Decision

The Board approves an increase to the Mainline's common equity ratio from 33 percent to 36 percent.

The Board approves a percentage of debt in the Mainline's capital structure of 64 percent.

Chapter 8

Other Matters

8.1 Cost of Debt

TransCanada's applied-for 2004 revenue requirement reflected an average cost of debt of 8.73 percent. The average applied-for amount and cost of funded debt reflected TransCanada's proposed redemption in July 2004 of the 8.50% Debentures and the 8.25% JSDs.

TransCanada initially sought a determination that the actual incurred cost of debt allocated to the Mainline was reasonable, but withdrew its request for such a direction in its 29 July 2004 evidence. TransCanada did not redeem the 8.25% JSDs in 2004. The 8.50% Debentures were redeemed, but on 1 November 2004. Nonetheless, TransCanada requested, in its July evidence, that the Board approve the initially applied-for average cost of debt of 8.73 percent, effectively seeking a cost of debt reflective, in part, of a deemed cost, rather than actual incurred cost of debt allocated to the Mainline.

Consistent with the RH-4-2001 Decision, TransCanada estimated the pre-funded cost of debt as being equal to the average cost of the Mainline's funded debt, which is made up of First Mortgage Pipe Line Bonds, Debentures, Medium Term Notes and the JSDs.

With respect to unfunded debt, TransCanada applied for a cost rate of 3.11 percent. In January 2005, TransCanada indicated that its actual cost of short-term financing for the twelve months ended 31 December 2004 had been 2.49 percent.

Views of the Board

The Board is of the view that the cost of debt to be included in the Mainline's 2004 revenue requirement should reflect the actual cost incurred to finance the Mainline's deemed level of debt.

Debt allocated to the Mainline by TransCanada and forming the Mainline's funded debt includes First Mortgage Pipe Line Bonds, Debentures, Medium Term Notes and the JSDs. The Board notes that TransCanada's applied-for cost of funded debt is not reflective of actual cost, since it assumes a redemption that did not occur and another redemption that occurred at a date different than had been forecast. The Mainline's 2004 cost of funded debt should reflect the fact that the 8.25% JSDs were not redeemed in 2004 and the actual date at which the 8.50% Debentures were redeemed. As part of its compliance filing, TransCanada should file revised schedules reflecting these two changes.

The Board notes that the Mainline's funded debt is likely to exceed, at times, the deemed debt level of 64 percent in the Mainline's capital structure. The Mainline capitalization is therefore expected to include a certain level of pre-funded debt. Consistent with the RH-4-2001 Decision, any pre-funded debt should be assumed to have a cost equal to the average cost of the Mainline's funded debt. This approach effectively allocates back to TransCanada a slice of the funded debt, equal to the excess in funded debt, which had previously been assigned to the Mainline.

Should the Mainline's capitalization require the use of unfunded debt, the cost of unfunded debt should reflect TransCanada's actual cost of short-term financing for the twelve months ended 31 December 2004, which is 2.49 percent.

Decision

TransCanada is directed to file as part of its compliance tolls filing detailed calculations of the Mainline's 2004 cost of debt reflecting:

- **a cost of funded debt that reflects that the 8.25% JSDs were not redeemed in 2004 and the actual date at which the 8.50% Debentures were redeemed;**
- **a cost of pre-funded debt equal to the cost of funded debt; and**
- **a cost of unfunded debt of 2.49 percent.**

8.2 Effective Date

The Phase II List of Issues included, as Issue 3, the appropriate effective date for any change to the Mainline's cost of capital. This section focuses on the appropriate date of any change to the Mainline's common equity ratio.

Position of TransCanada

TransCanada's application proposed 1 January 2004 as the effective date to implement any changes to capital structure. TransCanada submitted that the Board can deal with any changes in tolls on a retrospective basis, which would permit the collection of any difference in tolls arising since 1 January 2004 from tollpayers in future rates.

TransCanada noted that it had proposed to redeem the 8.25% JSDs on 30 June 2004 and did not object to any equity thickness that would be awarded for that reason to also be effective 30 June 2004, rather than 1 January 2004.

TransCanada pointed to a heavy regulatory calendar (e.g., NGTL General Rates Application and Generic Cost of Capital proceedings, both before the Alberta Energy and Utilities Board; and the

Mainline Phase I and North Bay Junction proceedings) as the main driving factor behind the date of filing of its 2004 Tolls Application. TransCanada also submitted that other factors that delayed the processing of Phase II were beyond its control. In particular, TransCanada noted that Phase II could not take place until after the Federal Court of Appeal decision was issued on TransCanada's Appeal of the RH-R-1-2002 Decision.

Position of Intervenors

CAPP indicated that it is always easier to implement change on a go-forward basis, but acknowledged that the effective date could be 1 January 2004. In addition, CAPP argued that TransCanada had the duty to file its application early enough for any change to be effective early in the test year.

IGUA expressed its opposition to any retroactive increases in tolls. IGUA submitted that the Board should consider the significance of any cost associated with the retrospective introduction of changes to the Mainline's cost of capital, and if necessary, consider levelling adjustments into the future.

Views of the Board

While the Board would have expected an application seeking a change to cost of capital to be filed much earlier than the end of January of the applicable test year, the Board accepts that the late filing can be explained by the complexity surrounding the appeal by TransCanada of the Board's RH-R-1-2002 Decision. In this instance, the Board is of the view that it would be reasonable to make the changes to the Mainline's capital structure effective 1 January 2004.

Decision

Changes to the Mainline's capital structure shall be effective 1 January 2004.

8.3 Expected Duration of the Decision

While TransCanada's application related to the 2004 Test Year, TransCanada expressed the view that to the extent the company was comfortable with the Phase II Decision, it may be capable of enduring for a period longer than one year.

TransCanada initially argued that the Board has the jurisdiction to make a decision that allows more or less than what is asked for and could therefore make a decision that is for a longer period of time than requested by the Applicant. However, TransCanada submitted that in order to do so, the evidence in this case would need to justify reaching the conclusion that the duration of the order should be something other than what was applied for. In reply argument, TransCanada clarified its position and submitted that the Board should not, in its Decision, be purporting to determine a cost applicable to future years. Nonetheless, the Board could provide guidance in its Decision, similar to that provided in the RH-2-94 Decision, when it expressed the expectation that it did not favour routine readjustments to capital structure.

CAPP argued that the Board was being asked to make judgments about issues and risk factors that span years and decades. As a result, CAPP submitted that the views of the Board in this instance will have an enduring effect. CAPP submitted that a well-founded judgment on issues of an enduring nature should continue to be applied in the future, unless circumstances change. CAPP further submitted that providing guidance as to what the Board would like to see in future proceedings in order to address certain issues would be helpful.

Ontario submitted that although the Board has the theoretical discretion to extend the application of its decision on capital structure for 2004 beyond that year, it would be unwise to do so in this instance. Ontario expressed the view that discretion must be exercised fairly and properly which, it submitted, requires reasonable notice to all potential participants in the proceeding in order to be procedurally fair.

Views of the Board

The Board acknowledges that its decisions in this instance apply solely to the 2004 Test Year but reiterates the statements made in the RH-2-94 Decision that it does not favour routine reassessments of capital structure. However, the Board is always prepared to consider a reassessment of capital structure in the event of significant change in business risk, in corporate structure, corporate financial fundamentals, or other changes of significance.

8.4 Tolls Resulting from this Decision

Views of the Board

The Board notes that the RH-2-2004, Phase I Decision was the subject of two review and variance applications to the Board; one filed by CAPP and one by Coral and the Cogenerators Alliance. At the time of writing this Decision, some aspects of these review and variance applications remain outstanding. Therefore, the Board is of the view that the Mainline's 2004 Tolls should remain interim, at their current level, pending the outcome of those aspects of the review applications that could impact the 2004 revenue requirement.

The Board requests that TransCanada file for approval of final tolls within 30 days of the later of either the release of the Phase II Decision or the Board's disposition of those aspects of the review applications of the Phase I Decision that could impact the 2004 revenue requirement.

When TransCanada files for final 2004 tolls, the Board is of the view that it would be appropriate for TransCanada to adjust the 2005 revenue requirement for the difference between the 2004 interim and 2004 final tolls, along with applicable carrying charges. However, should TransCanada and the TTF prefer another form of adjustment, TransCanada may include such a proposal as part of its compliance filing.

Decision

TransCanada shall file final tolls schedules with the Board for approval within 30 days of the later of either the release of the Phase II Decision or the Board's disposition of those aspects of the review applications of the Phase I Decision that could impact the 2004 revenue requirement. The filing shall reflect the Phase II Reasons for Decision and the decisions of the Board regarding the issues from Phase I.

Chapter 9

Disposition

The foregoing chapters together with Order AO-3-TGI-07-2003 constitute our decisions and Reasons for Decision in respect of those aspects of the 2004 Tolls Application heard by the Board in Phase II of the RH-2-2004 Proceeding.

The Board is of the view that the decisions reached in Phase II of the RH-2-2004 Proceeding are consistent with the comparable earnings, financial integrity and capital attraction standards set out in Chapter 2 of these Reasons for Decisions and will result in a fair return for the Mainline. Further, the Board is satisfied that the decisions reached in this phase of the hearing, in combination with the Tolls and Tariff provisions which were the subject of Phase I, will result in tolls that are just and reasonable for the 2004 Test Year.

Appendix I

Board Ruling on CAPP's Motion of 4 June 2004

Issued by letter dated 30 June 2004.

TransCanada filed its 2004 Tolls Application on 26 January 2004. With respect to cost of capital, TransCanada sought to increase its level of deemed common equity from the current 33 percent to 40 percent and to increase the approved return on equity (ROE) from the current 9.56 percent to 11 percent.

The Board issued Hearing Order RH-2-2004 on 23 March 2004 and stated that it would not be appropriate to initiate procedural steps with respect to Phase II, the cost of capital component of the 2004 Tolls Application, until after the release of the Court of Appeal Decision with respect to TransCanada's Appeal of the Board's RH-R-1-2002 Decision. The Court of Appeal Decision denying TransCanada's appeal was released on 16 April 2004.[1]

On 12 May 2004, TransCanada advised the Board that, in light of the Court of Appeal Decision, it would not seek variance from the RH-2-94 ROE Formula for 2004 which yields an ROE of 9.56 percent. TransCanada also indicated that it would maintain its 2004 Tolls Application position concerning its applied-for capital structure of 40 percent deemed common equity for 2004. On 28 May 2004, TransCanada filed related amendments to the 2004 Tolls Application.

On 4 June 2004, the Canadian Association of Petroleum Producers (CAPP) filed a notice of motion with respect to Phase II. CAPP requested the Board to:

a) direct that the correctness of the RH-4-2001 Decision is not an issue in the RH-2-2004, Phase II Proceeding;

b) direct that evidence as to capital structure must begin and end on the basis that the NEB Formula ROE is the fair ROE;

c) direct that evidence as to capital structure must focus on significant changes that have occurred since the RH-4-2001 Decision;

d) strike the evidence of Drs. Kolbe and Vilbert, Mr. Murphy, and Dr. Carpenter;

e) strike Appendix 1 to Appendix B-2 (Comparable Investments) and Appendices 2 (Business Risk: Company Profiles) and 3 (Business Risk: Comparative Business Risk Ratings) to Appendix B-3[2] in TransCanada's corporate evidence;

f) direct TransCanada to remove from Appendices B-1 (Overview), B-2 (Fair Return Evidence) and B-3 (Business Risk) of its corporate evidence all portions that fail to

1 *TransCanada Pipelines Ltd. v. National Energy Board,* [2004] F.C.A. 149.

2 The identification of the appendices was clarified in TransCanada's comments and CAPP's reply.

conform with directions (a), (b), and (c) above or that relate to evidence that has been struck; and

g) provide such further or other direction as the Board may consider just.

CAPP stated that even though TransCanada has withdrawn the request for an 11 percent ROE, it has not withdrawn the evidence previously filed that supports an 11 percent ROE and has not refocused the evidence on the appropriate deemed level of equity. Consequently, it is left to the parties to "figure out what is and is not relevant to capital structure as distinct from ROE."[3] CAPP notes that it is unfair and inefficient for parties to be faced with large amounts of highly technical and detailed material that is irrelevant.

CAPP noted that while TransCanada's amended application is based on 9.56 percent ROE, TransCanada continues to assert that 9.56 percent ROE is not fair and that a fair return would be 11 percent ROE on 40 percent common equity. CAPP argued that as a matter of law, the fair ROE for 2004 is the ROE produced by the Board's RH-2-94 Formula and that the correctness of the Formula, the RH-4-2001 Decision, and the RH-R-1-2002 Decision is no longer open to question.

It was submitted by CAPP that the fundamental question to be examined is what changes in business risk, in corporate structure, or in corporate financial fundamentals have occurred since capital structure was last decided in the RH-4-2001 Decision.

CAPP further stated that the evidence of Drs. Kolbe and Vilbert derives a fair return of 11 percent ROE on 40 percent common equity from a determination of the overall cost of capital (ATWACC) of sample companies. Under this approach the ROE and capital structure are inextricably linked. Both are contained in the ATWACC; hence if the Board agreed with the ATWACC methodology and 40 percent common equity, it would also be agreeing with the appropriateness of an 11 percent ROE. CAPP concluded that it is unfair and prejudicial to other parties to allow the evidence of Drs. Kolbe and Vilbert to stand.

By letter of 7 June 2004 the Board sought submissions of parties with respect to the motion. On 11 July 2004, the Industrial Gas Users Association (IGUA), and the Cogenerators Alliance and Coral Energy Canada Inc. filed letters in support of CAPP's motion. IGUA submitted that, for evidence regarding the appropriate level of deemed equity to be relevant, it must be confined in its scope to addressing any material changes in circumstances since the final day of the test years covered by the RH-4-2001 Decision. Furthermore, it must focus solely and exclusively on the issue regarding the appropriate level of deemed common equity. IGUA further submitted that the evidence of Mr. Lackenbauer and Mr. Engen should also be struck as it is far too broad and fails to satisfy the relevance test with respect to the appropriate level of deemed common equity issue.

TransCanada filed its answer to the CAPP motion on 16 June 2004. TransCanada submitted that the CAPP motion is entirely devoid of merit and should be dismissed. TransCanada expressed its view that the cost of capital requires *four* distinct decisions by the Board: (1) the forecast cost of debt; (2) the rate of return on equity; (3) the level of deemed common equity; and (4) the fair

3 CAPP motion dated 4 June 2004, at para. 13(b)

return on equity capital. It acknowledged that to date, the Board has only made one of the four determinations: the 9.56 percent ROE. TransCanada did not dispute the applicability of the Board Formula to determine the ROE as the Federal Court of Appeal upheld the Formula approach and TransCanada is not applying for review and variance of the Formula in 2004.

TransCanada stated that "as a matter of law, it is the return on equity capital (not the rate of return in isolation, or the level of deemed equity in isolation) that is subject to the fair return standard."[4] It argued that all of the evidence is addressed to the fair return on equity capital and therefore, all is relevant to the issues that remain to be determined by the Board in Phase II. TransCanada stated that Dr. Kolbe was asked to estimate the fair return on total capital, debt and equity combined, and the fair rate of return on equity at a 40 percent common equity ratio. TransCanada's position is that 40 percent common equity will bring the overall return closer to this level.

TransCanada stated that in respect of Mainline capital structure there is a "clean slate" for 2004 and that the RH-4-2001 and RH-2-94 Decisions do not apply to 2004. It submitted that it is the Board's legal obligation to hear an application that is placed before it and that TransCanada's filing on cost of capital in Phase II is directed to persuading the Board that the fair return on equity capital should be different and higher than that which was determined for 2001 and 2002.

On 22 June 2004, CAPP filed a response to TransCanada, in which it stated that under the method adopted by the Board to determine cost of capital, fair return is simply the arithmetic result of three determinations: (1) cost of debt; (2) ROE; and (3) capital structure. There is no fourth, separate determination of a fair return. The fair return on equity capital is simply the arithmetic result of the ROE and the proportion of deemed common equity in the capital structure. CAPP argued that TransCanada could only raise the fair return on equity in its entirety by putting the ROE into issue which they have chosen not to do.

CAPP also addressed TransCanada's "clean slate" argument and stated that a decision by the Board on capital structure is intended to stand until there are significant relevant changes that warrant a change in capital structure. CAPP noted that the RH-4-2001 and RH-R-1-2002 Decisions applied to 2003, not only to 2001 and 2002 as TransCanada stated. CAPP submitted that TransCanada is seeking to attack the correctness of the RH-4-2001 Decision which is no longer open to question since any possible attack has been closed by the RH-R-1-2002 Decision and the appeal judgment.

Views of the Board

Rate of Return on Equity

The Board notes that all parties who submitted comments on CAPP's motion agreed that the rate of return on equity for the Mainline has been set for 2004 at 9.56 percent by the application of the RH-2-94 ROE Formula. The applicability of the RH-2-94 ROE Formula for the Mainline was continued by the Board's RH-4-2001 Decision. TransCanada sought review and variance of the RH-4-2001 Decision, which was denied by the Board's RH-R-1-2002 Decision. The

4 TCPL submission dated 16 June 2004, at paragraph 17

RH-R-1-2002 Decision was subsequently appealed by TransCanada to the Federal Court of Appeal. The Court denied TransCanada's appeal on 16 April 2004. The opportunity to appeal the Court's decision has expired.

In its reason for judgment, the Court noted that the Board Order TG/TO-1-95, which implemented the RH-2-94 Decision, contained no time limit and therefore continues in force until reviewed or varied by the Board.[5] On 12 May 2004, TransCanada advised the Board that it was not prepared to advance a review and variance application in 2004, and that, in light of the Court Decision, it will not contest the applicability of the RH-2-94 ROE Formula of 9.56 percent to the Mainline for 2004.

On this basis, it is clear that the correctness of the RH-4-2001 Decision and the appropriateness of the RH-2-94 ROE Formula are not at issue in the RH-2-2004 Proceeding. The Board is therefore of the view that it would be inappropriate to consider evidence or arguments that state or suggest otherwise. Given that TransCanada has chosen not to file a review application on this issue, it is not open to it to submit that the appropriate ROE for the Mainline is something other than 9.56 percent, no matter what the views of the company may be. TransCanada cannot do through indirect means, that which it has chosen not to do directly. Therefore, the Board is of the view that TransCanada needs to amend its evidence to eliminate all instances which suggest that the appropriate rate of return on common equity for the Mainline in 2004 is anything other than 9.56 percent.

Capital Structure

The Board notes a clear divergence of views between parties concerning the appropriate evidence to be considered with respect to a determination of capital structure for the Mainline in 2004. CAPP submits that evidence as to capital structure must focus on significant changes that have occurred since the RH-4-2001 Decision. IGUA further submits that the scope should be confined to any material changes in circumstances which have occurred since the last day of the test years covered by the Board's RH-4-2001 Decision. TransCanada on the other hand submits that with respect to capital structure, there is a clean slate for 2004.

The Board is of the view that the law does not prescribe a particular approach to the nature of the evidence that should be filed in support of an assessment of appropriate capital structure. An applicant is therefore free to adopt the focus it deems appropriate in preparing evidence concerning capital structure. The same freedom also applies to any intervenor wishing to file evidence on this issue. The appropriate weight that any specific approach or piece of evidence should be given is a matter subject to argument after the evidence has been heard and is to be determined by the Board in making its decisions, not prior to hearing. In this context, the Board does not consider that it would be appropriate to issue a direction to TransCanada concerning the focus of its evidence pertaining to capital structure.

---

5 *Supra* note 1 at paragraph 50

Fair Return on Equity and Fair Return on Capital

The Board has consistently arrived at a determination of the overall level of fair return on equity by applying the approved rate of return on common equity to the deemed level of common equity in a pipeline's capital structure. Under this approach, the Mainline's fair return on equity for 2004 would be the RH-2-94 ROE of 9.56 percent applied to the appropriate level of deemed common equity that will be determined by the Board in Phase II of the RH-2-2004 Proceeding. This approach does not require the consideration of particular evidence pertaining to overall equity return.

Similarly, the Board's determination of overall cost of capital, or return on rate base, has been accomplished by calculating the weighted average of the cost of each component by its share in the Mainline's deemed capital structure. This approach has been recognized by the Federal Court of Appeal in *TransCanada Pipelines Ltd. v. Canada (National Energy Board).*[6]

While the Board is willing to consider alternative approaches to determine the fair return on equity and capital, the Board is mindful that in this instance, any alternative approach considered should recognize that the rate of return on equity for the Mainline in 2004 has already been determined to be 9.56 percent, through the application of the RH-2-94 Formula, and that the RH-2-94 Formula continues in force until reviewed or varied by the Board. Since TransCanada has not advanced a review and variance application in 2004, it would be inappropriate for the Board to consider alternative approaches that directly or indirectly question the correctness of the rate of return on common equity derived by the application of the RH-2-94 Formula to the Mainline in 2004. In other words, the Board is not prepared to undertake, through the consideration of alternative approaches to return on equity or return on capital, an indirect review of the RH-2-94 Decision. Such a review should only be contemplated through a review and variance application filed under subsection 21(1) of the NEB Act, or at the discretion of the Board.

Board Ruling

The Board is of the view that portions of TransCanada's evidence are not relevant to Phase II of the RH-2-2004 Proceeding, as they suggest that the rate of return on equity for the Mainline in 2004 should be other than 9.56 percent. Instances of such examples appear throughout TransCanada's evidence, such that the Board does not consider that it would be practical for the Board itself to go through TransCanada's evidence and decide what portions of it should be struck or amended.

Rather, the Board directs that TransCanada file amendments to its evidence in such a way as to remove any direct or indirect inferences to an appropriate rate of return on equity other than 9.56 percent for the Mainline in 2004 on or before noon, Calgary time, 15 July 2004.

As a result of the impending revised evidence from TransCanada, the Board has decided to amend the deadlines contained in paragraphs 28 and 29 of Hearing Order RH-2-2004. Attached is Order AO-2-RH-2-2004, amending Hearing Order RH-2-2004.

---

6 *Supra* to note 1

Appendix II

Board Ruling on CAPP's Letter of 4 August 2004

Issued by letter dated 12 August 2004.

The National Energy Board has received CAPP's letter of 4 August 2004 in which it expressed the view that TransCanada has not complied with the Board's direction of 30 June 2004. The Industrial Gas Users Association filed a letter supporting CAPP's comments on 6 August 2004.

CAPP had filed a notice of motion dated 4 June 2004 requesting, *inter alia*, that the Board strike certain TransCanada evidence from the record on the basis that the evidence asserted that a rate of return on equity (ROE) other than that derived from the Board's RH-2-94 ROE Formula (9.56 percent) was the fair return for 2004.

The Board ruled that as TransCanada had decided not to seek a review of the RH-2-94 ROE Formula, it is not open to TransCanada to submit that the appropriate ROE for the Mainline in 2004 is something other than 9.56 percent. TransCanada was directed to amend its evidence to eliminate all instances which made such a suggestion.

Further, the Board ruled that while it is willing to consider alternative approaches to determine the fair return on equity capital, any alternative approach must recognize that the ROE for the Mainline has been determined to be 9.56 percent. The Board stated that it would be inappropriate for it to consider alternative approaches that directly or indirectly question the correctness of the rate of return on common equity derived by the RH-2-94 ROE Formula.

As a result the Board directed TransCanada to amend its evidence to remove any direct references or indirect inferences to an appropriate rate of return other than 9.56 percent for the Mainline in 2004.

Parties have expressed diverging views on whether ATWACC evidence implies an indirect review of the Board's RH-2-94 ROE Formula. The Board reiterates its 30 June 2004 ruling that it will not allow TransCanada, through its ATWACC or other evidence to do indirectly that which it has chosen not to do directly. However, in the Board's view, TransCanada should be allowed to present its case as it relates to the issues to be addressed in Phase II of the RH-2-2004 hearing in the manner it deems appropriate, so long as the rules of natural justice are respected. While the Board will not, at this time, require TransCanada to further amend its filings, the Board cautions TransCanada and all parties, that it is not prepared to consider this evidence if its purpose is to suggest an indirect review of the RH-2-94 Formula.

Appendix III

Board Ruling on TransCanada's Motion of 12 November 2004

Issued from the Bench on 19 November 2004.

Background

TransCanada PipeLines Limited filed an application with the National Energy Board on January 26th, 2004, for the approval of tolls for the Mainline for 2004. Among other things, TransCanada sought the rate of return on equity of 11 percent on a common equity ratio of 40 percent.

On March 23rd, the Board issued the RH-2-2004 Hearing Order and indicated that it had decided to convene a two-phase oral hearing to consider the application. Phase I was to consider all matters raised in the application with the exception of cost of capital, which the Board indicated, would be heard in Phase II. The Board noted that it would not be appropriate to initiate further procedural steps in relation to the cost of capital component of the 2004 tolls application until after the release of the Federal Court of Appeal decision with respect to TransCanada's appeal of the Board's RH-R-1-2002 Decision.

On April 6th, the Federal Court of Appeal released its decision denying TransCanada's appeal of the Board's Decision in the RH-R-1-2002 Review[1]. By letter dated May 12th, TransCanada advised the Board that, in light of the Court Decision, it would not seek variance from the RH-2-94 ROE Formula for 2004 which yields a rate of return on equity of 9.56 percent for 2004. On May 28th, TransCanada filed related amendments to its 2004 Tolls Application, reflecting the applied for 9.56 percent ROE on a common equity ratio of 40 percent. The Board issued an amended Hearing Order (AO-1-R-2-2004) on June 7th which removed the appropriate rate of return on common equity for the Mainline as an issue to be addressed in Phase I.

The Canadian Association of Petroleum Producers filed a notice of motion on June 4th, 2004 requesting that the Board narrow the issues to be considered in Phase II. The balance of the relief requested focused on having portions of TransCanada's evidence struck from the record.

On June 30th the Board ruled that portions of TransCanada's evidence were not relevant to Phase II of the RH-2-2004 Proceeding, as those portions suggested that the rate of return on equity for the Mainline in 2004 should be other than 9.56 percent. The Board directed that TransCanada amend its evidence to remove any direct or indirect references to an appropriate rate of return on equity other than 9.56 percent for the Mainline in 2004.

On August 4th, the Board received a letter from CAPP in which it expressed the view that TransCanada had not complied with the Board's direction of June 30th. The Board responded

1 *TransCanada PipeLines Ltd. v. National Energy Board, et al.,* [2004] F.C.A. 149

with a letter dated August 12th, which reiterated the points made in its earlier ruling, including the fact that it would not allow TransCanada, through its ATWACC or other evidence, to do indirectly that which it has chosen not to do directly; that is, to seek a review of the RH-2-94 ROE Formula. However, the Board also stated that TransCanada should be allowed to present its case as it relates to the issues to be addressed in Phase II of the RH-2-2004 Hearing in the manner it deems appropriate, so long as the rules of natural justice are respected.

On October 19th, 2004, CAPP filed its evidence with the Board, the subject of which forms the basis of the motion filed by TransCanada.

TransCanada's Motion

On November 12th, TransCanada filed a motion requesting clarification regarding the issues to be considered in Phase II of RH-2-2004 and the parameters for the conduct and disposition of the proceeding. TransCanada requested that the Board hear the motion orally, prior to reply evidence which must be filed by November 25th, in order to give guidance to TransCanada with respect to this evidence, as well as the nature and extent of cross-examination in the hearing. On November 15th, the Board set down the motion for consideration today and allowed for written submissions to be filed by November 18th. Written submissions were received from the Industrial Gas Users Association and le Procureur général du Québec. These comments and the oral submissions made today by TransCanada, CAPP, and Coral Energy Canada Inc. have all been appreciated and have assisted the Board in reaching its decision on this matter.

In reaching its decision, the Board has been mindful of the comments made by parties regarding the efficiency of the process. The Board is of the view that this is a goal worth striving for, and we are of the view that hearing this motion at parties' convenience, before the hearing, and issuing an oral ruling shows our commitment to that goal. However, the Board also notes the comments today that regulatory efficiency cannot override:

- the legal principles;
- the rights of a party to present its case as it determines fit; or
- the needs of the Board to hear all, and the best evidence before reaching a decision.

Request (a) of the Motion

The first request by TransCanada is for a direction that "as a matter of law, the determination that is to be made by the Board in Phase II is the fair return on investment in the TransCanada Mainline for 2004".

The Board is very familiar with the law as set out in *Northwestern Utilities (1929)*, *Hope* and *Bluefield* on this issue. However, the Board notes that TransCanada has chosen not to apply for a review of the rate of return on equity. This hearing is therefore not an examination of all elements of cost of capital or fair return. Hearing Order AO-1-RH-2-2004 identifies the issues which, in the Board's view, require decisions, namely:

1) the appropriate capital structure for the Mainline;

2) the appropriate cost of debt for the Mainline, including any financial impact resulting from debt redemption; and

3) the appropriate effective date for any change to the Mainline's cost of capital.

Both CAPP and TransCanada have stated today that they are not attempting to limit the ability of the other party to present its case. In the Board's view, what was in dispute in the CAPP motion in June, and what is in dispute now, is the methodology that will be employed in order to arrive at a determination of the overall level of fair return on equity. The Board understands that TransCanada is seeking to have the Board consider return using a different methodology than the traditional methodology. To this end, the Board confirms its previous ruling that it is willing to consider alternative approaches to determine the fair return on equity and capital.

However, for the purposes of this ruling, the Board is not prepared to limit itself to the specific wording used in TransCanada's motion. The Board's responsibility according to the *National Energy Board Act* is to set just and reasonable tolls. The determinations which the Board has to make in Phase II of this Proceeding are decisions on the issues set out in the List of Issues, resulting in a decision on the application filed by TransCanada. By making decisions on the issues set out in the List of Issues, and utilizing the rate of return on common equity from the RH-2-94 formula, the end result will be the overall return on investment for the Mainline for 2004. TransCanada is free to submit evidence and argue that an alternative approach should be utilized in making these determinations. The Board cannot, and will not, prior to hearing all of the evidence, make a determination on which approach or approaches should be used.

Request (b) of the Motion

TransCanada's second request is for a direction that "as a matter of law, the issues to be considered in the determination of the fair return on investment in the Mainline for 2004 are not limited to any changes in the business risk and financial integrity of the Mainline since the RH-4-2001 Decision."

The Board has considered the law as set out in the motion and as discussed by parties in their submissions, and agrees with TransCanada that as a matter of law, it is not limited to arguing changes to risk and financial integrity since the RH-4-2001 Decision. As the Board stated in its ruling on CAPP's motion on this very issue on June 30th:

> The Board notes a clear divergence of views between parties concerning the appropriate evidence to be considered with respect to a determination of capital structure for the Mainline in 2004. CAPP submits that evidence as to capital structure must focus on significant changes that have occurred since the RH-4-2001 Decision. IGUA further submits that the scope should be confined to any material changes in circumstances which have occurred since the last day of the test years covered by the Board's RH-4-2001 Decision. TransCanada, on the other hand, submits that with respect to capital structure, there is a clean slate for 2004.

> *The Board is of the view that the law does not prescribe a particular approach to the nature of the evidence that should be filed in support of an assessment of appropriate capital structure.* An applicant is therefore free to adopt the focus it deems appropriate in preparing evidence concerning capital structure. The same freedom also applies to any intervenor wishing to file evidence on this issue. The appropriate weight that any specific approach or piece of evidence should be given is a matter subject to argument after the evidence has been heard and is to be determined by the Board in making its decisions, not prior to hearing. In this context, the Board does not consider that it would be appropriate to issue a direction to TransCanada concerning the focus of its evidence pertaining to capital structure. [Emphasis added]

The Board noted the comments of Mr. Schultz on behalf of CAPP that TransCanada is free to argue a change of approach and that CAPP is not attempting to limit the presentation of TransCanada's evidence. In keeping with our earlier rulings on this matter, while no party may argue that any other is prohibited from arguing an alternative approach, they are free to seek to show the flaws and errors of such an approach.

The Board therefore agrees with TransCanada, that TransCanada is not limited in its evidence to examining changes since 2001.

Request (c) of the Motion

The third request of the motion is for a determination that "as a matter of law, the impact on the Mainline revenue requirement and tolls of an increase in the cost of equity capital for the Mainline is not to be taken into account by the Board in the determination of the fair return on investment in the Mainline."

The Federal Court of Appeal in the *Appeal Decision* acknowledged that customers of the pipeline have an interest in ensuring that the Mainline's costs are not overstated.[2] However, in the Board's view, the Court also found that the impact of tolls on customers is an irrelevant consideration in the determination of the Mainline's cost of equity capital.[3]

While the Mainline's rate of return on equity is not an issue to be addressed in Phase II of the RH-2-2004 Hearing, the Board accepts that the impact of tolls on customers is an irrelevant consideration in the determination of other aspects of cost of capital. Therefore, the Board will not give weight to any evidence pertaining to impact of tolls on customers in making the determinations to be made in Phase II.

Request (d) of the Motion

TransCanada's final request is for the Board to confirm that it will not consider any evidence or permit any cross-examination in Phase II that is inconsistent with the law as stated in its motion. To the extent that the evidence of either TransCanada or CAPP suggests something contrary to this ruling, or any other Board ruling, the Board will not take such evidence into consideration.

---

2 *Ibid*. at para. 34

3 *Ibid*. at para. 25-42

At this stage, the Board is of the view that it would be premature to rule on whether an eventual line of cross-examination would be inappropriate.

The Board would like to thank all parties for their submissions, the Board's staff, the court reporters, the interpreters for accommodating the hearing of this motion on such short notice.

Order AO-3-TGI-07-2003

ORDER AO-3-TGI-07-2003

IN THE MATTER OF the *National Energy Board Act* and the regulations made thereunder; and

IN THE MATTER OF an application filed by TransCanada PipeLines Limited pursuant to Part IV of the Act for orders fixing and approving tolls that TransCanada shall charge for transportation services provided on its Mainline natural gas transmission system (Mainline) between 1 January 2004 and 31 December 2004; and

IN THE MATTER OF Hearing Order RH-2-2004.

BEFORE the Board on 15 April 2005

WHEREAS TransCanada filed an application dated 12 November 2003 for interim tolls for the Mainline effective 1 January 2004;

AND WHEREAS on 18 December 2003, the Board approved TransCanada's 12 November 2003 application, as amended on 3 December 2003, and issued Order TGI-07-2003;

AND WHEREAS TransCanada filed an application dated 26 January 2004 for an order fixing just and reasonable tolls that it may charge for or in respect of transportation services provided on its Mainline between 1 January 2004 and 31 December 2004 (2004 Tolls Application);

AND WHEREAS on 23 March 2004, the Board issued Hearing Order RH-2-2004 establishing a two-phase procedure to consider TransCanada's 2004 Tolls Application;

AND WHEREAS an oral public hearing was held in Ottawa, Ontario between 14 June 2004 and 25 June 2004 during which time the Board heard the evidence and argument presented by TransCanada and all interested parties with respect to RH-2-2004 Phase I matters;

AND WHEREAS on 23 July 2004, the Board issued Amending Order AO-1-TGI-07-2003 approving revised interim tolls effective 1 August 2004;

AND WHEREAS the Board's Decisions arising out of the RH-2-2004 Phase I Proceeding are set out in its Reasons for Decision dated September 2004, and in Order AO-2-TGI-07-2003;

AND WHEREAS applications for review of the RH-2-2004 Phase I Decision were filed by the Canadian Association of Petroleum Producers on 12 November 2004 and by Coral Energy Canada Inc. and the Cogenerators Alliance on 11 January 2005 (jointly, the Phase I review applications);

AND WHEREAS, an oral public hearing was held in Calgary, Alberta between 29 November 2004 and 4 February 2005 during which time the Board heard the evidence and argument presented by TransCanada and all interested parties with respect to RH-2-2004 Phase II matters;

AND WHEREAS the Board's Decisions arising out of the RH-2-2004 Phase II Proceeding are set out in these Reasons for Decision dated April 2005 and this Order.

THEREFORE, IT IS ORDERED, pursuant to Parts I and Part IV of the Act, that:

1. TransCanada shall file final tolls schedules with the Board for approval within 30 days of the later of either the release of the Phase II Decision or the Board's disposition of those aspects of the Phase I review applications that could impact the 2004 revenue requirement. The filing shall reflect the Phase II Reasons for Decision and the decisions of the Board regarding the issues from Phase I, including the following:

    a) the Mainline's rate of return on common equity shall continue to be based on the RH-2-94 Formula methodology;

    b) the Board approves an increase in the Mainline's deemed common equity ratio from 33 percent to 36 percent;

    c) the Board approves a percentage of debt in the Mainline's deemed capital structure of 64 percent;

    d) the effective date for reflecting these changes in capital structure for rate-making purposes shall be 1 January 2004; and

    e) any variance between the approved 2004 revenue requirement and the amounts collected pursuant to interim tolls shall be deferred and disposed of in future tolls.

NATIONAL ENERGY BOARD

Michel L. Mantha

Rate of Return on Common Equity (ROE) for 2004
NEB Letter, 2004

National Energy Board
Office national de l'énergie

File 4750-A000-11
28 November 2003

BY FACSIMILE

To: Parties Named in the Attached Distribution List

Rate of Return on Common Equity (ROE) for 2004

Pursuant to the ROE adjustment mechanism approved in the Multi-Pipeline Cost of Capital Decision (RH-2-94), revised on 14 March 1997 to eliminate rounding, the Board has approved a rate of return on common equity of 9.56 percent for the year 2004.

In arriving at its decision, the Board relied upon a 10-year Government of Canada forecast bond yield of 5.15 percent (Source: November 2003 Consensus Forecasts). To this forecast, the Board added 53 basis points, which was the average actual yield differential between the 10 and 30-year Government of Canada bonds observed during the month of October 2003 (Source: National Post). The above calculation produced a forecasted 30-year Government of Canada bond yield of 5.68 percent for 2004, which is 30 basis points lower than the 5.98 percent forecasted yield relied upon in the ROE calculation for 2003. The 30 basis point yield differential between the current and previous forecasts was multiplied by 0.75, producing a downward adjustment of 23 basis points to the 2003 approved ROE of 9.79 percent. Therefore, the ROE for 2004 is 9.56 percent.

Companies are directed to serve forthwith a copy of this letter on their shippers and interested parties.

Yours truly,

Michel L. Mantha
Secretary

To: Parties Named in the Attached Distribution List

Rate of Return on Common Equity (ROE) for 2005

Pursuant to the ROE adjustment mechanism approved in the Multi-Pipeline Cost of Capital Decision (RH-2-94), revised on 14 March 1997 to eliminate rounding, the Board has approved a rate of return on common equity of 9.46 percent for the year 2005.

In arriving at its decision, the Board relied upon a 10-year Government of Canada forecast bond yield of 5.05 percent (Source: November 2004 Consensus Forecasts). To this forecast, the Board added 50 basis points, which was the average actual yield differential between the 10- and 30-year Government of Canada bonds observed during the month of October 2004 (Source: National Post). The above calculation produced a forecasted 30-year Government of Canada bond yield of 5.55 percent for 2005, which is 13 basis points lower than the 5.68 percent forecasted yield relied upon in the ROE calculation for 2004. The 13 basis point yield differential between the current and previous forecasts was multiplied by 0.75, producing a downward adjustment of 10 basis points to the 2004 approved ROE of 9.56 percent. Therefore, the ROE for 2005 is 9.46 percent.

Companies are directed to serve forthwith a copy of this letter on their shippers and interested parties.

Re: **Rate of Return on Common Equity (ROE) for 2006**

Pursuant to the ROE adjustment mechanism approved in the Multi-Pipeline Cost of Capital Decision (RH-2-94), revised on 14 March 1997 to eliminate rounding, the Board has approved a ROE of 8.88 percent for the year 2006.

In arriving at its decision, the Board relied upon a 10-year Government of Canada bond yield forecast of 4.55 percent (Source: November 2005 Consensus Forecasts). To this forecast, the Board added 23 basis points, which was the average actual yield differential between the 10- and 30-year Government of Canada bonds observed during the month of October 2005 (Source: National Post). The above calculation produced a forecasted 30-year Government of Canada bond yield of 4.78 percent for 2006, which is 77 basis points lower than the 5.55 percent forecasted yield relied upon in the ROE calculation for 2005. The 77 basis point yield differential between the current and previous forecasts was multiplied by 0.75, producing a downward adjustment of 58 basis points to the 2005 approved ROE of 9.46 percent. Therefore, the ROE for 2006 is 8.88 percent.

Companies are directed to serve forthwith a copy of this letter on their shippers and interested parties.

Yours truly,

Michel L. Mantha
Secretary

To: Parties Named in the Attached Distribution List

Rate of Return on Common Equity (ROE) for 2007

Pursuant to the ROE adjustment mechanism approved in the Multi-Pipeline Cost of Capital Decision (RH-2-94), revised on 14 March 1997 to eliminate rounding, the Board has approved a ROE of 8.46 percent for the year 2007.

In arriving at its decision, the Board relied upon a 10-year Government of Canada bond yield forecast of 4.15 percent (Source: November 2006 Consensus Forecasts). To this forecast, the Board added 7 basis points, which was the average actual yield differential between the 10- and 30-year Government of Canada bonds observed during the month of October 2006 (Source: Financial Post). The above calculation produced a forecasted 30-year Government of Canada bond yield of 4.22 percent for 2007, which is 56 basis points lower than the 4.78 percent forecasted yield relied upon in the ROE calculation for 2006. The 56 basis point yield differential between the current and previous forecasts was multiplied by 0.75, producing a downward adjustment of 42 basis points to the 2006 approved ROE of 8.88 percent. Therefore, the ROE for 2007 is 8.46 percent.

Companies are directed to serve forthwith a copy of this letter on their shippers and interested parties.

Dossier 4750-A000-11
Le 23 novembre 2006

PAR TÉLÉCOPIEUR

Destinataires : Toutes les parties nommées dans la liste de distribution ci-jointe

Objet : **Taux de rendement du capital-actions ordinaire (RCO) fixé pour 2007**

Madame, Monsieur,

Conformément au mécanisme de rajustement du RCO approuvé dans le cadre de la décision sur le coût du capital des sociétés pipelinières (RH-2-94), et révisé le 14 mars 1997 pour éliminer l'arrondissement des chiffres, l'Office a autorisé un RCO de 8,46 % pour l'exercice 2007.

Pour le calculer, l'Office s'est fondé sur le rendement prévu de 4,15 % des obligations de 10 ans du gouvernement du Canada (selon le numéro de novembre 2006 de *Consensus Forecasts*), auquel il a ajouté 7 points de base, soit l'écart moyen entre les rendements réels des obligations de 10 ans et de 30 ans du gouvernement du Canada en octobre 2006 (selon le *Financial Post*). L'estimation du rendement des obligations à long terme (30 ans) du gouvernement du Canada est donc de 4,22 % en 2007, ce qui représente une baisse de 56 points de base par rapport au rendement prévu de 4,78 % qui a servi à calculer le RCO en 2006. L'Office a multiplié par 0,75 l'écart de 56 points de base entre la prévision actuelle et celle de l'an dernier, ce qui a abouti à un rajustement à la baisse de 42 points de base du RCO de 8,88 % autorisé pour 2006. Ainsi, le RCO de 2007 s'établit à 8,46 %.

Les sociétés sont priées de signifier immédiatement une copie de la présente lettre à leurs expéditeurs et aux parties intéressées.

Veuillez agréer, Madame, Monsieur, mes salutations distinguées.

Le secrétaire,

Michel L. Mantha

TABLE OF CONTENTS

PART ONE. BACKGROUND

I. THE APPLICATION

1. Filing

Newfoundland Power (NP), pursuant to Order No. P.U. 22(2002-2003) filed an Application (the *"Application"*) with the Board of Commissioners of Public Utilities (the "Board") on October 11, 2002 for an Order or Orders of the Board approving, among other things, the proposed rates for the various customers of NP, to be effective May 1, 2003. (See Appendix A)

On February 10, 2003 NP filed an amended Application to reflect 2002 actuals along with updated economic data. (See Appendix G) The Pre-filed Evidence, Exhibits and Studies filed as part of the original application were also updated and re-filed. In addition the evidence was revised to reflect the Board's decisions respecting NP's 2003 Capital Budget as contained in Order No. P.U. 36(2002-2003) issued on December 20, 2002. In the amended Application NP proposed revised rates to be effective August 1, 2003.

2. Application Proposals

In the Application NP is proposing the Board approve the following:

1. *"accounting treatments and policies with effect from January 1, 2003 to:*
   a) *amortize the recovery over a five year period, of an amount of $5.6 million that has accumulated in the Weather Normalization Reserve;*
   b) *adopt on a prospective basis, the market-related method of valuing pension assets for the purposes of determining pension expense;*
   c) *amortize over a three year period, the estimated Board and Consumer Advocate's regulatory costs of $1.2 million incurred with respect to this Application; and*
   d) *credit one-half of the balance of $944,000 in the Excess Revenue Account to Newfoundland Power's revenues in each of 2003 and 2004 to reduce revenue requirements from rates that would otherwise be recovered from customers in those years.*

2. *provision for customer recovery of the remaining balance of the 1992 and 1993 excess earnings by reducing revenue requirement to be recovered from rates by $112,000 in 2003 and $335,000 in 2004.*

3. *calculation of depreciation expense with effect from January 1, 2003 by:*
   a) *use of the depreciation rates as recommended in the Depreciation Study filed with the Application; and*
   b) *adjustment of depreciation expense to amortize over a 3 year period an accumulated reserve variance of $17.2 million identified in the Depreciation Study filed with the Application.*

4. *rates, tolls and charges effective for service provided on and after August 1, 2003, to provide an average increase in electrical rates of 0.96 per cent, based upon:*
   a. *a forecast average rate base for 2003 of $599,245,000 and for 2004 of $622,650,000;*

   b. *a rate of return on average rate base of 10.55 per cent in the range of 10.30 to 10.80 per cent; and*

   c. *a forecast revenue requirement to be recovered from electrical rates, following implementation of the proposals set out in paragraphs 9,10 and 11 of the Application, of $378,327,000 for 2003 and $385,490,000 for 2004.*

5. *continued use of the Formula with changes to:*
   a. *adopt the method used by the National Energy Board and the British Columbia Utilities Commission to determine the risk free rate;*
   b. *use an equity risk premium of 4.75 per cent at a risk free rate of 6 per cent for 2003; and*
   c. *allow a range of return on rate base of 50 basis points.*

6. *amendments to the Rules and Regulations governing Newfoundland Power's provision of electrical service to its customers to:*
   a. *eliminate the statement preparation fee;*
   b. *reduce the fee applicable for customer name changes from $14 to $8; and*
   c. *extend the application of the reconnection fee to circumstances where customers request reconnection of service following a landlord's request for disconnection of service.*

7. *defer dealing with outstanding issues related to revenue recognition and the Unbilled Revenue Increase Reserve Account pending resolution of an outstanding dispute with the Canada Customs and Revenue Agency.*

8. *additional capital expenditures for 2003 of $425,000 to permit Newfoundland Power to undertake a load research program."*

II. THE HEARING

1. Notice and Pre-Hearing Conference

Notice of the Application and Pre-hearing Conference was published in newspapers throughout the province. The Pre-hearing Conference was held on October 30, 2002 and resulted in the Board issuing Procedural Order No. P.U. 27(2002-2003), which identified registered intervenors, set procedural rules for the conduct of the hearing, and set the schedule for the filing and service of documents, the motions days and the actual hearing. (See Appendix B)

NP was represented throughout the hearing by Ms. Gillian Butler, Q.C. and Mr. Peter Alteen, LL.B.

The registered intervenors for the hearing were the Government appointed Consumer Advocate, Mr. Dennis Browne, Q.C., represented by Mr. Stephen Fitzgerald, LL.B., and Newfoundland and Labrador Hydro (NLH), represented by Mr. Geoffrey Young, LL.B.

The Board was assisted at the hearing by Mr. Mark Kennedy, LL.B., who acted as Board Hearing Counsel; Ms. Dwanda Newman, Board Counsel; Ms. Cheryl Blundon, Board Secretary; and Ms. Barbara Thistle, Assistant Board Secretary.

2. Interim Order

On December 16, 2002, NP filed an application with the Board for an interim order extending effective January 1, 2003 the current Schedule of Rates, Tolls and Charges approved in Order No. P.U. 22(2002-2003). The rates were to remain in place pending a further Order of the Board following the hearing of the general rate application. The Board subsequently issued Order No. P.U. 35(2002-2003) approving NP's proposal. (See Appendix E)

3. Motions and Procedural Order Amendments

At the first scheduled motions day on December 4, 2002 the Board heard representations on a motion from the Consumer Advocate regarding the evidence of one of NP's proposed cost of capital experts, Ms. Kathleen McShane. The motion requested that either: a) the Board strike Ms. McShane's evidence from the record; or b) if Ms. McShane's evidence is allowed, that the cost related to Ms. McShane's evidence not be the responsibility of the ratepayers but be borne by NP's shareholders; and c) the Board provide direction to the parties as to the number of experts a party should be permitted to call on any particular issue. Following the hearing of the motion the Board issued Order No. P.U. 33 (2002-2003) denying the motion. (See Appendix C)

At the request of and with the agreement of the parties, on December 12, 2002 Procedural Order No. P.U. 34(2002-2003) was issued, amending the schedule of dates and order of witnesses. (See Appendix D)

A further motions day was held on January 10, 2003. NP filed a motion requesting amendment of the Procedural Order No. P.U. 34(2002-2003) to extend the filing date for NP's responses to information requests and to delay the start date of the hearing to March 3, 2003. After hearing the motion the Board rendered an oral decision extending the date for the filing of responses by NP to information requests but reserved its decision on NP's request to postpone the start date of the hearing. The Board subsequently issued Procedural Order No. P.U. 1(2003) which among other things amended the schedule of dates and set the start date of the hearing for March 3, 2003. (See Appendix F)

On February 17, 2003 NP filed an application with the Board objecting to certain issues as set out in the Consumer Advocate's Issues List, specifically those issues relating to the setting and fixing of a rate of return on common equity for NP. NP requested that the Board: (1) issue an Order determining that it has no jurisdiction with respect to certain issues; (2) limit consideration of related issues at the public hearing; and (3) strike those issues from the Consumer Advocate's Issues List. On February 21, 2003 the Board heard from the parties regarding the application and subsequently issued Order No. P.U. 5(2003) denying the application of NP excepting that it would not hear evidence on the setting and fixing of a rate of return on common equity to the extent that it is beyond the Board's jurisdiction. (See Appendix I)

At the hearing on February 21, 2003 Board Counsel presented for consideration a revised Rules of Procedure, as well as an order of witnesses for the hearing. There was a disagreement between NP and the Consumer Advocate concerning the Rules of Procedure, specifically the rules surrounding the calling of panels of witnesses and also the manner of presenting to witnesses documents which are not part of the hearing record. The Board, after considering the submissions of the parties issued Procedural Order No. P.U. 4(2003) which modified the rules for the conduct of the hearing and set out the order of witnesses. (See Appendix H)

During the hearing the Board also received a request from the Consumer Advocate to issue subpoenas to 5 witnesses. NP requested an opportunity to make submissions on this issue and the Board heard from the parties on April 1, 2003. As a result the Board issued Order No. P.U. 8(2003) wherein it consented to issue only one of the subpoenas requested. (See Appendix K)

4. Technical Conference/Mediation

In preparing for the hearing the Board proposed a number of days be set aside to allow for a technical conference. The purpose of the technical conference was to provide the parties with an opportunity to settle certain issues in advance of the hearing. With the assistance of a Board appointed mediator, Dr. J. W. Wilson, the parties focused on cost of service allocation, rate structure and tariff matters.

Agreement was reached on all issues set out for mediation with the exception of one item related to meter reading. The parties subsequently filed a Mediation Report with the Board detailing issues upon which settlement was reached. The parties also consented to the admission of all pre-filed testimony and exhibits of witnesses pertaining to the settled issues without the calling of witnesses for the purpose of cross-examination.

The Board considered the Mediation Report and subsequently issued Order No. P.U. 7(2003) which accepted and adopted the Mediation Report and the proposed resolution of issues upon which the parties agreed. (See Appendix J) These proposals are incorporated into this Decision. Given the parties reached no agreement on meter reading, the Board has addressed the issue in this Decision based on evidence and cross-examination during the hearing.

The Board is of the view that the technical conference/mediation proved successful and contributed to a streamlining of the regulatory process. The Board believes this kind of dialogue between the parties provided a number of advantages including reduced regulatory costs, less time spent on expert testimony during the hearing, consensus decision making and reporting. Each of these enhance the quality of regulation in the public interest as well as to the benefit of the parties and the Board. The Board expresses its sincere desire to build on this initiative at future hearings and to incorporate technical conferences/mediation as a sound business practice aimed at addressing specific regulatory issues between hearings.

The Board wishes to thank Dr. Wilson and the parties for their support and cooperation in this very worthwhile initiative.

5. The Hearing

The hearing commenced on March 3, 2003 and continued over a six-week period for 23 hearing days. Written submissions were filed on April 22, 2003 and the Board heard oral argument on April 25, 2003. The following witnesses were called by the parties and the Board:

<u>Witnesses called by NP</u>:

Mr. Philip Hughes, CA	President and CEO, NP
Mr. Barry Perry, CA	Vice-President Finance and Chief Financial Officer, NP
Mr. Ron Crane	Director of Forecasting, NP
Mr. Earl Ludlow, P. Eng.	Vice President, Engineering and Operations, NP
Dr. Roger Morin	Professor of Finance, Robinson College of Business, and Professor of Finance for Regulated Industry, Centre for the Study of Regulated Industries, Georgia State University
Ms. Kathleen McShane	Senior Consultant and Vice-President, Foster and Associates, Bethesda, Maryland
Mr. John Browne	J.T. Browne Consulting, Toronto, Ontario
Mr. John F. Weidmayer	Gannet Fleming Valuation and Rate Consultants, Inc.
Mr. Bruce Chafe	Chair of the Board, NP

Witnesses called by the Consumer Advocate:

Dr. Basil Kalymon	Professor of Finance, Richard Ivey School of Business, University of Western Ontario

Witnesses called by Board Hearing Counsel:

Mr. William R. Brushett, CA	Partner, Grant Thornton LLP, St. John's, NL (Board's Financial Consultant)

Public participation days were held in St. John's and Corner Brook. During this phase of the hearing interested persons and organizations were offered the opportunity to present their views on issues arising from the Application.

The Board heard from the following persons during the public participation days:

In St. John's on April 4, 2003:

Mr. Owen Crossan, Regency Management Ltd., St. John's, NL
Mr. Greg Malone, Private Citizen, St. John's, NL
Mr. Gary Milley, Executive Director, Newfoundland & Labrador Parks/Recreation Association, St. John's, NL
Mr. Charlie Oliver, Martek Morgan-Finch, St. John's, NL
Mr. Terry McNeil, Climate Change Action Coordinator, Conservation Corps of Newfoundland and Labrador, St. John's, NL
Ms. Sara Peckford, Climate Change Action Coordinator, Conservation Corps of Newfoundland and Labrador, St. John's, NL
Mr. Dennis O'Keefe, Chair, Consumer Group for Fair Gas Prices, St. John's, NL
Mr. Bill Rossitor, Private Citizen, Mount Pearl, NL

In Corner Brook on April 11, 2003:

Ms. Priscilla Boutcher, Mayor, City of Corner Brook, NL
Mr. Edward Buckle, Private Citizen, Corner Brook, NL
Mr. Mark Baldwin, President, Corner Brook Chamber of Commerce, Corner Brook, NL
Mr. Peter Blake, Private Citizen, Corner Brook, NL
Mr. Michael J. Griffin, Q.C., Private Citizen, Grand Falls-Windsor, NL
Mr. Walwin Blackmore, Mayor, Town of Grand Falls-Windsor, NL

The Board appreciates the time and effort of those who appeared before the Board to present their views on the Application. The presentations and comments were very helpful in providing the Board with both personal and community perspectives and the Board has considered this input in making its decisions.

Interested persons and organizations were also given the opportunity to submit a Letter of Comment, which also formed part of the record before the Board. Letters of Comment were submitted by:

Mr. Gerald Hounsell, Splash "N" Putt Cabins, Glovertown, NL
Ms. Heide Pearce, Toulon Development Corporation, St. John's, NL
Mr. Wayne Richards and Ms. Janet Richards, Regency Towers, St. John's, NL
Ms. Catharine and Mr. Graham Bailey, Port Rexton, NL
Mr. & Mrs. Gerald Hennifent, Norris Arm, NL
Ms. Judy Tilley, Torbay Estates Limited, St. John's, NL
Mr. Mark Sexton, CEO, Corner Brook Economic Development Corporation, Corner Brook, NL

The Board also extends its appreciation to those persons and organizations submitting Letters of Comment.

In addition to the sworn evidence given at the hearing, which included evidence provided at the public participation days, additional evidence was entered by way of information requests, consent filings, and information filings. The Board has considered all the evidence before it in this proceeding and will refer directly to the evidence upon which it based its findings as set out in this Decision.

III. REGULATION OF NP 1998-2002

NP is an investor owned, fully regulated electrical utility which operates an integrated generation, transmission and distribution system throughout the island portion of the Province. All the common shares of NP are owned by Fortis Inc., a diversified holding company headquartered in St. John's. NP services approximately 220,000 residential and general service customers, or approximately 85% of all electrical consumers in the Province. Newfoundland and Labrador Hydro (*"NLH"*) serve the remainder. NP's total energy sales in 2002 were 4,765 GWh. NP purchases in excess of 90% of its energy requirements from NLH and supplies the rest itself using small hydro-electric generation.

NP's last rate review, in November 1998, was preceded by a full cost of capital hearing. Significant changes in market rates of return led to a preliminary investigation and a hearing was subsequently called by the Board in May 1998 under Section 88 of the *Act* into, *inter alia*, the matter of NP's rate of return and capital structure. The resulting Board Order No. P.U. 16(1998-99) used a maximum common equity ratio of 45% and return on equity (*"ROE"*) of 9.25% to calculate a rate of return on rate base of 9.91%, which contributed to a decrease in rates effective January 1, 1998 of 2.1%. The concept of an automatic adjustment formula to set rates in upcoming years was also considered and the utility was ordered to address this issue in a general rate application with a hearing scheduled for the fall of 1998. This application also incorporated a number of other outstanding issues, including funding of pension liability and possible excess earnings in 1992 and 1993.

Following this hearing, the Board issued Order No. P.U. 36(1998-99) in January 1999. This Order set rates for 1999 and put in place an Automatic Adjustment Formula (the *"Formula"*) to determine rates beyond the test year(s). The Formula was designed to annually adjust NP's rate of return on rate base based on changes in the forecast cost of common equity linked to changes in long-term Canada bond yields. The average weighted cost of capital was to be determined using this revised ROE and was then incorporated into the Formula on an annually adjusted basis along with the ratio of forecast average invested capital to average rate base in order to yield an allowed return on rate base and hence set rates in the following year. Additional details on the Formula are outlined on pg. 62 of this Decision. In addition to setting the Formula, Order No. P.U. 36(1998-99) also confirmed NP's maximum common equity ratio of 45% and determined for the 1999 test year a rate of return on rate base of 9.81%, based on an ROE of 9.25%. The result was a rate increase of 1% which became effective February 1, 1999.

Prior to the Board's issuing its cost of capital decision for NP in June 1998, the Court of Appeal rendered its opinion on a case stated before the Supreme Court of Newfoundland by the Board pursuant to Section 101 of the *Act*, (the *"Stated Case"*) requesting an opinion on the jurisdiction of the Board. Among other matters, the Court of Appeal provided an opinion regarding the Board's jurisdiction to:

- set and fix the level of return on common equity;
- regulate the return on rate base;
- require a public utility to maintain ratios within its capital structure; and
- deal with excess earnings of the utilities being regulated.

In addition to the matters raised during the hearing the Board's Order No. P.U. 36(1998-99) also addressed its understanding of the Court's opinion and its effect on the regulation of NP.

Application of the Formula resulted in an increase in NP's rates of 0.7% in 2000, no change for 2001, and a decrease of 0.6% for 2002.

In June 2002 the Board issued Order No. P.U. 7(2002-2003) arising from NLH's general rate application. This decision and the subsequent rate Order No. P.U. 21(2002-2003) resulted in an increase in NP's purchased power costs of 6.5%. In August 2002, NP filed an application with the Board requesting new rates in order to pass through these increased costs. The Board issued Order No. P.U. 22(2002-2003) which approved an increase of 3.68% to NP's customers. This Order fixed NP's rates until December 31, 2002 and directed NP to file a general rate application for a full review of its 2003 costs, including cost of capital, no later than October 11, 2002. The general rate application was filed as required and is the subject of this Decision and Order.

Since the effect of Order No. P.U. 22(2002-2003) was that no approved Schedule of Rates, Tolls and Charges would be in place as of January 1, 2003, NP filed an application on December 16, 2002 for an interim Order under Section 75 of the *Act*. This application requested that the existing rates remain in effect until further Order of the Board following the hearing of NP's general rate application. The Board approved this application and issued Interim Rate Order No. P.U. 35(2002-2003). Rates for 2003 will be finalized in this Decision and Order.

During the period 1998-2002, the Board also dealt with a number of additional applications from NP, including a number of routine Contribution in Aid of Construction approvals, annual approval of balances in the Weather Normalization Account and the annual approval of rate stabilization and municipal tax adjustments. The Board also held public hearings in each year from 1999-2002 to consider NP's capital budget proposals. At these capital budget hearings, the Board dealt with approval of revised amounts for rate base and invested capital for use in the Formula in determining return on rate base for the subsequent year.

Other specific decisions issued by the Board in relation to NP during this regulatory period (1998-2002) included:

- i) Order No. P.U. 24(1999-2000) – Approval of amortization and funding of pension liability associated with an early retirement program.
- ii) Order No. P.U. 37(2000-2001) – Approval of a rebate to customers of $6,733,000 plus HST credited to the Excess Revenue Account resulting from a tax reassessment.
- iii) Order No. P.U. 17(2001-2002) – Approval of NP's proposal to purchase poles jointly used with Aliant and the associated additional capital expenditures for 2003 of $22,100,000.
- iv) Order No. P.U. 23(2002-2003) – Approval of issuance of Series AJ First Mortgage Bonds up to $75,000,000 pursuant to Section 91 of the *Act*.

IV. STATUTORY POWERS AND RESPONSIBILITIES

The statutory powers and responsibilities described below are consistent with those set out in Order No. P.U. 7(2002-2003) for NLH and are intended to communicate to the utilities and other stakeholders the fundamental regulatory framework used by the Board in issuing its decisions, findings and subsequent Orders. This background may form a routine introduction to all future Board decisions involving a general rate application by a utility, although some variations in format and content may be evident from time to time.

The Board is an independent, quasi-judicial body established under Provincial legislation to regulate public utilities in the Province. Regulation is designed to ensure consumers receive safe and reliable electricity at rates that are reasonable while allowing the utility to earn a fair return on its investment in supplying the electrical service. Regulation strives to strike an equitable balance between the interests of consumers and the utility.

The regulatory framework of the Board consists of five cornerstones, as follows:

i) BOARD AUTHORITY sets out the legislative and legal powers and responsibilities of the Board.
ii) BOARD HEARING PROCEDURES govern the presentation of the evidentiary record on matters before the Board.
iii) REGULATORY PRINCIPLES which are commonly accepted in guiding sound public utility regulation.
iv) THE RATE SETTING PROCESS is founded in accounting, engineering and economic methodologies which are applied in combination with i), ii) and iii) and weighed by the Board in making decisions affecting rates.
v) REPORTING/COMPLIANCE provides appropriate regulatory monitoring of the utility's ongoing activities and compliance with Board Orders.

1. Board Authority

Mandate

The Board's authority is derived from its statutory powers and responsibilities as set out in the *Public Utilities Act* (the *"Act"*) and the *Electrical Power Control Act 1994 (S.N. 1994, Chapter-E-5.1)* (the *"EPCA"*).

The *Act* sets out the structure of the Board and defines its powers. The Board has responsibility for the general supervision of public utilities in the Province, which requires the Board to approve rates, capital expenditures and other aspects of the business of public utilities.

In addition to the provisions of the *Act*, the Board is also mandated through the *EPCA*, particularly Section 3, which states the power policy of the Province as follows:

"3. It is declared to be the policy of the province that

(a) the rates to be charged, either generally or under specific contracts, for the supply of power within the province

(i) should be reasonable and not unjustly discriminatory;
(ii) should be established, wherever practicable, based on forecast costs for that supply of power for 1 or more years;
(iii) should provide sufficient revenue to the producer or retailer of the power to enable it to earn a just and reasonable return as construed under the Public Utilities Act so that it is able to achieve and maintain a sound credit rating in the financial markets of the world; and
(iv) should be such that after December 31, 1999 industrial customers shall not be required to subsidize the cost of power provided to rural customers in the province, and those subsidies being paid by industrial customers on the date this Act comes into force shall be gradually reduced during the period prior to December 31, 1999;

(b) all sources and facilities for the production, transmission and distribution of power in the province should be managed and operated in a manner

(i) that would result in the most efficient production, transmission and distribution of power;
(ii) that would result in consumers in the province having equitable access to an adequate supply of power;
(iii) that would result in power being delivered to consumers in the province at the lowest possible cost consistent with reliable service…"

Section 4 of the *EPCA* states:

"4. In carrying out its duties and exercising its powers under this Act or under the Public Utilities Act, the public utilities board shall implement the power policy declared in section 3, and in doing so shall apply tests which are consistent with generally accepted sound public utility practice."

In summary, the *EPCA* mandates the Board to make rate decisions that are reasonable and not unjustly discriminatory. Rates are to be based on forecast costs for the supply of power for one (1) or more years. This timeframe in practice is generally referred to as the *"test year(s)"*. The legislation also ensures that the utilities are permitted to earn a just and reasonable financial return while maintaining a sound credit rating in the financial markets of the world. The legislation calls for the most efficient production, transmission and distribution of power that will afford consumers the lowest possible cost electricity consistent with equitable, safe and reliable service.

Form of Regulation

With regard to the form of regulation, Section 80(1) of the *Act* states:

"80. (1) A public utility is entitled to earn annually a just and reasonable return as determined by the Board on the rate base, as fixed and determined by the Board for each type or kind of service supplied by the public utility…"

This is commonly referred to as return on rate base regulation. Rate base consists largely of investment by the utility in plant and equipment and historically has constituted the statutory form of regulation used in the Province. Return on rate base regulation is more fully described in relation to the Rate Setting Process. Alternative forms of regulation in place elsewhere include Return on Equity (ROE) and/or an emerging trend toward Performance Based Regulation (PBR).

Statutory Limitations

The legislative authority of the Board is, nonetheless, subject to two limitations (Sections 5.1 and 5.2) in the *EPCA* as follows:

"5.1 Notwithstanding section 3 and section 4 of the Act and the provisions of the Public Utilities Act, the Lieutenant-Governor in Council may direct the public utilities board with respect to the policies and procedures to be implemented by the board with respect to the determination of rate structures of public utilities under the Public Utilities Act and, without limiting the generality of the foregoing, including direction on the setting and subsidization of rural rates, the fixing of a debt-equity ratio for Hydro and the phase in, over a period of years from the date of coming into force of this section, of a rate of return determination for Hydro and the board shall implement those policies and procedures.

5.2 The Lieutenant-Governor in Council may exempt a public utility from the application of all or a portion of this Act where the public utility is engaged in activities that in the opinion of the Lieutenant-Governor in Council as a matter of public convenience or general policy are in the best interest of the province, to the extent of its engagement in those activities."

To date, the Board has received no direction under either provision from the Lieutenant-Governor in Council in respect of NP.

Appeal Process

Section 99. (1) of the *Act* states the statutory authority embodied in an Order of the Board as follows:

"An appeal lies to the Court of Appeal from an order of the board upon a question as to its jurisdiction or upon a question of law, but the appeal can be taken only by leave of a judge of the court, given upon an application presented within 15 days after the making of the decision and upon the terms that the judge may determine."

An Order of the Board has the force of law and is binding on the parties and can only be appealed to the Court of Appeal on an issue of law or jurisdiction of the Board.

Stated Case

The most comprehensive judicial consideration of the authority of the Board comes from the comments of Mr. Justice Green in Newfoundland (Board of Commissioners of Public Utilities)(Re)(1998), 64 NFLD. & PEI R.60 (NFLD.C.A.) In 1998 the Board stated a case for the consideration of the Court of Appeal pursuant to Section 101 of the *Act*. Mr. Justice Green set out some general principles that apply to all decisions of the Board, which may be summarized as:

1. The *Act* should be given a liberal interpretation respecting the purpose of the legislation and the power policy of the province;
2. The Board has discretion in how it approaches its mandate;
3. The Board has all appropriate and necessary powers;
4. The Board must balance the interests of public utilities and electrical consumers;
5. The Board sets rates prospectively, after a full consideration of all available evidence; and
6. The Board has discretion to choose the approach to setting rates as long as it observes the legislation and sound utility practices.

The Court was clear in setting out that the Board must balance two sets of interests - the utility's right to a fair return and the consumer's right to reasonable access to power. Mr. Justice Green notes that the Board must be careful to balance both interests, when he says, at para. 144:

> *"It must always be remembered that, as has been emphasized throughout this opinion, the Board is charged with balancing the competing interests of the utility and the consumers of the service it provides. Neither set of interests can be emphasized in complete disregard of the interests of the other. Thus, in choosing to exercise a particular power within the Board's jurisdiction, the Board must always be mindful of whether, in so acting, it will be furthering the objectives and policies of the legislation and doing so in a manner that amounts to a reasonable balance between the competing interests involved."*

In conclusion, the Court found that the Board can be regulative and corrective but not managerial in its prospective regulation of a utility. The Board notes that the Court of Appeal suggested that the Board should observe a presumption of managerial good faith.

2. Board Procedures

The Board's procedures are governed by the relevant legislation and, as a quasi-judicial body, the principles of natural justice and procedural fairness apply. The *Act* and *Regulation 39/96* both set out procedures for the Board. In addition to prescribed regulations, Section 26 of the *Act* enables the Board to establish its own procedures. This permits the Board to exercise discretion to allow for a more informal and flexible treatment of issues.

The procedures of the Board address items such as the form of the application, public notice, submission by intervenors, information requests, document exchange along with rules and protocol surrounding public hearings. While the procedures in a hearing before the Board are less formal than a court, the principles of natural justice are still observed. Sufficient notice is given to all interested persons who are provided with the opportunity to participate. Witnesses are sworn, and their testimony is heard by way of both direct and cross-examination. Evidence is entered and documented and the Board maintains a full and complete record.

All hearing documentation is filed in electronic format with a paper copy maintained as the official Board record. The Board provides public access to all information through the Board's web site (**www.pub.nf.ca**). The web site is updated daily with transcripts and additional evidence filed during each day's proceedings posted in advance of the commencement of the hearing the following day. The evidence can also be viewed simultaneously by the Board, parties and witnesses on monitors located in the Hearings Room.

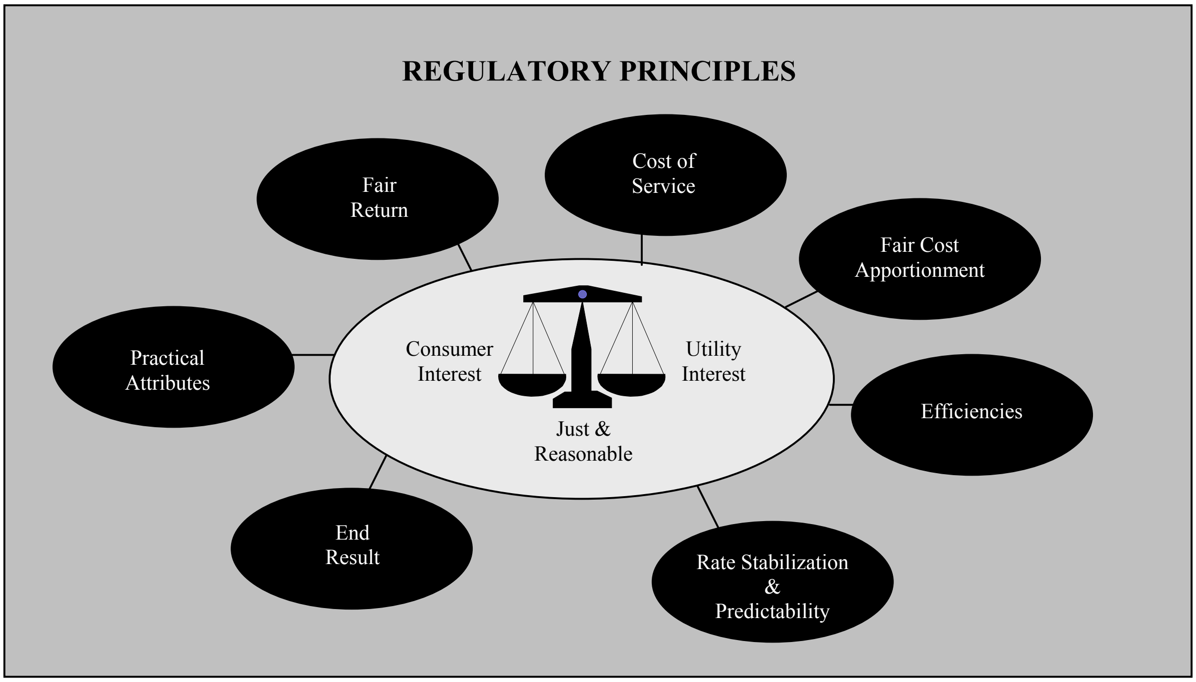
Through these procedures the Board ensures that the process is accessible and transparent for stakeholders, including the public. The Board may also travel throughout the province to hear from interested persons or organizations. Full and informed public debate and discussion on the issues is encouraged through the participation of the parties, the general public and, for major hearings, a government appointed consumer advocate.

After full consideration of all of the evidence the Board will issue a reasoned decision, usually in writing. Together with the Decision an Order of the Board will be issued and, as noted previously, can only be appealed to the Court of Appeal.

3. Regulatory Principles

Sound regulatory practices encompass fundamental principles which are used by regulators as a guide or roadmap to rational decision-making. As stated in the Bonbright J. C., Danielsen A.L, Kamerscen D.R., Principles of Public Utility Rates (Arlington: Public Utilities Reports, Inc., 1988): "*We are simply trying to identify the desirable characteristics of utility performance that regulators should seek to compel through edict.*" These are commonly referred to as Bonbright's principles and are specifically outlined on pages 383-384 of his book.

Section 4 of the *EPCA* directs the Board to apply tests that are consistent with generally accepted sound public utility practice. The Board sets out the following principles for purposes of its regulatory framework:



1. Fair Return

   Regulated utilities are given the opportunity to earn a fair rate of return. To be considered fair, the return must be:

   - commensurate with return on investments of similar risk;
   - sufficient to assure financial integrity; and
   - sufficient to attract necessary capital.

   The fair return principle is consistent with both Section 80(1) of the *Act* and Section 3(a)(iii) of the *EPCA.*

2. Cost of Service

   Under this principle a utility is permitted to set rates that allow the recovery of costs for regulated operations, including a fair return on its investment devoted to regulated operations - no more, no less. Costs should be:

   - prudent;
   - used and useful in providing the service;
   - assigned based on cause (causality);
   - incurred and recovered (matching costs and benefits) during the same period; and
   - reflective of private/social costs and benefits occasioned by the service.

3. <u>Fair Cost Apportionment</u>

Fairness of specific rates in the apportionment of total costs of service among the different ratepayers so as to avoid arbitrariness, capriciousness, inequities or discrimination. Under this principle, customers in similar situations should be treated equally (horizontal equity), while those in different situations should be treated differently (vertical equity). This principle would not deny cross-subsidization of rates among customers of equal circumstances but such subsidization should not cause undue discrimination. The principle of horizontal equity (i.e. equals treated equally) is set forth in Section 73(1) of the *Act* which requires that *"all tolls, rates and charges shall always, under substantially similar circumstances and conditions in respect of service of the same description, be charged equally to all persons and at the same rate, …".* Furthermore, the aspect of undue discrimination also has statutory reinforcement in Section 3(a)(i) of the *EPCA* which declares it to be "*…the policy of the province that the rates to be charged ………should be reasonable and not unjustly discriminatory."*

4. <u>Efficiencies</u>

Rate classes and rate blocks should discourage wasteful use of service while promoting all types and amounts of use that are economically justified. Greater efficiency should also be employed in promoting innovation and responding economically to changing demand and supply patterns.

5. <u>Rate Stability and Predictability</u>

Rates and revenues should be stable and predictable from year to year with a minimum of unexpected changes seriously adverse to either ratepayers or utility companies. This principle may justify smoothing out increases to avoid sharp rate climbs or temporary fluctuations. The emphasis using this standard relates to the timing of rate implementation.

6. <u>End Result</u>

In compliance with the legislation, the end result must be fair, just and reasonable from the perspective of both the consumer and utility.

7. <u>Practical Attributes</u>

Rates should be simple, understandable and publicly acceptable with a minimum of controversy upon implementation.

While setting out these principles may be useful to ensure full consideration of all the issues, the Board notes that at times they may contain ambiguities, conflict with legislation, be inconsistent and/or hold different priorities. The real challenge for the Board, in keeping with its legislative mandate, is to balance ofttimes competing objectives within the regulatory environment to ensure a set of sound and reasoned decisions serving the interests of both consumer and utility alike.

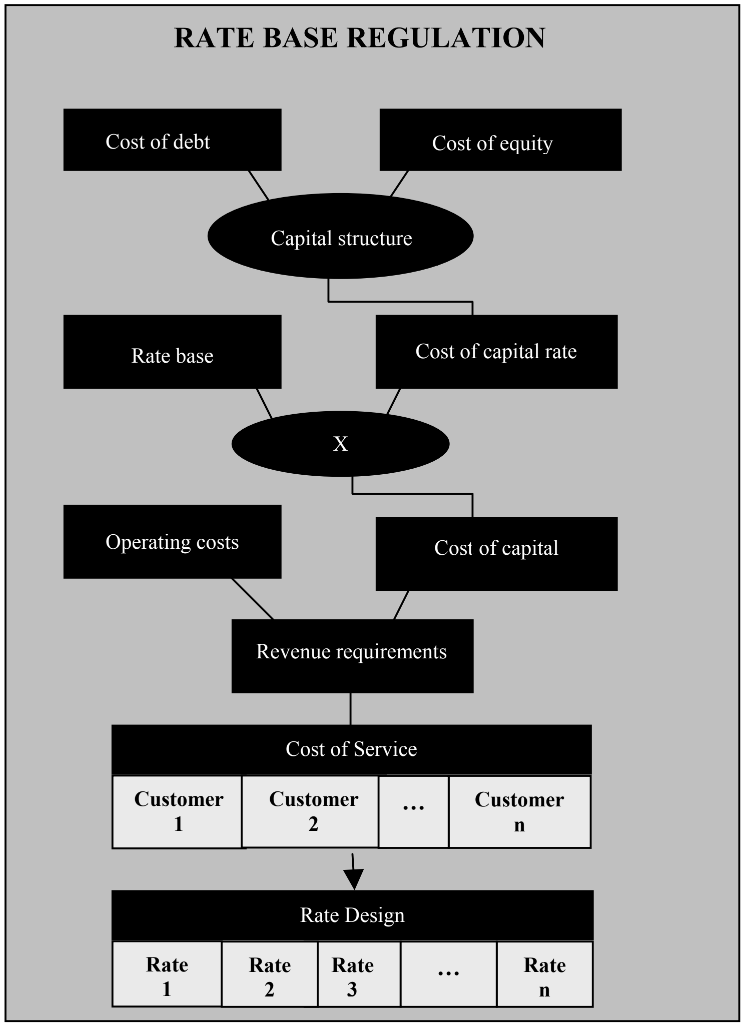
During rate proceedings the Board is often petitioned by intervenors and presenters to consider the customers' ability to pay when setting rates for various classes of customers and service. While cross subsidization of a group of customers contributing toward the cost of service assigned to another group of customers is a common regulatory practice, the ability of an individual customer to pay for the electrical service consumed is not considered by the Board in setting rates. Without compelling change in either legislation, public policy or structure of regulation, the Board will continue to pursue generally accepted regulatory principals as outlined above which does not incorporate ability to pay among its criteria for rate setting.

4. The Rate Setting Process

The rate setting process is founded in accounting, engineering and economic methodologies and is the proverbial glue that binds the regulatory framework. The Board's authority, the evidence and regulatory principles are combined by the Board through this process to make decisions affecting rates. The rate setting process is described below under the heading *"Rate Base Regulation"*.

Rate Base Regulation

As noted previously, pursuant to Section 80 of the *Act*, the regulatory framework of the Board is founded in rate base regulation. The elements of rate base regulation are illustrated as follows:



(As modified from *"Basics of Canadian Rate Regulation"*, pg. 13)
J. T. Browne and Charles Perron, Deloitte & Touche, 1997

The focus of return on rate base regulation is on earnings, in particular the allowed return per dollar of investment (rate base). Rates are set that give the regulated utility the opportunity to recover its revenue requirement consisting of its estimated operating costs and a fair return on its rate base. These costs are generally estimated for a test year(s) for which the rates are set.

Rate Base

Rate base is the amount of investment on which a regulated utility is allowed to earn a fair return. Rate base comprises primarily depreciated investment in plant and equipment plus working capital as well as certain deferred assets/costs attributable to future operations. Regulators tend to focus on whether additions to the rate base, looking at the asset, are needed and if the cost is reasonable.

Capital Structure

Capital structure is the relative amounts of equity and debt, commonly referred to as the debt to equity ratio, which comprises a company's total invested capital. The total invested capital represents the funds invested in the public utility by shareholders (equity) and by bondholders and other long-term debt holders (debt). The just and reasonable rate of return allowed on rate base is equivalent to the cost of capital representing the sum of the weighted costs of both debt and equity in the capital structure.

Revenue Requirement

Revenue requirement is the amount of revenue required by a utility to cover the sum of operating costs including debt service, depreciation, taxes and allowed return on rate base ($ rate base x cost of capital). The revenue requirement is the total amount of money a utility is eligible to collect from customers through rates:

Revenue Requirement = Operating Costs + (Rate Base x Rate of Return)

From a regulatory perspective, efficient operations, fully justified capital expenditures and a low cost capital structure all combine to minimize revenue requirement, and hence provide least cost electricity to ratepayers.

Cost of Service

Cost of service constitutes the basis on which the utility's revenue requirement is allocated to each class of customer served. The utility normally submits a study of the costs incurred in purchasing, producing, transmitting and distributing electricity to its customers, by customer class.

Rate Design

Once the cost of service or revenue requirement is allocated by customer class, specific rates are determined to recover the required costs/revenues from each customer within the class.

5. Reporting/Compliance

Reporting/Compliance is the mechanism used to monitor the ongoing activities of the utility from a regulatory perspective and is an important part of the regulatory framework. Section 16 of the *Act* states:

> *"The board shall have the general supervision of all public utilities, and may make all necessary examinations and inquiries and keep itself informed as to the compliance by public utilities with the law and shall have the right to obtain from a public utility all information necessary to enable the board to fulfil its duties."*

Consistent with the Court of Appeal's findings, the role of the Board is not to exercise managerial influence but to ensure appropriate reporting/compliance mechanisms are in place such that regulatory objectives are met. The objective of the Board is to focus on regulatory accountability of the utility rather than engage in detailed reviews and costly controls. In keeping with this approach, some examples of the Board's reporting/compliance requirements requested of the utilities include:

- Compliance with Board Orders;
- Annual financial review;
- Quarterly reports;
- Incident/Outage reports;
- Technical reports;
- Productivity, cost benefit and efficiency studies;
- CIAC audits; and
- Monitoring complaints.

6. Summary

The Board believes a consistent and equitable regulatory framework is in the interests of both the regulated utilities and consumers. The framework as described above has been in place in one form or another since the Board was established in 1949. This framework has evolved to date through a series of legislative amendments and case law and will continue to form the basis of the Board's exercise of its regulatory authority under existing legislation, both in this Decision and Order and on a go forward basis.

PART TWO. BOARD DECISIONS

I. SUBMISSION OF CONSUMER ADVOCATE ON EXCESS EARNINGS

As part of the preliminary procedures set by the Board each party was required to file an Issues List to help focus and define the relevant issues contained in the Application. In the listing filed by the Consumer Advocate the following issues were identified, *inter alia*, as matters to be addressed during the hearing:

> *"1. Excess earnings by Newfoundland Power above the allowed Rate of Return on Equity since the implementation of the Automatic Adjustment Formula and since Board Orders in 1998 and subsequent Orders;*
>
> *2. Rebate to consumers any excess earnings resulting from Newfoundland Power's earnings above the allowed Rate of Return on Equity since the implementation of the Automatic Adjustment Formula and since Board Orders in 1998 and subsequent Orders;*
>
> 3. *A re-definition of Excess Earnings so that excess earnings will include excess earnings which are beyond the Allowed Rate of Return on rate base and include also Excess Earnings which are beyond the allowed Rate of Return on Equity."*

Arising from the submission of these issues by the Consumer Advocate, NP filed an Interlocutory Application February 17, 2003, which sought an Order of the Board, *inter alia*, as follows:

> *"(a) pursuant to Section 11 of the Regulations, directing that insofar as the issues raised on the Consumer Advocate's Issues List are premised upon the Board possessing jurisdiction to:*
>
> *(i) set and fix the return that Newfoundland Power may earn on equity, or*
>
> (ii) *determine the existence of excess revenues other than on the basis of Newfoundland Power's return on rate base,*
>
> *those issues shall not be considered at the public hearing of the Application.*
>
> *(b) pursuant to Section 26 of the Regulations, directing an amendment of the Consumer Advocate's Issues List to strike out those matters contained in the Consumer Advocate's Issues List that are premised upon the Board processing jurisdiction to:*
>
> *(i) set and fix the return that Newfoundland Power may earn on equity, or*
>
> (ii) *determine the existence of excess revenues other than on the basis of Newfoundland Power's return on rate base."*

The application was heard before the Board on February 21, 2003 following which the Board issued Order No. P.U. 5(2003), which declined to strike any issue from the Consumer Advocate's list. The Board, however, confirmed that it would not hear evidence or submissions on the issue of the setting and fixing of the rate of return that NP may earn on equity to the extent that it is beyond the jurisdiction of the Board. The Board did not rule on whether it has the jurisdiction to determine excess earnings on any basis other than NP's return on rate base.

This issue was raised during the hearing by the Consumer Advocate in cross-examination of both Mr. Hughes and Mr. Perry, and also in final written submission and oral argument. In final submission (pg. 16) the Consumer Advocate stated that NP has earned more than $13 million over and above what the Board intended. In this respect NP earned an ROE greater than the 9.25% ROE used by the Board to set NP's return on rate base in Order No. P.U. 36(1998-99). The Consumer Advocate argued that no authority is found within the Stated Case to allow NP to retain these excess earnings. The Consumer Advocate further argued that the Board has jurisdiction to define excess revenue for the purposes of the operation of the Excess Revenue Account provided that definition meets the requirements as stated by the Court of Appeal. In support of his position the Consumer Advocate referenced the opinion of Justice Green as set out in paragraphs 111-114 of the Stated Case. The Consumer Advocate concluded:

> "*Based on the foregoing, it is clear that the Board had jurisdiction to define excess revenue for the purposes of maintenance of a reserve account by incorporating in the definition the maximum level of return on common equity."* (Final Submission, Consumer Advocate, pg. 18)

The Consumer Advocate further stated on page 19 of his final submission:

> *"If the Board had jurisdiction to define excess revenue for the purposes of the establishment of the excess revenue account by reference to a level of return on common equity, then the Board has jurisdiction to retroactively revise a previous Order for the purpose of correctly stating the definition of excess revenue."*

The Consumer Advocate requested the Board order these excess earnings to be either returned to consumers or treated similar to the disposition of excess earnings in Order No. P.U. 36(1998–99). (Final Submission, Consumer Advocate, pg. 22) In oral argument the Consumer Advocate further suggested that, if the Board was not prepared to rule on this issue, the matter could be referred back to the Court of Appeal for further clarification. Pending resolution of the issue, the Consumer Advocate requested that the Board consider whether or not NP should be required to segregate such earnings into an interest bearing account. (Transcript, April 25, 2003, pgs. 117-118)

NP disagreed with the Consumer Advocate's position and dealt with the issue extensively in its written submission. NP argues the Board's jurisdiction on this issue is limited as follows (Section G, pg. 17):

> *"From a legal perspective NP submits that the Stated Case clearly indicates that the Board's jurisdiction to regulate a public utility's returns is limited to regulation of the return on rate base. This limitation was specifically indicated by the Court of Appeal to apply to the determination of excess revenues. While the Court of Appeal did refer in the Stated Case to the Board's ability to define a "reserve account" by reference to returns on equity, it specifically provided that the Board could not in so defining an account deprive a public utility of a level of return on rate base to which the Board had determined the utility to be entitled under s.80(1) of the Act. In fact, the Stated Case explicitly indicated how excess earnings were to be determined."*

NP's position is that only where a utility's return on rate base exceeds the upper limit of the rate of return on rate base as prescribed by the Board does the Board have jurisdiction over the disposition of those earnings. (Transcript, April 25, 2003, pg. 52)

NP also raised concerns about the Consumer Advocate's suggestion that the Board has the *"jurisdiction to retroactively revise a previous order"* to allow a rebate to customers. NP submitted that this would amount to retroactive regulation, stating that:

> *"Finally, on the issue of regulation of excess revenues, the Board has issued a series of orders specifically defining and redefining Newfoundland Power's Excess Revenue Account. Insofar as the issues raised in this proceeding constitute revisiting those orders, they raise serious issues of retroactive regulation that are contrary to both law and sound public utility practice."* (Written Submissions, NP, Section G, pg. 18)

NLH did not address the issue of NP's excess earnings in either written submissions or oral argument, though it did participate in the initial motion of the Consumer Advocate.

The Court of Appeal, in para. 57 of the Stated Case, specifically addressed the impact of any calculations by the Board of a rate of return on common equity, stating:

> *"Subsection 80(1) makes no reference at all to determining, let alone setting and fixing, the rate of return on common equity. The calculation of an appropriate rate of return on common equity is truly a mere component in the overall process of determining a just and reasonable return on rate base".*

The above comment of Justice Green was central to his conclusions outlined in para. 61 of the Stated Case where he states:

> *"I therefore conclude that the power to determine a just and reasonable return on rate base, as contained in section 80(1) of the Act, does not include within it a power to set and fix a rate of return on common equity, but it obviously does contemplate that the analysis would be undertaken and factored into the conclusion as to what is a just and reasonable return on rate base."*

This conclusion is confirmed by Justice Green, where in para. 109, he states:

> *"In light of the answer given to Question 1, the benchmark for determining excess revenue is the range of return on rate base determined by the Board to be just and reasonable".*

The Board concluded it is appropriate and necessary that the Board consider the cost of common equity in deriving a just and reasonable return on rate base. It is the Board's view that the Stated Case confirms that the *Act* does not confer upon the Board a jurisdiction to fix and determine the returns of NP other than with reference to the utility's rate base. The cost of common equity is merely an input into the determination of a just and reasonable return.

The suggestion of the Consumer Advocate that the Board require NP to rebate to consumers any *"excess earnings above the allowed Rate of Return"* since 1998 requires that the

Board have the jurisdiction to first determine that there are excess earnings in relation to the return on equity and also that the Board has the jurisdiction to dispose of those excess earnings.

The following key paragraphs in the Stated Case guide the Board in making its final determination on the issues raised by the Consumer Advocate:

"111. As a result of the discussions at the hearing, however, it is apparent that there is a more fundamental issue at stake. The assumption appears to be that if the Board chooses to define excess revenue for the purpose of establishment of the excess revenue account in terms of revenue earned in excess of the maximum return on common equity, it is in effect saying that revenue earned below that maximum but which happens to be in excess of the just and reasonable return on rate base as determined by the Board under s-s. 80(1) is necessarily money which the utility can keep. This position is obvious from the arguments made by counsel for NLP since his position has been throughout that excess revenue has no meaning other than by reference to the definition used for the purposes of the excess revenue account. As indicated previously[78], this is not a correct interpretation of the situation. The same assumption is also apparent from the position taken by the Consumer Advocate who argues that the decision of the Board to define excess revenue for the purpose of the excess revenue account in terms of exceeding the return on common equity, as opposed to rate base is ultra vires the Board because the Board must determine excess revenue by reference to revenues which are earned in excess of a just and reasonable return on rate base.

112. The assumption that the definition of excess revenue for the purpose of the operation of the reserve account is equivalent to the concept of excess revenue flowing from earnings in excess of a just and reasonable return on rate base as prescribed under s-s. 80-1, is false. I agree with the Consumer Advocate, for reasons already given[79], that any revenues earned in excess of the maximum range of a just and reasonable return on rate base are revenues to which the utility is not automatically entitled. It does not follow, however, that for the purposes of regulating the accounts of the utility, the Board is prevented from requiring payment into an excess revenue account on a different basis (provided it does not deprive the utility of the level of return on rate base to which it has been determined to be entitled). The Board can and should deal with all revenue earned in excess of a just and reasonable return on rate base; however, it does not have to require that all of it be paid into an excess revenue account.

113. As indicated in the answers to Questions 3 and 4, the Board has a broad jurisdiction as to how to deal with the excess and it may well be that, in the circumstances obtaining, it will determine that only a portion (i.e. that portion above the maximum return on common equity) should be paid into a reserve account. It might determine that the rest should be rebated to consumers or used by the utility in furtherance of the objective of ensuring that it maintains a sound credit rating in the financial markets of the world. In short, there is nothing wrong in principle with the Board defining excess revenue for the purposes of a reserve account differently from the notion of excess revenue as determined by a comparison with a just and reasonable return on rate base as determined by s-s. 80(1). In so doing, however, the Board ought not to assume that any additional excess revenue ought necessarily to be returned to the utility to be used as it sees fit. The Board

---

[78] para. [73]

[79] paras. [31], [50]

has jurisdiction, and in exercise of its legislative mandate it ought to exercise that jurisdiction, to make a determination as to how that remaining excess revenue, if any, should be dealt with consistent with the objectives and policies of the legislation.

114 Accordingly, the technical answer to Question 5 is "no" but so as to limit any confusion over the implications of the wording of the question, I would add that the Board has jurisdiction to define excess revenue for the purposes of maintenance of a reserve account by reference to the maximum level of return on common equity (or any other appropriate measure for that matter) but that does not mean that the Board may for all purposes define the level of excess revenue to which the utility is not entitled by reference to that measure; rather, the Board must determine, on the specific circumstances of the case, what is to be done with respect to any excess revenue measured against a just and reasonable return on rate base. If all or a portion of the excess revenue, measured against the return on rate base, is not ordered to be paid into a reserve account, it must nevertheless be dealt with in some other manner consistent with the objects and policies of the legislation. It should not be simply assumed that such excess revenue if not required to be paid into a reserve account belongs to the utility to be dealt with as it sees fit."

In para. 114 the Board's jurisdiction to define excess revenue for the purposes of maintenance of a reserve account by reference to the maximum level of return on common equity is in the context of determining what earnings must be paid into a reserve account or, in the alternate, what funds not paid into a reserve account may be otherwise appropriately disposed of by the Board. However, the Court of Appeal is clear in para. 112 that any definition of excess earnings is subject to the ultimate proviso that the utility can not be deprived of the level of return on rate base which was allowed.

The Board finds that the Consumer Advocate is incorrectly equating measures which the Court has indicated are appropriate to the Board for purpose of defining and establishing a reserve account with measures which the Board may use to determine the existence of excess earnings to which NP is not entitled. The Consumer Advocate does not distinguish whether or not the measure encroaches upon earnings to which the utility is entitled as of right; in particular, earnings which are within the range of the return on rate base as ordered by the Board but may be in excess of the component rate of return on equity.

Following the rendering of the majority opinion in the Stated Case, through Order Nos. P.U. 36(1998-99) and P.U. 37(1998-99), the Board effectively revised the definition of the Excess Revenue Account such that the account to this date has been maintained with reference to the upper limit of the allowed range of return on rate base as set and fixed by the Board. This change for purpose of maintenance of this account was a recognition by the Board that, while it could continue to maintain an excess earnings account with reference to the rate of return on common equity, it appears to be of little practical consequence to do so when the only jurisdiction the Board has to dispose of these earnings is when they exceed the range of return on rate base.

The Board therefore concludes that the only jurisdiction it can exercise is over excess earnings which exceed the allowed range of return on rate base as set by the Board. In respect of these earnings the Board can order that they be utilized for the benefit of ratepayers in a manner the Board deems appropriate and in accordance with the objectives and policies of the legislation. The Board in future will continue to exercise its discretion in this manner to the benefit of ratepayers, specifically as set forth in Order Nos. P.U. 36(1998-99) and P.U. 37(2000-2001), but it cannot go further and exceed its jurisdiction by depriving NP of earnings to which it is otherwise entitled under the *Act.*

The Board finds that it has no jurisdiction under the *Act* to require payment by NP into a reserve account or otherwise deprive NP of any amount which is within the allowed return on rate base as fixed and determined by the Board pursuant to Section 80(1) of the *Act.*

II. FORECASTING ISSUES

Mr. Ron Crane, NP's Director of Forecasting, provided evidence on NP's customer and energy sales forecasts for 2003 and 2004. These forecasts form the basis of the test year projections for both revenue from electrical sales and for purchased power expense, NP's largest single expenditure. Exhibit BVP-27 (1st Revision) provides details on NP's customer and energy sales forecasts, along with the economic and financial assumptions used.

1. Economic Assumptions

The economic assumptions used by NP in preparing the customer and energy sales forecasts are based on the Conference Board of Canada's *Provincial Outlook, Long Term Forecast 2003 Edition*, dated December 6, 2002. According to Mr. Crane, Gross Domestic Product (GDP) is forecast to grow by 3.2% in 2003 and 1.5% in 2004. In 2003 the economy will benefit significantly from the development of both the White Rose and Voisey's Bay projects and continued increases in oil production. This compares to an average annual growth in excess of 5% since 1997, largely as a result of large resource based projects such as Hibernia and Terra Nova. The low growth in 2004 reflects a deceleration in oil production from 2003 levels and a decline in construction expenditure. The fishing industry is forecast to grow modestly over the forecast period with landings expected to increase marginally. As a result, the goods-producing sector is forecast to grow by 4.1% in 2003 and 0.9% in 2004. [Exhibit BVP-27, (1st Revision), pg. 5] The Conference Board of Canada's *Provincial Outlook, Winter 2003*, February 24, 2003 revised the GDP forecast for the goods producing sector to show an increase of 8.9% for 2003 and a decrease for 2004 of 1.5%. (U #17)

NP's electrical energy sales growth is primarily influenced by growth in the service sector of the economy as opposed to GDP. More specifically, changes in employment levels, personal income, energy prices and population demographics in NP's service territory are more determinative of sales growth than resource industry production levels. The service sector is expected to grow by 2.7% in 2003 and 1.8% in 2004. [Exhibit BVP-27, (1st Revision), pg. 5] Economic growth will not be uniform across NP's service territory. In the Northeast Avalon, growth will continue to be robust principally due to the offshore oil industry. With the exception of the impact of the development of the White Rose Project on the Burin area, much of rural Newfoundland is expected to continue the trend of economic stagnation.

2. Customer Growth and Energy Sales Forecast

Domestic customer growth is largely influenced by the number of housing starts in each year. Mr. Crane states that, even though 2001 and 2002 have shown significant improvements in housing starts, this level is not sustainable with the demographic changes occurring in the province. The Conference Board of Canada forecasts housing starts of 1,695 units in 2003 and 1,493 in 2004. Based on this projection the number of domestic customers is forecast to grow by 0.9% in 2003 and 0.8% in 2004. [Exhibit BVP-27, (1st Revision), pg. 7]

Average domestic electricity consumption is forecast to increase by 0.7% in 2003 and remain at that level in 2004. The combined impact of customer growth and changes in average electricity use will result in growth in the volume of domestic energy sales under proposed rates of 1.6% in 2003 and 0.8% in 2004. [Exhibit BVP-27, (1st Revision) pg. 7]

The number of General Service customers is forecast to grow by 0.5% in 2003 and 2004. Under proposed rates the volume of General Service energy sales is forecast to grow by 2.2% in 2003 and 2.4% in 2004. The increased level of growth in the General Service forecast reflects activity related to construction for the White Rose project at Marystown which started in the fourth quarter of 2002. [Exhibit BVP-27, (1st Revision), pg. 8]

In Street and Area lighting class the number of customers is forecast to grow on average by 0.5% during 2003-2004, while the volume of energy sales is forecast to grow on average by 0.1%. [Exhibit BVP-27, (1st Revision), pg. 8]

Exhibit BVP-27 (1st Revision)**,** (pg. 11 of 13) shows the customer and energy sales forecasts for the 2003 to 2004 period under both existing and proposed rates. Under both scenarios the number of customers is forecast to increase by 0.8% in 2003 and 0.7% in 2004. Energy sales under existing rates are forecast to increase by 1.8% in 2003 and 1.5% in 2004. Energy sales under proposed rates are forecast to increase by 1.8% in 2003 and 1.4% in 2004. NP has incorporated the impact of elasticity into its energy sales forecast as required by Order No. P.U. 7(1996-97).

3. Forecasting Accuracy

During the hearing and in written submissions the Consumer Advocate raised the issue of NP's forecasting accuracy and the impact on revenue of *"under forecasting"* of energy sales in any given year. The Consumer Advocate argued that *"there is a disincentive for NP to accurately forecast its energy sales since if NP receives more revenue than anticipated in its forecast in any one year, NP suffers no consequence unless and until these revenues cause NP to overearn on its rate base."* (Final Submission, Consumer Advocate, pg. 14)

The Consumer Advocate has taken specific issue with NP's forecast of housing starts, stating that this input has been understated by NP in its forecasting for 2003.

In U #18 NP prepared an analysis of the effects on the forecast of energy sales of the different housing forecasts that were put before the Board during the hearing, as well as the effect of the negotiated settlement. The results of this analysis show an overall variance of approximately 0.1% on energy sales for the scenarios considered. Mr. Crane also testified that a new forecast incorporating recent events in the Province such as the flood in Badger, the potential closure of the cod fishery, and the recent announcements of a paper mill shut down would indicate approximately the same, or perhaps slightly lower, energy sales than the forecast contained in Exhibit BVP-27 (1st Revision). (Transcript, March 18, 2003, pg. 56/5; pg. 57/9)

The Consumer Advocate submitted that *"NP's growth in sales volume from year to year should be more closely monitored on an annual basis, since in 2001 and 2002 NP's forecasting has been significantly inaccurate…"* (Final Submission, Consumer Advocate, pg. 15)

Grant Thornton also reviewed NP's forecasting methodology and reasonableness of assumptions and raised no concerns. (Grant Thornton Report-NP-2003 GRA, pgs. 33-34)

A comparison of forecast energy sales to weather adjusted actual sales shows a variance of –0.4% for 1999, which is the test year used by the Board in NP's 1998 GRA hearing. Overall variances for the period 1992 to 2003 range from –2.9% in 1992 to +2.4% in 2002, with over half the variances being less than 0.5%. The Board is satisfied these variances are indicative of very good forecasting accuracy. The Board also notes that the forecasting methodology is continually tested against actual observed data using *"back casting"* techniques to ensure that the methodology remains sound. (Transcript, March 18, 2003, pg. 92/3; pg. 94/12)

The Board agrees with the Consumer Advocate that NP's growth in sales volume from year to year should be monitored. In Order No. P.U. 36(1998-99) the Board made the following Order:

> *"2(g) The Board will continue its practice of undertaking annual reviews of the company expenses and other financial and operating information of interest to the Board. Factors such as growth and sales volume will be monitored and a hearing will be convened by the Board on its own motion to consider revision in the company's revenue requirement if there is reason to believe that the adjustment mechanism has led or would lead to a level of earnings above what the Board believes to be just and reasonable."*

Since the 1998 hearing the Board has monitored growth and energy sales volumes through quarterly regulatory reports from NP and as part of its annual financial reviews. The Board has not found it necessary to make any adjustments to the forecasts for growth and energy sales as presented for the test year 1999 and upon which existing rates are based.

The Board will accept NP's customer and energy sales forecasts for the test year period 2003-2004.

III. RISK ASSESSMENT

An assessment of risks including business, regulatory and financial risks is a key determinant in NP's ability to maintain and achieve the financial targets and objectives contained in its application. The Board has assessed the evidence pertaining to each of these risks in setting NP's appropriate capital structure and return on equity (ROE) for ratemaking purposes.

1. Defining Risks

During the hearing, the Board heard a considerable amount of evidence regarding the exposure of NP to varying risks. These risks were described using a number of terms including business risk, regulatory risk, financial risk, investment risk and general utility risk without necessarily a clear evidentiary distinction being made when referring to these differing types of risk. For example, in its oral argument NP stated: *"Without exception, all three cost of capital experts agree that overall Newfoundland Power's business risks have not changed materially since 1998, and Newfoundland Power is of average business risk overall."* (Transcript, April 25, 2003, pg.22/15-20) Consistent with this position, NP cited evidentiary references from the three cost of capital experts in stating *"All experts agreed that Newfoundland Power has an approximately average utility risk."* (Written Submissions, NP, Section C, pg. 10/9-12)

Two of these references, Ms. McShane and Dr. Morin, referred to investment risk as opposed to business risk with Dr. Morin actually following up the specific reference to investment risk with the fact that NP's business risk actually exceeds that of other utilities. The third reference by Dr. Kalymon includes business risk along with capital structure risk and overall volatility in arriving at his conclusion on NP's risk profile.

Because of the lack of clarity, the Board feels compelled to distinguish between these various risks before attempting to assess them. With this in mind, the Board found Dr. Morin's pre-filed evidence helpful [Pre-filed Evidence, Dr. R.A. Morin, pgs. 18-25] along with definitions of Drs. Winters and Waters in 1998. [P.U. 16(1998-99), pgs. 20-21] The latter is particularly appropriate since it was the relative risks in each category comparing the current evidence with that of 1998 which became a primary focus of experts during the hearing. Described below are an explanation of the relevant definitions for each category of risk to be explored by the Board.

Dr. Morin	Drs. Winters and Waters (1998)
Business Risk	
Refers to the relative variability of operating profits induced by the external forces of demand for and supply of the firm's products, by the presence of fixed costs, by the extent of diversification or lack thereof of services, and by the character of regulation.	The basic risk that the utility's operating income may not be sufficient to service all its obligations, including the provision of the return on equity the investor regards as fair and expects to receive, in one or more future periods.
Regulatory Risk	
Normally included with business risk and refers to the quality and consistency of regulation applied to a given utility and to the fairness and reasonableness of regulatory decisions.	Similarly included with business risk as the risk that rates will not be set at a level sufficient to provide a fair rate or return on total capital invested.
Financial Risk	
Refers to the additional variability of earnings induced by the employment of fixed cost financing, that is, debt and capital stock.	Risks that arise through the corporation's financing and capital structure.

The Board feels the above definitions are consistent and reasonable. The Board accepts these definitions and sees no particular conflict in terms of the evidence presented during the hearing.

2. Business Risk

NP started the hearing by indicating that its overall business risks were relatively high compared to other Canadian electric and gas utilities. This is borne out in CA-599 and Mr. Perry's evidence. [Pre-filed Evidence, B.V. Perry, (1st Revision) pg. 24/21-22] In oral argument, however, NP concluded: *"Without exception, all three cost of capital experts agree that overall Newfoundland Power's business risks have not changed materially since 1998, and Newfoundland Power is of average business risk overall".* (Transcript, April 25, 2003, pg. 22/15-19)

As noted earlier, while this is not strictly accurate in terms of the evidence before the Board, there was a good deal of consensus around this particular issue. Ms. McShane testified there have been no material changes in NP's business risk profile since 1998. [Pre-filed Evidence, Ms. K. McShane, pg. 4/22-23] While noting NP operates in a highly favourable regulatory environment, Dr. Kalymon concurred in his overall assessment that the business risks of NP have not changed substantially since the last hearing. Dr. Kalymon qualified this by observing NP's business risk may now indeed be lower than certain other Canadian utilities but, at most, is comparable to the average levels for regulated Canadian companies. (Pre-filed Evidence, Dr. B. Kalymon, pg.11/19-20; pg. 12/15-19). Dr. Morin indicated that business risk for NP is principally forecasting risk and following a review of several related factors concluded that NP's business risks exceeded that of other utilities. [Pre-filed Evidence, Dr. R. Morin, pg. 22/11-12]

In addition, the Board was presented with evidence on factors influencing business risk including economic forecasts, demographic trends, regulation, competitive forces and various cost considerations highlighted by NP. Based on the level of consensus reached on this issue the Board will not belabour the evidence on these factors but will comment generally on each.

In the short to medium term aligning itself closest with the period covered by this application, the Conference Board of Canada is projecting strong economic performance in the Province though at a decelerating rate. This projection is mitigated somewhat by continuing out-migration, particularly affecting rural areas. The Board acknowledges that an aging demographic profile coupled with proportionately higher population losses in rural areas will continue to have a negative impact on NP's business risk in the longer term.

Unlike some other provincial jurisdictions, there is no evidence before the Board to suggest the regulatory environment in this Province will change. Those experts commenting on regulatory risk viewed the quality and consistency of the Board's decisions in a positive light with Dr. Morin rating the risk as slightly above average by Canadian standards. Dr. Morin attributed this to the company's low allowed ROE for 2002 and structural deficiencies in the automatic adjustment formula. (Pre-filed Evidence, Dr. R. Morin, pg. 23/26-30)

During the hearing, a regulatory caution was raised in relation to Standard and Poors' (*"S & P's"*) research report dated March 5, 2003, indicating Canadian utility regulation would be reassessed in terms of a credit rating factor. This reassessment stems from S & P's concerns regarding the reliability of the generally positive influence of regulatory factors, particularly business risk, used in its analysis of Canadian utilities. S & P plans to seek the views of Canadian regulators.

The Board acknowledges S & P's intention to reassess Canadian utility regulation as a credit rating factor but believes it is premature to speculate on the outcome of this review and even more inappropriate to apply such speculation to the decisions affecting this Order. The Board will, however, be cognizant of the relevant issues in making its decisions and it does note some recent prospectives that reflect positively on the regulatory environment affecting NP in the Province. S & P's October, 2002 research report granting an *"A"* rating to NP C$75,000,000 first mortgage bonds offered the following observation:

> *"Newfoundland Power's relatively low business risk profile is supported by cost of service/rate of return regulation; the ability to flow through all power costs; a weather normalization mechanism; and no exposure to cyclical industrial customers, which are serviced directly by the provincial government-owned utility, Newfoundland and Labrador Hydro."*

Also, the Dominion Bond Rating Service (DBRS) in its January 31, 2003 report ranks the regulation of NP as a strength in its credit rating considerations.

The competitive prospects facing NP remain relatively stable. CA-601 reveals NP will continue to face competition from traditional sources such as furnace oil, propane and wood with the degree of competition dependent on the relative economics between electricity and competitive fuels. In CA-602, while noting the spectre of the Electricity Policy Review, NP responds it possesses no specific evidence that its role in the provision of electricity will be challenged by competition in the next five years.

With a view to the arguments presented by Mr. Perry on fixed and variable costs as well as interest rates [Pre-filed Evidence, B.V. Perry, (1st Revision), pgs. 22-24], the Board is not persuaded that either of these items will significantly affect the business risk of NP.

Following this assessment, the Board agrees that the business risk profile of NP has not changed appreciably since 1998.

The Board does not anticipate a change in the business risk of NP in the foreseeable future and concurs with the assessment of NP and the cost of capital experts that NP is of average business risk compared to other utilities.

3. Financial Risk

i) Market Conditions

Fluctuating conditions in the capital markets were presented by NP as an important consideration in contributing to its cost of capital. NP pointed to the changes which have occurred in the capital markets since 1998; in particular, the spread between the company's first mortgage bonds and long-term Canada bond yields. These spreads have trended from 68 basis point in 1996 to 130 in November 1998 to 185 in October 2002. In 2002, the spread between NP's bonds and long-term Canada bonds was 2.7 times greater than in 1996. This increased volatility, NP argued, contributed to greater risk and a higher cost of capital, affecting both the rate at which NP can borrow and the return to which its investors are entitled. (Written Submissions, NP, pg. 10/14-26; pg. 11/1-15; Transcript, April 25, 2003, pg. 25/1-10).

Ms. McShane described numerous factors which have contributed to changes in both the bond and equity markets since 1998. A combination of investors scurrying to safer government securities combined with decreased government borrowing has resulted in thin markets, especially for 30-year maturities. A negative spread which existed between 10-year and 30-year Canada bond yields has corrected itself. Canadian corporate bonds, however, have maintained a normal positive yield slope. Ms. McShane suggests the growing spreads between utility bonds and long term Canadas can be traced to a number of events since 1998 – a scarcity premium related to decreased government borrowing, flights to quality investments in the face of the global market crisis of 1998, and the subsequent crisis of confidence in corporate America, as well as a widespread economic downturn from which global recovery is not yet assured, particularly in the U.S. In terms of the equity market, Ms. McShane reviewed multiple factors which, in her judgement, warrant expanding the Board's analysis of the market risk premium beyond historic Canadian risk premiums and more in line with the U.S. equity markets. In an exhibit duplicated below, Ms. McShane shows the deterioration in relative average allowed

ROEs between Canadian and U.S. utilities along with a corresponding widening gap in risk premiums while observing average long-term government bond yields have remained similar. (Pre-filed Evidence, Ms. K. McShane, pgs. 23-36)

Year	Average Allowed ROE Canadian Utilities	Average 30-Year Canada Yield	Risk Premium	Average Allowed ROE U.S. Utilities	Average 30-Year/Long Term Treasury Yield	Risk Premium
1994	11.6%	8.7%	2.9%	11.3%	7.4%	4.0%
1995	12.1%	8.4%	3.7%	11.5%	6.9%	4.6%
1996	11.4%	7.8%	3.6%	11.3%	6.7%	4.6%
1997	10.9%	6.7%	4.2%	11.3%	6.6%	4.8%
1998	10.3%	5.6%	4.7%	11.6%	5.5%	6.0%
1999	9.5%	5.7%	3.8%	10.7%	5.9%	4.8%
2000	9.8%	5.7%	4.1%	11.4%	5.9%	5.5%
2001	9.6%	5.8%	3.9%	11.0%	5.5%	5.6%
2002	9.5 %	5.8%	3.7 %	11.2%	5.7%	5.5%

This evidence, Ms. McShane concluded, calls into question the validity of the current levels of allowed returns as determined by automatic adjustment formulas, which were first introduced in Canada in 1994. (Pre-filed Evidence, Ms. K. McShane, pgs. 15-38)

In his assessment of market conditions, Dr. Kalymon pointed to budgetary surpluses, particularly citing the Government of Canada, as providing major relief to borrowing pressure on the capital markets, resulting in lower yield expectations by investors. Long-term bond rates can be seen as relatively stable and parallel the development of more stable and low levels of inflation in the economy. Dr. Kalymon further indicated equity markets have been exceptionally volatile in the past two years. After double digit gains from 1996 through to 2000, investor confidence has been shaken in 2001 and 2002 with significant declines in price/earnings ratios, overall returns and dividend yields. Dr. Kalymon concluded volatility has led to investor expectations reflecting low inflation levels and lower effective inflation risk premiums. (Pre-filed Evidence, Dr. B. Kalymon, pgs. 6-9)

The Board believes that, while experts agreed that substantive changes have occurred in the capital markets since 1998, they presented contradictory interpretations as to how these changes may impact NP's cost of capital. NP relied on market volatility as being central to its argument for a higher ROE. Dr. Kalymon explained that, when economic conditions and market conditions change, especially under volatile circumstances, one has to be very careful in interpreting the results of various tests to determine the cost of capital. (Transcript, March 26, 2003, pg. 19/11-15)

The Board concurs that dramatic changes have occurred in the capital markets since 1998. This market volatility has impacted cost of capital in a number of ways. The Board agrees that expectations of equity investors have been dampened in recent years by events occurring in the capital markets and this has resulted in moderating the historic levels of ROEs. This trend is reflected in Ms. McShane's evidence where allowed average ROEs for Canadian utilities have declined from 11.6% in 1994 to 10.3% in 1998 and 9.5% in 2002. In addition, as demonstrated by NP's October, 2002 bond issue, spreads between corporate borrowing and long-term government bonds are widening to reflect market volatility and the higher risk associated with corporate bonds. This gap is wider still in relation to the equity market, reflecting the even higher risk associated with equity investments.

Apart from the more universal impacts on the capital markets arising from volatile market conditions, there was no evidence presented to the Board which would signify any greater financial risk to NP than other comparable Canadian utilities resulting from these same conditions.

The Board finds that capital market conditions, in particular affecting the equity market, have changed substantially since 1998. This volatility has contributed to an overall reduction in investor expectations in the equity market from historic levels. In addition, volatility has contributed to greater spreads being demanded by corporate bondholders and equity investors to account for added risk as compared to long-term government securities. The Board finds these trends will similarly influence NP but present no greater financial risk to NP than will be experienced by other comparable Canadian utilities.

ii) Creditworthiness & Credit Rating

The *EPCA* mandates that rates charged by NP provide sufficient revenue to enable the company to earn a just and reasonable return, as provided in the *Act*, in order for it to achieve and maintain a sound credit rating in the financial markets of the world.

Along with an assessment of business risk, the creditworthiness and ultimately the credit rating of an enterprise is determined following a thorough evaluation by the various credit rating agencies of the company's financial performance while paying particular attention to its capital structure.

In reviewing NP's corporate performance for the period 1994 to 2004, Mr. Hughes highlighted a number of factors impacting financial performance. [Pre-filed Evidence, P. Hughes, (1st Revision), pg. 3/6-12] These include:

- Gross operating expenses are forecast to decrease by approximately 9% on a historical basis (23% inflation adjusted);
- The workforce is forecast to decrease by approximately 25%;
- The number of customers served is forecast to increase by approximately 9%; and
- The volume of energy sales is forecast to increase by approximately 13%.

In reviewing NP's actual financial results for 1998-2002, [Exhibit BVP-1, (1st Revision); EAL-2, (1st Revision); Grant Thornton Report-NP 2003 GRA] the Board noted the following:

- Energy sales have increased from $333,000,000 to $363,000,000, an increase of 9.0%;
- Other revenue accumulated during this period amounted to $28,000,000, primarily derived from pole attachment sources;
- Total assets have grown from $586,000,000 to $705,000,000, an increase of 20.3%, primarily attributable to upgrading and replacement of property, plant and equipment; and the purchase of joint use poles;
- Gross operating expenditures remained relatively stable over the period with 1998 at $55,400,000 and 2001 at $55,100,000 and showing a 4.2% decrease in 2002 to $52,800,000. Grant Thornton attributes this to savings in early retirement allowances ($963,000), deferred regulatory costs for the 1998 hearing ($384,000), other operating expenses including travel, tools/clothing and computing equipment/ software offset by increased insurance costs (net $960,000); and
- Net income increased from $22,200,000 to $29,400,000, an increase of 32.4%.

As shown below, the average capital structure for NP denoting relative proportions of debt and equity remained relatively stable for the period 1998-2002 with interest coverage increasing from 2.41x to 2.61x. [Exhibit BVP-1, (1st Revision), pg. 12]

Regulated Average Capital Structure		
	1998	**2002**
Debt	53.80%	54.63%
Preferred Equity	1.88%	1.54%
Common Equity	44.32%	43.83%
Interest Coverage (x-times)	2.41 x	2.61 x

According to NP, it is this improved interest coverage resulting from increased revenue from extraordinary events, primarily the tax reassessment and the Aliant pole purchase, that contributed to S & P's reinstatement in 2001 of NP's first mortgage bonds to an *"A"* rating. (Written Submissions, NP, Section C, pg. 34/11-15)

With the exception of the period 1998-2001, NP has been historically able to sustain an *"A"* credit rating on its first mortgage bonds. In its October 16, 2002 Report, S & P assigned an *"A"* rating to NP's C$75,000,000 first mortgage bonds issued at that time. In January 31, 2003, DBRS released its credit rating report confirming its long standing *"A"* rating for NP's first mortgage bonds. DBRS concluded for a regulated utility NP's financial profile is relatively strong with low leverage and favourable coverage ratios.

No cost of capital expert disputed the current creditworthiness or credit rating associated with NP. Ms. McShane noted the cost of debt to be borne by NP's ratepayers reflects a single "A" credit rating and there has been no impact to date resulting from S & P's announcements referred to earlier. (Supplementary Evidence, Ms. K. McShane, pg. 2/15-24) Dr. Morin indicated that relative to other Canadian utilities, NP's financial risks remain below average. (Pre-filed Evidence, Dr. R. Morin, pg. 25/3-4) Dr. Kalymon provided a comparative analysis of NP's bond rating with other utilities and concluded the financial viability of NP is well established based on both the credit ratings assigned the company and its demonstrated ability to access capital markets. Dr. Kalymon further observed that this is accomplished despite the smaller size and riskier market within which NP operates and indicates several other utilities operate with a lower credit rating. (Pre-filed Evidence, Dr. B. Kalymon, pg. 16/21-24)

The Board believes that the financial integrity and performance of NP is sound. Both the management and employees of NP can take pride in this accomplishment. This achievement is acknowledged by the credit rating agencies and is demonstrated by the continuing success of NP in accessing the capital markets. The Board will explore in the following section the issue of the credit linkage involving Fortis and NP and its potential impact on NP's future creditworthiness.

The Board finds that based on its financial performance NP continues to sustain a sound credit rating which is providing appropriate and cost efficient access to the financial markets.

iii) S & P's Credit Linkage NP to Fortis

Considerable evidence was heard throughout the hearing regarding the relationship between Fortis, the parent company, and NP, its subsidiary, and the impact or effect of this relationship on the regulated entity NP. The evidence referred to inter-corporate transactions, reciprocal staffing arrangements, linkage of credit ratings, financial cross-subsidization, and comparisons of financial targets including capital structure. These issues are dealt with in this Decision, on pgs. 55-61. The purpose of this assessment is to review the potential impact on NP's financial risk of S & P's credit linkage between NP and Fortis.

The comparative credit ratings between Fortis and NP summarized from evidence are as follows:

Credit Rating	Fortis	NP
Bonds	BBB (S&P) BBB+ (DBRS)	A (S&P) A (DBRS)
Corporate	A- (S&P)	A- (S&P)

During the hearing considerable attention was focused on information contained in two S & P research reports.

S & P's October 16, 2002 publication stated:

"Although Newfoundland Power's key debt-related ratios are expected to remain relatively stable, with a debt-to-capital ratio of about 55% and funds from operations (FFO) to interest coverage in the 2.8 times (x) to 3.0x range, it is the consolidated financial profile of Fortis that will influence ratings actions on Newfoundland Power in the future. Fortis' financial profile has remained relatively stable over the past six years with consolidated debt to capital in the 60%-65% range and FFO to interest coverage in the 2.25x-2.50x range. Nevertheless, key financial ratios are presently outside the acceptable range for the current rating and consolidated business risk profile.

Future ratings actions on Newfoundland Power will be directly determined by ratings actions on Fortis. The negative outlook on Fortis reflects a financial profile that inadequately supports the company's growing business risk and the current ratings. The ratings outcome on Fortis is expected to be resolved within the next year as part of Standard and Poor's ongoing assessment of global utility ratings criteria in light of some uniquely Canadian characteristics, including low deemed equity allowances and comparatively low ROEs that largely dictate a Canadian utility's financial profile. Nevertheless, adverse ratings actions are highly likely if there is no reduction in Fortis' consolidated business risk or improvement in key debt-related ratios."

The March 5, 2003 research report explained S & P would meet with Canadian regulators among others as part of its planned assessment. The report also listed Fortis as one of several Canadian companies S & P has placed on negative credit watch pending the outcome of this review. S & P noted selective downgrades in credit ratings may result from amongst this list based on the assessment, but some or all of the ratings could indeed remain unchanged.

NP indicated this linkage by S & P of parent and subsidiary is new and NP, like other utilities who are impacted, is seeking clarification from S & P in order to assess the implications. NP emphasized the other credit rating agencies (DBRS and Moody's) continue to treat NP as a stand-alone utility. (Transcript, March 7, 2003, pg. 40/8-19)

In written submissions, NP distinguishes, correctly in the Board's judgement, between the two separate issues raised in S & P's research reports. These include: (1) the assessment of Canadian utility regulators as a rating factor; and (2) the credit linkage between Fortis and NP. On the first issue, as outlined when dealing with the question of NP's regulatory risk, the Board believes it is premature to speculate on the outcome of this review in making decisions affecting this Order. With respect to the second issue, NP points out that Fortis is not subject to regulation and its capital structure requirements are based upon different considerations and will not mirror NP's. Fortis' debt is unsecured and non-recoverable to the assets of NP. It is these assets that allow NP to fulfil its obligation to serve its customers and serves as security for NP's outstanding long-term debt. The long-term debt is comprised entirely of first mortgage bonds which are rated *"A"* by both DBRS and S & P and ratepayers benefit from this rating. NP confirmed the uncertainty surrounding S & P's ratings and pronouncements but concluded a weakening of NP's balance sheet resulting from the Board's decisions would only increase the current level of risk. (Written Submissions, NP, Section C, pgs. 35-40)

Both Dr. Morin and Ms. McShane echoed support for NP's position, stating the Board should continue to evaluate the utility on a stand-alone basis in consideration of its *"A"* first mortgage bond rating. (Supplementary Evidence, Dr. Morin, pg. 3 and Ms. McShane, pgs. 2-4)

Dr. Kalymon referred to S & P's notice suggesting that the high leverage of Fortis is potentially damaging to the credit rating of NP and may cost ratepayers money. Dr. Kalymon suggests that, if NP was so concerned about coverage ratios, appropriate adjustments could be started at the parent (Fortis). Dr. Kalymon argues this only adds to the justification to revisit NP's capital structure and ROE consistent with his recommendations. (Transcript, March 27, 2003, pgs. 55/18-25; 56/1-9)

Following a review of a number of financial indicators comparing NP and Fortis, the Consumer Advocate submitted that the consequences of this relationship, insofar as it impacts on the Board's assessment of NP's allowed ROE or capital structure, should be borne solely by NP and not its ratepayers. (Final Submission, Consumer Advocate, pgs. 49-54)

Board Hearing Counsel observed it is reasonable to conclude that, if Fortis' corporate rating is lowered and by linkage NP's, there will be pressure placed on the debt ratings of NP as well. Using some examples, Board Hearing Counsel suggested the subsidiary can mitigate the potential impact of any *"linkage"* by maintaining operational and financial distance from the parent, referred to in the ratings industry as *"ring fencing"*. Conversely, closely integrated subsidiaries are more exposed to the risk of their parents; the more the parent and affiliate share resources and personnel, the greater the risk the subsidiary will lose its financial independence and status as a stand-alone utility. In any event, Board Hearing Counsel concludes the linkage between Fortis and NP is a significant and potentially troubling change in the ratings game with implications for how NP is to be regulated in the future. (Final Brief, Board Hearing Counsel, pg. 9/9-25)

The Board takes particular note that, for the first time in NP's history, a link has been made by a credit rating agency (S & P) assigning it the same corporate credit rating as Fortis, which has now been placed on a negative credit watch, citing the parent's unacceptable financial ratios. The Board agrees the outcome of this review by S & P remains uncertain but could conceivably result in a downgrade to NP's corporate rating and in turn affect its *"A"* bond rating. A downgrade in its bond rating will translate into higher debt costs to NP and potentially higher rates to its customers, a situation the utility has stridently argued against throughout the course of the hearing. This prospect is unacceptable and the Board will require NP to take all steps possible to mitigate against this outcome.

The Board acknowledges that its jurisdiction over the relationship between NP and Fortis is limited to regulating NP. The Board's responsibility is to set fair and reasonable financial targets for NP while ensuring least cost electricity to consumers. As reflected on pg. 46 of this Decision the Board has concurred with NP's proposal to maintain a capital structure of 45% common equity. Despite this decision taken by the Board to preserve a bond rating compatible with least cost electricity, NP could potentially experience a lower bond rating resulting in higher incremental costs for electricity by virtue of its association with its parent Fortis. The Board believes this condition is not in the interest of either consumers or the utility. The Board recognizes this situation is not a reality at this time but such an outcome presents a distinct and troubling consequence. The Board is not prepared to simply presume a stand-alone utility in the future and has an obligation to ensure the financial integrity and independence of NP is fully protected on behalf of those it serves.

The Board concludes that in the interest of both the utility and its customers. NP should continue to be treated as a stand-alone utility. Therefore, the Board will require NP to take all appropriate steps necessary to preserve the financial integrity and independence of the utility. As a first step, NP will be required to file a report by June 30, 2004 addressing how it can ensure stand-alone status in respect of its corporate credit linkage by S & P to Fortis. This report should: 1) document discussions with the credit rating

agencies and Fortis on this issue; 2) explain how other regulated Canadian utilities are facing similar challenges; 3) provide a list of possible mitigating actions; and 4) provide a plan of implementation of recommended actions.

4. Summary of Risks

The Board concurs with the consensus among the experts in finding that the business risks associated with NP were average compared to other Canadian utilities. The regulatory risk of NP is subject to the review proposed by S & P to determine the quality of regulation as a credit ratings factor. The Board points to evidence indicating a generally positive regulatory environment in which NP operates. The Board concludes it is inappropriate to speculate on the outcome of this review by S & P in its decisions relating to this Order.

As demonstrated by NP's most recent bond issue (October 2002) the utility has been able to maintain a sound credit rating and cost efficient access to the financial markets. The financial performance and capital structure of NP is quite favourable relative to other Canadian utilities. Market conditions, while particularly volatile in the equity market, are not viewed by the Board to have any greater impact on the financial risk of NP in comparison to other utilities.

While experts agreed NP's current financial risk was below average, respective positions were complicated by other related issues. In this respect, the Board expresses serious concerns regarding S & P's pronouncements linking the credit rating of NP with that of Fortis, which has been placed on negative credit watch by S & P. The Board has directed NP to take all steps necessary to protect its status as a stand-alone utility and so preserve its financial integrity and independence.

With a view to overall investment risk, Dr. Morin concluded the net result of his medley of risk factors is that NP possesses average total investment risk to possibly slightly above average. (Pre-filed Evidence, Dr. R. Morin, pg. 25/8-9) Ms. McShane indicates that, with a common equity ratio close to 45%, NP would be viewed by investors as approximately average investment risk relative to the spectrum of investor-owned electric and gas-utilities in Canada. (Pre-filed Evidence, Ms. K. McShane, pg.11/11-13) Based on his assessment of business risk, capital structure risk and volatility risk, Dr. Kalymon observed that NP would be considered by investors to be, at most, comparable in risk to the average regulated utility company in Canada. (Pre-filed Evidence, Dr. B. Kalymon, pg. 16/8-10). NP concurred with the three experts in concluding it had an approximately average utility risk. (Written Submissions, NP, Section C, pg.10/9)

Despite the change in circumstances since 1998, the Board finds that the overall investment risk of NP is average when compared to other Canadian utilities. This finding will be the basis on which the Board will consider a commensurate capital structure and ROE for the utility.

IV. FINANCIAL TARGETS AND OBJECTIVES

1. Introduction

The Board acknowledges the fundamental distinction between the challenges faced by management in managing the capital structure and ROE of a utility and the Board's responsibility in balancing the interests of both the utility and consumers. Before examining the evidence relating to the capital structure of NP, the Board believes it would prove useful to the process to examine this distinction more closely.

i) Management Perspective

The challenge of the company's management is to maintain an efficient capital structure which will seek to balance the risks and costs associated with each source of funds, both debt and equity, in an effort to secure least cost capital. Given that debt is generally less risky than equity and hence is available at lower cost, in practice this management challenge reduces to establishing financial parameters, including a capital structure, that when managed in concert with the various business, regulatory and financial risks facing the company will ensure its creditworthiness in the financial markets so as to attract least cost debt. On the other hand, common shareholders are a company's primary risk takers because they receive a return on their investment only after payment of interest on bonds and other debt and dividends on preferred stock. For a regulated enterprise, the fundamental challenge for management concerning return on equity is to maximize the company's net income or earnings in order to provide the highest return possible to the shareholder within the rules laid down by the regulator. The realization of this challenge will in turn provide a stream of dividends and/or enhanced share value to the shareholder which will attract future investment as required.

ii) Board Perspective

Prior to 1996, the Board accepted capital structure objectives of NP believed necessary to maintain the company's *"A"* rating. During its 1996 general rate application, however, NP proposed modifications to its capital structure which were not supported in the Board's resulting order. This situation in part prompted the Stated Case referral whereby the Supreme Court of Newfoundland, Court of Appeal, provided an opinion regarding the Board's jurisdiction in a number of areas, including whether the Board can require a public utility to maintain ratios within its capital structure.

The Stated Case describes the process of establishing rates of return on each component of capital structure and the rate of return on rate base. In para. 28, Mr. Justice Green states:

> *"The costs associated with long term debt and preference shares are generally static over the period covered by a particular rate hearing. Accordingly, they are often described as 'embedded costs'. The rate of return necessary to be earned on rate base to cover the cost of debt and preference shares can therefore usually be easily determined based on the interest rates or dividend rates applicable to such instruments. In the case of common equity, however, the cost of the utility of this source of funds depends upon a number of factors, especially current market conditions which, by nature, can be volatile."*

In para 56, Mr. Justice Green continues:

"All of these considerations favour an approach that, in principle, should limit the degree of intrusion by the Board into the managerial control by the utility over financial decision-making. As emphasized earlier the powers of the Board should be generally regulatory and corrective, not managerial."

In para 57, Mr. Justice Green concludes:

"An alternative to actual intrusion into the utility's financial affairs in the form of a direction as to how the enterprise should be structured is for the regulator, <u>for the purpose of setting rates,</u> to base its estimates of the cost of capital on a hypothetical appropriate capital structure, thereby disregarding the utility's actual capitalization."

It is clear the Board's role is not to second-guess management on its financial decisions regarding the utility's actual capitalization. The Board's approach, however, will be to consider an appropriate capital structure upon which to estimate the cost of capital for ratemaking purposes. The Board used this approach in its 1998 hearing and will consistently follow this methodology in this Decision and Order. Clearly management has the prerogative to set a capital structure different from that ordered by the Board.

A fair ROE will be calculated by the Board, based primarily on a review of the various methodological tests and other evidence presented by the cost of capital experts.

iii) Relationship between Capital Structure, Return on Equity and Interest Coverage

Capital structure is the mix of debt and equity invested in a company with debt representing the investment of bondholders or other long-term debt holders and equity representing the investment of shareholders, in either common or preferred stock.

The relationship between capital structure, return on equity and interest coverage is a key element in any cost of capital determination.

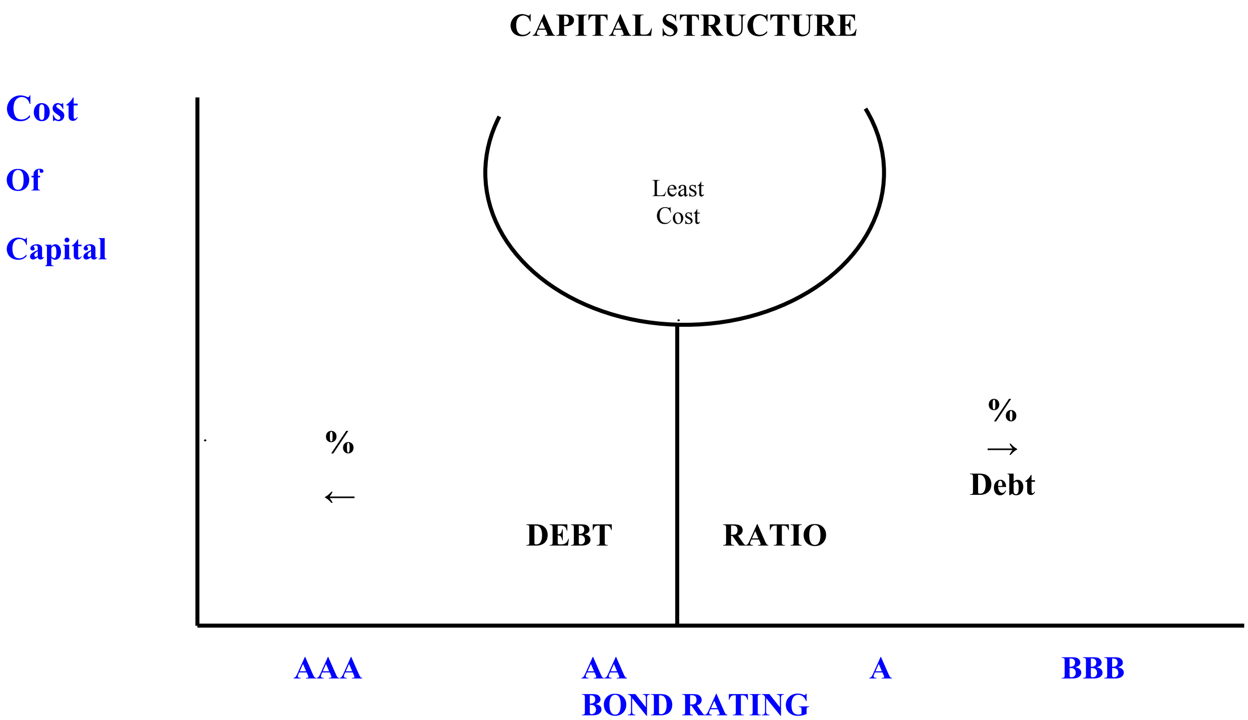
Interest coverage represents the ability of a company to meet its debt obligations and is derived as a ratio of earnings before interest and taxes to annual interest charges. Interest coverage is a prime ratio used by credit rating agencies in measuring the creditworthiness of a company since it reflects both the earnings capacity of the company and how well its capital structure or indebtedness is managed.

Return on equity (ROE) is a ratio of a company's net income or earnings (less any preferred dividends paid) to the shareholders' common stock equity or investment. ROE essentially is the measure of earnings available to common shareholders compared to their investment.

Exhibit BVP-6 (2nd Revision) demonstrates the sensitivity in the relationship between capital structure, return on equity and interest coverage. As debt increases and hence, common equity decreases combined with a decreasing ROE (all elements potentially reflecting higher risk), the interest coverage and creditworthiness of the company decreases. Higher ROEs, less debt and more common equity translates into a higher interest coverage and improved creditworthiness.

Dr. Morin explained all these things are circularly or logically linked together in a balanced system. The ROE will determine a company's profitability and interest coverage on its interest charge. The level of debt or common equity will determine how much interest a company will have to cover and that will influence ROE because lower common equity and higher risk means higher ROE. (Transcript, March 24, 2003, pg. 5/20)

The following illustration presented by Dr. Morin (Exhibit RAM-11, pg. 7) proved a useful conceptual model for the Board:



The horizontal axis displays the quality or bond rating along with the capital structure or debt to equity ratio. Moving in the direction AAA - AA - A - BBB signifies deteriorating bond ratings and increasing proportions of debt to equity. With regard to the curve, as the weight of debt increases the cost of capital reduces because of the increased use of low cost, tax deductible capital. As debt continues to increase, however, the benefit associated with low cost, tax deductible capital is more than offset by the rising cost of equity or return demanded by the investor and by the debt holder to assume the higher levels of risk associated with this increased debt. The U-shape function delineates the least cost capital structure reflecting the optimal trade-off between risk on the one hand and return on the other. The Board acknowledges the cost of capital experts may disagree on where this function falls on the horizontal axis.

2. Capital Structure

A summary of the historical and proposed capital structure of NP is as follows: [P.U. 16(1998-99), pg. 45 and CA-200, Attachment A (1st Revision), pgs. 5-6]

Capital Structure Historical and Proposed			
Order No.	**Debt**	**Preferred Equity**	**Common Equity**
P.U. 1(1990)	45-50%	6-9%	42-47%
P.U. 6(1991)	45-50%	5-10%	40-45%
P.U. 7(1996-97)	47-55%	3-6%	40-45%[1]
P.U. 16(1998-99)	Average for test year until adjusted by Board	Average for test year	< 45%[2]
Year			
2002 (actual)	54.63%	1.54%	43.83%
2003 (proposed)	54.28%	1.45%	44.27%
2004 (proposed)	54.06%	1.39%	44.55%

For the purpose of setting electricity rates, NP has proposed a forecast regulated average capital structure composed of 44.27% common equity in 2003 and 44.55% common equity in 2004.

NP referenced prior decisions of the Board in support of its position and notes the current capital structure has been maintained through appropriately managing dividend payouts to its shareholder. NP referred to Ms. McShane's evidence describing NP as a relatively small, stand alone utility which requires more conservative capital structures than larger utilities (i.e. a larger common equity ratio) in order to achieve an equivalent credit rating. NP further recited Ms. McShane's evidence indicating that the financial guidelines established by S & P for an *"A"* rated company with business risk similar to NP requires common equity 47.0 - 52.5% placing NP at the lower end of the compatible range. NP concluded that, since it has experienced no material change in risk since 1998, there is little reason to reduce the protection accorded to debt holders. (Written Submissions, NP, Section C, pg. 5 12-14)

Dr. Morin indicated he has always been supportive of the past attitude displayed by the Board regarding capital structure. He stated in respect of a possible meeting between the Board and S & P over its regulatory concerns: *"just tell our story, there we have the highest common equity ratio in Canada here. We have first mortgage bonds here, unlike any other utility in Canada."* Dr. Morin suggested, however, now is not the time to weaken NP's capital structure. (Transcript March 24, 2003, pgs. 86/8-10; 88/2-8).

---

1 Common equity exceeding 45% deemed preferred with ROE of 6.33% assigned for rate setting.
2 For purposes of setting rates through the automatic adjustment formula, lesser of 45% or projected average common equity in test year.
ROE of 6.33% applied to preferred equity as well as common equity > 45%.

Dr. Kalymon on the other hand observed high levels of equity imply expensive costs of capital and this is very relevant to customers of the utility because lowering the cost of capital means lowering their rates. Dr. Kalymon also pointed out that Fortis is clearly functioning with leverage structures that are substantially higher than NP and it is troublesome that consumers cannot enjoy the same efficiency that a more leveraged capital structure would imply. Dr. Kalymon concluded from his analysis that the capital structure risk of NP is well below that of comparable Canadian utilities and recommends a reduction in the common equity ratio to 40% which still places NP at the top end for regulated utilities in Canada. Dr. Kalymon suggested the differential between the approved 45% and the 40% could be substituted with preferred shares as a desirable way to hold interest coverage. (Transcript, March 26, 2003, pgs. 17/14-17; 18/1-14; Pre-filed Evidence, Dr. B. Kalymon, pgs. 13-15)

The Consumer Advocate supported the recommendations of Dr. Kalymon indicating a fairer capital structure for NP should be adopted and implemented by the Board. (Final Submission, Consumer Advocate, pg. 51)

Board Hearing Counsel explained that, as a consequence of both double leverage financing at the parent corporate level and substantial debt financing of its non-utility enterprises, Fortis' consolidated capital structure has more debt and less equity (and, therefore is correspondingly riskier) than the capital structure NP recommends for ratemaking purposes in this application. Board Hearing Counsel noted the argument of the Consumer Advocate that maintaining an *"A"* rating in view of Fortis' own choice of a much thinner consolidated common equity ratio may be both futile and exceedingly costly to NP's ratepayers, especially if little or no additional long-term bond financing is required by NP in the near future. (Final Brief, Board Hearing Counsel, pgs. 14-15)

The capital structure of NP has been maintained through the ongoing decisions of the Board as contained in its respective Orders and also NP's actions in managing the level of common equity accordingly. Generally in the past it has been determined by the Board that a strong equity component is needed to mitigate the impact of NP's relatively small size and low growth potential. The Board reiterates its earlier finding that NP has an average business risk which incorporates these elements into this assessment. The Board also notes that NP retained an *"A"* credit rating in its October 2002 bond issue with an actual capital structure of 44% equity despite having an ROE characterized by NP as the lowest in Canada. Based on this recent experience and the Board's findings relating to NP's risk profile, the Board is not convinced at this time to change what has proven a sound and successful capital structure for NP. The Board is not satisfied that the common equity component could be notably reduced without significantly compromising interest coverage. Dr. Kalymon's proposal to substitute preferred shares for equity is not seen as an acceptable solution in the judgement of the Board. The Board notes this same proposal by Dr. Kalymon was rejected in Order No. P.U. 16(1998-99). In reaching this decision of a maximum 45% common equity component, the Board recognizes NP will continue to retain one of the most favourable capital structures among Canadian utilities of comparable risk. The Board acknowledges the sensitivity in the relationship between capital structure and ROE and the importance of maintaining an appropriate balance to ensure both efficient access to the capital markets by NP and least cost electricity for consumers. The challenge for the Board now is to set an appropriate ROE which will preserve this necessary balance.

Having reviewed the evidence the Board is of the opinion that it is reasonable and prudent to maintain the capital structure deemed appropriate in Order No. P.U. 16(1998-99). The proportion of regulated common equity in the capital structure should not exceed 45%. Any regulated common equity in excess of 45% will only be entitled to a rate of return equal to the rate of return on preferred equity. For the purpose of determining the weighted average cost of capital (WACC), the Board accepts NP's proposed forecast average capital structure for the 2003 and 2004 test years.

3. Return on Equity (ROE)

NP has proposed that the Board allow a return on regulated common equity of 10.75% for ratemaking purposes. This ROE compares to 9.25% found by the Board in 1998, and 9.05% which is currently in place based on the Formula.

i) ROE Tests

The three standard methodological tests for determining ROE were applied by the experts in varying ways. The three tests can be generally described as follows:

- Equity Risk Premium Test - A forward looking test which measures ROE in terms of a risk-free rate, normally determined in relation to government guaranteed long-term bond yields plus a premium to reflect the added risk associated with investing in the common equity of an enterprise. The Capital Asset Pricing Model (CAPM) is a variation of this test weighted more toward measuring the market price of risk to account for such factors as interest rate change and economic growth.

- Discounted Cash Flow (DCF) Test – Measures ROE in terms of the present value of projected returns to the investor, both dividends and expected growth, discounted at an appropriate rate to reflect the risk associated with these returns.

- Comparable Earnings Test - Measures ROE in relation to the past earnings of comparable companies which are then used as a proxy for future returns of the utility being considered.

ii) Application of Tests

The following summary highlights the evidence of each expert witness in applying these cost of equity tests.

Summary of Expert Evidence of Cost of Equity

Ms. McShane (@ 45% Common Equity)

Test	Description of Evidence	Rate %
Equity Risk Premium		10.5-11.25%
(i) Risk-Free Rate	• 30 year yield based on Consensus Forecasts using 10-year Canadas plus spread (est.) to account for yield differential.	• 6.0%
(ii) Risk Premium	• 3 tests conducted (incl. CAPM). Results (1) 4.0% @ beta 0.60-0.65%, (2) 4.75-5.0%; and (3) 4.6% - Updated 4.7%. • Canadian and U.S. data used *"Bare bones"* cost of equity (i) + (ii)	• 4.0-4.75%
(iii) Total ERP (iv) Other	• Add 50 basis points to reflect financing costs associated with other risk variables.	• 10.0-10.75% • 0.5%
Discounted Cash Flow		11.5%
(i) DCF Rate	• 2 DCF tests conducted with Results (1) 11.0 - 11.1% & (2) 11.1%. - Updated 11.5%. • U.S. data used as proxy for NP.	• 11.0%
(ii) Other	• Add 50 basis points for financing cost as above.	• 0.5%
Comparable Earnings		12.75-13.25%
	• 2 tests conducted using (1) Canadian industrials and (2) U.S. low risk industrials with emphasis on (1). Results as follows: (1) 12.75-13.25% and (2) 14%.	
Recommended ROE		**11.5–11.75%**

Dr. Morin (@ 45% Common Equity)

Test	Description of Evidence	Rate %
Equity Risk Premium		**10.5-11.0%**
(i) Risk-Free Rate (ii) Risk Premium	• Same as Ms. McShane above. • 6 studies conducted (incl. CAPM) @ beta 0.67%. Results ranging from 4.4% - 6.1% and average 5.1%. • Studies involve 2 aggregate stock market, 2 utilities and 2 regulators allowed risk premiums. • Primarily U.S. data weighted toward Canada.	• 6.0% • 4.5 – 5.0%
Discounted Cash Flow		10.5 – 11.0%
	• DCF used only to confirm ERP Results	
Recommended ROE		**10.5–11.0%**

Dr. Kalymon (@ 40% Common Equity)

Test	Description of Evidence	Rate %
Equity Risk Premium		**7.54–8.04%**
(i) Risk-Free Rate	• Spot bond yields for 10-year Canadas on December 17, 2002 coinciding with the date of his pre-filed evidence submission.	• 5.04%
(ii) Risk Premium	• For 1981-2001 negative risk premium of equities on TSX index. Incompatible with risk theory. Reversed to positive by removing capital gains on 10 year Canada. Real rate of bond interest adjusted upward to reflect increased risk of average company on TSX.	• 2.5 – 3.0%
Discounted Cash Flow		7.10–9.85%
	• Alternative DCF based on growth in dividend yield and earnings/book value. • 2 tests conducted. Results (1) utility 7.10 – 8.60% and (2) industrials 8.41 – 9.85%.	
Comparable Earnings		7.72–9.84%
	• 2 tests conducted with adjustments for market to book ratios Results (1) industrials 7.72-8.82% and utilities 7.93 – 9.84%.	
Recommended ROE		**8.5– 9.0%**

iii) Reliance on Tests

In Order No. P.U. 16(1998-99), the Board relied principally on the equity risk premium in establishing the appropriate return on regulated common equity and ordered its use in the Formula.

All three cost of capital experts presented evidence on the equity risk premium test.

Ms. McShane completed all three tests, including the DCF and comparable earnings tests and assigned some weight to each test in making her recommendation. (Pre-filed Evidence, Ms. K. McShane, pg. 64/18-20)

Dr. Morin concentrated primarily on the equity risk premium test while using the DCF test only in support of his equity risk premium recommendation. Dr. Morin noted in his evidence the DCF and comparable earnings methodologies are particularly difficult to implement in practice when you are dealing with the fast-changing and fluid circumstances of the Canadian utility industry and the scarcity of reliable capital market data on comparable companies. In addition, Dr. Morin pointed to other conceptual and methodological difficulties in applying the comparable earnings method. (Pre-filed Evidence, Dr. R. Morin, pg. 14/23-26; pg. 17/13-28)

Dr. Kalymon conducted all three tests while applying variations to the traditional DCF and comparable earnings tests. Dr. Kalymon observed the outcomes of different tests provide a wide range of results reflecting extreme volatility in the general equity markets in recent years. For this reason and given the experience of stable bond yields, Dr. Kalymon placed greater reliance on the equity risk premium test and the results of the utility sample in presenting his ROE recommendation. (Pre-filed Evidence, Dr. B. Kalymon, pg. 41/24-25; pg. 42/1-6) Dr. Kalymon did indicate, however, that other test results lead to an upward push to his primary equity risk premium outcomes in reaching his recommended ROE. (Transcript, March 26, 2003, pg. 159/1-15)

The equity risk premium test received primary weighting by the expert witnesses, with other tests demonstrating certain difficulties either with their methodology, application or outcomes. The Board notes that Ms. McShane's DCF and comparable earnings tests were both higher than the upper range of the equity risk premium test and, when applying all three tests, produced a bias in her recommended ROE beyond that sought by NP. The Board is also persuaded by the fact that the equity risk premium test is anchored in the bond market which has demonstrated significantly greater stability in recent years as compared to the equity market. The Board believes, in the absence of evidence which would warrant change, consistent decision making conforming to existing practices promotes a more reliable and stable regulatory environment with less risk. The continuity of the equity risk premium test also has added relevance to the automatic adjustment formula which is considered later in this Decision

The Board will continue to rely principally on the equity risk premium test and will determine a return on regulated common equity primarily with a view to establishing a risk-free rate based on long-term Government of Canada bond yields plus an appropriate risk premium.

iv) Equity Risk Premium Test

Risk-Free Rate

In relying on the equity risk premium test in 1998, the Board established the risk-free rate with reference to the yield on long-term 30-year Government of Canada bonds. The Board determined that 5.75% was an appropriate forecast of the long-term bond rate to be used in setting the risk-free rate. In concert with this decision, the Board similarly ordered that long-term (30-year) Government of Canada bonds be used as the basis for setting the risk-free rate to be applied to the equity risk premium model in introducing the automatic adjustment formula.

Dr. Morin and Ms. McShane based their risk-free rate on a forecast of 30-year bond yields derived from the Consensus Forecast of 10-year Canada bonds plus an allowance for an observed spread between 10-year and 30-year Canada bonds. Both experts used August 2002 Consensus Forecasts which anticipates that the 10-year yield 3-months and 12-months hence will be 5.3% and 6.0% respectively, for an average of 5.65%. Dr. Morin and Ms. McShane concurred on an estimate of 35 basis points as reflecting the recent and historic spread between 10-year and 30-year Canadas which, when added to the 5.65%, provides a 6.0% long-term yield and represents a reasonable forecast on the risk-free rate for the 2003 test year. (Pre-filed Evidence, Dr. R. Morin, pg. 44/5-15**;** Ms. K. McShane, pg. 44/15-23)

Ms. McShane indicated Consensus Forecasts would bring to bear the judgment of forecasters in predicting future long-term bond rates as opposed to actual which are subject to greater cyclical variation. (Transcript, March 25, 2003, pg. 81/7-25)

Dr. Morin suggested stability is enhanced by substituting Consensus Forecast on long-term Canada bonds instead of actual. (Transcript, March 24, 2003, pg. 81/5-8)

Dr. Kalymon selected a risk-free rate of 5.04% which equates with the spot bond yields for 10-year Canada bond rates coincident with the date of his pre-filed evidence. (Pre-filed Evidence, Dr. B. Kalymon, pg. 25/6-7)

NP indicated the recommended risk-free rate proposed by Dr. Morin and Ms. McShane is the method used by the National Energy Board (NEB) and the British Columbia Utilities Commission (BCUC). (Written Submissions, NP, Section C, pg. 29/5-8)

The Consumer Advocate indicates Ms. McShane and Dr. Morin overstate long-term Canada bond rates at a forecast 6%, when actual 30-year rates are only 5.55%. (Final Submission, Consumer Advocate, pg. 45)

In accepting the 6.0% risk-free rate and Consensus Forecast method proposed by NP, the Board would be effectively abandoning its present automatic adjustment formula in favour of the NEB or BCUC model or some variation thereof. Based on the comparison shown in BVP-17, pg. 5 and the evidence during the hearing assessing the performance of each formula, the Board is not convinced that either the NEB or the BCUC model demonstrates sufficiently superior operating characteristics to warrant a change in formula methodology. Depending on the assumptions, it could be argued that the existing Formula methodology actually out-performed either or both of these proposed alternatives. The Board also expresses concern with the notable spread which would have to be factored into the formula between Consensus Forecast and actual long-term Canada Bond yields. The Board believes that greater regulatory stability and consistency is encouraged by retaining the existing methodology and linking the risk-free rate to actual 30-year bond yields.

For additional guidance in determining the appropriate risk-free rate using actual long-term 30-year Canada Bond yields, the Board turned to various references, as follows:

References		Description	Rate
1.	Pre-filed Evidence, Ms. K. McShane, Schedule 4	Average long-term Canada yield 1999-2002	5.75%
2.	Final Argument, Consumer Advocate, pgs. 30-31	Spot yield	5.55%
3.	Transcript, March 24, 2003, pg. 137/22	Spot yield	5.62%

The Board determines a risk-free rate of 5.60% is fair and reasonable.

The Board will utilize 5.60% as the forecast of the risk-free rate to be applied in the equity risk premium test for the test years 2003 and 2004.

<u>Equity Risk Premium</u>

In 1998, in applying the equity risk premium test, the Board determined a risk premium of 3.00%, based on a market risk premium of 5.00% and a relative risk factor of 0.6.

Ms. McShane conducted three equity risk premium tests using a combination of U.S. and Canadian data. The Capital Asset Pricing Model (CAPM) resulted in a market risk of 6.0% - 6.5% and a relative risk factor or beta of 0.6 - 0.65 for a risk premium of an average Canadian utility similar to NP of 4.0%. The remaining tests produced risk premiums of 4.75% - 5.0% and 4.6% (updated to 4.7%). Ms. McShane's risk premium recommendation was 4.0% - 4.75%.

Ms. McShane added 50 basis points to what she refers to as the *"bare-bones"* cost of equity to cover financing flexibility. This adjustment according to Ms. McShane is designed to allow for 3 distinct elements: (1) flotation costs relating to costs upon sale of the new equity; (2) a cushion for unanticipated capital market conditions; and (3) a recognition of the fairness principle between book and market value of stock when comparing regulated utilities with sample industrials. Ms. McShane suggested that to ignore these principles in setting an appropriate financing flexibility adjustment is to ignore the basic premise of regulation. (Pre-filed Evidence, Ms. K. McShane, pgs. 53-54)

Dr. Morin performed six tests which also included a CAPM and an empirical CAPM. Applying a beta of 0.67 to a market risk of 6.7% resulted in risk premiums of 4.5% and 5.0% respectively. These multiple tests used primarily U.S. data and resulted in a risk premium ranging from 4.4% - 6.1% with an average of 5.1%. Weighing this average in favour of the

Canadian data, Dr. Morin concluded a risk premium for NP of 4.5% - 5.0% was reasonable. Dr. Morin made no adjustment to account for financing flexibility.

Dr. Kalymon's risk premium is predicated on his analysis that during 1981-2001 the TSX had realized negative risk premium when compared to long-term Canada bonds. This result, Dr. Kalymon commented, is inconsistent with conventional risk theory but can occur in highly fluctuating markets. Dr. Kalymon reversed to a positive risk premium of the TSX Index by removing the capital gain of bondholders. Following a calculation of the real rate of interest on 10-year Canada bonds at 2.74% (5.04% risk-free rate less 2.3% inflation) and, given equity investment is more risky than bonds, Dr. Kalymon anticipates an average company trading on the TSX should expect a risk premium of 2.50% - 3.00%. Dr. Kalymon concluded no relative risk or beta adjustment is necessary for NP. (Pre-filed Evidence, Dr. B. Kalymon, pgs. 22-28) Dr. Kalymon made no adjustment to his risk premium test but did make a downward revision of 50-100 basis points to both his other tests, DCF and comparable earnings, to account for the lower risk of the regulated versus his industrials sample. (Pre-filed Evidence, Dr. B. Kalymon, pgs. 32/6-7; 34/17-18; 38/11-12)

NP argued the risk premiums derived by Dr. Morin and Ms. McShane are based on long-term economic studies of the differences in actual returns on equity compared to yields on long-term government bonds. NP suggested Dr. Kalymon's equity risk premium approach exercises more subjective judgment than economic theory. (Written Submissions, NP, Section C, pg. 29/13-22; pg. 30/1-5)

The Consumer Advocate submitted both Dr. Morin's and Ms. McShane's recommendations should be rejected as their tests contain primarily U.S. data and their recommendations are considerably higher when compared to regulatory awards in Canada. The Consumer Advocate disputed the subjective characterization of Dr. Kalymon's evidence, citing a 100-year study as a satisfactory alternative determination of the risk premium test. (Final Submission, Consumer Advocate, pgs. 41-45; Transcript, April 25, 2003, pg. 79/5-11)

Financing Costs

Before making a determination on the equity risk premium, the Board is of the view that consideration of the issue of financing flexibility is necessary. The Board notes only Ms. McShane recommended a 50 basis point adjustment for financing flexibility. Despite NP's contention in its written submissions (Section C, pg.17), as indicated above Dr. Kalymon did not make an allowance for financing but adjusted the DCF and comparable earnings test downward by 50-100 basis points to reflect the lower risk of a regulated utility versus his industrials sample. The Board acknowledges that financing costs were incorporated in Order No. P.U. 16(1998-99). The Board believes this regulatory practice varies depending on jurisdiction and notes the Ontario Energy Board in CA-535 (Attachment B) provided for flotation costs whereas in its recent decision 2002 NSUARB 59, the Nova Scotia Utility and Review Board did not make such a provision. (Final Submission, Consumer Advocate, Appendix 2) While limited evidence was brought before the Board concerning financial flexibility, the Board observes 2 of the 3 cost of capital experts made no such allowance. The Board is of the opinion its application introduces a further measure of subjectivity in setting ROE. The Board believes the issue of financing costs are best considered within the context of the equity risk premium.

The Board will make no adjustment to the equity risk premium test for financing costs.

Equity Risk Premium

From an empirical standpoint, Dr. Morin explained that allowed risk premiums expand when interest rates go down and shrink when interest rates go up. This relationship he noted is indicative of the capital market response which is built into the testing process of examining allowed returns. (Transcript, March 24, 2003, pg. 119/13-19) In addition, the Board observes that this relationship has been reflected in historical trends between long-term interest rates and risk premiums in both Canada and the U.S. This trend is also consistent with the findings of the Board following its review of the impact of market conditions on pg. 35 of this Decision.

In considering the appropriate risk premium, the Board highlights the following:

- The investment risk of NP is average overall;
- Long-term bond rates and inflation are anticipated to remain relatively stable;
- A capital structure of 45% equity and 55% debt has been supported by the Board;
- Higher risk premiums allowed in the U.S. bear no discernable relationship to NP and the focus of the Board will be on allowed risk premiums of comparable Canadian utilities; and
- No separate financing costs are being considered.

In light of the above, the Board is of the view that the recommendation of Dr. Kalymon for an equity risk premium of 2.50% - 3.00% is too low. Dr. Morin recommended a risk premium of 4.5% - 5.0% while Ms. McShane recommended a risk premium of 4.0 - 4.75% while later adjusting for financing flexibility of 50 basis points. The Board concludes these are somewhat high.

The Board deems an equity risk premium of 4.15% to be fair and reasonable.

The Board will incorporate a risk premium of 4.15% in the equity risk premium test in calculating the cost of common equity.

v) ROE Summary

The Board summarizes its findings in respect of the equity risk premium test as follows:

Risk-Free Rate	5.60%
Risk Premium	4.15%
	9.75%

The Board will utilize a return on regulated common equity of 9.75% for the purposes of determining the WACC for both 2003 and 2004.

4. Interest Coverage

As previously detailed on pg. 42 of this Decision, interest coverage represents essentially an arithmetic determination which is a function of the capital structure, in particular its debt level, and the ROE reflecting the ability of the company's earnings to cover or meet these debt obligations.

NP noted interest coverage is the principal ratio used by credit rating agencies to assess the creditworthiness of the Company. Exhibit BVP-6 (2nd Revision) demonstrates the nature of this relationship with lower interest coverage depicting greater risk through a combination of higher debt and lower earnings and vice-versa. Exhibit BVP-5 (1st Revision) proposes an interest coverage of 2.50x for 2003 and 2.53x for 2004, assuming a 45% common equity capital structure and an ROE of 10.75% and 10.72% respectively. NP explained it had prepared this application with a target interest coverage at the mid-point in the range of 2.4x to 2.7x identified as suitable in Order No. P.U. 16(1998-99). [Pre-filed Evidence (1st Revision), B. V. Perry, pgs. 15/23;16/1-2]

NP argued the only time in its history that the utility received a downgrade in its bond rating was by S & P following the issuance of P.U. 16(1998-99) when interest coverage was in the lower end of this range. But for the additional revenue generated by the extraordinary events, NP concluded its bond rating would not have been reinstated to *"A"* and a rate hearing would have been necessary to restore NP's financial integrity. (Written Submissions, NP, Section C, pgs. 5; 32; 34; 35)

Given the dispersion of recommended ROEs, not unexpectedly cost of capital experts were divided in their opinion on interest coverage. Dr. Kalymon confirmed he had no difficulty maintaining a recommended 40% capital structure and a return of 8.75% yielding interest coverage in the range of 2x. (Transcript, March 27, 2003, pg. 60/15-21). Dr. Kalymon compared interest coverage for a number of regulated Canadian utilities which showed a mean of 2.65x and a range from 1.80x to 3.56x. Dr. Kalymon concluded NP with a highly stable and very protected market should be able to operate with an interest coverage at the lower end of this range. (Pre-filed Evidence, Dr. B. Kalymon, pg. 14/8-16)

Both Dr. Morin and Ms. McShane disagreed with Dr.Kalymon. Dr. Morin noted S & P's pretax interest coverage benchmark for a single *"A"* utility with a *"very strong"* business risk position is 2.9x. (Supplementary Evidence, Dr. R. Morin, pg. 4/10-11). He indicated his own recommended 45% common equity ratio and ROE translated into interest coverage of 2.5x or 2.6x. (Transcript, March 24, 2003, pg. 22/11-13) Ms. McShane pointed to S & P's guidelines requiring interest coverage of 2.8x-3.4x for a company of comparable business risk to NP. (Pre-filed Evidence, Ms. K. McShane, pg. 10). Ms. McShane observed NP's ability to maintain an *"A"* rating for its recent bond issue at interest coverage considerably less than the lower end of this range may be attributable to S & P placing weight on the fact that NP's bonds are secured by its assets. (Transcript, March 26, 2003, pg. 10/18-20)

The Consumer Advocate argued NP failed to provide any evidence from a bond-rating agency to suggest that the level of interest coverage requested by NP is required for an *"A"* bond rating. The Consumer Advocate suggested that, if S & P has stated that for an *"A"* rating the range is 2.0 - 3.2x and given that agency's reviews of Fortis Inc., the Board should not attempt to over-compensate NP by providing for interest coverage over and above the requirement of the bond rating agency. (Final Submission, Consumer Advocate, pg. 55)

The Board is fully cognizant of the relationship between capital structure and ROE and the measure of risk it attaches to NP as a consequence of its decisions regarding financial targets. As indicated previously, maintaining an appropriate balance between these factors in the interests of both NP and consumers is one of the key challenges faced by the Board in this Application. The Board does not regulate interest coverage but notes the resulting coverage is 2.4x from BVP-6 (2^{nd} Revision) when applied to its findings of maintaining a capital structure of 45% common equity and an ROE of 9.75%. The Board notes a 2.4x interest coverage remains within the range previously accepted by the Board in Order No. P.U. 16(1998-99), though admittedly at its lower end. Given the average risk assigned to NP, the Board believes that this interest coverage serves a realistic and compatible balance between NP and its customers. NP indicated it will not be going to the bond market again until 2006. (Transcript, March 7, 2003, pg. 134/11-15) The Board does not accept that an ROE of 75 - 100 basis points higher than the 9.75% deemed fair and reasonable by the Board is warranted in order to sustain a 2.5x interest coverage based on a capital structure that ranks amongst the most favourable when compared to utilities of equivalent risk.

The Board finds an interest coverage in the order of 2.4x is acceptable given NP's level of risk and the Board's findings in this Decision with respect to NP's capital structure and return on regulated equity.

V. INTER-CORPORATE RELATIONSHIPS AND CHARGES

1. Background

The issue of inter-corporate transactions between NP, its shareholder Fortis, and with affiliated companies has been considered and addressed in previous Orders of the Board. In Order No. P.U. 6(1991) the Board directed the following: (i) a quarterly reporting mechanism be put in place; (ii) NP's code of accounts be modified to identify all inter-corporate transactions; and (iii) NP conduct a study into the financial policies of regulated Canadian utilities with respect to mark up percentages on related party transactions. This study, completed for NP by Deloitte and Touche, was filed with the Board in March 1996. In Order No. P.U. 7(1996-97) the Board: (i) set a deadline for the filing of inter-corporate quarterly transaction reports; (ii) set the basis for allocation of specific charges from Fortis to NP; and (iii) provided direction to NP on the treatment of certain costs as non-regulated or regulated expenses. The Board also accepted the principles presented in the Deloitte and Touche Study ordering that:

- i) inter-corporate services obtained from a competitive market be valued at market;
- ii) in acquiring a competitive service from an affiliate, the allowed regulated expense shall be the lowest cost bid or tariff;
- iii) in cost allocations from affiliates and the parent, transactions must be supported by documentation;
- iv) the markup on the cost must also be supported by reasonable documentation;
- v) a markup may include return on capital only where assets were used to deliver service or good;
- vi) inter-corporate loans involving NP must be valued at their opportunity cost and documentation to support the rate shall be kept;
- vii) pole attachment charges to Unitel shall be valued at the same rate offered to Newtel or CATV operators; and
- viii) postage and courier charges must include labour and the standard overhead charge.

Inter-corporate issues were also raised at NP's 1998 general rate hearing. In Order No. P.U. 36(1998-99) the Board found that the directives set by Order No. P.U. 7(1996-97) and NP's treatment of non-regulated expenses continued to be appropriate and no changes were ordered.

At this hearing issues concerning NP's relationship with its shareholder Fortis and also with other Fortis subsidiaries were raised by the Consumer Advocate. The Consumer Advocate argued that:

> *"the level and complexity of NP's inter-company transactions with Fortis Inc., and all of its related subsidiaries is exposing NP, and therefore ratepayers, to unnecessary financial and insurance risks; reveals that NP may be operating with too many employees; indicates an improper use of regulated funds; and shows that NP is charging preferential interest amounts on outstanding balances due from Fortis related companies, contrary to Section 107 of the Act."* (Final Submission, Consumer Advocate, pgs. 63-64)

The Board has dealt with the financial risks of NP's relationship with its shareholder Fortis on pgs. 38-40 of this Decision. The other issues raised by the Consumer Advocate are addressed separately below.

2. Level of Inter-Corporate Transactions

Board Hearing Counsel observed that Fortis now comprises some nine subsidiaries, eight of which are utilities. (Final Brief, Board Hearing Counsel, pg. 4/4-5) By contrast, there were three utilities referred to in Fortis' 1998 Annual Report. A comparison of Fortis' operating revenues shows NP contributing an estimated 71% in 1998, declining to 57% in 2001. In describing its vision Fortis' 2002 Annual Report states:

> *"The principal business of Fortis will remain the ownership and operation of electric distribution utilities. We will be proactive and innovative in responding to the challenges and opportunities presented by changes in the electricity industry. While the continued profitable expansion of the electric utilities in the Fortis family is our first priority we will also pursue opportunity to acquire other utilities in Canada, the Caribbean and the NorthEastern United States."*

The Board believes the relationship between Fortis, its affiliated companies and NP has become much more complex and integrated since 1998. This relationship extends beyond corporate governance issues between shareholder and subsidiary and has escalated to where NP supplies an increasing level of services to Fortis and its affiliated companies, in particular, insurance and staff, including executive and professional support. NP's regulated and unregulated inter-corporate transactions with Fortis and its sister companies have multiplied several times since 1998 and involve the flow of significant services and charges between affiliates. (Grant Thornton Report-NP 2003 GRA, Schedule 6C) Furthermore, in the case of Central Newfoundland Energy (CNE), Board Hearing Counsel notes professional staff are provided by NP to a sister company, 50% owned by Fortis, which may arguably be viewed as a competitor of NP since it produces energy and sells it in the Province. The Board believes there is no reason to anticipate these transactions between NP and its affiliates will stabilize and the evidence appears to support a continuing escalation, particularly as additional utilities are acquired by Fortis as outlined in its vision. NP argues these inter-corporate arrangements benefit customers of the utility since they generate additional revenues which serve to reduce rates as well as enhance employee development and provide exposure to outside business practices and ideas.

The Board places considerable stock in the advice given by Board Hearing Counsel:

> There is a down side to the Board's openly encouraging Newfoundland Power to pursue this strategy further in that it would further integrate Newfoundland Power possibly into Fortis and the sister companies. And this has implications for the ratings of Newfoundland Power, vis-a-vis it's own stand alone status. So, it's a thorny issue, it's not one that's simply resolvable by addressing it--it's not simply resolvable by suggesting to Newfoundland Power that they just unbridled, go ahead with providing professional services at market rates. But it is something that needs to be monitored and there needs to be a concerted policy put in place so that we can measure this going forward.
>
> (Transcript, April 25, 2003, pg. 157/12-25; pg. 158/1-3)

With regard to the provision of staff and other services to its affiliates, the Board agrees NP may indeed be deriving benefits on behalf of ratepayers. The Board believes, however, such benefits should be transparent, demonstrable and maximized to the advantage of ratepayers. In the absence of these stated objectives, the customers of NP may pay incrementally more for their electricity with either Fortis and/or its other subsidiaries sharing in these benefits. As previously indicated the Board's singular focus in its regulatory responsibility is NP and it is the Board's mandate to ensure electric consumers in the Province enjoy least cost electricity. The Board recognizes it may be several years before NP's next general rate application and, given the ever increasing complexity and number of inter-corporate transactions, it is incumbent upon the Board to ensure the interests of ratepayers are protected.

The Board acknowledges the Deloitte Touche guidelines covering inter-corporate transactions of NP which were put in place in Order No. P.U. 7(1996-97) and went unchanged by the Board in Order No. P.U. 36(1998-99). While these guidelines have generally proven adequate to date, the Board is persuaded in light of the corporate growth of the Fortis family that explicit regulatory policy direction is required to govern NP's inter-corporate transactions into the future. Therefore, in addition to the existing guidelines, NP will be required to observe certain principles in all of its inter-corporate transactions.

The overriding principal that should govern NP is that all inter-corporate transactions between affiliates shall be fully transparent and subject to scrutiny by the Board.

The Board acknowledges the general presumption of managerial good faith but notes that transactions between the utility and its affiliates present unique challenges, as they are non-arms-length transactions. Therefore, the onus will be placed on the utility to establish, to the satisfaction of the Board, that the transaction is prudent and that any corresponding costs reflect *"fair market value"* or *"cost based pricing"*, including a return on invested capital, as appropriate.

The Board has no desire to *"micromanage"* the operations of the utility and places the responsibility with NP to demonstrate to the Board that it has operated in the best interests of the utility and its customers. The Board expects directors and officers of NP to act in a manner which does not prejudice the interests of ratepayers in transactions with affiliates. Inter-corporate transactions between the utility and its affiliates should provide benefit to the electrical consumer and should not be implemented so as to disadvantage the consumer.

NP will be required to observe the following principles in all inter-corporate transactions:

(i) All inter-corporate transactions between a utility and its affiliates shall be fully transparent and are subject to scrutiny by the Board.
(ii) A utility shall have the right to manage its affairs but it must demonstrate to the satisfaction of the Board that all affiliate transactions are prudent.
(iii) A utility shall ensure that inter-corporate transactions will not disadvantage the interests of ratepayers and furthermore that ratepayers and the utility will derive some demonstrable benefit from such transactions.
(iv) The onus is on the utility to show that it is in compliance with the guidelines and principles with respect to inter-corporate transactions.

These principles may be amended by the Board from time to time. Given the implications of these principles on both NP and its affiliates, NP will be required to undertake a review and update of its operating practices and procedures relating to any and all inter-corporate transactions to ensure that the principles as set out above are reflected. The results of such a review shall be reported to the Board no later than March 31, 2004.

3. Centralized Insurance Administration

NP currently handles the insurance administration for Fortis and its subsidiaries. All insurance billings, claims, etc. for the Fortis Group of Companies are coordinated and paid through an employee of NP. NP charges the related companies through inter-corporate billings. The Consumer Advocate argued that *"this is an unusual function for a subsidiary to perform for its parent, and can lead to the exposure of NP to increased insurance costs as a result of its linkage with the insurance risks of other companies over which NP has no control."* The Consumer Advocate further argued that NP has not demonstrated any compelling reasons why it should bear the risk of paying out all of Fortis companies' insurance premiums or why it should remain risk-linked with other Fortis companies. The additional labour and accounting costs associated with performing this function were also questioned. (Final Submission, Consumer Advocate, pgs. 65-66)

In an undertaking to the Consumer Advocate, NP provided information on the relationship of NP's annual insurance premium to the claims experience of other Fortis companies. (U #1) This information included a comparison of loss ratios (ratios of the total claims under a policy of issuance to the total premiums paid for coverage under the policy) for the Fortis Group of Companies and NP. The loss ratios for Fortis and NP for auto and liability policies are comparable; loss ratios for property are 208% for Fortis and 147% for NP; and loss ratios for all coverages is 149% for NP compared to 152% for Fortis. Total insurance premiums for 1997-2003 for the Fortis Group were $5,912,915 with $3,071,518 (51%) allocated to NP. In U #1 NP also identified the following benefits of participating in a group insurance program:

1. diversity of claims experience among a group of insured parties can benefit participants who experience higher incidence of claims in a given period;
2. volume discounts on premiums available as a result of the spreading of risk and economies of scale;
3. savings resulting from sharing of broker services; and
4. improved access to leading specialty insurance markets, such as those specializing in insuring utility risk.

In written submission (Section D, pg. 16) NP argued that its centralized insurance management is more cost effective than if it were to purchase insurance on its own as a small electric utility.

It is unusual, in the Board's view, for a subsidiary company to perform a centralized function such as insurance administration for the parent company and its affiliates. The Board's primary concern in this matter is that ratepayers are not subsidizing or contributing to the insurance expenses of Fortis and related companies and also that there is no additional cost to NP (and hence ratepayers) of NP's participation in a group insurance program. NP has argued that there is a benefit to maintaining the insurance expertise in-house rather than having to out-source. Based on the evidence the Board is satisfied that the insurance costs are tracked and billed to the related companies as required. The labour charges for NP's staff persons associated with the activity are billed as well, including the appropriate markups. Inter-corporate charges are reported to the Board quarterly and reviewed by the Board's Financial Consultants as part of their annual financial reviews.

A more difficult issue for the Board is the determination of whether there is actually a benefit accruing to NP and its ratepayers as a result of this activity. Mr. Perry indicated that NP had not gone to market for a stand-alone quote for insurance coverage based on NP's risks alone. While the benefits listed by NP above relate primarily to cost savings, these savings have not been quantified and the Board has no information before it to satisfy itself on this question. On this issue the Board agrees with the Consumer Advocate's submission that NP should be directed to demonstrate that there is a real, quantifiable benefit to ratepayers for NP to remain as the central insurance administrator for Fortis and its subsidiaries and that there is a real benefit to ratepayers for NP to continue to participate in the group insurance plan rather than to be insured on a stand-alone basis.

NP will be directed to prepare a report which should compare and quantify the benefits to NP and ratepayers of its administration of and participation in a centralized insurance program for the Fortis Group of Companies, rather than be insured on a stand-alone basis. This report should be filed with the Board no later than March 31, 2004.

NP will be required to modify its quarterly reports on inter-corporate charges to show separately associated labour and other staff and expense charges billed in relation to NP's insurance administration on behalf of Fortis and related companies.

4. Inter-Corporate Staff Exchanges and Associated Charges

The Consumer Advocate raised the issue of the number of NP's employees working for affiliated companies and the charge for these transactions. Specific concerns raised include the charge rate for Mr. Hughes, NP's President and CEO, for doing work for Fortis companies, and the increasing level of staff charges billed to Fortis for NP's employees working on behalf of Fortis or related companies. The Consumer Advocate submits that *"NP has excessive staff if it is able to operate without the staff that generated the $1,600,000 in staff charges to Fortis companies in 2002."* (Final Submission, Consumer Advocate, pg. 67)

The Board has already addressed the issue of the level of inter-corporate transactions and has identified the principles that should govern inter-corporate activity between NP and affiliated companies. The Board's responsibility in this area is to ensure that ratepayers are only paying for those costs necessarily incurred by NP in the provision of electrical service.

NP bills Fortis and its related companies for time spent by NP employees working with these companies based on timesheets and the individual specific rate of pay plus a loading factor to recover related overheads. It also bills affiliated companies all out-of-pocket expenses, which are passed on at cost. Certain engineers and technicians are charged at market rates where market rates are ascertainable. The Board's Financial Consultants review inter-corporate charges each year and report to the Board. A review of Schedule 6A of Grant Thornton's report filed in this proceeding indicates that the level of staff charges to Fortis has increased since 1999. (Grant Thornton Report-NP-2003 GRA) As well it is apparent that the increase in Fortis' interests in other electrical utilities such as Fortis US Energy Corp., Belize Electricity Limited, Belize Electric Company Limited and CNE, has resulted in additional inter-corporate staff charges since 1999.

According to CA-666 the percentage of Mr. Hughes' total compensation charged to Fortis and related companies has been in the range of 18% each year since 1999, with the exception of 2001 when 25% of Mr. Hughes' total compensation was charged. In addition to this direct compensation charge NP also bills for associated overhead costs on an hourly basis. CA-667 provided similar information for other NP executives. This information indicates that a portion of the total compensation for other executives is also billed to Fortis and related companies but that the percentages are much lower than that charged for Mr. Hughes. Of the remaining executive Mr. Perry, NP's Vice President Finance and CFO, has the most significant charge, with 21% of his total compensation charged in 2001 and 17% charged in 2002.

In addressing this issue in cross-examination the Consumer Advocate suggested that the charge out rate for Mr. Hughes is in the order of $170 per hour, based on the evidence filed in the hearing. (Transcript, March 3, 2003, pg. 158/21-9) In response, Mr. Hughes could not confirm the rate nor whether that rate is in his opinion a market rate for a CEO since he does not have a benchmark.

> Q. Is your answer then that that would be a market rate?
>
> A. I don't know. I mean, obviously what a CEO gets paid for is to produce far more value and make more changes and set the direction than what they're getting paid. To be honest, I can't think of an example where a CEO is charged out to a non-related company. So I haven't got a benchmark, so I suppose, Mr. Fitzgerald, I'm neither agreeing or disagreeing, I just don't—I can't think of a comparative.

Based on the evidence the Board is satisfied that the time for NP's employees, other than executive and management, is being recorded and charged out to Fortis and affiliated companies at market rates or other appropriate rates. In the Board's view this should also be the case for executive and management, rather than using a cost plus overhead basis. This approach in the Board's view recognizes the value of the service being provided by NP. If a market rate is not ascertainable (as seems to be the case), NP should add an appropriate premium to its cost-based rates as a proxy.

As part of the review of operating practices and procedures relating to inter-corporate transactions NP will be required to investigate the utilization of market rates for executive and management time charges. In lieu of market rates, NP shall propose an appropriate markup on its cost-based rates as a proxy for market in the event that utilization of market rates is not practical.

5. Billing Practices and Interest Arising from Inter-Corporate Transactions

The Consumer Advocate also raised the issue of billing practices to related companies for inter-corporate transactions, specifically the timing of billings and interest charges on overdue accounts. It was submitted by the Consumer Advocate that *"the billing out of NP staff charges on a quarterly basis, where the cost to pay the staff and provide travel funds are incurred on a monthly, if not weekly, basis by NP, reveals a significant benefit that Fortis and its affiliates receive from NP."* (Final Submission, Consumer Advocate, pg. 68) The Consumer Advocate also argued that NP's practice of not charging these companies interest for overdue accounts is unfair to consumers and is in contravention of Section 107 of the *Act*, which essentially prohibits preferential billing.

During the hearing, in response to questioning from the Consumer Advocate regarding timing of insurance billings and subsequent payments, Mr. Perry acknowledged that NP has incurred a cost associated with receivables over 30 days from related companies. In an undertaking NP provided a pro-forma calculation of interest that would have accrued in each of years 2000-2002 on inter-corporate receivables over 30 days if interest had been charged based on NP's average short-term borrowing rate for that year. This information showed that the interest charges would have totalled approximately $12,400. (U #16) Mr. Perry also testified that this issue of billing practices to Fortis and related companies has been addressed and corrected. (Transcript, March 13, 2003, pg. 120/9-19)

The Board is satisfied that the time and expenses relating to inter-corporate transactions are being tracked and recorded as required, and that NP is billing and recovering those costs from related companies. The Board expects, however, that the billings for these services performed by NP on behalf of related companies be treated in the same manner as any billings for amounts owing that NP would issue to a non-related company as part of its normal trade or business practice. The Board's finds that this is one of the ways that it can assure itself that NP is not treating its billings and receivables to Fortis and affiliates differently than it would any other unrelated party to which it provides service. It follows that billings to Fortis and related companies should be issued on the same terms and conditions, and be assessed appropriate interest charges and penalties in the case of late payments, as for non-related parties. It is not clear from the evidence that this is the case. For example, NP calculated the pro-forma interest in U #16 using its average short-term borrowing rate, which the Board estimates to be approximately 4% - 4.5%. This interest rate appears to be much lower than the interest rate or penalty that would normally be applied to outstanding bills, which is typically calculated on a prime rate plus basis. The Board also expects billings to Fortis and related companies to be undertaken within 30 days of the service and/or expenses being charged for recovery.

NP will be required to apply billing and collection practices with respect to inter-corporate transactions which are consistent with those applied to unrelated parties. Billings to Fortis and related companies should also be undertaken within 30 days of the service and/or expenses being charged for recovery.

VI. AUTOMATIC ADJUSTMENT FORMULA

In Order No. P.U. 16(1998-99) and P.U. 36(1998-99) the Board ordered the use of an automatic adjustment formula (the *"Formula"*) to set an appropriate rate of return on rate base for NP on an annual basis. The Board also determined that after NP's rate of return on rate base had been set for three consecutive years using the Formula, and without a hearing, then a hearing will be convened in the following year to consider the cost of capital, including a full review of forward looking test year projections.

The Formula put in place by the Board in 1998 is as follows:

$$\textbf{Rate of Return On Rate Base} = \left[\frac{\textbf{Invested Capital}}{\textbf{Rate Base}} \times \textbf{Weighted Average Cost of Capital} \right] + \frac{\textbf{Z}}{\textbf{Rate Base}}$$

Where Z represents amounts which are recognized in the calculation of either weighted average cost of capital or rate of return on rate base, but not both. These amounts include:

(A) Amortization of Capital Stock Issue Expenses;
(B) Interest on Customer Deposits; and
(C) Interest Charges to Construction.

The Formula adjusts NP's rate of return annually based on changes in the forecast cost of common equity. This forecast change is based on changes in long term Government of Canada Bond yields. By use of an equity risk premium approach the Board determined that the appropriate return on regulated equity for NP was the sum of the risk free cost of capital (i.e. the average of long term Government of Canada bond yields) and an adjusted risk premium which varies based upon the changes to the risk free cost of capital. The resulting rate of return on common equity, along with the appropriate rate of return on preferred equity and the embedded cost of debt are then used to calculate the Weighted Average Cost of Capital (WACC). The appropriate rate of return on rate base is calculated by multiplying this WACC by the ratio of forecast average invested capital to forecast average rate base plus a Z factor as shown above. The Formula also adjusts on an annual basis the ROE, forecast average invested capital and average rate base. All other components of the Formula are based on 1999 test year data.

1. Existing Formula Performance

The Formula has been used in each of 1999, 2000 and 2001 to set the rate of return on rate base (and hence rates) for NP for the years 2000, 2001 and 2002. In Order No. P.U. 28(2001-2002) the Board ordered, among other things, that NP undertake a review of the performance of the Formula. The results of this review were filed as part of the evidence in this proceeding. (Exhibit BVP-17)

The following table shows the allowed range of return on rate base as set by the Board for 1997-1999 and as derived by the Formula for 2000-2002 and, for comparison purposes, the actual returns achieved by NP:

Returns on Rate Base: 1997 to 2002			
Year	Allowed Rate of Return	Allowed Range (%)[1]	Actual Return (%)[2]
1997	10.65	10.50- 10.80	10.71
1998	9.81	9.63 - 9.99	9.86
1999	9.98	9.80- 10.16	10.04
2000	10.28	10.10- 10.46	10.46
2001	10.28	10.10- 10.46	10.46
2002	10.06	9.88- 10.24	9.94

[1] As set out in various Board Orders.
[2] As reported by NP in its annual returns.

Consumer electricity rates were set each year based on the rate of return on rate base, which is the midpoint of the allowed range of return set by the Board, using a 36 basis point spread. The operation of the Formula resulted in adjustments to rates for 2000 and 2002 of less than 1% with rates remaining unchanged in 2001.

One of the conclusions of the Formula review contained in BVP-17 is that the Formula yielded a low return on common equity when compared to similar mechanisms adopted by the NEB and the BCUC.

A significant issue raised during the hearing was the increasing spread between the actual rate of return on rate base and the actual rate of return on regulated equity. This issue was highlighted by Grant Thornton as part of their annual reviews of the operation of the Formula for 2000 and 2001. The following comparison of the actual return on average regulated common equity with the actual return on average rate base for 1998 to forecast 2002 was provided by Grant Thornton (Grant Thornton Report-NP 2003 GRA, pgs. 19-20):

Comparison of Actual Returns on Rate Base and Regulated Common Equity					
	1998	1999	2000	2001	Forecast 2002
Return on Average Common Equity	9.58%	9.81%	10.80%	11.35%	10.32%
Return on Average Rate Base	9.86%	10.04%	10.46%	10.46%	9.79%
Spread between actual returns	(0.28%)	(0.23%)	0.34%	0.89%	0.53%
Spread based on formula returns	-	(0.73%)	(0.69%)	(0.69%)	(1.01%)

In its evidence NP describes two events which have affected the returns for 2000 and 2001 i.e. the treatment of GEC for income tax purposes and the Aliant pole purchase. Grant Thornton adjusted the returns for the effect of these two events as shown below:

Returns Adjusted for Extraordinary Events per Exhibit BVP-2					
	1998	1999	2000	2001	Forecast 2002
Return on Average Common Equity	9.58%	9.81%	9.92%	8.50%	9.43%
Return on Average Rate Base	9.86%	10.04%	10.07%	9.23%	9.47%

Grant Thornton also prepared an analysis of the impact of changes in the individual components of the Formula. As a result of this analysis two additional areas were identified for further consideration by the Board: (i) changes in forecast versus actual embedded cost of debt; and (ii) changes in forecast versus actual ratio of average invested capital to average rate base.

Before considering the evidence put forward in the hearing regarding proposed changes to the Formula the Board wishes to provide its opinion and findings regarding the effectiveness of the Formula since 1998 and on the continued use of the Formula for setting rates beyond this Decision.

2. Board's View on Continued Use of the Formula

The appropriateness of implementing an automatic adjustment mechanism for resetting the rate of return in years subsequent to a test year to reflect changes in financial benchmarks was considered by the Board in NP's 1998 cost of capital hearing. In Order No. P.U. 16(1998-99) the Board stated the following (pg. 103):

> *"The Board is of the view that there is merit to a formula, in light of the cost of a full cost of capital hearing and the potential savings to consumers which could be realized. The Board also believes that the adoption of an automatic adjustment mechanism will create greater predictability, which will thereby reduce the risk of regulatory uncertainty. In the opinion of the Board, a mechanism to facilitate an annual review at modest costs will be of benefit to the ratepayer and the Company."*

The Board also stated in Order No. P.U. 16(1998-99) that it would call a hearing if circumstances change, so as to render the use of an automatic adjustment formula to be inappropriate, citing specific examples on pg. 104 as follows:

a) deterioration in the financial strength of the Company, resulting in an inappropriately low interest coverage;
b) changes in financial market conditions which would suggest that the formula is not accurately reflecting the appropriate return on equity; and
c) fundamental changes in the business risk of the Company.

The Board has monitored the operation of the Formula as part of its ongoing supervisory role in regulating the utility. Revised values for rate base and invested capital for use in the Formula for each year were reviewed and approved by the Board as part of that year's capital budget hearing. The Board's financial consultants reviewed the operation of the Formula as part of their annual financial reviews of NP. As well NP was required to file quarterly reports with the Board which, in addition to the required annual report, provided information on actual financial performance, both regulated and non-regulated. In Order No. P.U. 36(1998-99) the Board also specified the time period for the setting of rates using the Formula to three consecutive years, after which a full cost of capital hearing would be convened.

As stated in Order No. P.U. 16(1998-99) one of the primary motivations for adopting the Formula was the potential savings to be realized from a regulatory process that does not require frequent cost of capital hearings, which are time consuming and expensive. It was also recognized that the use of a formula may reduce regulatory risk due to the certainty associated with an automatic adjustment mechanism in reflecting changing financial conditions. In the Board's view the use of the Formula has contributed to stable rates for consumers and lower regulatory costs since 1998. Rate changes due to the operation of the Formula have been +0.71% in January 2000, no change in January 2001 and a decrease of 0.56% in 2002. Many of the issues raised during this hearing relating to NP's earnings and the impact of extraordinary events on those earnings do not relate to the operation of the Formula and are discussed elsewhere in this Decision. None of the parties advocated abandoning the Formula but rather proposed specific changes to the Formula on a go forward basis.

In the Board's view there is merit in continued use of a formula for the same reasons as set out in Order No. P.U. 36(1998-99) and stated above. This was the Board's first experience with an automatic adjustment mechanism and, based on the evidence in this hearing, the Board believes that adjustments to the Formula itself and implementation of specific triggers leading to a review of the Formula's components will improve its operation and effectiveness.

3. Changes as Proposed by NP

In this Application NP is proposing three changes to the Formula: 1) change the manner of determining the risk free rate by adopting the method utilized by the National Energy Board (NEB) and the British Columbia Utilities Commission (BCUC); 2) adopt an equity risk premium of 4.75% at a risk free rate of 6%; and 3) expand the range of return on rate base to 50 basis points. These proposals are discussed in detail in the following sections.

i) Risk-Free Rate

NP stated that the calculation of the risk-free rate in the Formula as put in place by the Board is out of step with similar mechanisms currently in use in Canada and that, as a result, "*NP's returns are established by means outside of the mainstream for such mechanisms in use for Canadian utilities*" [Pre-filed Evidence, B. V. Perry, (1st Revision), pg. 47/1-2]. Mr. Perry goes on to state that the short observation period for setting the risk-free rate exposes NP's investors to additional risk.

The risk-free rate used in the existing Formula is based on the actual yields of two series of long-term Government of Canada bonds. The observed average of the daily closing yields for the last five trading days of October and the first five trading days of November for Government of Canada 8% Issue, maturing June 1, 2027 and the 5.75% Issue, maturing June 1, 2029 is used to forecast the risk-free rate for the upcoming year.

NP proposes that the Formula be amended to adopt the NEB and BCUC approach to determining the risk-free rate. The NEB's formula uses a forecast 10-year bond yield as calculated by taking the average of the 3-month and 12-month-out forecasts of 10-year Government of Canada bond yields as set out in the November issue of *Consensus Forecasts* (published by Consensus Economics Inc., London, England). This forecast 10-year bond yield is added to the observed spread between the 10-year and 30-year Government of Canada bond yields for the current year, calculated by averaging the yields published daily in the National Post throughout October of the current year, to provide a forecast risk-free rate for the next year. The BCUC uses the same calculation for the forecast risk-free rate.

NP provided a comparison of the risk-free rate forecasts and actual 30-year Government of Canada bond yields for 1999 to 2002 as outlined below (Written Submissions, NP, Section G, pg. 8):

Comparison of Risk Free Rate Forecasts and Actual 30-Year Government of Canada Bond Yields: 1999-2002 (%)				
Forecasts:	**1999**	**2000**	**2001**	**2002**
Newfoundland	5.49	6.18	5.75	5.50
NEB	5.69	6.12	5.73	5.63
BCUC[1]	5.47	6.04	5.73	5.63
Actual Yields[2]	**5.72**	**5.71**	**5.76**	**5.68**

[1]In 2000 the BCUC adopted a longer observation period to establish the forecast spread between 10 and 30-year bond yields.
[2]Actual yields are the average of Bank of Canada published month end yields for 30-year Government of Canada Bonds for each year.

NP submitted that the table above provides conclusive evidence that the NEB formula has greater predictive accuracy and lower volatility in predicting the risk-free rate than the existing methodology contained in the Formula. Dr. Morin and Ms. McShane agreed with this proposed change, principally because of its relative stability as compared to spot observations of long-term Canada bond yields.

The Consumer Advocate does not support this proposed change, and stated that "*if the Board is to continue with a formula it should continue with the ten trading days' methodology as provided for in P.U. 16 (1998-99)…*" (Final Submission, Consumer Advocate, pg. 28). Dr. Kalymon suggested that the existing formula methodology for calculating the risk-free rate has been more accurate than the NEB's methodology.

As stated previously in this Decision the Board is not convinced that either the NEB or the BCUC model demonstrates sufficiently superior operating characteristics to warrant a change in formula methodology. The Board believes that greater regulatory stability and consistency is encouraged by retaining the existing Formula.

The Board will continue to use the existing methodology in the Formula for calculating the risk-free rate. However, the risk-free rate will now be calculated based on the actual yields of the three most recent series of long-term Government of Canada bonds

during the 10 trading days being monitored as reported in The Globe and Mail under the heading *"Ask Yields"*. The observed average of the daily ask yields for the last five trading days of October and the first five trading days of November for these three most recent issues will be used to forecast the risk-free rate for the upcoming year, in each year of operation of the Formula.

ii) Equity Risk Premium

NP is also proposing that the Formula be amended by establishing, at a risk-free rate of 6.0%, an equity risk premium of 4.75%.

In Order No. P.U. 16(1998-99) the Board determined that the total risk premium (including an allowance of 50 basis points to cover underwriting costs, the risk of dilution of share value and unforeseen circumstances) to be used in the Formula with a risk-free rate of 5.75% was 350 basis points, or 3.50%, to give an ROE of 9.25%.

The Board has determined that a total risk premium of 415 basis points, or 4.15%, is reasonable. This is the value that will be used and adjusted on the same basis as was ordered in Order No. P.U. 36(1998-99) in the application of the Formula.

4. Embedded Cost of Debt

The issue of the variance between the embedded forecast cost of debt used in the Formula and the actual cost of debt was raised by Grant Thornton (Grant Thornton Report-NP 2003 GRA, February 4, 2003, pg. 22). In Order No. P.U. 36(1998-99) the Board fixed the embedded cost of debt for purposes of the Formula at 9.18%. This cost of debt remains constant from year to year. Actual embedded cost of debt for 1999 to 2001 has been below that used in the Formula, ranging from 9.01% in 1999 to 7.79% in 2002. According to Grant Thornton:

> *"The decrease in the embedded cost of debt means that actual interest costs are lower than anticipated in the Formula. Generally speaking, assuming other items are constant, as interest costs decrease earnings increase and vice versa. What this means in terms of the operation of the Formula is that because the cost of debt is set at a higher level than actual, the Company has the opportunity to increase the return on equity while still staying within the limits of rate of return on rate base."*

Grant Thornton suggested the Board consider the significance of variations in the embedded cost of debt and whether the Board should consider modifying the Formula to adjust for forecast changes in the embedded cost of debt annually. In supplementary evidence Grant Thornton suggested that, as an alternative to modifying the cost of debt annually in the Formula, the Board may establish criteria which would trigger a review of the Formula and the cost of capital. This review would be triggered whenever certain variables or returns generated by operation of the Formula vary significantly from expectations. (Supplementary Evidence, Grant Thornton, pg. 3)

The Consumer Advocate submitted that the operation of the Formula unadjusted for the true cost of embedded debt has resulted in additional income of approximately $7,500,000 for NP for the years 2000, 2001 and 2002. This extra income, according to the Consumer Advocate, contributed to NP's over-earning on its equity in each year since the implementation of the Formula. The Consumer Advocate supports the annual adjustment of the forecast embedded cost of debt. (Final Submission, Consumer Advocate, pgs. 36-39)

The Board agrees that the changes in the embedded cost of debt from that set by the Formula for the 1999 test year have contributed in part to the earnings above the ROE used in the Formula. These changes in debt costs are caused by a number of factors, however, including use of more short-term debt by NP to finance its operations, and changes in interest rates. In addressing this issue in the context of the Formula the Board does not wish to put mechanisms in place that would restrict the ability of NP's management to lower costs, including debt costs, between cost of capital hearings. The real issue for the Board is how the benefit of these lower costs is passed on to consumers.

In the Board's view it would be contrary to the purpose of having an automatic adjustment mechanism if, once a formula has been established, the Board were to use variances from forecasts of requirements to adjust various formula components as they change. In implementing a formula the Board must select reasonable and justified test year values based on the evidence. In the Board's view this is consistent with the prospective nature of setting rates. Changes in test year values are expected. The primary concern for the Board is to ensure that the components in the Formula remain appropriate. This was recognized by the Board in Order No. P.U. 36(1998-99).

The Board concludes that a triggering mechanism tied to the overall cost of capital would be more appropriate. This will provide the Board with the opportunity to review not only the components of the Formula but also to examine the reasons for the variances from test year values. If the variances are related to changing financial and market conditions that the Board or parties could not have foreseen or anticipated, an adjustment to the Formula may be appropriate. The Board does not want, however, to discourage NP from continuing to seek efficiencies to lower costs and will focus primarily on those components that remain outside the control of the utility. As an added monitoring mechanism the Board will require NP to provide additional information on changes in the embedded cost of debt as part of its annual returns.

NP will be required to modify the schedule filed as part of its annual return that calculates the embedded cost of debt to identify specifically the causes of variations in the actual embedded cost of debt from the cost forecast for the test year period.

5. Trigger Mechanism for Early Review

From the Board's perspective, a significant indicator that the Formula may not be operating as intended in setting the rate of return on rate base is when NP's actual earned return on regulated equity in a given year is significantly higher than the expected return or cost of equity determined for that year. In this context it is logical that the triggering mechanism for an early review of the Formula be some pre-defined threshold for the observed rate of return on regulated equity. The Board finds that a good reference point for the threshold is the upper limit of the range of return on rate base. The threshold should be higher than the upper limit otherwise a review would be triggered even though the utility did not earn outside the allowed range.

The Board feels that an appropriate trigger point would be when the actual rate of return on regulated equity for any given year is greater than 50 basis points above the cost of equity as determined by the Formula. Where in any year this threshold trigger is exceeded, the Board will require NP to file a report, as part of its annual return, which details the variations in all components of the cost of capital and explains the circumstances or facts leading to such variations. The Board will undertake an immediate review of this information and make an assessment as to the most appropriate course of action which may involve calling for a hearing on cost of capital.

The Board will establish a mechanism tied to the observed rate of return on regulated common equity which may trigger an early review of the Formula and cost of capital. Where the actual rate of return on regulated equity in any intervening year exceeds the cost of equity determined by the Formula by more than 50 basis points, then NP will be required to file a report with the Board in its annual return setting out the circumstances and facts contributing to the difference.

6. Period of Operation

NP set out its position on the period of operation of the Formula in its response to CA-343. NP has proposed that the Formula be used for a further three year period, stating that customer rates should be set for 2003 and 2004 by Order arising from this hearing and the Formula be used to set rates for 2005, 2006 and 2007. This would mean, presumably, that NP would come before the Board no earlier than late 2007 or early 2008 for a cost of capital hearing unless circumstances change such that an earlier hearing is required by the Board or requested by NP.

It is evident from the record that there are several events that will occur in the next 2-3 years that may impact NP's financial position. These were summarized in the final brief of Board Hearing Counsel (pg. 24). The specific impacts of these events on NP cannot be determined at this time, especially those events outside NP's control, such as the outstanding CCRA issue and the outcome of S & P's ratings review. If either of these events has a negative or material impact on NP's financial position the Board anticipates that NP will request an earlier hearing to review its cost of capital. However, the Board is of the opinion that the proposed period of operation of the Formula for a three-year period starting in 2004 (i.e. to set rates for 2005, 2006 and 2007) is reasonable and meets the intended objective of regulatory efficiency and stability. The Board has put in place with this Decision a triggering mechanism which, along with the Board's ongoing monitoring, will provide the opportunity for the Board to convene an early review if deemed necessary.

The Board will approve the use of the Formula, as modified by this Decision, for a further three-year period. Customer rates will be set for 2003 and 2004 by this Decision and Order. The Formula will be used to set the rate of return on rate base, and hence customer rates, for 2005, 2006 and 2007.

7. Ratio of Average Invested Capital to Average Rate Base and Inclusion of Deferred Charges in Rate Base

Deferred Charges

In its review of the Formula Grant Thornton observed, as inputs are updated annually, the resulting calculation adds both complexity and variability to the operation of the Formula. For example, deferred charges such as pension costs which may fluctuate substantially from year to year are included in invested capital but not in rate base. Grant Thornton suggests that if the Board wishes to improve the operation of the Formula one alternative the Board may wish to consider is the Asset Rate Base method, where all regulated assets of the utility are included in rate base. The Asset Rate Base method is applied to NLH and is an equally acceptable regulatory practice which would more closely equate rate base and total required invested capital. Grant Thornton points out, however, that even with the inclusion of deferred charges in rate base a difference still remains between NP's average rate base and average invested capital. Grant Thornton reconciles this difference as $3,799,000 in 2003 and $2,858,000 in 2004. (Supplementary Evidence, Grant Thornton, pgs. 3-4) Grant Thornton acknowledges these remaining differences should eventually be absorbed into the Asset Rate Base model but this will require further analysis and is best left to NP's next general rate application. (Transcript, April 8, 2003, pg. 13/16-25)

Grant Thornton explained including deferred charges into NP's rate base under the Asset Rate Base method will add approximately $77,000,000 to the rate base in 2003 but will not increase revenue requirement as NP is also recovering these costs through the current Invested Capital approach. Grant Thornton noted that deferred charges are forecast to increase significantly over the next five years and suggested that the Board apply a prudence test each year to deferred charges in conjunction with its hearing of the company's capital budget application. (Supplementary Evidence, Grant Thornton, pgs. 3-4; Exhibit II)

NP indicated that Grant Thornton's alternative does not appear to affect the balance between the interests of the utility and its customers and that the Board is free to make choices between reasonable regulatory alternatives. (Written Submissions, NP, Section G, pg. 5/1-7) The Board Hearing Counsel indicated that if the Board were to adopt the Asset Rate Base method as recommended, it will need to establish a reporting process and review guidelines for testing the prudence of pension related expense, as their determination involves expert actuarial evidence and the exercise of considerable management discretion. (Final Brief, Board Hearing Counsel, pg. 22/22-30)

The only expert commenting on the issue, Mr. J.T. Browne, appeared indifferent to either option as long as the cost of financing the investment is recovered and regulatory accounting principles are followed. Mr. Browne commented that in his experience there is generally a presumption of prudence unless there is evidence to the contrary. (Transcript, March 31, 2003, pg. 71/15-25; pg. 78/11-14)

The Board finds that changing the Formula and adopting the Asset Rate Base method will result in a consistent approach to determining rate base for both NP and NLH. Furthermore, the

Formula will also be simplified and the results more stable year over year. The Board will require NP to observe appropriate guidelines to ensure proper annual monitoring of these deferred charges. The Board acknowledges NP's understanding that this change has no impact on the utility but notes in the reconciliation of the remaining differences based on the Asset Rate Base method more work is required. Whether or not these subsequent adjustments will be revenue neutral for NP is uncertain. The Board indicates, however, these issues will be a subject of the NP's next general rate hearing, at which time the evidence of all parties will be heard.

Regulated verses Book Equity

In its written submission, NLH addressed the issue of utilizing return on *"regulated common equity"* versus return on *"book value"* in measuring NP's return on equity. The difference between regulated equity and book equity is one of the reconciling items noted by Grant Thornton in their reconciliation of Average Invested Capital and Average Rate Base (including deferred charges). (Supplementary Evidence, Grant Thornton, Exhibit II) NLH submitted that, in moving to the Asset Rate Base method for NP, the Board may consider discontinuing the use of regulated common equity in favour of book equity.

The Board believes that the arguments put forward by NLH with respect to using book equity have considerable merit, however, the Board is not prepared to make such a change in regulatory practice at this time. As noted above, this is one of the remaining reconciling items between Invested Capital, as currently calculated, and Rate Base. The Board will direct NP to address all reconciling items, including this issue, no later than its next general rate application.

The Board finds that the Asset Rate Base method should replace the Invested Capital approach currently used to calculate NP's rate base. The move to the Asset Rate Base method will begin in 2003 by incorporating deferred charges in rate base. The Board will direct NP to implement the following guidelines in switching to the Asset Rate Base method:

- **(i) Average deferred charges based on BVP-11 to be added to the average rate base for the 2003 and 2004 test years and all subsequent fiscal years.**
- **(ii) Evidence relating to changes in deferred charges, in particular deferred pension costs, to be filed annually at the capital budget hearing.**
- **(iii) NP will provide a reconciliation of average Rate Base to average Invested Capital annually at the capital budget hearing.**
- **(iv) NP will review no later than its next general rate application, the appropriateness and approach to including the remaining reconciling items in the Rate Base. This review will address the issue of discontinuing the use of regulated common equity in favour of book equity.**

VII. RATE BASE

1. Average Rate Base and Return on Rate Base

NP's average rate base comprises investment in plant and equipment less accumulated depreciation to which is added an amount owed to NP by its customers in the Weather Normalization Reserve and allowances for inventory and cash working capital and from which is deducted amounts for Contribution in Aid of Construction ("CIAC"). The return on rate base comprises the cost of debt, rate of return on preferred equity and rate of return on regulated common equity.

The average rate base, return on rate base and rate of return on rate base is calculated on pg. 8 of Exhibit BVP-1 (1st Revision) for 1998 through to 2002 and forecast for 2003 and 2004. A summary of the relevant rate base figures presented by NP is as follows:

Financial Results and Forecasts
Rate of Return on Rate Base
(000's)

	Historical Data					Proposed	
	1998	1999	2000	2001	2002	2003	2004
Return on Regulated Common Equity	$ 22,299	$ 23,639	$ 27,237	$ 29,699	$ 29,518	$ 31,822	$ 33,429
Return on Preferred Equity	626	626	626	623	613	613	613
Finance Charges	25,233	26,488	26,641	26,700	26,853	30,774	31,626
Return on Rate Base	48,158	50,753	54,494[1]	57,024[1]	56,984	63,209	65,668
Average Rate Base	488,204	505,688	520,979	545,162	573,337	599,245	622,650
Rate of Return on Rate Base	9.86%	10.04%	10.46%	10.46%	9.94%	10.55%	10.55%

[1] Subject to rounding

NP's proposed rate of return on average rate base for 2003 and 2004 is 10.55% arrived at by dividing a forecast return on rate base of $63,209,000 (2003) and $65,668,000 (2004), by an average rate base of $599,245,000 and $622,650,000 respectively.

Grant Thornton conducted a review of the pre-filed evidence comparable to these revised figures and concluded that the results were calculated in accordance with established practice and contained no discrepancies. (Grant Thornton Report – NP 2003 GRA, pgs. 21; 26)

The Board heard no evidence contesting NP's proposed rate base calculations for 2003 and 2004 but notes these specific numbers will change based on other findings of the Board as contained in this Decision.

Specifically, the Board has determined that effective in 2003 the Asset Rate Base method will replace the Invested Capital approach currently used to calculate NP's rate base and as a result deferred charges will now be incorporated in this rate base.

Based on this decision the Board calculates the impact on average rate base for the 2003-2004 test year period as follows:

	2003 (000's)	**2004 (000's)**
Average Rate Base as proposed by NP	\$599,245	\$622,650
Average deferred charges	\$72,970	\$80,452
Revised average Rate Base	\$672,215	\$703,102

The rate of return on rate base proposed by NP for the test year period is 10.55%. The decision to include deferred charges in rate base affects the translation of the weighted average cost of capital into an allowed rate of return on rate base. In moving to the Asset Rate Base method the Board accepts the premise that the change should be neutral in terms of its impact on total allowed return and revenue requirement. The Board calculates the change in revised rate of return on rate base for the test year period based on NP's Application and incorporating the Board's decisions on rate base and ROE as follows:

Applying Formulas Designated A & B:

A. Weighted Average Cost of Capital (WACC) =

	% Debt	**x**	**Embedded Cost of Debt**
+	**% Preferred Equity**	**x**	**Rate of Return on Preferred Equity**
+	**% Common Equity**	**x**	**Rate of Return on Regulated Common Equity**

B.

$$\textbf{Rate of Return On Rate Base (RORB)} = \boxed{\frac{\text{Invested Capital}}{\text{Rate Base}} \times \text{WACC}} + \frac{Z}{\text{Rate Base}}$$

Calculations

2003

A. **WACC** = (54.28% x 8.54%) + (1.45% x 6.31%) + (44.27% x 9.75%)

= 9.04%

B. **RORB** = $\left[\frac{\$668{,}416}{\$672{,}215} \times 9.04\% \right] + \frac{(208)}{\$672{,}215}$

= 8.96%

2004

A. **WACC** = (54.05% x 8.39%) + (1.39% x 6.31%) + (44.55% x 9.75%)

= 8.97%

B. **RORB** = $\left[\frac{\$700{,}244}{\$703{,}102} \times 8.97\% \right] + \frac{(150)}{\$703{,}102}$

= 8.91%

With respect to the calculation of WACC above, the Board has considered the various components which factor into this calculation.

In previous sections of this Decision, the Board has stated its findings with respect to the capital structure and the cost of equity (ROE).

The cost of preferred equity proposed by NP is 6.31%. The calculation of this rate is detailed in Exhibit BVP-14. This rate compares with the 6.33% cost assigned to preferred equity in Order No. P.U. 16(1998-99). The Board did not hear any evidence contesting this rate of return for preferred shares and accepts the 6.31% as the cost of preferred equity as proposed. This rate of return of 6.31% will also be used as the allowed rate of return on any regulated common equity in excess of 45%.

The embedded cost of debt proposed by NP is 8.54% for 2003 and 8.39% for 2004. The calculation of these rates are detailed in Exhibit BVP-12 (1st Revision). The Board has reviewed the evidence relating to embedded cost of debt, including the forecast short-term interest rates, and accepts the embedded cost of debt as proposed for 2003 and 2004 of 8.54% and 8.39% respectively.

NP will be required to file a revised calculation of rate base and return on rate base for test years 2003 and 2004 which reflects the decisions taken by the Board.

2. Range of Rate of Return on Rate Base

In Order No. P.U. 36(1998-99) the Board approved an increase in the range of return on rate base from 24 basis points to 36 basis points, stating at pg. 70:

> *"The introduction of an expanded range of 36 basis points will provide an incentive for the company to improve productivity and will allow for some variation in financial variables other than those adjusted by the formula."*

In this Application NP has proposed an increase in the range of return on rate base from 36 basis points to 50 basis points. According to NP the small changes in customer rates in 2000 and 2002 suggests that the range of rate of return on rate base used in the Formula is too narrow. The offsetting rate changes would not have occurred with a wider range. NP concludes that a wide range of rate of return on rate base will potentially result in greater rate stability and predictability for both NP and its customers. [Pre-filed Evidence, B. V. Perry, (1st Revision), pg. 50]

NP's cost of capital expert witnesses also supported the expansion of the range, stating that it will promote efficiency and result in less frequent rate changes. (Written Submissions, NP, Section B, pg. 11/9-12)

The Consumer Advocate does not support expanding the range to 50 basis points, stating that *"There is no verifiable evidence to show that the increased range from twenty-four basis points to thirty-six basis points provided a corresponding improvement in efficiency…."* (Final Submission, Consumer Advocate, pg. 30):

The Consumer Advocate argued that the only beneficiary was NP which benefited from additional revenue in 2000 and 2001 as a result of an expanded range of rate of return on rate base. If the range had been maintained at 24 basis points the Consumer Advocate submitted NP would have over earned in those years, and that this additional revenue would have gone into the Excess Revenue Account. (Final Submission, Consumer Advocate, pgs. 30-31)

In assessing this proposal Grant Thornton provided the following caution to the Board (Supplementary Evidence, Grant Thornton Report, pg. 7/15-18):

> *"In assessing the Company's proposal to expand the range of allowed return the Board should consider the issue in the context of the determination of the overall cost of capital. All of the factors related to rates of return and cost of capital are interrelated and none, including the range of allowed return, should be assessed in isolation."*

Grant Thornton also suggested the Board consider three additional factors in assessing the appropriateness of an expanded range of rate of return on rate base:

i) an expanded range will potentially decrease the number of rate changes and result in greater rate stability and predictability;
ii) expanding the range results in a higher upper limit for the allowed return on rate base; and

iii) the range of rate of return can provide an incentive for NP to improve productivity and generate operating efficiencies resulting in lower costs which would be passed on to ratepayers in a subsequent rate hearing.

The proposed change in the range of rate of return on rate base does not affect the determination of NP's overall revenue requirement for the test year period since the allowed return on rate base is the mid-point of the allowed range. The proposed change would result in a higher upper limit for the allowed return and for the purposes of defining the Excess Revenue Account.

In Exhibit BVP-20 (1st Revision) NP demonstrates that the proposed 50 basis point range of return on rate base is based on a 100 basis point range for rate of return on regulated common equity. In Supplementary Evidence (pg. 7/12-13), Grant Thornton stated that the current 36 basis point range for return on rate base has an implied 73 basis point range of return on regulated common equity for 2003. The Board notes that with the inclusion of deferred charges in rate base, this implied range of return on regulated common equity increases from 73 to 81 basis points. This change is not considered significant enough to warrant a change in the range of rate of return.

In the Board's view the range of rate of return on rate base can act as an incentive device to encourage NP to seek efficiencies between rate hearings, which can then be passed on to customers. This is evidenced in the operational efficiencies and cost savings that have been implemented by NP since the last rate hearing in 1998. The Board does not agree with the Consumer Advocate that only NP has benefited from the expanded range set by the Board in 1998. Ratepayers will derive the benefit for the efficiencies through lower costs, and hence lower rates into the future. The Board believes it is important to maintain the range as an incentive for NP to continue to seek efficiencies and productivity improvements in its operations.

The Board is not convinced however that a further expansion in the range from 36 basis points to 50 basis points, as proposed by NP, is warranted or necessary at this time. In the Board's view, while there are opportunities for future operating efficiencies, the Board feels that the existing range of 36 basis points has served both NP and ratepayers well over the period of operation of the Formula and should be maintained.

The Board will approve a range of 36 basis points for the rate of return on rate base for test years 2003 and 2004 and for use with the Formula, unless otherwise ordered by the Board.

VIII. ACCOUNTING TREATMENT AND POLICIES

1. Amortization of Recovery of Balance in Weather Normalization Reserve

The Weather Normalization Reserve is a combination of two reserves: Degree Day Normalization Reserve and Hydro Production Equalization Reserve. The Degree Day Normalization Reserve normalizes the company's revenue and purchased power costs for annual variations in weather conditions. The Hydro Production Equalization Reserve normalizes the company's purchased power expense for annual variations in normal stream-flows to its hydro plants.

The balances in the Weather Normalization Reserve are filed with and approved annually by the Board. The balance in the reserve owing from customers as at December 31, 2001 is outlined below [Pre-filed Evidence, B. V. Perry, (1st Revision), pg. 62]:

Weather Normalization Reserve Balance as at December 31, 2001 ($millions)	
Hydro Production Equalization Reserve	9.4
Degree Day Normalization Reserve	0.5
Total	**9.9**

While the degree day variations have been observed to be approximating zero over time, the balance in the Hydro Equalization Reserve owing from customers has been increasing since 1987 and is at $9,400,000 at the 2001 year end. The following table provides a breakdown of this balance for each contributing factor [Pre-filed Evidence, B. V. Perry, (1st Revision), pg. 65]:

Breakdown of the 2001 Hydro Production Equalization Reserve Balance ($millions)	
Increase in purchased power mill rate	4.9
Decrease in Income Tax Rate	0.7
Variation from Normal Stream Flows	3.8
Total	**9.4**

In Order Nos. P.U. 9(2001-2002) and P.U. 2(2002-2003) the Board ordered "*At the next general rate review, the function and methodology of the Weather Normalization Reserve will be reviewed by the Board whereby the Applicant shall present its views on the function and methodology of the reserve and its proposal for the disposition of the deficit balance contained in the reserve account.*" This issue was reviewed as part of this hearing. While NP has not proposed any changes in the function and methodology of the reserve account, NP does propose to recover the portion of the weather normalization reserve that is not expected to reverse over time.

NP states that the reserve balance of $5,600,000 resulting from increases in the purchased power mill rate ($4,900,000) and the income tax rate ($700,000) is not expected to reverse over time. For this reason NP is proposing to amortize the recovery from customers of the $5,600,000 balance in the Hydro Production Equalization Reserve ($8,700,000 pre-tax) over 5 years beginning in 2003. The amortization for the period 2003 through 2007 increases purchased power expense by approximately $1,700,000 in each year.

NP commissioned a Water Management Study in 2000 and, based on the recommendations of this study, adjusted its annual normal production levels for the purposes of calculating transfers to or from the Hydro Production Equalization Reserve. As recommended in the study, NP is also proposing a further review of normal hydro production levels and reserve balances in 2005, and every five years thereafter. This review will include a review of the mill rate and the income tax rate changes so that any necessary adjustments can be put to the Board for approval.

NP states that, as a result of its review, the Degree Day Normalization reserve is working as intended and no changes or necessity for further review are proposed.

NP's expert accounting witness, Mr. J. T. Browne, provided evidence as to whether NP's proposed treatment of the non-reversing portion of its Hydro Production Equalization Reserve is consistent with established regulatory principles. (Pre-filed Evidence, J.T. Browne, <u>Accounting and Regulatory Issues Related to Future Employee Benefits and the Hydro Production Equalization Reserve, October 11, 2002</u>, pgs. 15-16) Mr. Browne stated that the reserve represents a cost of providing regulated service and that, according to the cost of service standard, NP should have a reasonable opportunity to recover the balance through allowed rates, including the non-reversing amounts. He also stated that the issue is in what period should it recover the non-reversing amounts. Mr. Browne provides the following opinion on the recovery period at pg. 15 of his report:

> *"With the information now available, the non-reversing amount represents costs of providing service in previous periods. Since it is not possible to adjust past rates, it would normally be appropriate to recover the balance through rates over as short a period as is reasonable, such as a period within three to five years. However, the non-reversing amount was built up over a period of 30 years. Therefore the principle of intergenerational equity is not as applicable as it might otherwise be. As a result, it is reasonable to place more of an emphasis on smoothing the impact of the amortization on rates, consistent with the principle of rate stability and predictability. An amortization period of five years achieves this. Accordingly, a five-year amortization is appropriate".*

Mr. Browne concludes that NP's proposed treatment of the non-reversing portion of its Hydro Production Equalization Reserve is consistent with established regulatory principles.

In written submission (pg. 80-81) the Consumer Advocate cautioned the Board "*to rely on its own view of intergenerational equity*" when determining the length of time over which the outstanding balance should be recovered. Although not explicitly stated the Board takes from the Consumer Advocate's submission that a longer recovery period is preferable. A longer recovery period would reduce the revenue requirement in each year.

Grant Thornton reviewed NP's proposals with respect to the Hydro Production Equalization Reserve and found the proposals reasonable. Grant Thornton also agrees that the disposition of the $5,600,000 outstanding balance that will not reverse over time is appropriate at this time. The proposed amortization period of five years was seen as reasonable and in line with amortization periods used for prior balances, such as the amortization of the change in GEC from full cost accounting to incremental, and the true-up variance from the 1996 Gannett Fleming depreciation study. The impact on rates is also minimized as compared to a shorter recovery period such as three years. The impact on revenue requirement is $1,120,000 for a five-year amortization period as compared to $1,870,000 for a three-year recovery period. (Grant Thornton Report-NP 2003 GRA, pg. 6/7-9)

The Board is satisfied that NP's proposal to amortize the recovery of the non-reversing portion of the Reserve is reasonable and will address in part some the concerns raised in Order No. P.U. 9(2001-2002). With respect to the appropriate amortization period the Board accepts that five years is a reasonable recovery period which will allow NP to recover its costs while minimizing the impact on consumers. The Board is reluctant to extend recovery of any outstanding balance longer than necessary. The Board also accepts NP's proposal to review the balance in the reserve at the end of each five-year period and identify any non-reversing amounts. The timing of this review will coincide with the recovery period for the current outstanding balance approved in this Decision.

The Board will accept NP's proposal to amortize the recovery of the $5,600,000 balance in the Hydro Production Equalization Reserve over a period of five years, beginning in 2003. NP will be required to review the balance in the Hydro Production Equalization Reserve as of December 31, 2005 and to apply to the Board for an Order as to the disposition of outstanding balances, positive or negative, as part of its next general rate application.

2. Adjustments to Pension Accounting

NP currently uses the fair market method to value pension assets for the purposes of determining pension expense. NP has proposed to adopt the market-related method on a prospective basis beginning on January 1, 2003. NP states the basis for using the market-related value approach to calculate expected return on pension plan assets is to create a smoothing impact on its pension expense. NP also submits that the use of a three-year moving average provides a rational and systematic manner to recognize the pension expense and reduces the volatility of that expense caused by changing market conditions.

Grant Thornton reviewed NP's proposal and found that the pension accounting changes as proposed are reasonable and in accordance with Section 3461 of the CICA Handbook and with Generally Accepted Accounting Principles (GAAP). The move to a market-related approach will reduce pension expense in 2003 from $4,500,000 to $3,300,000, and in 2004 pension expense will be reduced from $3,600,000 to $3,400,000. (Grant Thornton Report-NP 2003 GRA, pg. 6/38-43) This results in lower revenue requirement, and therefore lower rates.

NP is proposing to adopt this approach on a prospective basis beginning January 1, 2003 rather than on a retroactive basis. NP submits that this approach is consistent with other accounting policy changes previously approved by the Board. For example, in Order No. P.U. 17(1987) the Board approved the adoption of the CICA recommendations on pension accounting on a prospective basis. [Pre-filed Evidence, B. V. Perry, (1st Revision), pg. 68/4-5]

The Board will approve NP's proposal to adopt the market-related method of determining pension expense on a prospective basis, effective January 1, 2003.

3. Depreciation Accounting

i) Depreciation Study Update

In Order No. P.U. 7(1996-97) the Board ordered NP to submit its next depreciation study in 2001. On December 14, 2001 NP filed with the Board a depreciation study prepared by Gannett Fleming Valuation and Rate Consultants, Inc. (*"Gannett Fleming"*) based on plant in service as at December 31, 2000. The service life analysis performed by Gannett Fleming in the 2001 study resulted in a reduction in the depreciation rates recommended for Distribution, Transmission, Substation and Transportation equipment. The study also provided a comparison between the accumulated depreciation recorded by NP with respect to plant in service as of December 31, 2000 and a calculated reserve based on the new depreciation rates recommended. The actual reserve variance as of December 31, 2000 was calculated by Gannett Fleming at $5,100,000. [Pre-filed Evidence, B. V. Perry, (1st Revision), pg. 55/20-22]

In addition to the change in depreciation rates, Gannett Fleming recommended that NP adopt the mid-year convention for book depreciation practices. NP had historically calculated annual depreciation expenses using the full year convention, which assumes all property is in service for twelve months in the year it is installed. This results in a full year of depreciation recorded for current year's additions. The mid-year convention assumes that all property is installed on July 1 of each year, so that only a half-year of depreciation expense is recorded for current year's additions. Based on Gannett Fleming's recommendation NP adopted the mid-year convention in 2001, resulting in a reduction in depreciation expenses for 2001 of approximately $900,000 in that year. [Pre-filed Evidence, B. V. Perry, (1st Revision), pg. 56/11-13]

As part of this Application NP filed an updated depreciation study, also completed by Gannett Fleming. This study reflects changes in plant in service as at December 31, 2001 and also includes, as part of the plant in service, the joint use poles purchased from Aliant. In addition Gannett Fleming calculated the accumulated reserve variance as at December 31, 2001 based on the mid-year convention for book depreciation as adopted by NP in 2001. In the updated study Gannett Fleming recommended that NP record the joint use poles purchased from Aliant using original cost and accumulated depreciation. Gannett Fleming also recommended that NP continue to use the straight-line equal life group method that it has been using for a number of years for its plant assets with the exception of certain General and Communication accounts.

The Consumer Advocate did not raise any specific objections to the recommendations of the 2002 Depreciation Study as proposed by NP to be adopted on a prospective basis. In written submission (pg. 80) the Consumer Advocate argued that, if NP had adopted the recommendations of the 2001 Gannett Fleming Study in 2002, NP's revenue requirement for that year could have been reduced by $5,800,000. The Consumer Advocate submits that this contributed to NP's higher ROE return in 2002.

Grant Thornton reviewed the 2002 Updated Depreciation Study and confirmed that the results and recommendations of the study have been incorporated into NP's depreciation estimates for 2003 to 2004. Grant Thornton also confirmed that the use of the half-year rule for calculating depreciation on net capital additions is very common practice and is in compliance with generally accepted accounting principles. (Grant Thornton Report-NP 2003 GRA, pgs. 11-12)

The Board has reviewed the submissions and evidence regarding the Depreciation Study and accepts the recommendations of the study. The Board does not accept the Consumer Advocate's submission that adoption of the study in 2002 would have reduced NP's revenue requirement. The Board considers the issue of revenue requirement as part of its consideration of test year expenses in a general rate hearing. Adoption of any of the recommendations outside a test year period would not have affected rates to consumers, whether the impact was positive or negative.

The Board will approve the 2002 Depreciation Study as filed. The depreciation rates as recommended in the Depreciation Study will be approved for calculating depreciation expense for the test year period 2003 and 2004

ii) Reserve Variance Adjustment

Gannett Fleming has calculated the accumulated reserve variance as at December 31, 2001 based on application of the mid-year convention. This results in an increase in the reserve variance from $5,400,000 as at December 31, 2000 to $17,200,000 as at December 31, 2001. Gannett Fleming has recommended that where the reserve variance exceeds 5% on an individual account basis, the accumulated reserve variance for that account be amortized over the account's composite remaining life. This would result in a reduction of depreciation expense (*"true-up"*) of $1,200,000 in each of the next five years, and would still result in accumulated reserve variances not being fully amortized. This approach was also recommended by Gannett Fleming in the 1996 Depreciation Study. In Order No. P.U.7 (1996-97) the Board determined that from the perspective of correcting a depreciation estimate every five years (based on the time frame between depreciation studies) the amortization of the accumulated reserve variance over five years has the quality of intergenerational equity. If a 5-year amortization period is used for the true-up, depreciation expense is reduced by $3,500,000 in each of the next 5 years. [Pre-filed Evidence, B. V. Perry, (1st Revision), pgs. 58-59]

In this Application NP is proposing that the reserve variance in excess of 5% be amortized over a three-year period 2003-2005, resulting in a depreciation expense reduction or *"true-up"* of $5,800,000 in each of these years. NP states that the three-year amortization period coincides with the next depreciation study expected in 2006, based on plant in service as of December 31, 2005 and is consistent with the Board's view on intergenerational equity expressed in Order No. P.U. 7(1996-97). This approach also reduces the costs borne by NP's customers for that period. [Pre-filed Evidence, B. V. Perry, (1st Revision) pg. 60] Based on NP's proposal the amount of $5,800,000 has been used to reduce NP's revenue requirement in each of 2003 and 2004.

While the Board adopted a five-year amortization period for the depreciation expense true-up in 1996, NP's proposal in this Application to use a three-year recovery period reduces expenses for the test year period and results in lower costs to be recovered from consumers. The Board agrees with NP that this proposal is consistent with the principle of intergenerational equity.

The Board will approve NP's proposal to amortize the depreciation reserve variance over the three-year period 2003-2005.

4. Accounting Treatment for Other Employee Future Benefits

NP's other employee future benefits, other than pensions, include retirement allowances to qualifying employees and the cost of health, medical and life insurance for retired employees. These expenses are currently recognized by NP on a cash basis. The current costs for health, medical and life insurance for retired and current employees is estimated to be $1,400,000 in each of 2003 and 2004, of which approximately 75% is charged to operating expenses. The cost of retirement allowances in 2003 and 2004 is estimated to be $200,000. These costs are tax deductible in the year they are incurred [Pre-filed Evidence, B. V. Perry, (1st Revision), pg. 71]

Section 3461 of the CICA Handbook recommends the use of the accrual method of accounting for other employee future benefits effective January 1, 2000. The accrual method requires the financial statements to reflect the estimated cost incurred during the financial reporting period.

NP states that adopting the accrual method of accounting for these benefits would represent a change in accounting policy for the company. In Exhibit BVP-25 (1st Revision) NP compares the current cost of its employee future benefits and the estimated accounting expense for these benefits if the company adopted the CICA recommendations. According to this Exhibit a change to accrual accounting for other employee future benefits will result in a $4,100,000 increase in revenue requirement for 2003, including additional income tax of $1,500,000.

As a result of the impact of moving to the accrual method NP is proposing to continue to account for employee future benefits on a cash basis. NP also states that it will continue to monitor this obligation and corresponding regulatory practice and that it may propose to recover these costs on an accrual basis in the future.

NP's accounting expert witness, Mr. J.T. Browne, provided the following opinion on this issue (Pre-filed Evidence, J.T. Browne, <u>Accounting and Regulatory Issues Related to Future Employee Benefits and the Hydro Production Equalization Reserve, October 11, 2002</u>, pg. 10):

> "*NP is not following Section 3461 in accounting for its OFEBs and what GAAP would normally require. However, as long as it is reasonably expected that rates will produce sufficient additional revenue to cover the cost of the future employee benefits in rates when payment is required and such rates will be chargeable and recoverable from customers, NP's accounting policy for its OFEBs is in accordance with GAAP. If the Board approves NP's proposal to continue with the pay-as-you-go method for rate setting purposes, it is likely that the above conditions will be met and NP's accounting policy for its OFEBs will be in accordance with GAAP.*"

In addressing the question of whether NP's treatment of employee future benefits for rate setting purposes is consistent with established regulatory practice, Mr. Browne concludes at pg. 13 of his report that:

> *"From the perspective of the principle of intergenerational equity, the accrual method for recovering OFEB costs is preferable to the pay-as-you-go method proposed by NP. However, the NP proposal is a practical approach that recognizes the impact of dealing with the transition from one method to the other".*

Grant Thornton also reviewed NP's proposal and concluded that NP's proposal of using the cash basis for accounting for other future employee benefits is acceptable. (Grant Thornton Report-NP 2003 GRA, pg. 8/1-2)

In addressing this proposal the Board is cognizant of the fact that in Order No. P.U. 7 (2001-2002) it approved NLH's proposal to adopt the accrual method of accounting for other employee future benefits in accordance with GAAP. However as part of its proposal, NLH did not propose to recover from ratepayers the actuarial accrued balance of other employee future benefits of $21,200,000, proposing instead to write-off this balance against prior period earnings. In the case of NP the additional cost to ratepayers of moving to the accrual method is in the order of $4,100,000 in each of 2003 and 2004. To avoid rate impact on consumers the Board is prepared to accept NP's proposal to continue with using the cash basis for recognizing expenses for other employee future benefits.

The Board is concerned about the potential liability for employee future benefits and is of the view that NP should explore using the accrual method of accounting for these benefits. The Board recognizes that there are significant transitional obligations associated with this change in accounting policy but once the transitional obligation has been met these costs should decrease. NP should continue to monitor its obligations with respect to employee future benefits and corresponding regulatory practice. The Board will direct NP to propose a plan at its next general rate application for moving towards the accrual method of accounting for employee future benefits as recommended by CICA. The Board emphasizes such a plan should be presented to the Board as an alternative to the existing method and should address the transitional impact with a view to fulfilling NP's obligation to its employees while at the same time moderating its impact on rates. The Board will then be in a position to consider this alternative accrual method and its specific impacts at the next hearing.

The Board will approve NP's proposal to continue using the cash basis for recognizing expenses for other employee future benefits. With its next general rate application, NP will be required to submit a report which addresses the use of the accrual method as an alternative to the existing accounting treatment for other employee future benefits.

5. Amortization of Regulatory Costs

NP is proposing to amortize over a three-year period the estimated external costs of $1,200,000 associated with the public hearing of this Application. This results in a recovery of $400,000 per year for each of the next three years. This proposed treatment of hearing costs is similar to that approved by the Board in Order No. P.U. 36 (1998-99) following NP's 1998 General Rate Proceeding. In that Order the Board approved amortization of external hearing costs of $1,150,000 over a three-year period commencing in 1999.

Grant Thornton has reviewed NP's proposal and concludes that the proposal is reasonable. According to Grant Thornton the deferral of such costs is intended to better match the costs of major proceedings over the intervening period and also smoothes the effect on NP's cost of service, which is advantageous to the consumer.

The Consumer Advocate and NLH did not raise any issues with this proposal. The Board accepts the proposal as reasonable and consistent with past regulatory practice.

The Board will approve NP's proposal to amortize over a three-year period, beginning in 2003, the estimated regulatory costs of $1,200,000.

6. Disposition of Excess Revenue Account – 2001 Excess Earnings

In Order No. P.U. 29(2001-2002) the Board approved the following definition of the Excess Revenue Account:

> *"This account shall be credited with any revenue in excess of the upper limit of the allowed range of return on rate base as determined by the Board. Disposition of any balance in this account shall be as determined by the Board. For 1998 all earnings in excess of 9.99% rate of return on rate base, for 1999 all earnings in excess of 10.16% rate of return on rate base, for 2000 and 2001 all earnings in excess of 10.46% rate of return on rate base, and for 2002 and subsequent years all earnings in excess of 10.24% rate of return on rate base shall, unless otherwise ordered by the Board, be credited to this account."*

In 2001 NP earned excess revenue of $944,000 over the upper limit of the allowed range of return on rate base of 10.46% as set by the Board for 2001. This amount was reported by NP to the Board in Return 10A of its 2001 Annual Report to the Board. As required this amount was set aside in the Excess Revenue Account to be disposed of as determined by the Board. In this Application NP is proposing to apply this excess revenue to reduce the revenue requirement equally for 2003 and 2004 ($472,000 in each year), which will in turn result in lower rates to customers over this period. [Pre-filed Evidence, B. V. Perry, (1st Revision), pg. 74/6-8]

Grant Thornton reviewed NP's proposal and concluded that NP's proposed approach was reasonable and that ratepayers will receive full recovery of the $944,000 over the two-year period 2003 and 2004 (Grant Thornton Report-NP 2003 GRA, pg. 9/13-15). Grant Thornton also addressed the option of rebating the amount directly to consumers, as was approved by the Board in dealing with the disposition of the 2000 excess earnings of $6,500,000. Grant Thornton points out that, since NP is requesting a rate increase in this Application, rebating the excess earnings to consumers would result in a higher increase in rates being requested for 2003. As well the magnitude of the 2001 excess earnings is considerably less than it was for the 2000 excess earnings and hence the impact on consumers would be significantly less.

During the hearing the Consumer Advocate raised the issue of the appropriate disposition of the Excess Revenue Account, suggesting that any amounts in the Excess Revenue Account should be rebated to consumers forthwith. (Transcript, April 8, 2003, pg. 88/14-22 and pg. 89/6-12) The Consumer Advocate also suggested that NP's handling of the Excess Revenue Account disposition during its rate filing was not transparent and was confusing to consumers.

The Board is satisfied that NP has acted properly and in compliance with Board directives with respect to the Excess Revenue Account, and in particular in relation to the disposition of the existing balance. The Board approved the existing definition of this Account in Order No. P.U. 29(2001-2002) and NP has properly credited this account in 2001 with earnings above the 10.46% rate of return on rate base, as required. The Board has the authority and discretion to determine the disposition of this Account and the Board will exercise this discretion in this Decision.

As a result of the Board's finding in this Decision on the ROE to be used in setting the rate of return on rate base, the Board expects that there will be a decrease in revenue requirement for the test year period. As a result NP's proposal to apply the 2001 excess earnings against the increased revenue requirement to minimize the rate increase is no longer valid. In the Board's view the appropriate disposition of this account would be to rebate the excess earnings to customers.

The Board finds that the 2001 excess earnings of $944,000 should be rebated to customers. NP will be required to submit a proposal for this rebate as part of its filing of revised rates.

7. 1992-1993 Excess Earnings

In Order No. P.U. 36(1998-99) the Board determined that there were excess earnings in 1992 and 1993 totalling $1,908,000 on an after tax basis. The Board ordered "*The amount of $1,908,000 which is the total of the after tax excess earnings for 1992 and 1993, be established as a component of common equity on which no return will be allowed for the period 1999-2003. The total amount to be recovered is $954,000, which represents one-half of the after tax excess earnings, and a review will take place before the end of the year 2003 as to the disposition of any outstanding amount.*"

Since 1999 NP has been complying with this Order and, up to 2002, has recovered $715,118 of the total $954,000, leaving $238,882 remaining to be recovered. [Pre-filed Evidence, B. V. Perry, (1st Revision) pg. 85] The amount of $715,118 recovered from 1999 to 2002 represents a reduction in revenue from rates and savings to ratepayers of $1,233,000 over this period.

NP is proposing to recover the outstanding amount over the two-year period 2003-2004, by adjusting rates as of August 1, 2003 to give a prorated recovery based on energy sales from

August 1 to December 31, 2003. The effect of this adjustment would be a total recovery of $112,000 in 2003 and $335,000 in 2004, for a total recovery of $447,000, including income tax effects. [Exhibit BVP-28, (1^{st} Revision)]

Grant Thornton reviewed NP's proposal and concluded the approach was reasonable and achieves better than full recovery for ratepayers over the two-year period. (Grant Thornton Report-NP 2003 GRA, pg. 10/32-34)

The Board will accept NP's proposal for adjusting 2003-2004 revenue requirement to recover the outstanding amount of the 1992-1993 excess earnings as required by Order No. P.U.36(1998-99), subject to any adjustments arising from this Decision.

8. Deferral of Certain Outstanding Issues

i) Revenue Recognition Study

NP has asked the Board for approval to defer dealing with the outstanding issues relating to the revenue recognition study and the Unbilled Revenue Increase Reserve Account pending resolution of an outstanding dispute with the Canada Customs and Revenue Agency (CCRA). The dispute deals with NP's current policy of revenue recognition and an associated income tax reassessment by CCRA.

NP has always recorded revenue as customers are billed whereas CCRA's position is that NP is required to report its revenue on the accrual basis. NP maintains that it is recording revenue in accordance with Board Orders. The issue relates primarily to the billings and associated revenue for electrical consumption for the last two weeks of the year, for which bills are issued after December 31. The revenue for those two weeks is approximately $20,000,000, before taxes. (Transcript, April 9, 2003, pg. 5/2-25; pg. 6/1)

In Order No. P.U. 36(1998-99) the Board ordered NP to file a revenue recognition study with the Board before its next general rate application or by March 31, 2000, whichever is earlier. The Board later amended this Order by deleting reference to March 31, 2000 and substituting the words *"at such time to be determined by the Board."*

NP submitted that the filing of a revenue recognition study at this time could potentially prejudice its position with respect to its dispute with CCRA over the Income Tax Reassessment. According to NP if it were to lose this dispute it would mean a liability of approximately $14,400,000, of which 50% has already been deposited with CCRA. This liability would have to be recovered through electricity rates.

The Consumer Advocate questioned NP's company witness, Mr. Perry and Mr. Brushett of Grant Thornton, the Board's Financial Consultant, on this issue. In response to a question from the Consumer Advocate on the revenue impact to NP of using the accrual method to recognize revenue, Mr. Brushett testified: (Transcript, April 9, 2003, pg. 6/12-25)

A. From an accounting point of view, you're correct in that there would be additional revenue recognized offsetting an expense that would have to be recognized. But just so that the record's clear and the Board understands, there's no extra revenue. There will be no extra cash coming in. It's a timing thing. This is revenue that, under an accrual method, would be recognized in December instead of being recognized in January. So it's no extra cash available to pay it as such but it is, from an accrual accounting point of view, the timing of recognition, yes, one would offset the other.

The Consumer Advocate's position on this issue was set out in final submission (pg. 79):

"If, as it appears, there is no detriment to consumers by changing to the accrual method advocated by CCRA no further expenditures should be made from regulatory funds in reference to this issue. If NP's shareholder wishes to proceed with the case for reasons best known to itself, the cost of financing this case, together with interest and penalties, should come from non-regulated funds or be supported entirely by NP's shareholders."

The Board has outlined its position with respect to the revenue base and the revenue recognition policy of NP in Order No. P.U. 36(1998-99). The Board accepts NP's position in this proceeding that any further consideration of this issue at this time may prejudice the outcome of its current dispute with CCRA with respect to the Income Tax Reassessment relating to revenue recognition. The Board does not agree with the Consumer Advocate that NP's pursuit of this issue with CCRA is not beneficial to ratepayers. Resolution of the issue will provide certainty to the Board and NP on a go forward basis. The Board will deal with any issues arising from the final decision of the tax case, including any potential liabilities or benefits to ratepayers, once the case has been resolved.

The Board will approve NP's request to defer dealing with the outstanding issues relating to the Revenue Recognition Study pending resolution of the dispute with CCRA.

ii) Unbilled Revenue Increase Reserve Account

In Order No. P.U. 36(1998-99) the Board established an unbilled revenue increase reserve account to record the difference between recognizing revenue based on the two differing revenue recognition policies and the difference arising from a delayed implementation of an approved rate increase from January 1, 1999 to February 1, 1999. The Board ordered that the disposition of this account be dealt with after the revenue recognition policy has been fully reviewed at a public hearing.

Since the Board has agreed to the deferral of the issues relating to the Revenue Recognition Study until the dispute between NP and CCRA is resolved, the Board will also approve NP's request to defer dealing with the disposition of the unbilled revenue increase reserve account. This issue will be dealt with as part of the Order arising from consideration of the Revenue Recognition Study to be filed by NP, as was intended in Order No. P.U. 36(1998-99).

9. Accounting for Early Retirement Programs

The Consumer Advocate raised the issue of NP's accounting treatment of early retirement programs. In 1999 NP applied to the Board for approval to amortize and fund pension liability over an extended period, which was approved in Order No. P.U. 24(1999-2000). However in 2000 and 2001 early retirement programs were funded and expensed in those years. The Consumer Advocate argues that this *"uneven treatment of such an expense can lead to consumers losing out on a fair opportunity to share in NP's excess revenue if in that year NP manages to over-earn on its ROE but stays within its range of return on rate base, based on NP's interpretation of the Stated Case."* (Final Submission, Consumer Advocate, pg. 81) The Consumer Advocate recommends a 10-year amortization for early retirement programs.

NP's position on this issue is stated below [Pre-filed Evidence, B. V. Perry (1st Revision, pg. 69/11-16]:

> *"CICA recommendations provide that the cost of early retirement programs be recorded in the current period. When the forecast cost of any retirement program is so large that recognition of the costs in one accounting period will have a material negative impact on Newfoundland Power's financial position in that particular year, the Company has applied to the Board to deviate from CICA recommendations and amortize the early retirement program costs over a period of years."*

On questioning by Board Hearing Counsel Mr. Perry described NP's approach to deciding how to expense an early retirement program:

> A. ….I think when we assess the financial operations of the Company and make our decision whether to come before the Board, that's a management assessment, you know, we're at the point in the year when we're prepared to offer the program, can we expense it right away, get the cost out of the way immediately and not come before the Board based on our judgement of what the financial results are, I think that's management, you know, it's strictly management, so I believe it's working the way it is right now, and I think the Company has proven that its approach on early retirement programs are doing very good and it's been probably the biggest tool we've had to cut costs in our operations. So I'm not certain it's one that we should tinker with.
> (Transcript, March 11, 2003, pgs. 152-153/14-6)

Mr. Brushett of Grant Thornton was also questioned on this issue by the Consumer Advocate. When asked about the impact of expensing the early retirement programs in 2000 and 2001, both years when NP had excess earnings, Mr. Brushett stated:

> A. That's correct. In those two years, had there been a decision to defer and amortize, there would have been additional excess earnings. But I guess the other consideration that the Board would have to look at here is that the costs would be recovered from rate payers at some point. It's just a matter—what we're talking about now is the timing. So are they charging off in those years, in years when, for lack of better terminology, you know, they can be absorbed. They do reduce, hypothetically, a rebate that might otherwise go back to consumers, but that would be giving them a cheque today and taking it back from them in 2004, 5, 6, 7 and 8. So it's really what we're talking about is timing, and I think those are the issues that the Board would have to consider. At the end of the day, the total cost of these amendments to the pension plan and the cost of the early retirement programs would be recovered from rate payers. It's just a matter of can you absorb it in those years or-

Q. Sure. And I'm not denying that they would be recovered, I'm just wondering what the timing is and shouldn't that be some consistent policy.

A. So under the scenario that you're suggesting, you know, might have resulted in a rebate in those years, but then rates would be higher next year and the year after and so on as a result of that. So that's I guess the considerations that the Board would have to take into account in assessing it.

The Board agrees with NP that the decision to offer early retirement programs and the accounting treatment of those programs is a management issue and that CICA guidelines should apply in the first instance. If the impact on the financial position of NP of expensing the costs as required by CICA is material then NP would either have to not offer the program or apply to the Board to recover those costs over a period of time. The costs for the 2000 and 2001 early retirement programs were not recovered in rates and, now that the programs have been expensed, will not be required to be recovered in future rates. Consumers are also benefiting on a go forward basis from the lower operating costs resulting from reduced labour expenses. While amortization of the 2000 and 2001 programs may have resulted in higher excess earnings, amortization would also mean that those costs would now be incorporated into rates for recovery. The Board agrees with Mr. Brushett that, from a consumer perspective, it's an issue of timing and that ultimately the total costs of any program would be recovered.

The Board accepts NP's treatment of expenses associated with the 2000 and 2001 early retirement programs.

IX. REVENUE REQUIREMENT

1. Test Year

Section 3(a)(ii) of the *EPCA* states:

"It is declared to be the policy of the province that…

(a) the rates to be charged, either generally or under specific contracts, for the supply of power within the province…

(ii) should be established, wherever practicable, based on forecast costs for the supply of power for 1 or more years."

NP's proposals for revenue requirement and resulting rate changes are based on test years 2003 and 2004. It has been the practice of the Board to utilize forward-looking test year costs for a single year. The 1998 hearing utilized forecast costs for 1999 as the test year for the purpose of setting rates and also for implementing the automatic adjustment formula.

The issue of the use of a 2003 and 2004 test year period was canvassed by Board Hearing Counsel in cross examination of Mr. Perry (Transcript, March 13, 2003, pg. 79/81):

Q. Mr. Perry, we'll start with a general question, if you will, in a number of instances in the application, Newfoundland Power is asking for the Board's approval of accounting treatments or rates of return or the fixing or determining of forecast rate base for both fiscal year 2003 and fiscal year 2004. And I'm wondering if you could tell us whether, from a Company's perspective, do we have a 2003 test year that the Board's dealing with or a 2004 test year or are both test years from the power company's perspective?

A. Commissioners, we've had some debate on this, I guess, internal to the Company, but essentially we're looking at both years. We believe that by the time we get through the hearing and we receive the order of the Board we're going to be halfway through this year probably. So we feel that brings in 2004 as the year that will see the full impacts of the Company's proposals and the Board's order. So, we felt that it made sense if we could put together a proposal that carried us through both years and that's how we see it.

Q. So, you see 2004 as a test year, then?

A. Yes, I guess I would say that, Mr. Kennedy, you know, essentially, it's – we're looking at the two-year period as what we've put before the Board as being, you know, what the Company believes is sufficient to carry it through to the end of 2004…

None of the other parties took a position on the issue of the test year.

The Board accepts NP's reasoning for proposing a test year period to cover 2003 and 2004. Many of the proposals for deferred costs and amortization of recoveries have been spread over the two-year period. If the Board were to adopt a test year of 2003 along with an automatic adjustment formula, the Formula would have to be used in the fall of 2003 to set rates for 2004, which could result in two rate adjustments within a relatively short time frame.

The Board will use fiscal years 2003 and 2004 as the test years for determining revenue requirement, as proposed by NP.

2. Test Year Revenue Requirement

Revenue requirement is the sum of the required return on rate base, depreciation and total operating costs to be recovered from consumers in rates. Total operating costs include purchased power, income taxes and operating expenses.

NP's proposed revenue requirement is shown below: [Exhibit BVP-26 (1st Revision); Pre-filed Evidence, B. V. Perry, (1st Revision), pg. 83]

Summary of Proposed 2003 and 2004 Revenue Requirement ($000s)		
	2003	**2004**
Purchased Power	226,499	229,941
Operating Expenses	51,837	52,434
Depreciation Expense	29,234	30,589
Income Taxes	16,644	16,983
Return on Rate Base	63,209	65,668
	387,423	**395,615**
Deductions:		
Other Revenue	(7,787)	(8,593)
2001 Excess Revenue	(472)	(472)
Non-Regulated Expenses (Net of Tax)	(725)	(725)
Revenue Requirement from Rates[1]	378,439	385,825
Revenue from Existing Rates[2]	377,237	82,193
Required Increase in Revenue from Rates	**1,202**	**3,632**

[1] Before adjustment for 1992-1993 Excess Earnings (See pg. 86 of this Decision).

[2] Rates as approved by Order No. P.U. 29 (2001-2002) as adjusted for RSA and MTA in Order No. P.U.22 (2002-2003) and continued as interim rates under Order No. P.U. 35 (2002-2003)

The following expenses comprising NP's proposed revenue requirement are reviewed by the Board:

i) Purchased Power

Purchased power expense is the largest of NP's expenses in providing electrical service and accounts for almost 59% of NP's gross revenue requirement. Estimates of purchased power expense depends on the forecast energy sales and the rate charged to NP by NLH for electricity purchased by NP. Purchased power expense is affected by the operation of the Weather Normalization Reserve, as discussed on pgs. 77-79 of this Decision, and elasticity impacts due to the proposed rate increase.

The forecast purchased power expense includes an amount of $1,700,000 in each of 2003 and 2004 due to the amortization of the balance in the Weather Normalization Reserve. A reduction of $100,000 in 2003 and $300,000 in 2004 is applied to account for elasticity impacts.

The Board has accepted NP's forecast of customer growth and energy sales for the test year period as described on pg. 29 of this Decision. These forecasts, along with the wholesale rate charged by NLH, form the basis for the purchased power expense. If the wholesale rate charged by NLH for purchased power changes as a result of NLH's general rate application to the Board, NP will apply for an increase in rates to account for this increased expense.

The Board accepts the purchased power expense for the test year period 2003-2004, as proposed by NP, subject to any adjustments arising from this Decision.

ii) Operating Expenses

Operating expenses account for approximately 13% of NP's total revenue requirement in each of 2003 and 2004. These expenses include labour costs, which account for over 50% of the total operating expenses, vehicle expenses, materials, travel, telecommunications, tools and clothing allowances, insurances, equipment rental and maintenance, vegetation management, and other similar types of expenditures.

NP can exercise some control over operating costs and this area is where NP has focused most of its effort in finding efficiencies and minimizing costs.

Over the period 1998 to 2003, NP's gross operating expenses are expected to remain relatively stable, ranging from $55.4 million in 1998 to a forecast of $54.5 million in 2004. [Pre-filed Evidence, E. A. Ludlow, (1st Revision), pg. 6/7-9] Over the same period the number of customers and NP's total sales will have increased by 4.9% and 10.8% respectively. On a per customer basis, gross operating expenses are forecast to decrease over the period by 7%, compared to forecast inflation of 11.9%. (Pre-filed Evidence, E. A. Ludlow, pg. 7/6-10)

The operating expense forecasts for the test year period 2003-2004 have been adjusted to account for the deferral and amortization of regulatory costs and the move to a market-related value for calculating pension expense, as shown below [Pre-filed Evidence, B. V. Perry, (1st Revision), pg. 81]:

Proposed Operating Expenses: 2003-2004 ($millions)		
	2003	**2004**
Operating Expense Forecast	54.1	52.5
Deferral of Regulatory Costs	(0.8)	0.4
Pension Expense Changes	(1.5)	(0.5)
Proposed Operating Expense Forecast	**51.8**	**52.4**

The adjustments for regulatory costs and pension expense changes are discussed in detail on pg. 84 and pgs. 79-80 this Decision.

The majority of the proposed operating expenditures were not contested in the hearing. The primary area challenged by the Consumer Advocate was the level of executive compensation and the Board will deal with this area separately.

As a result of Order No. P.U. 7(1996-97), NP has been filing with the Board annually its Advertising and Marketing Report the purpose of which was to detail objectives for the year as well as quantative measures of success and a description of advertising efforts. Since 1997 the Board's Financial Consultants have included in their annual review of NP a report on its advertising and marketing expenses. Over that period they have consistently reported that nothing has come to their attention that would indicate that NP is not in compliance with Order No. P.U. 7(1996-97).

The Board will continue to instruct its Financial Consultants as part of their annual financial review of NP to report on advertising and marketing expenditures of the Company to ensure that these expenditures meet the criteria established in Order No. P.U. 7(1996-97). However, the Board feels that the annual filing of a separate report is no longer necessary.

The Board accepts the proposed operating expense forecast for the test year period 2003-2004, with the exception of executive compensation which is dealt with separately below.

The Board will no longer require NP to file an annual Advertising and Marketing Report.

Executive Compensation

The Consumer Advocate has taken issue with the level of executive compensation in this proceeding and has asked the Board to reduce the level of compensation recovered in rates.

In P.U. 36(1998-99) the Board reviewed in detail NP's overall methodology for setting executive and management compensation. During the 1998 proceeding NP submitted that its executive compensation plan was appropriate on the grounds that [Order No. P.U. 36(1998-99), pg. 36]:

i) the process of determining compensation used by the company was reasonable, involving the Board of Directors (absent of the executives involved), Hay Management Group and a Human Resources Committee with independent parties;
ii) the targets used are reasonable and represent an all Canadian industrial reference community; and
iii) the implementation of the executive and management compensation plan below target was reasonable and conservative.

NP also argued at the 1998 hearing that, with respect to Short Term Incentives (STIs), the 1999 test year figures are based on bonuses at 100% of target, as compared with the awarding of 130% of target in 1997. Bonuses in excess of 100% of target are the responsibility of the shareholder. During the 1998 proceeding the Consumer Advocate took issue with the level of executive compensation and the magnitude of increases over a two-year period. Other issues raised by the Consumer Advocate in 1998 concerned the use of the all Canadian Industrial reference group and NP's assertion that it needed to use this reference community in order to be able to attract, motivate and retain executives.

In Order No. P.U. 36(1998-99) (pg. 41) the Board "*accepted the level of executive and management compensation as reasonable, in the absence of any evidence to the contrary*".

In this Application NP has not proposed any changes to the methodology for setting executive compensation. The following table compares the average base salaries, STI payouts and other compensation for the period 1999-2002, and for the forecast period 2003-2004.

Executive Compensation 1999-2004F (Based on CA-664)						
Year	**Total Base Salary [1]**	**% Change**	**Total Short Term Incentive[2]**	**% Change**	**Total Salary + STI**	**% Change**
1999	667,887		200,000		867,887	
2000	721,922	8.09%	268,558	34.28%	990,480	14.1
2001	818,000	13.31%	430,000	60.11%	1,248,000	28.0
2002	875,000	6.99%	487,500	13.37%	1,362,500	9.2
2003F	903,100	3.21%	257,775	-47.12%	1,160,875	(14.8)
2004F	930,193	3.00%	265,509	3.00%	1,195,702	3.0

[1] Certain figures have been omitted from the table for consistency and comparison purposes. Corporate Counsel & Secretary was removed from Management to Executive in 2001, and the Vice President, Engineering & Energy Supply retired in 2001 without being replaced.

[2] STI forecast for 1999 test year (during 1998 general rate application proceeding) at 100% payout for revenue requirement calculation. Grant Thornton's report filed at the 1998 proceeding (pg. 5) indicates 100% payout of STI was $164,400. This table shows actual STI payouts, over and above the 100% payout level.

The Consumer Advocate argues that, since the Board approved NP's executive compensation in 1998, the level of compensation has risen dramatically. The Consumer Advocate also took issue with the submission of NP that it is necessary to compensate executives on a national scale to be able to attract and retain executives, suggesting that NP could provide but one example of an executive recruited on a national scale. It was argued by the Consumer Advocate that the evidence is that NP's policy is to promote from within NP and by way of transfer from within the Fortis Group of Companies, with three members of the Executive Team being transferred to Fortis since 1998. The Consumer Advocate favours the approach taken by the Nova Scotia Utility and Review Board (NSUARB) in their recent decision concerning executive compensation at Nova Scotia Power Inc. (NSUARB-NSPI-P-875, October 23, 2002), stating that the circumstances are similar. (Final Submission, Consumer Advocate, pg. 61)

The Governance and Human Resources Committee of NP's Board of Directors is responsible for providing advice and recommendations to the Board of Directors regarding bonuses and incentives as well as total annual compensation to NP's executives. Final approval of overall compensation and bonuses is made by the Board of Directors. Mr. Bruce Chafe, Chair of the Board of NP and Chair of the Governance and Human Resources Committee testified on the issue of executive compensation. In responding to questioning from the Consumer Advocate on the level of compensation paid to NP's executive Mr. Chafe provided the following comments: (Transcript, April 4, 2003, pg. 6-7)

Q. So could you comment, please, Mr. Chafe, on the level of compensation paid to Newfoundland Power's executive?
A. I firmly believe that the compensation paid to the executives of Newfoundland Power is fair and reasonable.
Q. And are there basic goals within which—that you aim for in establishing the level of executive compensation?

A. There are two primary goals. One is to attract and retain competent, skilled professional executives, and to do this, we have to set their base compensation on a median of industrial companies in Canada. We believe this is fair. Newfoundland Power is a large—I like to think of it as an industrial company, complex company, and I believe to base it on a median of industrial companies in Canada is reasonable, given that the market for these executives, this talent that we have to employ, is of a national scale.

The second, having set the base salaries, the second plank, and I believe these are the fundamentals to properly rewarding any executive group, the second plank is to provide an incentive. It's one thing to pay a base salary. Another is to provide a financial incentive primarily to ensure their performance. In Newfoundland Power's case, we have a balanced set of operating objectives which we set, as I mentioned earlier, in the meetings, the targets and goals to be achieved and these are pretty mathematical, as well as practical, and these targets include reliability, safety, controlling operating costs, and earnings.

Grant Thornton reviewed NP's approach and process with respect to setting executive compensation and compared it to the approach and process used in 1998, concluding (Grant Thornton Report-NP 2003 GRA, pg. 39):

"Essentially the approach used today is the same as in 1998. Specifically, the overall design and components of the plan have not changed and the policy of setting compensation by reference to the median of the Canadian industrial practice is consistent with 1998."

The 2001 Hay Report (CA-251) reviewed the job evaluation ranking of executives, the competitive position of the individual elements of compensation, and the existing compensation policy. The analysis in the 2001 Hay Report compares compensation practice at NP to that of the median of Canadian Industrials, and outlines the recommendations with respect to compensation at NP. The most significant recommendation affecting executive compensation concerned the design of the STI program and non-cash benefits.

In the Board's view the information before it does not support the Consumer Advocate's contention that Executive Salaries have risen dramatically since 1998. While overall levels of compensation have increased, annual base salary increases have ranged from approximately 3%-8% once the salaries are normalized to adjust for retirements and hirings. These base salary increases are not, in the opinion of the Board, unreasonable. Most of the increase in overall compensation has been in the areas of STI payouts. However, the Board notes that STI payouts in excess of 100% of target, as approved by the Board in 1998, were borne by the shareholder, Fortis, since these amounts were not included in the 1999 test year revenue requirement. The forecast STI payouts for 2003 and 2004 in revenue requirement are based on 100% payout and are significantly lower than the payouts for 2000 and 2001.

In cross-examination of Mr. Hughes, Board Hearing Counsel raised the issue of STI payouts in excess of 100% of target in a year where NP had declared portion of the STI payout above 100% would decrease the amount of excess earnings that would otherwise have been declared by NP.

Q. So, in a situation like that can I ask you what your view would be on that 150,000 figure that we're using, do you see that as a figure that should more properly be taken from the amount that would otherwise go to the shareholder as opposed to the amount that would otherwise go to the ratepayer?

A. I think it's one of those issues you can argue many ways. This is just my opinion, and I think there are other valid opinions. I think where the Company has produced on the tax operating costs and the Aliant poles excess earnings of $6.6 million for the benefit of consumers, the fact that an extra 100,000 retained by the Company I don't think is a huge issue. I understand the theory and I think you're right, Mr. Kennedy. You know, I mean, it's obviously true. But, I suppose I can't help but think that surely that's good for customers that the costs are coming down and so on. But, it's one of those issues, unlike some others, where I think it's legitimate to have different thoughts on it. You know, that happens to be my thought, but I-

Q. It's not a policy carved in stone, if you may?

A. I think different people would take different positions on something such as that. You know, you asked me what my opinion, and I view, well, it was $6.6 million rebate against 100,150, but somebody could argue it the other way.

(Transcript, March 6, 2003, pg. 14/6-25; pg. 15/1-12)

This issue was also addressed by the Consumer Advocate in final written submission (pgs. 61-62) stating that, if the STI payouts additional to the forecast had not been paid out, the same would have gone to excess earnings. The Consumer Advocate argues that NP's shareholder should be responsible for one-half of the compensation paid to NP's executives.

NP's revenue requirement for the test year includes an amount for STI payouts at 100% of target, and payouts in excess of this amount are borne by the shareholder, Fortis. The Board agrees that customers do benefit in the long-term when efficiencies are achieved and agrees that the use of STI payouts is an appropriate means of encouraging such efficiencies. However, the Board recognizes that such efficiencies also benefit the shareholder and concludes that any STI payouts in excess of 100% of target should be paid by the shareholder. This applies to both executive and management STI payouts.

The Board will direct that any STI payouts in excess of 100% of target payouts will be the responsibility of the shareholder, Fortis, and will be charged to non-regulated operations.

The Board agrees with the Consumer Advocate's submission that *"…the Board has within its purview the ability to set an amount for executive compensation and ratepayers would not be responsible over and above that amount."* (Final Submission, Consumer Advocate, pg. 61) However, the Board in this case has not been provided with any evidence other than the assertion by the Consumer Advocate that compensation levels are too high. While the levels of individual compensation may be considered high by some measures, the Board does not have any information on the record which would enable it to evaluate other appropriate alternative comparators for NP's executive compensation.

The Board will accept the level of executive compensation as reasonable for the purposes of determining test year period costs.

The Board accepts the level of executive compensation as part of NP's revenue requirement for the test year period 2003-2004.

iii) Depreciation Expense

The depreciation expense forecast for 2003 and 2004 reflects the depreciation rates recommended in the 2002 Depreciation Study and a true-up of $5,793,000 per year in each of 2003, 2004 and 2005.

The proposed depreciation expense for 2003 and 2004 is summarized below [Pre-filed Evidence, B. V. Perry, (1st Revision), pg. 60]:

Schedule of Depreciation: 2003-2004 (000s)		
	2003	**2004**
Depreciation Expense – Current Year	37,369	38,797
Adjustment for Proposed Depreciation Rates	(2,342)	(2,425)
Adjustment for True-up	(5,793)	(5,793)
Proposed Depreciation Expense	**29,234**	**30,589**

The Board has approved the updated 2002 Depreciation Study and revised depreciation rates as well as the true-up adjustment on pgs. 81-82 of this Decision. No objections or issues were raised with respect to the level of depreciation expense.

The Board accepts the depreciation expense for the test year period 2003–2004, as proposed by NP.

iv) Income Taxes

NP's forecast income tax expense for the test year period incorporates the tax impacts of the proposed increase in customer rates and the accounting changes described elsewhere in this Decision. No issues were raised with respect to this forecast expense.

The Board accepts the forecast income tax expense for the test year period 2003-2004, as proposed by NP, subject to any adjustments arising from this Decision.

v) Return on Rate Base

NP's forecast of return on rate base was calculated based on a forecast return on regulated common equity of 10.75% as proposed in its Application. As a result of the findings of the Board in this Decision, NP will be directed to recalculate the return on rate base. The revised amount will be incorporated into NP's revised filing of revenue requirement arising from this Decision.

3. Deductions from Revenue Requirement

NP's revenue required from consumer electrical rates is reduced by other revenue received by NP and also by deducting expenses incurred by NP in non-regulated activities. In this Application NP has also proposed applying 2001 excess revenue of $944,000 to offset revenue requirement for the 2003 and 2004 test years.

These deductions are dealt with separately below

i) Other Revenue

NP has forecast other revenue of $7,787,000 in 2003 and $8,593,000 in 2004. This revenue is primarily derived from pole attachment revenue ($6,430,000 in 2003 and $7,333,000 in 2004) with other amounts received from customer jobbing, wheeling charges, fees and miscellaneous sources. [Pre-filed Evidence, B. V. Perry, (1st Revision) pg. 7]

The Board accepts the deduction from revenue requirement of other revenue for the test year period 2003-2004, as proposed by NP.

ii) Adjustment for 2001 Excess Revenue

The Board dealt with NP's proposal for the disposition of the Excess Revenue Account on pgs. 84-85 of this Decision.

Since the Board will require that the 2001 Excess Revenue be rebated to customers, NP's revenue requirement will not be reduced by this amount, as proposed by NP.

iii) Non-Regulated Expenses

Non-regulated expenses are those expenses that are not recoverable through rates under Section 80(2) of the *Act*. NP has estimated non-regulated expenses, net of tax, of $725,000 in each of 2003 and 2004.

Grant Thornton reviewed the non-regulated expenses recorded by NP for the period ended September 30, 2002 and the forecast non-regulated expenses for 2002, 2003 and 2004. Grant Thornton's conclusion was that the non-regulated expense forecast appeared reasonable and is in accordance with Board Orders, including P.U. 7(1996-97).

The Board accepts the deductions from revenue requirement of non-regulated expenses for the test year period 2003-2004, as proposed by NP.

4. Summary of Allowed Revenue Requirement

NP will be required to calculate and file a revised revenue requirement for 2003 and 2004 based on its proposals in this Application, and incorporating the changes set out in this Decision relating to the allowed rate of return on rate base and the adjustment for 2001 Excess Revenue.

The Board will accept, subject to review of reasonableness and prudence, certain other secondary or incidental changes in revenue requirement which arise as a result of this Decision.

X. COST OF SERVICE

1. Background

NP's Cost of Service methodology was last reviewed by the Board at the company's 1996 general rate proceeding. At that time NP proposed changes to its Cost of Service methodology to reflect where appropriate recommendations arising from the 1992 generic Cost of Service Study hearing. In Order No. P.U. 7(1996-97) the Board approved NP's proposed changes on a temporary basis and ordered a detailed review of NP's Cost of Service methodology at its next rate hearing. The changes reflected the 1992 generic Cost of Service methodology, which was also adopted by NLH as part of its last general rate hearing.

Specific changes proposed by NP and temporarily approved by the Board in Order No. P.U. 7(1996-97) are as follows [Pre-filed Evidence, L. Henderson, (1st Revision), pg. 6]:

- Classification of NP's hydraulic plant using system load factor on energy rather than 100 % demand;
- Allocation of NP's generating plant (hydraulic and thermal) using a single coincident peak allocation ("*1 CP"*) rather than non-coincident peak allocation ("*NCP*");
- Allocation of NP's transmission plant using 1 CP rather than NCP;
- Allocation of purchased power transmission demand costs using 1 CP rather than NCP;
- Allocation of purchased power generation demand costs using 1 CP rather than NCP; and
- Allocation of NP's funding of NLH's rural deficit based on allocated class cost and removal of the rural deficit from the calculation of revenue to cost ratios. Prior to 1996 the rural deficit was included in the purchased power expense and classified based on the demand energy split for purchased power expense.

2. NP's Proposed Cost of Service Methodology

For the most part NP has incorporated into its Cost of Service methodology the Board's recommendations for NLH's Cost of Service study as approved in Order No. P.U. 7 (2001-2002) with the exception of the following (Exhibit LCH-1, pg. 4):

- NP uses a single NCP allocator for distribution costs related to demand while NLH uses the ICP allocator;
- NP uses a minimum system analysis (also called minimum size method) to classify distribution conductor, pole and fitting costs as either customer related or demand related while NLH uses the zero intercept method; and
- NP does not assign any of its transmission costs to the generation function and consequently none are allocated to energy.

3. Mediation Report

As discussed on pgs. 4-5 of this Decision the parties to this proceeding agreed to put the Cost of Service and Rate Design issues to a mediation process. As a result a consent Mediation Report was filed and accepted by the Board as part of the proceeding, with the Board agreeing to incorporate into its Decision the recommendations of the parties as set out in the report.

The parties agreed in the Mediation Report that the Cost of Service proposals temporarily approved by the Board in Order No. P.U. 7(1996-97) should be approved in this Decision.

In addition the Mediation Report recommended the Board approve two additional changes to NP's Cost of Service methodology:

- General expenses (i.e. General System Costs and Administration and General Costs) should be functionalized and classified based on the assumption that a portion of these costs is related to net utility plant (capital labour expense as a percentage of capital labour expense plus operating labour expense), rather than assuming (as previously) that all of these costs relate to operating and maintenance (O&M) expense; and
- The Cost of Service study should use normalized revenue and normalized purchased power expense rather than actual revenue and purchased power expense, unadjusted for normalization, as previously.

It was also recommended that the Board approve NP's use of an NCP allocator for distribution demand costs even though this differs from the 1 CP allocator that NLH was directed to use for distribution demand costs in Order No. P.U. 7(2002-2003).

The Board has reviewed the Mediation Report and the evidence filed relating to Cost of Service issues. The Board accepts the recommendations of the parties as set out in the Mediation Report and will approve the recommendations as presented.

4. Future Load Research

The evidence filed by NP's Cost of Service expert witness Mr. L. Brockman indicated that NP's current load research data is nearing the end of its useful life as a predictor of class demand. This information is important in ensuring that the allocation of demand costs among customer groups is fair. To ensure the best available information on customer class demand is used updated load research data is necessary. NP is proposing to implement a new load research program including representative samples from each customer class. The load research study period is planned to begin in the 2003-2004 winter season and has a forecast capital cost of $425,000 for the metering, meter reading equipment and computer software. NP has requested approval of this additional amount as part of its capital expenditures for 2003.

The parties agreed in the Mediation Report that this expenditure should be approved.

The Board will approve additional 2003 capital expenditures of $425,000 for a load research program, as proposed by NP.

XI. RATES, RULES AND REGULATIONS

1. Mediation Report

In the Mediation Report the parties recommended the following with respect to rate design:

- The Board should approve tail block rate increases above the average class increase for Rates 2.2, 2.3 and 2.4 so as to better reflect short-run marginal energy costs in these tail block rates;
- The Board should approve the elimination of minimum monthly ("ratcheted") demand charges, linked to the customer's maximum demand during the previous twelve months, in General Service Rates 2.2, 2.3, and 2.4.
- The Board should retain the Curtailable Service Option Credit of $29/kva in Rates 2.3 and 2.4 and require NP to inform customers of the possibility of significant future changes in this credit.[1]
- The Board should approve NP's proposed merger of street light and area lighting rates for the 400W MV fixtures with the 250W HPS fixtures that replace them. The Board should also approve NP's proposed removal from the Schedule of Rates, Rules and Regulations, the charges for the 1,000W MV fixture, the 700W MV fixture and the 150W HPS post top fixture, since these no longer exist on NP's system.
- To the extent possible, there should be no adverse customer rate impacts. Any overall revenue change should be distributed equally to each class of customers. With the exception of any change in basic customer charges, no customer should have a rate change that produces an annual cost change that is more than twice the system average (unless the dollar impact is minimal).[2]
- The Board should approve a change to Regulation 9(o) to reduce the application fee for a customer name change from $14.00 to $8.00 (the current new service fee).
- The Board should approve the removal of clause 9(n) to eliminate charges for the preparation of account statements for billing information prior to the most recent twelve months.
- The Board should approve a change to Regulation 9(f) and a proposed new clause 12(g) permitting charging the reconnect fee to new customers in apartments where a reconnection is required subsequent to a request by a landlord to disconnect an apartment. Such customers will not be required to pay the new service application fee.

---

[1] It was noted in the Mediation Report that whereas NP states the $29 credit "is reasonable" the CA's position is that until there are cost-reflective wholesale power purchase rates (from Newfoundland Hydro), benefit to NP from the Curtailable Service Option will be hidden, and there is now little evidence to suggest changing the current option. The implication is that while all parties agree that the Curtailable Service Option Credit should now be retained as it is, a change may be appropriate if Hydro's wholesale rates change.

[2] It was noted in the Mediation Report that possible future rate changes, such as those that may be justified by the results of future load research, may warrant a redistribution of revenue responsibility between rate classes and/or annual cost changes for some customers that differ significantly from the system average.

- The current basic monthly customer charges for domestic (residential) service and small general service rate 2.1 should be reduced by $1.00. The revenue loss associated with this change should be made up by adjusting the energy component of these same rates so that the change does not impact customers in other rate classes.

As part of this proposal NP also agreed that: (1) it will not propose a basic customer charge increase as a result of any wholesale rate increase in NLH's 2003 general rate proceeding; and (2) in its next general rate application, NP will cap the customer charge recovery of distribution costs allocated to customers at 50% of these allocated distribution costs for rate classes, with the remainder to be recovered through energy charges. Distribution costs are network costs beyond the service drop and do not include customer specific costs such as meters, meter reading, billing and service drops.

It was also agreed by the parties to recommend that the Board proceed, as planned, to consider implementation of improved cost-reflective wholesale power rates to be charged to NP by NLH. To facilitate that process, the Board should schedule (and provide such notice as may be required) a one-day consultation to take place within 30 days after NLH's general rate filing, wherein NLH would discuss and provide information to stakeholders on its proposed wholesale power rate design.

As well the parties recommended that the Board direct NP, in consultation with the Consumer Advocate and Board Staff, to propose a *"peer group"* of utilities and performance measures upon which to evaluate NP's performance. Upon Board approval of the peer group and performance measures, NP will collect and report annually statistical information relative to the peer group performance. NP should be entitled to recover its reasonable documented costs of this effort.

The Board has reviewed the Mediation Report and the evidence filed relating to Rate Design issues. With the exception of the issue relating to meter reading, which was not agreed to by the parties, the Board accepts the recommendations of the parties as set out in the Mediation Report and will approve the recommendations as presented.

Since the conclusion of the hearing of this Application, NLH has filed its general rate application for 2004. The Board will direct that the scheduling of the consultation recommended in the Mediation Report on NLH's wholesale power rate design be considered at the pre-hearing conference for NLH's general rate application.

The Board will direct NP to propose to the Board for approval of a *"peer group"* of utilities and performance measures upon which to evaluate NP's performance in accordance with the terms of the Mediation Report.

The Board once again expresses its appreciation for the efforts of the parties in settling these issues through the mediation process.

2. Outstanding Issues Relating to Rates, Rules & Regulations

i) Meter Reading

During mediation the issue of meter reading as provided for in NP's Rules and Regulations was not agreed upon by the parties. The Consumer Advocate recommended in the Mediation Report that the wording of the first sentence of *"Rules and Regulations 8. Meter Reading"* should be revised to read:

> *"With the exception of circumstances beyond its reasonable control, the company shall read meters monthly."*

NP recommended retaining the present language which states:

> *"Where reasonably possible the Company shall read meters monthly provided that the Company may, at its discretion, read meters at some other interval and estimate the reading for the intervening months."*

The parties agreed that the resolution of this issue does not require the calling of expert cost of service or rate design witnesses, and that the Board panel is able to resolve the issue based on arguments that the parties will make in their briefs and on hearing examination of the parties' policy and revenue requirement witnesses.

The Consumer Advocate's position as set out in the Mediation Report was that customers who receive estimated bills often think that the estimates are high and that they would prefer an actual meter reading rather than an estimated bill. The Consumer Advocate also argued during the hearing that, since NP is paid as part of the basic customer charge to read meters, estimates should only be allowed in exigent circumstances. The Consumer Advocate also submits that the practice of estimating meters during the summer months should be stopped.

NP believes that its estimates are reasonably accurate, that there are few customer complaints and that the estimation process during summer vacation months saves costs (approximately $40,000) by reducing the need for temporary employees. NP submitted that the summer estimating program is a management issue, and that the program is part of an overall approach to manage the cost of meter reading. Savings from the summer estimating program ranged from $20,000 to $45,000 for the years 2000 to 2002, compared to total meter reading costs of $2,000,000 per year. Based on these savings NP plans to continue with its summer meter reading program. NP's position is that no change in Regulation 8(a) is warranted. (Written Submissions, NP, Section F, pgs. 3-4)

The Board has reviewed the submissions of the parties on this issue and notes that there appears to be a number of separate issues raised, namely meter reading frequency, the recovery of the costs of meter reading and estimation of meters.

The issue of monthly vs bi-monthly meter reading was addressed by the Board at NP's 1996 general rate hearing after which the Board accepted NP's proposal to return to monthly meter reading. The issue of the summer estimating program is not, in the Board's view, related to monthly meter reading but is rather a management issue aimed at efficiencies and cost savings. Under the existing regulations NP has the discretion to implement such a program and did not seek the Board's approval at the time. The Board notes the savings to ratepayers of the estimating program. The Board has monitored this program since it was put in place by NP in 2000 and observes that it does not appear to have had any adverse impact on customers. The Board will not order NP to end this program at this time and incur additional costs to be recovered from ratepayers.

The costs of meter reading are recovered by NP in the Basic Customer Charge (BCC). The BCC includes those customer related costs that occur because a customer is connected to the system, regardless of whether energy is used or demand is incurred. These costs usually include the cost of the meter, the cost of the service wire, and the costs associated with billing customers, including meter reading costs, collection costs, billing system costs and customer service costs. NP's expert witness on Cost of Service confirmed that NP's BCC for residential and small general service classes recovers 100% of the cost of metering, billing, customer information and service wire costs, and 60% of the customer related distribution system cost. (Pre-filed Evidence, L. Brockman, pg. 10)

Even though the BCC recovers those costs associated with meter reading, it is not correct to say that NP is being paid to read every customer's meter. The BCC recovers NP's total customer related costs by spreading the total of those costs to all customers connected to the system, regardless of where they live or how much each customer contributes to the BCC on an individual basis. The BCC represents in effect the average customer cost and does not reflect the actual cost of the specific components of the cost, such as the cost of reading that customer's meter. In the Board's view the issue of recovery of meter reading costs is not an issue in this hearing requiring a determination by the Board. NP is entitled to recover its total cost of providing service and, if the costs are not recovered in the BCC, the costs will be recovered in rates.

It is the role of the Board to investigate, mediate and try and resolve complaints from customers experiencing problems with the utilities. The Board's regulatory staff tracks complaints and their resolution and through this process is able to identify issues which may require intervention with the utility by either the Board or its staff. For example it was as a result of this complaint process that the Board initiated a comprehensive review in 1996 of the CIAC Policy, culminating in a public hearing in the fall of 1997.

Several specific examples were raised during the hearing, both by the Consumer Advocate and by individual presenters, regarding meter reading practices of NP. As well since the commencement of this hearing Board staff have received a number of complaints regarding meter reading and estimating of meters such that a review of this issue is viewed by the Board as warranted at this time.

The Board will not direct any changes to the wording of Rules & Regulations 8-Meter Reading at this time. The Board will undertake a review of NP's meter reading program with a focus on the estimating methodology and process. This review will also include an assessment of existing regulatory and utility practice in other Canadian jurisdictions.

ii) Demand Charges for Recreational Facilities

Mr. Gary Milley of the Newfoundland & Labrador Parks/Recreation Association raised the issue of demand charges for major recreational facilities during his presentation to the Board in St. John's. Mr. Milley requested the Board to consider either reducing or eliminating the demand rate charged community facilities such as stadiums and swimming pools. If this couldn't be done Mr. Milley requested that some type of rebate or benefit program be put in place for community facilities. (Transcript, April 3, 2003, pg. 81)

NP's position on this issue is that elimination or reduction of demand charges to these customers for essentially social welfare considerations is not consistent with the objectives of good rate making. NP points out that a similar discount on demand charges provided to churches and schools was eliminated during the 1980s. [P.U. 47(1982), P.U. 51(1982)] NP submits that demand charges that apply to major recreational facilities should be maintained at the same level as those for other general service customers served under the same respective rate class. (Written Submissions, NP, Section F, pgs. 6-7)

No other submissions were made by other parties on this issue.

The Board has been presented with similar requests in previous hearings, which essentially petition the Board to consider the *"ability to pay"* of the consumer. The Board has outlined its position on this issue in reference to its statutory powers and responsibilities on pg. 17 of this Decision. While the Board acknowledges the challenges these major recreational facilities face with respect to operating costs in general, and costs for electricity consumption specifically, the Board agrees with NP that demand charges should be maintained at the same level as those for other general service customers. This is consistent with cost based ratemaking and is fair and equitable to all customers in that class. To do otherwise would involve a subsidy to one group of customers at the expense of another. The Board notes that the approval of NP's proposal to discontinue demand related minimum monthly charges will partially address some of the concerns raised by Mr. Milley.

The Board will not make any adjustments to the application of demand charges within the General Service Rates.

iii) Availability of the Domestic Rate

Mr. Owen Crossan of Regency Management Ltd. and Mr. Charlie Oliver of Martek Morgan-Finch requested the Board amend NP's Schedule of Rates, Rules and Regulations so that the rates for the house meters of apartment buildings be classified as a residential rate, instead of a commercial rate. Their position is that the house meter in an apartment building is used for a non-commercial, exclusively domestic use such as washers and dryers and lights in hallways and stairways. Mr. Crossan submitted that the Provincial and Federal Government have, through taxation policies, agreed that apartment buildings are solely for residential use and should be classified as such. He cited as examples the fact that the Provincial Government does not require HST to be charged for the use of the washers and dryers by the tenants and the fact that the Federal Government does not require payment of HST on a lease of one month or more.

NP submits that the common areas of apartment buildings and condominiums provide a service to all tenants of the facility and do not meet the definition of a Domestic Unit in the Rules and Regulations. The *"Customer"* in the case of the common area is the management of the apartment building or condominium, and is not the same *"Customer"* as referred to in the Availability Clause for the Domestic Rate 1.1. NP argues that the management of the apartment complex or condominium is engaged in a commercial enterprise and the service provided by the appropriate General Service Rate. (Written Submissions, NP, Section F, pg. 10)

NP also notes in written submission (Section F, pg. 10) that this issue has been before the Board in previous hearings in 1987, 1989 and 1991. At these hearings the Newfoundland and Labrador Pensioners and Senior Citizens Federation requested that Domestic Rate be used for their clubrooms rather than the General Service Rate. In Order No. P.U. 6(1991) the Board confirmed NP's definition of a Domestic Unit and found that these clubrooms do not meet that definition. [P.U. 6 (1991), pg. 80-81]

NP's Rules and Regulations define a *"Domestic Unit"* as follows:

> *"Domestic Unit means a house, apartment or similar residential unit which is normally occupied by one family, or by a family and no more than four other persons who are not members of that family, or which is normally occupied by no more than six unrelated persons."*

If a customer does not meet this definition of a domestic unit the rate charged will be the applicable General Service Rate, depending on demand. Common areas of apartment buildings or condominiums do not meet the definition of the Domestic Rate class in NP's rate structure. In the Board's view making the domestic rate available to common areas of apartment buildings and condominiums would not be fair to other customers in substantially similar circumstances who are also charged a commercial rate.

The Board agrees with NP's submission that the management of the apartment complexes and condominiums are engaged in commercial activity. The argument against this position appears to be based on the fact that the end users of the electrical service are the same tenants who live in the buildings and who meet the definition of *"Domestic Unit"*. However, the *"Customer*" in the case of the common areas of the building for the purpose of provision of electrical service by NP is the building management and not the tenant. This service is properly charged under the commercial rate structure, and presumably the costs are incorporated into the rental rates of the tenants.

The Board will not order the Domestic Rate be made available to house meters of apartment buildings.

iv) Requirement for Security Deposit

In presentations to the Board during public participation day in Corner Brook, Mr. Mark Baldwin and Mr. Peter Blake raised the issue of the appropriateness of NP's policy regarding payment of security deposits and its effect on small business. Mr. Blake is a small business owner in Corner Brook who testified about the impact the requirement to pay a security deposit required has on cash flow and start up costs for a small business in its first year of operation. Mr. Blake also questioned the interest rate of two percent less than prime which is paid by NP on deposits stating that in his view NP is making a profit off his deposit. (Transcript, April 11, 2003, pgs. 74-79)

In written submission (Section F, pgs. 11-14) NP argued that the requirement of a security deposit helps to minimize costs resulting from the outstanding bills left by new businesses which fail. If the security deposit were not in place other customers would have to pay those costs. As electrical service is provided in advance of payment by customers, the amount of deposit, equivalent to two months usage, is viewed by NP as justified.

NP further argued that the existing annual expense of $700,000 for uncollectable bills (net of application of security deposits) would increase to approximately $1,100,000 annually if the Customer Deposit Policy was not in place. As to the interest paid on deposits, NP's position is that the rate paid on cash security deposits is approximately equal to the rate the customers would earn on a 2-year GIC and similar to the rate NP pays on short-term borrowings, and hence is reasonable.

Regulation 4 (a) of the Rules and Regulations states as follows:

> *"4. Security for Payment*
> *(a) An applicant or a customer shall give such reasonable security for the payment of charges as may be required by the Company pursuant to its Customer Deposit Policy as approved by the Board, from time to time."*

The Board approved the existing Customer Deposit Policy in March 1988. This policy sets out the conditions under which reasonable security for payment shall be required and also sets out the form of the security as either cash deposit, bank letter of credit, payment bond, letter of guarantee or any other form of security acceptable to NP.

In addressing this issue the Board acknowledges that the payment of a cash security equivalent to the average cost of two months service may create a financial burden for certain new businesses. However, the Board also recognizes a fairness principle in that, if these new businesses do fail other customers will have to pay for the costs incurred to provide electrical service for which NP will not recover. The security deposit has been used to offset these potentially unrecoverable costs in the past. The Board notes the amount of $400,000, which is the difference in uncollectable bills net of application of the security deposit, as a significant cost to be borne by other customers.

In the Board's view this would not be fair to other customers on the system, especially those who have already paid their full cost towards their electrical service. The existing policy is seen by the Board as reasonable and in the best interests of all customers. The Board notes that there are several options as to the form of security a new business customer may elect to provide and expects that these options are made known by NP and available to customers.

The Board is not persuaded that changes to the Customer Deposit Policy or to the Rules and Regulations respecting security deposits would be fair to other customers. The Board will not order a change in the present policy covering the rate of interest paid to customers on cash security deposits.

v) Requirement for Inspection of Service Prior to Reconnection

In his presentation to the Board Mr. Crossan also requested that the Board eliminate the requirement for inspections prior to the reconnection of service where the unit is vacant for any period of time and there has been no electrical work or repairs carried out. According to NP, this requirement is based on written direction from the Province's Chief Electrical Inspector that, where a service has been disconnected for more than 90 days, an electrical inspection is required prior to the reconnection of service. Mr. Crossan stated that it was his understanding this requirement is as a result of an existing rule of the Board.

The Board does not have any such rule in place relating to inspections prior to reconnections. This requirement is put in place for NP by the Province's Chief Electrical Inspector. NP states that it must abide by the requirements of the Chief Electrical Inspector unless informed otherwise and that it has no discretion with respect to this issue. The Board agrees with NP.

The requirement for inspection of service prior to reconnection is primarily a safety issue and the Board will not intervene.

vi) Rate Change Implementation

In order to finalize rates to be implemented as a result of this Application, NP will be directed to re-file, along with its revised revenue requirement and revised calculations of rate base and return on rate base, its Schedule of Rates, Tolls and Charges to be effective for billings on or after August 1, 2003 incorporating the decisions of the Board. The rates shall be calculated on the same basis as in the Application and shall be designed to remain in effect through 2004.

NP will also be directed to file a proposal as to the finalization of interim rates as set by Order No. P.U. 35(2002-2003) and the disposition of any variance between revenue generated based on these interim rates and the revised 2003 test year revenue requirement. The proposal should include a plan for the rebate of this amount to customers.

The Board will review NP's revised filing to ensure its decisions are appropriately incorporated and then issue a final Order, approving or modifying, as it deems appropriate, NP's rate base, NP's return on rate base and the revised rates for NP's customers as of August 1, 2003.

XII. OTHER ISSUES

1. Conservation/Demand Side Management

The issue of conservation and demand side management was raised in this proceeding by the Consumer Advocate. In final submission (pg. 74) the Consumer Advocate stated that "*NP's efforts toward conservation are virtually non-existent.*" The effectiveness of NP's activities in demand side management and energy efficiency programs was also questioned by the Consumer Advocate. He cited the evidence provided by Ms. Sarah Peckford and Mr. Terry McNeil, both of the Conservation Corps, who made a presentation to the Board during the public participation day in St. John's. Due to a lack of funding the Conservation Corps has had to lay off staff and the partnership negotiated between the Corps and NP as of December 2002 is effectively at an end. This means that Newfoundland and Labrador is the only province in Canada in which an Energuide Assessment Program is not available. The Consumer Advocate argues that

> *"This lack of a conservation agent and an Ener-Guide Assessment comes at a time during which consumers owe $100 million to pay the cost of Bunker C fuel burned at the Holyrood Generating Station, and it comes at a time during which consumers are using electricity more, not less. The average consumption in Newfoundland has risen.".*
> (Consumer Advocate, Final Submission, pgs. 75-76)

The Consumer Advocate requests that the Board provide policy and give specific and meaningful direction to the utilities on conservation issues.

The other parties to the hearing did not address this issue and NP did not provide its position in final submissions or oral argument. In addition to the presentation provided by the representatives from the Conservation Corps and their responses to questions, there were several information requests regarding conservation and DSM to which NP responded.

NP outlined its approach to demand side management and energy efficiency programs in its response to CA-239:

> *"The intent of DSM programs is to manage the demand side use of electrical energy in order to minimize electricity rates. During the last several years, Newfoundland Power has focused its DSM activities on programs that improve customer service and enhance the value customers receive from electricity. The Company has taken this approach because the size and isolated nature of the Newfoundland electrical system, and its current dynamics as reflected in load forecasts and generation cost projections, suggest that larger scale DSM activities are unlikely to have significant impact, either on load or on generation requirements. Unless circumstances warrant a change in direction, the Company will maintain the current focus of its DSM activities into the future.*
>
> *It is the intent of the Company that all customers benefit from the Company's DSM activities either directly as participants, indirectly as non-participants or through improved customer service. DSM initiatives will be assessed on an ongoing basis to ensure they meet the needs of the Company's customers."*

Since 1990 NP has been required to file annually with the Board a progress report of its DSM activities. These reports describe the benefits of NP's DSM activities, including results and associated costs. In the Board's view these reports have been informative and provides important information, especially with respect to customer based activities. The Board will continue to require these reports as ordered in Order No. P.U. 7(1996-97).

This issue was raised during the hearing of NLH's general rate application in 2001. In Order No. P.U. 7(2002-2003) the Board recognized and supported NLH's efforts in partnering with the Conservation Corps. The Board also stated that activities in this area should be implemented and monitored within the customer service group, as one of the main goals of such programs is improving customer access to conservation tools and energy saving initiatives, which is the case with NP. NP should consider expanding its customer satisfaction survey to obtain more specific information from customers with respect to conservation of energy and customer needs.

The Board supports NP's past efforts in partnering with the Conservation Corps to provide customer access to the Corps' services and encourages NP to continue to pursue similar partnerships and initiatives in the future. The Board was impressed with the presentation by the Corps on its programs and the potential benefits to homeowners in terms of energy conservation and resulting lower energy bills, and acknowledges the Corps' current funding challenges. NP was just one of the parties participating in supporting the Ener-Guide Program and the Board is not prepared to direct NP to support any particular conservation initiative on its own accord or to fund any specific group.

In the Board's view the issue of conservation and energy efficiency is one the Board can consider in the context of least cost electricity for consumers in the province. The relationship between rates and electricity consumption and the impact of DSM and energy efficiency programs is complex, especially when overlayed with the impact on the electrical system and generation planning. The differences in the structure and customer profile of each of the utilities also has to be considered. The Board acknowledges the reports on NP's DSM activities provide useful information. The Board finds it difficult, however, to provide specific and meaningful policy direction to the utilities on DSM and conservation issues in the absence of supporting evidence and related impacts on the system overall. This matter would be most appropriately addressed in the context of a generic proceeding involving both utilities and interested parties. The Board will consider the manner and timing of such a proceeding following the hearing of NLH's general rate application.

PART THREE. SUMMARY OF BOARD DECISIONS

1. SUBMISSION OF CONSUMER ADVOCATE ON EXCESS EARNINGS

1. The Board finds that it has no jurisdiction under the *Public Utilities Act* to require payment by NP into a reserve account or otherwise deprive NP of any amount which is within the allowed return on rate base as fixed and determined by the Board pursuant to Section 80(1) of the *Act*.

II. FORECASTING ISSUES

2. The Board will accept NP's customer and energy sales forecasts for the test year period 2003-2004.

III. RISK ASSESSMENT

3. The Board does not anticipate a change in the business risk of NP in the foreseeable future and concurs with the assessment of NP and the cost of capital experts that NP is of average business risk compared to other utilities.

4. The Board finds that capital market conditions, in particular affecting the equity market, have changed substantially since 1998. This volatility has contributed to an overall reduction in investor expectations in the equity market from historic levels. In addition, volatility has contributed to greater spreads being demanded by corporate bondholders and equity investors to account for added risk as compared to long-term government securities. The Board finds these trends will similarly influence NP but present no greater financial risk to NP than will be experienced by other comparable Canadian utilities.

5. The Board finds that based on its financial performance NP continues to sustain a sound credit rating which is providing appropriate and cost efficient access to the financial markets.

6. The Board concludes that in the interest of both the utility and its customers. NP should continue to be treated as a stand-alone utility. Therefore, the Board will require NP to take all appropriate steps necessary to preserve the financial integrity and independence of the utility. As a first step, NP will be required to file a report by June 30, 2004 addressing how it can ensure stand-alone status in respect of its corporate credit linkage by S & P to Fortis. This report should: 1) document discussions with the credit rating agencies and Fortis on this issue; 2) explain how other regulated Canadian utilities are facing similar challenges; 3) provide a list of possible mitigating actions; and 4) provide a plan of implementation of recommended actions.

7. Despite the change in circumstances since 1998, the Board finds that the overall investment risk of NP is average when compared to other Canadian utilities. This finding will be the basis on which the Board will consider a commensurate capital structure and ROE for the utility.

IV. FINANCIAL TARGETS AND OBJECTIVES

8. Having reviewed the evidence the Board is of the opinion that it is reasonable and prudent to maintain the capital structure deemed appropriate in Order No. P.U. 16(1998-99). The proportion of regulated common equity in the capital structure should not exceed 45%. Any regulated common equity in excess of 45% will only be entitled to a rate of return equal to the rate of return on preferred equity. For the purpose of determining the weighted average cost of capital, the Board accepts NP's proposed forecast average capital structure for the 2003 and 2004 test years.

9. The Board will continue to rely principally on the equity risk premium test and will determine a return on regulated common equity primarily with a view to establishing a risk-free rate based on long-term Government of Canada bond yields plus an appropriate risk premium.

10. The Board will utilize 5.60% as the forecast of the risk-free rate to be applied in the equity risk premium test for the test years 2003 and 2004.

11. The Board will make no adjustment to the equity risk premium test for financing costs.

12. The Board will incorporate a risk premium of 4.15% in the equity risk premium test in calculating the cost of common equity.

13. The Board will utilize a return on regulated common equity of 9.75% for the purposes of determining the WACC for both 2003 and 2004.

14. The Board finds an interest coverage in the order of 2.4x is acceptable given NP's level of risk and the Board's findings in this Decision with respect to NP's capital structure and return on regulated equity.

V. INTER-CORPORATE RELATIONSHIPS AND CHARGES

15. NP will be required to observe the following principles in all inter-corporate transactions:

    (i) All inter-corporate transactions between a utility and its affiliates shall be fully transparent and are subject to scrutiny by the Board.
    (ii) A utility shall have the right to manage its affairs but it must demonstrate to the satisfaction of the Board that all affiliate transactions are prudent.
    (iii) A utility shall ensure that inter-corporate transactions will not disadvantage the interests of ratepayers and furthermore that ratepayers and the utility will derive some demonstrable benefit from such transactions.

(iv) The onus is on the utility to show that it is in compliance with the guidelines and principles with respect to inter-corporate transactions.

16. These principles may be amended by the Board from time to time. Given the implications of these principles on both NP and its affiliates, NP will be required to undertake a review and update of its operating practices and procedures relating to any and all inter-corporate transactions to ensure that the principles as set out above are reflected. The results of such a review shall be reported to the Board no later than March 31, 2004.

17. NP will be directed to prepare a report which should compare and quantify the benefits to NP and ratepayers of its administration of and participation in a centralized insurance program for the Fortis Group of Companies, rather than be insured on a stand-alone basis. This report should be filed with the Board no later than March 31, 2004.

18. NP will be required to modify its quarterly reports on inter-corporate charges to show separately associated labour and other staff and expense charges billed in relation to NP's insurance administration on behalf of Fortis and related companies.

19. As part of the review of operating practices and procedures relating to inter-corporate transactions NP will be required to investigate the utilization of market rates for executive and management time charges. In lieu of market rates, NP shall propose an appropriate markup on its cost-based rates as a proxy for market in the event that utilization of market rates is not practical.

20. NP will be required to apply billing and collection practices with respect to inter-corporate transactions which are consistent with those applied to unrelated parties. Billings to Fortis and related companies should also be undertaken within 30 days of the service and/or expenses being charged for recovery.

VI. AUTOMATIC ADJUSTMENT FORMULA

21. The Board will continue to use the existing methodology in the Automatic Adjustment Formula for calculating the risk-free rate. However, the risk-free rate will now be calculated based on the actual yields of the three most recent series of long-term Government of Canada bonds during the 10 trading days being monitored as reported in The Globe and Mail under the heading *"Ask Yields"*. The observed average of the daily ask yields for the last five trading days of October and the first five trading days of November for these three most recent issues will be used to forecast the risk-free rate for the upcoming year, in each year of operation of the Formula.

22. The Board has determined that a total risk premium of 415 basis points, or 4.15%, is reasonable. This is the value that will be used and adjusted on the same basis as was ordered in Order No. P.U. 36(1998-99) in the application of the Formula.

23. NP will be required to modify the schedule filed as part of its annual return that calculates the embedded cost of debt to identify specifically the causes of variations in the actual embedded cost of debt from the cost forecast for the test year period.

24. The Board will establish a mechanism tied to the observed rate of return on regulated common equity which may trigger an early review of the Formula and cost of capital. Where the actual rate of return on regulated equity in any intervening year exceeds the cost of equity determined by the Formula by more than 50 basis points, then NP will be required to file a report with the Board in its annual return setting out the circumstances and facts contributing to the difference.

25. The Board will approve the use of the Formula, as modified by this Decision, for a further three-year period. Customer rates will be set for 2003 and 2004 by this Decision and Order. The Formula will be used to set the rate of return on rate base, and hence customer rates, for 2005, 2006 and 2007.

26. The Board finds that the Asset Rate Base method should replace the Invested Capital approach currently used to calculate NP's rate base. The move to the Asset Rate Base method will begin in 2003 by incorporating deferred charges in rate base. The Board will direct NP to implement the following guidelines in switching to the Asset Rate Base method:

(i) Average deferred charges based on BVP-11 to be added to the average rate base for the 2003 and 2004 test years and all subsequent fiscal years.
(ii) Evidence relating to changes in deferred charges, in particular deferred pension costs, to be filed annually at the capital budget hearing.
(iii) NP will provide a reconciliation of average Rate Base to average Invested Capital annually at the capital budget hearing.
(iv) NP will review no later than its next general rate application, the appropriateness and approach to including the remaining reconciling items in the Rate Base. This review will address the issue of discontinuing the use of regulated common equity in favour of book equity.

VII. RATE BASE

27. NP will be required to file a revised calculation of rate base and return on rate base for test years 2003 and 2004 which reflects the decisions taken by the Board.

28. The Board will approve a range of 36 basis points for the rate of return on rate base for test years 2003 and 2004 and for use with the Formula, unless otherwise ordered by the Board.

VIII. ACCOUNTING TREATMENT AND POLICIES

29. The Board will accept NP's proposal to amortize the recovery of the $5,600,000 balance in the Hydro Production Equalization Reserve over a period of five years, beginning in 2003. NP will be required to review the balance in the Hydro Production Equalization Reserve as of December 31, 2005 and to apply to the Board for an Order as to the disposition of outstanding balances, positive or negative, as part of its next general rate application.

30. The Board will approve NP's proposal to adopt the market-related method of determining pension expense on a prospective basis, effective January 1, 2003.

31. The Board will approve the 2002 Depreciation Study as filed. The depreciation rates as recommended in the Depreciation Study will be approved for calculating depreciation expense for the test year period 2003 and 2004.

32. The Board will approve NP's proposal to amortize the depreciation reserve variance over the three-year period 2003-2005.

33. The Board will approve NP's proposal to continue with the cash basis for recognizing expenses for other employee future benefits. With its next general rate application, NP will be required to submit a report which addresses the use of the accrual method as an alternative to the existing accounting treatment for other employee future benefits.

34. The Board will approve NP's proposal to amortize over a three-year period, beginning in 2003, the estimated regulatory costs of $1,200,000.

35. The Board finds that the 2001 excess earnings of $944,000 should be rebated to customers. NP will be required to submit a proposal for this rebate as part of its filing of revised rates.

36. The Board will accept NP's proposal for adjusting 2003-2004 revenue requirement to recover the outstanding amount of the 1992-1993 excess earnings as required by Order No. P.U. 36(1998-99), subject to any adjustments arising from this Decision.

37. The Board will approve NP's request to defer dealing with the outstanding issues relating to the Revenue Recognition Study pending resolution of the dispute with Canada Customs and Revenue Agency (CCRA).

38. Since the Board has agreed to the deferral of the issues relating to the Revenue Recognition Study until the dispute between NP and CCRA is resolved, the Board will also approve NP's request to defer dealing with the disposition of the unbilled revenue increase reserve account. This issue will be dealt with as part of the Order arising from consideration of the Revenue Recognition Study to be filed by NP, as was intended in Order No. P.U. 36(1998-99).

39. The Board accepts NP's treatment of expenses associated with the 2000 and 2001 early retirement programs.

IX. REVENUE REQUIREMENT

40. The Board will use fiscal years 2003 and 2004 as the test years for determining revenue requirement, as proposed by NP.

41. The Board accepts the purchased power expense for the test year period 2003-2004, as proposed by NP, subject to any adjustments arising from this Decision.

42. The Board accepts the proposed operating expense forecast for the test year period 2003-2004, with the exception of executive compensation which is dealt with separately below.

43. The Board will no longer require NP to file an annual Advertising and Marketing Report.

44. The Board will direct that any STI payouts in excess of 100% of target payouts will be the responsibility of the shareholder, Fortis, and will be charged to non-regulated operations.

45. The Board accepts the level of executive compensation as part of NP's revenue requirement for the test year period 2003-2004.

46. The Board accepts the depreciation expense for the test year period 2003-2004, as proposed by NP.

47. The Board accepts the forecast income tax expense for the test year period 2003-2004, as proposed by NP, subject to any adjustments arising from this Decision.

48. The Board accepts the deduction from revenue requirement of other revenue for the test year period 2003-2004, as proposed by NP.

49. Since the Board will require that the 2001 Excess Revenue be rebated to customers, NP's revenue requirement will not be reduced by this amount, as proposed by NP.

50. The Board accepts the deductions from revenue requirement of non-regulated expenses for the test year period 2003-2004, as proposed by NP.

51. NP will be required to calculate and file a revised revenue requirement for 2003 and 2004 based on its proposals in this Application, and incorporating the changes set out in this Decision relating to allowed rate of return on rate base and the adjustment for 2001 Excess Revenue.

52. The Board will accept, subject to review of reasonableness and prudence, certain other secondary or incidental changes in revenue requirement which arise as a result of this Decision.

X. COST OF SERVICE

53. The Board has reviewed the Mediation Report and the evidence filed relating to Cost of Service issues. The Board accepts the recommendations of the parties as set out in the Mediation Report and will approve the recommendations as presented.

54. The Board will approve additional 2003 capital expenditures of $425,000 for a load research program, as proposed by NP.

XI. RATES, RULES AND REGULATIONS

55. The Board has reviewed the Mediation Report and the evidence filed relating to Rate Design Issues. With the exception of the issue relating to meter meading, which was not agreed to by the parties, the Board accepts the recommendations of the parties as set out in the Mediation Report and will approve the recommendations as presented.

56. Since the conclusion of the hearing of this Application, NLH has filed its general rate application for 2004. The Board will direct that scheduling of the consultation recommended in the Mediation Report on NLH's wholesale power rate design be considered at the pre-hearing conference for NLH's general rate application.

57. The Board will direct NP to propose to the Board for approval a *"peer group"* of utilities and performance measures upon which to evaluate NP's performance in accordance with the terms of the Mediation Report.

58. The Board will not direct any changes to the wording of Rules & Regulations 8-Meter Reading at this time. The Board will undertake a review of NP's meter reading program with a focus on the estimating methodology and process. This review will also include an assessment of existing regulatory and utility practice in other Canadian jurisdictions.

59. The Board will not make any adjustments to the application of demand charges within the General Service Rates.

60. The Board will not order the Domestic Rate be made available to house meters of apartment buildings.

61. The Board is not persuaded that changes to the Customer Deposit Policy or to the Rules and Regulations respecting security deposits would be fair to other customers. The Board will not order a change in the present policy covering the rate of interest paid to customers on cash security deposits.

62. The requirement for inspection of service prior to reconnection is primarily a safety issue and the Board will not intervene.

63. In order to finalize rates to be implemented as a result of this Application, NP will be directed to re-file, along with its revised revenue requirement and revised calculations of rate base and return on rate base, its Schedule of Rates, Tolls and Charges to be effective for billings on or after August 1, 2003 incorporating the decisions of the Board. The rates shall be calculated on the same basis as in the Application and shall be designed to remain in effect through 2004.

64. NP will also be directed to file a proposal as to the finalization of interim rates as set by Order No. 35(2002-2003) and the disposition of any variance between revenue generated based on these interim rates and the revised 2003 test year revenue requirement. The proposal should include a plan for the rebate of this amount to customers.

65. The Board will review NP's revised filing to ensure its decisions are appropriately incorporated and then issue a final Order, approving or modifying, as it deems appropriate, NP's rate base, NP's return on rate base and the revised rates for NP's customers as of August 1, 2003.

PART FOUR. BOARD ORDER

IT IS THEREFORE ORDERED THAT:

CAPITAL STRUCTURE

1. **The proportion of regulated common equity in the capital structure shall not exceed 45%. Regulated common equity in excess of 45% of the total invested capital shall not attract a rate of return higher than the rate of return on preferred equity of 6.31%.**

2. **For purposes of determining the weighted average cost of capital, the Board accepts the forecast average capital structure for the 2003 and 2004 test years as proposed by NP. The forecast average capital structure for 2003 shall be deemed to be debt of 54.28%, preferred equity of 1.45%, and common equity of 44.27%; and, for 2004, debt of 54.06%, preferred equity of 1.39%, and common equity of 44.55%.**

RATE BASE/RETURN ON RATE BASE

3. **NP shall move toward the adoption of the Asset Rate Base method for determining rate base and beginning in 2003 shall incorporate the average deferred charges, as set out in its Application, to the average rate base.**

4. **NP shall calculate and file a revised average rate base and return on rate base for 2003 and 2004, based on its proposals in this Application, incorporating the changes set out in this Decision and Order, which include:**
   i. **A return on regulated common equity of 9.75% is to be used for calculating the weighted average cost of capital for the 2003 and 2004 test years; and**
   ii. **The move to the Asset Rate Base method of determining rate base.**

5. **NP shall file annually with its capital budget application, unless otherwise ordered by the Board:**
   i. **Evidence relating to changes in deferred charges, including pension costs; and**
   ii. **A reconciliation of average rate base to average invested capital.**

6. **NP shall file no later than its next general rate application a report on including in rate base the remaining reconciling items between rate base and invested capital as described in this Decision and Order.**

7. **The allowed range of rate of return on rate base shall be 36 basis points for 2003 and 2004 and for use in the Automatic Adjustment Formula, unless otherwise ordered by the Board.**

AUTOMATIC ADJUSTMENT FORMULA

8. Unless the Board otherwise orders upon application by NP or by the Board of its own motion, the rate of return on rate base for the years 2005, 2006 and 2007 shall be set using the Automatic Adjustment Formula that was established by the Board in Order No. P. U. 36 (1998-99), incorporating the changes set out in this Decision and Order, including:

- **i. The move to the Asset Rate Base method; and**
- **ii. The use of the three most recent, rather than the two previously specified, series of long-term Government of Canada bonds in determining the risk-free rate.**

9. NP shall apply no later than November 30th in each of 2004, 2005 and 2006 for the application of the Automatic Adjustment Formula to the rate of return on rate base and for a revised Schedule of Rates, Tolls and Charges effective January 1 in each year following.

10. NP shall prepare and file with the Board:

- **i. With its annual return until otherwise directed by the Board, a modified schedule calculating the embedded cost of debt for the reporting year to identify specifically the causes of variations in the actual embedded cost of debt from the cost forecast for the test period; and**
- **ii. With its annual return where in a year the actual rate of return on regulated equity is greater than 50 basis points above the cost of equity as determined by the Formula, a report explaining the circumstances and facts contributing to the difference.**

INTER-CORPORATE RELATIONSHIPS AND CHARGES

11. NP shall review and update its operating practices and procedures to reflect the principles governing all inter-corporate transactions as set out in this Decision and Order, and which may be amended by the Board from time to time.

12. NP shall file with the Board:

- **i. By June 30, 2004 a report addressing its stand-alone status in respect of the corporate credit linkage of NP to Fortis, as detailed by the Board in this Decision and Order.**

- **ii. By March 31, 2004 a report as to its operating practices and procedures relating to any and all inter-corporate transactions, including:**
    - **a) An investigation of the utilization of market rates or a suitable proxy markup for executive and management time charges;**

b) Quantification of the benefits to NP and its customers of its administration of and participation in a centralized insurance program for the Fortis Group of Companies and comparing these benefits to being insured on a stand-alone basis;

c) A comparison of NP's billing and collection practices with respect to affiliate companies and unrelated parties.

iii. Modified quarterly reports which show separately the associated labour and other staff and expense charges billed in relation to NP's insurance administration on behalf of Fortis and related companies.

ACCOUNTING TREATMENT AND POLICIES

13. NP's proposal to amortize the recovery of the $5,600,000 balance in the Hydro Production Equalization Reserve over a period of five years, beginning in 2003, is approved.

14. NP's proposal to adopt the market-related method of determining pension expense on a prospective basis, effective January 1, 2003, is approved.

15. The 2002 Depreciation Study and depreciation rates included therein are approved.

16. NP's proposal to amortize the depreciation reserve variance over the three-year period 2003-2005 is approved.

17. NP's proposal to continue using the cash basis for recognizing expenses for other employee future benefits is approved.

18. NP's proposal to amortize over a three-year period, beginning in 2003, regulatory costs of $1,200,000 is approved.

19. NP's request to defer dealing with the outstanding issues relating to the Revenue Recognition Study and the unbilled revenue increase reserve account is approved.

20. NP shall file with the Board:

i. A new depreciation study as of December 31, 2006;

ii. No later than with its next general rate application a report which addresses the use of the accrual method for other employee future benefits; and

iii. As part of its next general rate application a proposal as to the disposition of the balance in the Hydro Production Equalization Reserve as of December 31, 2005.

REVENUE REQUIREMENT

21. NP shall calculate and file a revised total revenue requirement for the 2003 and 2004 test years based on its proposals in this Application, incorporating the changes set out in this Decision and Order.

22. NP shall rebate to customers the 2001 excess earnings of $944,000 and shall file for the approval of the Board a proposal for this rebate.

23. NP's proposal for adjusting 2003-2004 revenue requirement to recover the outstanding amount of the 1992-1993 excess earnings as required by Order No. P.U. 36(1998-99) is approved, subject to any adjustments arising from this Decision and Order.

24. Regulated expenses for 2003 and subsequent years shall exclude short-term incentive program payouts in excess of 100% of target.

25. NP is no longer required to file the Advertising and Marketing reports required by Order No P. U. 7(1996-97).

COST OF SERVICE

26. NP shall revise its cost of service methodology, using the COS methodology as proposed by NP, incorporating the changes set out in this Order which include the recommendations of the Mediation Report, as set out in Schedule 1 of this Decision and Order.

RATES, RULES AND REGULATIONS

27. NP shall revise and file for the approval of the Board a revised Schedule of Rates, Tolls and Charges which shall be effective for monthly bills issued August 1, 2003 through to December 31, 2004, based on the proposals of NP in its Application, incorporating the changes set out in this Decision and Order, which include the recommendations of the Mediation Report as set out in Schedule 2 of this Decision and Order.

28. NP shall file a proposal as to the finalization of interim rates as set by Order No. P.U. 35(2002-2003) and the disposition of any variance between revenue generated based on those interim rates and the revised 2003 test year revenue requirement.

29. NP shall revise and file for the approval of the Board revised Rules and Regulations, based on the proposals of NP in this Application, incorporating the changes set out in this Decision and Order, which include the Recommendations of the Mediation Report as set out in Schedule 2.

30. **NP shall revise and file for the approval of the Board the definition of *"excess earnings"* in the company's system of accounts to reflect earnings above the maximum of the allowed range of rate of return on rate base.**

31. **NP shall file with the Board by March 31, 2004 a report suggesting a *"peer group"* of utilities and performance measures upon which to evaluate NP's performance, in accordance with the terms of the Mediation Report.**

CAPITAL ITEM

32. **The additional 2003 capital expenditure of $425,000 for a load research program as proposed by NP is approved.**

HEARING COSTS

33. **NP shall pay the expenses of the Board arising from this Application, including the expenses of the Consumer Advocate incurred by the Board, pursuant to Section 117 of the *Act*.**

Dated at St. John's, Newfoundland and Labrador this 20th day of June 2003.

SCHEDULE 1

COST OF SERVICE

RECOMMENDATIONS OF

THE MEDIATION REPORT

ORDER NO. P. U. 19(2003)

COST OF SERVICE RECOMMENDATIONS OF THE MEDIATION REPORT

1. Newfoundland Power's ("NP's") cost of service study filed in this proceeding is fundamentally appropriate and in general compliance with Board Orders from previous hearings that have accepted NP's use of embedded cost of service studies as a guide in determining the revenue requirement increases or decreases to be applied to each class.

2. The following changes to NP's cost of service methodology, which received temporary Board Approval in NP's 1996 General Rate Proceeding, should be approved in this case:

   - Classification of NP's hydraulic plant using system load factor on energy rather than 100 per cent demand;
   - Allocation of NP's generating plant using a Single Coincident Peak allocation ("1CP") rather than Non-Coincident Peak allocation ("NCP");.
   - Allocation of NP's transmission plant using 1CP rather than NCP;
   - Allocation of purchased power transmission demand costs using 1CP rather than NCP;
   - Allocation of purchased power generation demand costs using 1CP rather than NCP;
   - Allocation of NP's funding of Newfoundland Hydro's rural deficit based on allocated class costs (with the rural deficit amount removed from determination of allocators to class cost).

COST OF SERVICE
RECOMMENDATIONS OF
THE MEDIATION REPORT

3. The Board should approve two additional changes to NP's cost of service methodology:

   - General expenses (i.e., General System Costs and Administration and General Costs) should be functionalized and classified based on the assumption that a portion of these costs is related to net utility plant (capital labor expense as a percentage of capital labor expense plus operating labor expense), rather than assuming (as previously) that all of these costs relate to operating and maintenance (O&M) expense.

   - The cost of service study should use normalized revenue and normalized purchased power expense rather than actual revenue and purchased power expense, unadjusted for normalization, as previously.

4. The Board should approve NP's use of an NCP allocation for distribution demand costs even though this differs from the 1CP allocator that Newfoundland Hydro was directed to use for distribution demand costs in Order No. P. U. 7(2002-2003).

SCHEDULE 2

RATES, RULES AND REGULATIONS

RECOMMENDATIONS OF

THE MEDIATION REPORT

ORDER NO. P. U. 19(2003)

RATES, RULES AND REGULATIONS
RECOMMENDATIONS OF
THE MEDIATION REPORT

1. The Board should approve tail block rate increases above the average class increase for Rates 2.2, 2.3 and 2.4 so as to better reflect short-run marginal energy costs in these tail block rates.

2. The Board should approve the elimination of minimum monthly ("ratcheted") demand charges, linked to the customer's maximum demand during the previous twelve months, in General Service Rates 2.2, 2.3 and 2.4.

3. The Board should retain the Curtailable Service Option Credit of $29/kva in Rates 2.3 and 2.4 and require NP to inform customers of the possibility of significant future changes in this credit.

4. The Board should approve NP's proposed merger of street light and area lighting rates for the 400W MV fixtures with the 250W HPS fixtures that replace them. The Board should also approve NP's proposed removal from the Schedule of Rates and Regulations, the charges for the 1,000W MV fixture, the 700W MV fixture, and the 150W HPS post top fixture, since these no longer exist on NP's system.

5. To the extent possible, there should be no adverse customer rate impacts. Any overall revenue change should be distributed equally to each class of customers. With the exception of any change in basic customer charges (see issue "9", below), no customer should have a rate change that produces an annual cost change that is more than twice the system average (unless the dollar impact is minimal).

6. The Board should approve a change to Regulation 9(o) to reduce the application fee for a customer name change from $14.00 to $8.00 (the current new service fee).

7. The Board should approve the removal of clause 9(n) to eliminate charges for the preparation of account statements for billing information prior to the most recent twelve months.

8. The Board should approve a change to Regulation 9(f) and a proposed new clause 12(g) permitting charging the reconnect fee to new customers in apartments where a reconnection is required subsequent to a request by a landlord to disconnect an apartment. Such customers will not be required to pay the new service application fee.

RATES, RULES AND REGULATIONS
RECOMMENDATIONS OF
THE MEDIATION REPORT

9. The current basic monthly customer charges for domestic (residential) service and small general service rate 2.1 should be reduced by $1.00. The revenue loss associated with this change should be made up by adjusting the energy component of these same rates so that the change does not impact customers in other rate classes. NP also agrees that (1) it will not propose a basic customer charge increase as a result of any wholesale rate increase in Hydro's 2003 GRA proceeding, and (2) in its next GRA, NP will cap the customer charge recovery of distribution costs allocated to customers at 50% of these allocated distribution costs for these rate classes, with the remainder to be recovered through energy charges. Distribution costs are distribution network costs beyond the service drop and do not include customer specific costs such as meters, meter reading, billing and service drops.

Application for Approval of Certain Revisions to its Rates, Charges and Regulations

Appendix - B	List of Formal Intervenors
Appendix - C	Summary 2006 Cash Working Capital Requirement
Appendix - D	Conservation & Energy Efficiency Plan 2006 - Detailed Summary Table

1.0 INTRODUCTION

[1] This decision is further to a public hearing conducted by the Nova Scotia Utility and Review Board (the "Board") over 13 days between November 14, 2005 and December 2, 2005, in the matter of an application by Nova Scotia Power Incorporated ("NSPI", the "Company", the "Utility") for approval of revisions to its Rates, Charges and Regulations.

[2] NSPI is a regulated public utility and is the successor to Nova Scotia Power Corporation, a Crown Corporation which was privatized in 1992. As of January 1, 1999, NSPI became the principal subsidiary of Nova Scotia Power Holdings Incorporated, now known as Emera Incorporated ("Emera").

[3] NSPI is engaged in the production and supply of electrical energy. It distributes electricity through a province-wide system and, as at December 31, 2004, served approximately 468,000 customers, including six municipal electric utilities. Its revenues for the year 2004 were $935 million and its total assets, as at December 31, 2004, were $3.1 billion.[1]

[4] In its application, dated July 5, 2005, NSPI requested an increase in rates to meet its proposed revenue requirement. It has used its estimated expenses for 2006 as the test year for ratemaking purposes. The proposed rate increases result in an average overall increase of 14.7% across all above-the-line classes. On November 21, 2005, NSPI announced that it had reached an agreement with its supplier on pricing for natural gas

[1]Exhibit N-2, Appendix A

under an existing long-term natural gas purchase agreement, lowering its 2006 fuel forecast by $22 million. According to a News Release issued by NSPI on that date, the agreement reduces the proposed average rate increase to approximately 13% (Undertaking U-43).

[5] The public hearing was duly advertised in accordance with **sections 64** and **86** of the **Public Utilities Act**, R.S.N.S. 1989, c. 380, as amended (the "**Act**"), which read as follows:

> **Approval of schedule of rates and charges of utility**
> **64 (1)** No public utility shall charge, demand, collect or receive any compensation for any service performed by it until such public utility has first submitted for the approval of the Board a schedule of rates, tolls and charges and has obtained the approval of the Board thereof.
>
> **Filing with Board**
> **(2)** The schedule of rates, tolls and charges so approved shall be filed with the Board and shall be the only lawful rates, tolls and charges of such public utility until altered, reduced or modified as provided in this Act. R.S., c. 380, s. 64.
>
> **Notice of hearing of application for rate changes**
> **86** Notice of the hearing of any application, for the approval of or providing for an increase or decrease in the rates, tolls and charges of any public utility, shall be given by advertisement in one or more newspapers published or circulating in the cities, towns or municipalities where such changes are sought, for three consecutive weekly insertions preceding the date of said hearing, unless otherwise ordered by the Board. R.S., c. 380, s. 86.

[6] A total of 39 formal intervenors responded to NSPI's application. A number of these parties (identified in Appendix B attached) were represented at the hearing by Counsel. The Nova Scotia Department of Energy (the "Province"); the Consumer Advocate (the "CA"); Avon Valley Greenhouses Ltd. *et al.* ("Avon"), whose Counsel represented approximately 19 intervenors; Stora Enso Port Hawkesbury Limited and Bowater Mersey Paper Company Limited ("SEB"); Halifax Regional Municipality ("HRM"); Affordable Energy Coalition ("AEC"); Ecology Action Centre ("EAC"); Electricity Consumers

Alliance of Nova Scotia ("ECANS"); Canadian Manufacturers & Exporters ("CME"); GasWorks Energy Corp. ("GasWorks"); the Liberal and NDP Caucus offices; Dr. Larry Hughes; and the Municipal Electric Utilities of Nova Scotia Co-operative ("MEUNSC") all participated in the hearing. The Board also received numerous submissions from members of the public opposing NSPI's application.

[7] A significant part of NSPI's evidence involves the cost of fuel, particularly imported coal, as well as the projected benefit potentially earned by NSPI on the resale of natural gas. NSPI filed this information on a confidential basis. The Board imposed the precedent, established in the 2002 rate case and applied again in the 2005 rate case, which provides access to this information only to those intervenors who agree to sign confidentiality undertakings.

[8] As a result, certain testimony, undertakings, exhibits and transcripts are considered confidential and are accessible only to the Board and those parties who agreed to sign confidentiality undertakings. For the most part, redacted versions of this evidence are on the public record. In addition, certain of the hearing days relating to evidence on fuel were conducted on an *in camera* basis.

[9] In its 2002 decision the Board stated that:

> While conducting *in camera* sessions is an unusual occurrence for the Board, it is not precluded by the Board's regulatory rules. Indeed the rules contemplate information being filed in confidence and also provide for other parties to request its disclosure. The Board believes that its role as a regulator responsible for protecting the public interest requires it to issue a decision that is, in all respects, accessible to the public. The Board considers that it is unacceptable to issue two versions of a decision - one public and one confidential. Therefore, although the Board has carefully considered all of the evidence filed during this

> proceeding, including those parts which involve confidential information, the Board has chosen, in this decision, to avoid direct reference to confidential information.
>
> (Board Decision, October 23, 2002, p. 5)

[10] As it did in the 2005 rate case, the Board continues to believe that this is the most appropriate manner in which to issue a decision in a case where a significant portion of the evidence is confidential. Accordingly, to the extent possible, this decision will not refer directly to confidential information.

[11] The Board wishes to acknowledge, with appreciation, the contribution and participation of the intervenors, NSPI and the public in this proceeding. The significant work of the parties, as well as the expert witnesses appearing at the hearing, assisted the Board considerably in this process. The Board has reviewed, analyzed and considered many thousands of pages of material in its decision-making process.

2.0 BACKGROUND

[12] NSPI is a vertically integrated, investor-owned, regulated public utility with a virtual monopoly on electricity service throughout the Province. It is the primary electricity supplier in Nova Scotia, providing over 95% of the electricity generation, transmission and distribution in the Province.[2] The Board regulates NSPI in the public interest on a cost-of-service basis. The **Act** gives the Board broad regulatory oversight over public utilities and provides it with the authority to discharge its regulatory responsibilities. Some of the relevant statutory provisions are as follows:

> **Supervision of utility by Board**
> **18** The Board shall have the general supervision of all public utilities, and may make all necessary examinations and inquiries and keep itself informed as to the compliance by the said public utilities with the provisions of law and shall have the right to obtain from any public utility all information necessary to enable the Board to fulfil its duties. R.S., c. 380, s. 18.
>
> **Form of books and records of utility**
> **27** The Board may prescribe the forms of all books, accounts, papers and records required to be kept by any public utility and every public utility is required to keep and render its books, accounts, papers and records accurately and faithfully in the manner and form prescribed by the Board and to comply with all directions of the Board relating to such books, accounts, papers and records. R.S., c. 380, s. 27.
>
> **Examination and audit of accounts**
> **29 (1)** The Board may provide for the examination and audit of all accounts, and all items shall be allocated to the accounts in the manner prescribed by the Board.
>
> **Authority to inspect books or records of utility**
> **(2)** The agents, accountants or examiners employed by the Board shall have authority under the direction of the Board to inspect all and any books, accounts, papers or records and memoranda kept by any public utility. R.S., c. 380, s. 29.
>
> **Power to determine value of property of utility**
> **30 (1)** The Board may at any time, with the assistance of such engineers, accountants, valuators, counsel and others as it deems wise or advisable to employ, inquire into and determine the extent, condition and value of the whole or any portion of the property and assets of any public utility used and useful in furnishing, rendering or

[2] Exhibit N-25, IR-2, p. 9

supplying a particular service to or for the public, as of a date to be fixed by the Board.

Duty of utility to furnish information

33 (1) Every public utility shall furnish to the Board from time to time, and as the Board may require, maps, profiles, contracts, reports of engineers and other documents, records and papers, or copies of any and all of the same in aid of any investigation and to determine the value of the property of such public utility, and every public utility shall co-operate with the Board in the work of the valuation of its property in such further particulars and to such extent as the Board may direct.

Approval of improvement over $25,000

35 No public utility shall proceed with any new construction, improvements or betterments in or extensions or additions to its property used or useful in furnishing, rendering or supplying any service which requires the expenditure of more than twenty-five thousand dollars without first securing the approval thereof by the Board. R.S., c. 380, s. 35; 2001, c. 35, s. 30.

Separate rate base for each service supplied

42 (1) The Board shall fix and determine a separate rate base for each type or kind of service furnished, rendered or supplied to the public by a public utility.

Factors considered in establishing rate base

(2) In establishing a rate base the Board shall determine the value of the physical assets of the public utility in accordance with the provisions of this Act, including in such value the actual reasonable and necessary cost of labour and supervision up to and including gang foreman, and the Board may, in its discretion, make allowances for the following matters, and such other matters as the Board deems appropriate:

(a) necessary working capital;

(b) organization expenses to the extent of such sum as the public utility may establish to the satisfaction of the Board to have been reasonably and prudently expended out of capital account in respect of organization expenses as defined by the regulations of the Board;

(c) construction overheads to the extent of such sum as the public utility may establish to the satisfaction of the Board to have been reasonably and prudently expended out of capital account in respect of engineering, superintendence, legal services, taxes and interest during construction, and like matters not included in the valuation of the physical assets;

(d) expenses of valuations to the extent of such sums as may have been expended in respect of a valuation by the Board and, with the approval of the Board, charged to capital account;

(e) costs in whole or in part of land acquired in reasonable anticipation of future requirements.

Amortization of organization and valuation expenses

(3) The Board may direct that a public utility shall make such provision as to the Board seems proper for the amortization of the sums allowed in a rate base for organization expenses and expenses of valuations, and may direct that the sums required annually for such amortization shall be charged as an operating expense.

Revision of rate base

(4) The Board may from time to time revise any rate base making due allowance for extensions and additions to, improvements or alterations in and withdrawals or retirements from, the property and assets of the public utility.

Existing rate base

(5) Until a rate base is determined by the Board for any public utility pursuant to this Section, the present rate base for such public utility as from time to time revised or accepted by the Board shall continue in effect and shall be the rate base for such public utility, provided that the Board may direct that any such public utility shall make such provision as to the Board seems proper for the amortization of the sums allowed in such rate base for organization expenses, expenses of valuations or allowances not mentioned in subsection (2) and may direct that the sums required annually for such amortization shall be charged as an operating expense. R.S., c. 380, s. 42; 1992, c. 8. s. 35.

Orders by board respecting rates and charges of utility

44 The Board may make from time to time such orders as it deems just in respect to the tolls, rates and charges to be paid to any public utility for services rendered or facilities provided, and amend or rescind such orders or make new orders in substitution therefor. R.S., c. 380, s. 44.

Amount utility entitled to earn annually

45 (1) Every public utility shall be entitled to earn annually such return as the Board deems just and reasonable on the rate base as fixed and determined by the Board for each type or kind of service furnished, rendered or supplied by such public utility, provided, however, that where the Board by order requires a public utility to set aside annually any sum for or towards an amortization fund or other special reserve in respect of any service furnished, rendered or supplied, and does not in such order or in a subsequent order authorize such sum or any part thereof to be charged as an operating expense in connection with such service, such sum or part thereof shall be deducted from the amount which otherwise under this Section such public utility would be entitled to earn in respect of such service, and the net earnings from such service shall be reduced accordingly.

Earnings are in addition to expenses and allowances

(2) Such return shall be in addition to such expenses as the Board may allow as reasonable and prudent and properly chargeable to operating account, and to all just allowances made by the Board according to this Act and the rules and regulations of the Board. R.S., c. 380, s. 45.

Power to compel compliance by utility

46 The Board shall have power, after hearing and notice by order in writing, to require and compel every public utility to comply with the provisions of this Act and any municipal ordinance or regulation relating to said public utility, and to conform to the duties imposed upon it thereby by the provisions of its own charter, if any charter has or shall be granted it, provided, that nothing herein contained shall be held to relieve any public utility or its officers, agents or servants, from any punishment, fine, forfeiture or penalty for violation of any such law, ordinance, regulation or duty imposed by its charter, nor to limit, take away or restrict the jurisdiction of any court or other authority which now has or which may hereafter have power to impose any such punishment, fine, forfeiture or penalty. R.S., c. 380, s. 46.

Duty to furnish information

51 (1) Every public utility shall furnish to the Board all information required by it to carry into effect the provisions of this Act, and shall make specific answers to all specific questions submitted by the Board.

Duty to furnish safe and adequate service

52 Every public utility is required to furnish service and facilities reasonably safe and adequate and in all respects just and reasonable. R.S., c. 380, s. 52.

Approval for transfer of undertaking

62 Notwithstanding the provisions of any Act of the Legislature, no public utility shall sell, assign or transfer the whole of its undertaking or any part thereof to any person or corporation except with the approval of the Board first had and obtained. R.S., c. 380, s. 62.

Approval of schedule of rates and charges of utility

64 (1) No public utility shall charge, demand, collect or receive any compensation for any service performed by it until such public utility has first submitted for the approval of the Board a schedule of rates, tolls and charges and has obtained the approval of the Board thereof.

Filing with Board

(2) The schedule of rates, tolls and charges so approved shall be filed with the Board and shall be the only lawful rates, tolls and charges of such public utility until altered, reduced or modified as provided in this Act. R.S., c. 380, s. 64.

Equal rates and charges for similar services

67 (1) All tolls, rates and charges shall always, under substantially similar circumstances and conditions in respect of service of the same description, be charged equally to all persons and at the same rate, and the Board may by regulation declare what shall constitute substantially similar circumstances and conditions.

Contravention prohibited

(2) The taking of tolls, rates and charges contrary to the provisions of this Section and the regulations made pursuant thereto is prohibited and declared unlawful. R.S., c. 380, s. 67.

[13] NSPI last filed an application for a general rate increase in June of 2004. The hearing was held between November 2004 and January 2005, and the Board's decision was issued on March 31, 2005. Certain findings in the 2005 rate decision, which are relevant to this case, can be summarized as follows:

- The Board reduced NSPI's revenue requirement by $53,244,000 million (approximately $70 million considering tax impacts) for the 2005 test year, which resulted in an average rate increase of approximately 5.3% for above-the-line customers, with an estimated rate increase of approximately 6.1% for most of these customers, including domestic customers, effective April 1, 2005. NSPI had proposed an average overall rate increase of 12.4% across all classes;

- The Board approved a 10.4% rate increase for all below-the-line customers, effective January 1, 2005;

- A settlement agreement proposed by NSPI was not approved, primarily due to the Board's concerns that its acceptance would cause the significantly higher cost of fuel projected by NSPI to be deferred to the expense of ratepayers either in 2005 or in later years;

- The common equity ratio for ratemaking purposes was increased from 35% to 37.5%;

- The Board approved a return on equity at 9.55% for the purpose of setting rates, with the earnings range set at 9.30% to 9.80%;

- The Board directed NSPI to use a return on rate base methodology for its next rate application rather than its long-standing practice of determining the return on the equity portion of total capitalization;

- NSPI was found to be imprudent by the Board in its imported coal procurement practices by failing to address these issues quickly, or efficiently enough, following the 2002 rate decision, to adequately protect itself or its ratepayers. As a result, the Board directed that the cost of fuel and purchased power approved for the 2005 test year be reduced by $18 million to reflect this imprudency;

- NSPI was directed to promptly engage high level in-house expertise to lead the imported coal aspect of its fuel procurement process and to establish a more efficient and accountable decision-making structure with respect to fuel procurement;

- Given the imprudence and inadequacies in NSPI's fuel procurement practices, the Board determined it inappropriate to approve a fuel adjustment mechanism;

- The Board determined that **s. 21** taxes should be deferred for 2005 and 2006, and that they be amortized over an eight year period commencing in 2007. This resulted in an actual reduction in NSPI's 2005 revenue requirement of approximately $32.7 million;

- The proposed increases for miscellaneous charges were found to be too high and were limited by the Board to an increase equal to the average rate of increase for above-the-line rates, rounded to the nearest dollar;

- The Board determined that it does not have the statutory authority to approve a rate assistance program to help low-income customers meet their electricity costs;

- The Board directed NSPI to initiate a technical conference process, with interested parties and stakeholders, to pursue an improved and effective demand side management program.

3.0 FUEL ISSUES

3.1 General Overview

[14] In its Notice of Application and Direct Evidence, NSPI indicated that this rate case is substantially about 2006 fuel costs, and it indicated that "... As is the case with similar utilities throughout North America, Nova Scotia Power and its customers are facing increasing costs for solid fuels, natural gas and oil driven by high and volatile global energy markets".[3]

[15] NSPI pointed out that customer rates approved for 2005 are based on a fuel and purchased power budget of $359 million. It expects that the fuel expense for the 2006 test year will be $120 million higher, for a total expected fuel and purchased power cost of $479 million. This amount is shown in Table 2, Appendix A of Exhibit N-2.

[16] Given the magnitude of the projected increase in fuel costs and its impact on rates, all aspects of NSPI's fuel procurement strategy, policies, procedures and cost estimates were subject to thorough scrutiny at the hearing.

[17] The Liberty Consulting Group ("Liberty") was engaged by Board Counsel and carried out a comprehensive review of NSPI's fuel procurement strategy, policies, procedures and cost estimates, just as it had in connection with the previous rate application. In its Direct Evidence, Liberty sets out the key points in its evidence:

Fuel Forecasting

- Prices in the fuel market are cyclical, volatile, and difficult to predict with a substantial degree of certainty.

---

[3]Exhibit N-1, p. 7

- We continue to believe from the information made available that NSPI has chosen a near-term emission-requirements path of procuring and burning low sulfur coal from the international market in its generating stations.
- Fuel management strategies must recognize the unpredictable nature of the fuel markets.

Fuel Management

- Fuel management encompasses all fuels for power generation, from the initial stages of planning, through development of strategies, procurement, fuel transportation, contract administration, and inventory management. Fuel management includes optimization evaluations of capital expenditures related to fuel use, and balancing fuel mixes among generating stations. It also requires the existence and use, in supporting fuel procurement decisions, of tools and models sufficient to allow sound consideration of the comparative costs of producing electrical energy at the bus-bar, consistent with reliability, environmental requirements, and legal considerations.
- NSPI has since the last case made substantial progress in addressing the fuel management weaknesses that we observed. A number of important challenges remain to be met, however, in satisfying itself and the Board that a full range of necessary capabilities exists.

    - NSPI has significantly improved its Fuel Procurement Policies and Procedures, but there are still opportunities for improvement
    - NSPI has significantly improved its fuel procurement portfolio strategy
    - NSPI has made satisfactory progress in beginning to build its new fuel supply portfolio, but must continue to make commitments to bring about its intended results
    - NSPI has made satisfactory progress in improving the image it conveys to the coal supply market
    - NSPI has satisfactorily resolved Liberty's organization-structure concerns from the prior case
    - NSPI has not sufficiently improved its procedures for fuel hedging
    - NSPI does not appear to have the necessary procedures for the procurement of purchased power
    - NSPI has not demonstrated a use of modeling in long-term coal supply analyses sufficient to evaluate fully such issues as fuel switching costs, or system generating unit changes, to comply with the lower SO_2 cap
    - NSPI has made some improvements in its fuel procurement model, but still cannot demonstrate that it is procuring fuels that will result in the lowest possible cost of electrical energy delivered to the bus-bar
    - NSPI has not demonstrated a satisfactory contract administration system, that it has conducted the appropriate reviews of fuel procurement solicitations, or that the appropriate levels of management have reviewed and approved procurement decisions and commitments.

2006 Fuel Cost Review

- Volatility in market prices for fuel used for electricity generation has continued and market prices have increased substantially since the last case.

- There is substantial reason to believe that this volatility will remain in the period during which NSPI will collect the rates to be established in this proceeding.
- Such volatility will create a substantial risk of over or under recovery of costs.
- That risk exists, no matter how sound the methods and the application of them to forecasts by NSPI.
- NSPI continues to suffer significant harm from past failure to adopt a robust portfolio strategy; not making sufficient long-term fuel commitments as far back as 2002 will continue to cause 2006 fuel costs to be higher than they should be.
- The magnitude of that harm has not diminished as much as might have been expected in light of NSPI's change to a portfolio strategy, because 2006 fuel costs now appear to be significantly higher than they did during the last case.
- NSPI's estimate of its 2006 solid fuel costs has turned out to be too high, as recent NSPI purchases have reduced the amount of uncommitted tonnages and at prices less than NSPI had estimated.
- **[confidential]**
- NSPI's arrangement with affiliate Emera Energy Services ("EES") for the sale of excess NSPI natural gas does not comport with standards of arm's-length dealing with affiliates, good utility practice, or the Board's 2002 decision addressing NSPI's use of an affiliate for off-system gas sales.
- There were a number of anomalies in the solicitation process that NSPI used to select EES as the entity to purchase its excess natural gas; the documentation provided by NSPI indicates favoritism to EES.
- It would be reasonable for NSPI to sell its excess natural gas directly to a broader market **[confidential]**; at the least, NSPI should conduct arm's-length, competitive solicitations for its gas sales.
- NSPI's forecast of the total cost of its HFO requirements for 2006 appears reasonable; however, this conclusion must be qualified because of questions about affiliate purchases and sales.
- There appear to have been substantial levels of sales and purchases of heavy fuel oil between Emera Fuels; the available documentation indicates that NSPI did not follow normal processes with respect to competitive purchasing practices and management approvals.

(Exhibit N-97, pp. 5-9)

[18] Based on its review, Liberty made the following recommendations:

Planning

1. NSPI should immediately conduct an overall re-evaluation of its generating system to determine the optimum way of meeting new requirements for control of SO_2 emissions, as well as emissions of other pollutants of concern, from its generating plants. Such re-evaluation should incorporate a long-term view, not just the next several years. The recommended study should consider not only all fuel supply options, but also integration of fuel supply options with capital expenditures for alteration, modification, or expansion of its generating units, in order to achieve the lowest possible costs for generation of power, consistent with reliability, environmental concerns and legal considerations.

Organization and Procedures

2. NSPI should develop a more comprehensive set of fuel hedging policies and procedures that measure up to industry standards.

3. NSPI should develop a complete set of procedures for the procurement of purchased power.

4. NSPI should continue to refine its own internal spreadsheet model for fuel procurement in order to bring it to a level of sophistication that permits evaluation of fuel-supply options and procurement decision-making on the basis of procuring that mix of fuels that will result in producing the lowest possible cost of electrical energy delivered to the bus-bar.

5. NSPI should continue to revise and refine the Fuel Procurement Policies and Procedures to resolve the concerns expressed in this testimony.

6. NSPI should continue to tighten the controls on the overall fuel procurement process so that proper, readily available documentation demonstrates clearly that appropriate levels of senior management, including the Fuel Strategy Table, have reviewed and approved recommendations made to them regarding specific fuel procurement decisions.

Fuel Supply Portfolio

7. NSPI should continue to build the fuel supply portfolio so that the parameters currently set forth by NSPI in its Fuel Procurement Policies and Procedures are achieved by December 31, 2007.

. . .

Affiliates

11. NSPI should immediately bid on a fully competitive and arm's-length basis its sale of excess natural gas for a one-year term, and should arrange for and coordinate that bidding and the cancellation of the existing agreement with EES with all reasonable dispatch. No costs associated with the termination of the agreement with EES should be included in customer rates.

12. NSPI should also promptly conduct a complete and objective study of the net economic and other impacts of establishing an in-house capability to perform this sale function. The study should take into account likely future gas purchases and internal use and it should quantify the differential economics of a full range of options. It should be filed with the Board within six months, and NSPI should specifically seek Board approval of the approach it intends to use (*e.g.,* asset management, internal function, operation by NSPI within/without Canadian markets) to sell excess gas after the expiration of the new one-year contract that we recommend be put out for competitive bid as promptly as possible.

13. There needs to be a comprehensive audit of affiliate transactions directly and indirectly affecting NSPI fuel procurement, sales, and costs, in order to verify that such transactions are not adversely affecting utility fuel costs.

(Exhibit N-97, pp. 9-12)

[19] Fuel experts retained by SEB and Avon echoed some of the same concerns and criticisms as Liberty and added a few more of their own. As is readily apparent, therefore, there are several important fuel related issues which the Board must address.

3.2 Fuel Procurement Strategy

3.2.1 Overview

[20] As a result of the Board's 2005 rate decision with respect to the 2005 rate application, NSPI has made a number of changes with respect to its fuel procurement strategy, policies and procedures. NSPI, in its Direct Evidence, sets out these changes:

> The Board made several findings and issued directives concerning fuel procurement. NSPI has been asked to file a report with the Board within six months of the 2005 decision "outlining the implementation of the changes" directed by the Board. That report will be filed by September 30, 2005. Meanwhile, having listened to concerns of the Board and customers, NSPI has worked to:
>
> • Reorganize its fuel procurement function so that there is a single individual responsible for both the commercial and strategic aspects of fuel procurement. The Director, Energy, Fuels & Risk Management has an extensive background with NSPI and brings valuable experience to this position. He reports to the General Manager, Power Production who in turn reports to the Chief Operating Officer of NSPI. This organizational structure provides more efficient and accountable decision-making with respect to fuel procurement.
>
> • Engage the services of an executive recruitment firm, STM Associates of Salt Lake City, Utah to identify candidates with experience in international coal markets and coal procurement for employment with NSPI to lead the imported coal supply aspect of the Company's coal procurement. Presently NSPI is screening candidates and expects that the successful individual would be in the position by September of 2005. The selected candidate will report to the Director, Energy Fuels and Risk Management. In the interim, the fuel procurement strategy has been developed and

is being executed with the ongoing assistance of Energy Ventures Analysis Inc. In addition to its work in developing the fuel procurement strategy, EVA independently evaluates all solid fuel supply bids and participates on the Fuel Strategy Table.

• Revise its Policies and Procedures Manual to incorporate both specific comments and general concerns identified by the Board and other intervenors during the 2005 rate proceeding including:

○ Revising its policy statements regarding objectives to more clearly indicate NSPI's commitment to a portfolio strategy and to the evaluation of purchased fuels based upon a quality adjusted valuation on a system-wide basis; and

○ Defining a detailed portfolio strategy.

• Commit to further expanding its procurement portfolio to include multi-year commitments for low sulphur coal imports. To that end, NSPI solicited the market for multi-year offers in January and April 2005....

• Reconstitute its Fuel Strategy Table so that the Vice President, Emera Energy Services no longer participates. This will address concerns related to potential conflicts of interest between Emera and NSPI.

. . .

(Exhibit N-1, pp. 43-44)

[21] The issue is whether the changes described by NSPI, adequately address the problems identified in the 2005 rate decision.

3.2.2 Submissions - NSPI

[22] NSPI states that its objective, with respect to its Fuel Procurement Strategy, "... is to procure and manage a reliable and competitively-priced supply of fuel for its generation fleet consistent with regulatory and environmental requirements. This objective incorporates NSPI's use of renewable energy such as hydro, wind, tidal, biomass as well as demand side management." It goes on to state that it will achieve this objective with "...

first, a solid fuels procurement portfolio that consists of a combination of long and medium term agreements that collectively account for between 70 to 80 percent of its annual solid fuel procurement and, second, a HFO and natural gas procurement strategy that allows NSPI to maximize the value of its long-term purchase contract for natural gas by consuming or selling the natural gas (and buying HFO) when it is economic to do so. NSPI further intends to complement its physical portfolio of fuels with appropriate financial hedges that are currently available or might become available in the future."[4]

[23] For purposes of its portfolio strategy, NSPI defines short-term agreements as being for one year or less; medium-term as being between one and four years; and long-term as being greater than four years.[5]

[24] NSPI indicates in its Direct Evidence that it plans to continue to expand and refine its portfolio to:

- Provide a reliable source of competitively-priced fuels to the NSPI generating fleet that meet regulatory and environmental requirements;
- Maintain a portfolio of long, medium, and short-term agreements that provide for supply and supplier diversification with credit worthy counter-parties;
- Manage market volatility through agreements with staggered expiration dates, volume options, and varied pricing mechanisms;
- Maximize competition among suppliers by qualifying as many sources as possible;
- Buy Nova Scotia coal should competitive supplies of suitable quality be available; and

[4]Exhibit N-1, pp. 44-45

[5]Exhibit N-1, p. 45

- Review commitments on an on-going basis.

(Exhibit N-1, p. 47)

[25] In a response to an Information Request from the Province, NSPI stated:

> NSPI moved quickly to implement the Board's directives regarding fuel procurement. Since the 2005 Rate Decision received by NSPI on March 31, 2005, NSPI has made the following changes:
>
> - Mr. Todd Sattler, VP Energy Services, ceased to participate in NSPI's Fuel Strategy Table immediately on receipt of the Board's decision. Also, Mr. Chris Huskilson no longer participates in the FST as of August, 2005.
> - Mr. Mark Sidebottom was appointed to the position of Director, Energy, Fuels, and Risk Management. Within this role, Mr. Sidebottom takes on responsibility for both the strategic and commercial aspects of fuel procurement, ensuring that a single person is accountable for both.
> - NSPI has established a more efficient and accountable decision-making structure.
> - The Fuel Procurement Policies and Procedures Manual has been revised to address the Board's directives from the 2005 Rate Case Decision, as well as the preferences expressed by customers. The Manual reflects the intention to reduce fuel price volatility and develop a portfolio with increased long and medium-term contracts, and
> - NSPI has been working diligently to recruit high level in-house expertise to lead the imported coal supply aspect of its fuel procurement process, and with the assistance of a world-wide executive recruiter the process is nearing its final stages.
>
> (Exhibit N-72, NSDOE IR-91, Attachment 1, p. 24)

[26] In its Rebuttal Evidence filed with the Board on November 8, 2005, NSPI requested Board approval of the Fuel Procurement Strategy:

> In the short period since the end of the last rate case, NSPI has worked expeditiously to update its policies and procedures manual in order to respond to the concerns of the Board and customers.
>
> In general, the revised policies and procedures manual along with the restated procurement policy has received favourable reviews. Remaining areas of concern to Liberty are the hedging policy, and documentation. NSPI commits to further refining its hedging policies and

procedures in concert with Liberty or alone as the Board sees fit and to providing whatever procurement documentation the Board determines is appropriate.

NSPI requests an endorsement from the Board of the procurement policies and procedures as set out in the Manual filed with the Board in September.

(Exhibit N-153, pp. 52-53)

[27] In its Closing Argument, NSPI requests that the Board approve its Fuel Procurement Policies and Procedures Manual, and that the Board confirm that the strategy is being appropriately implemented.

3.2.3 Submissions - Liberty and Intervenors

Liberty

[28] With respect to NSPI's fuel procurement strategy, Liberty's Direct Evidence stated that:

NSPI has made significant, positive change to its fuel portfolio strategy. The new strategy is clear, does away with the limitation of contract lengths, and provides for longer term contracts with staggered expiration dates. The new approach eliminates the central theme of the old, speculative strategy, which was to stay close to the market, which we saw as a euphemism for spot purchases. The essential points of the new strategy are that NSPI will seek to:

- Maintain a portfolio of long-, medium-, and short-term agreements that provide for supply and supplier diversification with credit-worthy counterparties
- Reduce the effects of market volatility through agreements with staggered expiration dates, volume options, and varied pricing mechanisms
- Maximize competition among suppliers by qualifying as many reliable, creditworthy, and geographically diverse sources as possible
- Buy Nova Scotia fuels, if available, based on price and quality
- Review commitments in order to determine whether renegotiations would be appropriate in the context of a changed market

- Build relationships with suppliers and counterparties based on credible performance

. . .

The exact components of the portfolio may vary over time in response to the market and other events. NSPI has already begun to build its solid fuel portfolio, and states that it desires to achieve its target portfolio percentages over the next 24 months. NSPI recognizes that this schedule may need to be extended, should there be limited supplier interest in longer-term agreements.

NSPI's new strategy is reasonable, and responds well to Liberty's recommendations in the prior case. We also recognize that a portfolio cannot be built instantly, but will take time to assemble, cautioning that the issue of time lag begs the question of when the construction of such a portfolio should have begun.

NSPI's April 2005 solicitation sought **[confidential]** tonnes per year of long-term low-sulfur coal supply through 2008. NSPI recognized this solicitation as its first attempt to add a long-term solid fuel supply contract to its portfolio, in response to the Board's March 2005 decision. NSPI properly handled the solicitation, including a sufficient number of qualified potential suppliers, conducting bid evaluations, and making a decision that appears sound from the information that NSPI provided. NSPI procured the least-cost supply offered. This procurement was the only long-term solid-fuel supply agreement entered during the 2004/2005 period, but NSIP[sic] did make shorter term purchases.

Liberty did find, however, that the documentation supporting this decision failed to demonstrate approvals by the required level of management. The documents contained a page representing decisions of the Fuel Strategy Table and showing its approval. The documentation, however, was not in the form of official minutes of the Fuel Strategy Table, and did not contain any formal signatures authorizing the procurement. Liberty found the same deficiency in the majority of solicitations that NSPI conducted in 2004 and 2005. In no case were formal minutes of the Fuel Strategy Table included in what NSPI provided in response to Liberty's request for procurement documents.

The solid-fuel procurement commitments that NSPI has now made move it in the proper direction in increasing the percentage of supply from long-term contracts. The following table demonstrates the current solid fuel percentages (bases [sic] on 2005 tonnages) compared to the target solid fuel percentages. NSPI finds itself presently below target for long- and medium-term solid fuel contracts. However, we believe that its pace is reasonable, again subject to the concern about when NSPI began to implement this approach.

. . .

NSPI has established an appropriate fuel supply portfolio strategy, and has taken substantial efforts in building a portfolio that corresponds to it. The short time since the decision in the prior case addressing assembly of this new portfolio makes understandable that the portfolio is not yet fully assembled. NSPI has stated that it intends to complete assembly of the desired portfolio in approximately 24 months; Liberty feels that every effort should be made to accomplish this objective.

. . .

NSPI has acted effectively and timely in developing and implementing its new portfolio strategy. The strategy appropriately responds to Liberty's recommendations from the prior

> case and includes an appropriately defined mix of long-term, mid-term, and short-term fuel contracts. NSPI's implementation of this strategy is acceptable, considering the time available since the Board's decision from the prior case in March 2005.
>
> (Exhibit N-97, pp. 29-32 and p. 35)

[29] With respect to NSPI's fuel procurement policies and procedures, Liberty expressed concerns about the lack of management approvals concerning total tonnages to be acquired for the 2006 commitment, and concluded that there is a lack of "proper contract administration systems" at NSPI.[6]

[30] Liberty's overall conclusions with respect to coal procurement and supply in 2005 and beyond are as follows:

> ... We found that NSPI has improved its solicitations, and that it has corrected the RFP language concerns we had observed in the last case. NSPI's solicitations have become more precise in communicating what NSPI actually wants in terms of tonnages and years of delivery. These improvements respond well to concerns that Liberty expressed in the last case.
>
> Liberty requested that NSPI provide the detailed evaluations associated with solicitations; in many cases it provided only those performed by EVA. Liberty realizes that NSPI is in a transition period, but believes that NSPI must move in the immediate future to develop and use the capability to conduct such evaluations with internal resources. Liberty believes that NSPI should make such internal evaluations the norm as soon as its new Senior Manager Solid Fuels is on-board and up to speed. Liberty emphasizes that its concern in this respect is administrative and not substantive. Our review of the bids disclosed no reason to conclude that NSPI failed to make a sound decision on which bidder to select.
>
> We emphasize, however, that attention to detail is essential to maintaining good performance in the long run. Our experience demonstrates that there is a point, which is hard to define objectively, at which the degree of inattention to administrative and procedural matters becomes great enough to create concerns about the quality of substantive decisions and job performance.
>
> We observed a number of other cases that fall into this category. Liberty requested that NSPI provide documentation reflecting the securing of management approvals necessary for procurement. NSPI provided only sketchy and incomplete information in response. Most procurements included a "Record of Decision" from the Fuel Strategy Table, but in no case did Liberty find minutes of Fuel Strategy meetings, or NSPI management signatures

[6] Exhibit N-97, p. 44

> indicating approval to proceed with commitments to suppliers. Most files contained copies of commitment letters signed by the NSPI Solid Fuels Commercial Manager or the Solid Fuels Operation Manager. The authority of these individuals, however, does not extend to the commitments as large as those for which they signed, absent written documentation with accompanying signatures from upper management.
>
> Typically, Liberty finds that utilities provide copies of procurement documentation approvals containing actual signatures of management, and of management committee personnel, indicating that, in logical sequence, management has seen, reviewed, and approved the evaluations and recommendations that led to the actual commitment of procurement from any given fuel supplier.
>
> (Exhibit N-97, pp. 44-46)

[31] Liberty also examined NSPI's procurements of purchased power, fuel oil, and natural gas. With respect to purchased power, Liberty indicated that the forecasted power purchases for 2005 and 2006 were not under contract. NSPI makes purchases on an hourly basis as needed to supplement the most economic running of its generation fleet. Liberty expressed concern that NSPI "...does not appear to have any procedures governing the procurement of purchased power."[7] Without such procedures, Liberty is not able to determine whether or not the procurement of purchased power is being managed and controlled effectively.

[32] With respect to fuel oil and natural gas, Liberty stated that, as a share of the generation fuels mix, its use is expected to rise from 16.4% in 2004 to 17.8% in 2006. Liberty indicated that from 2000 to late 2003, NSPI "...alternated between HFO and gas in the Tufts Cove steam units, depending on the delivered cost of HFO relative to the proceeds of selling the gas into the U.S. market. Since November 2002, however, the

[7] Exhibit N-97, p. 50

proceeds from selling the gas have been high enough to justify regular sale of gas and HFO burning at Tufts Cove."[8]

[33] With respect to NSPI's Fuel Procurement Policies and Procedures Manual, according to Liberty, NSPI has made significant changes and has shown a solid commitment to improvement. However, Liberty expressed concern that "...it has taken longer than it should have to make changes. Moreover ... the lateness in making the changes make it impossible to determine how well they will be implemented....Only the passage of time under them, which has not yet happened, will allow insight affecting that question."[9]

[34] Liberty indicated that its major concerns in the last rate case concerning fuel procurement and the portfolio strategy have now been satisfactorily resolved with the new procedures. However, it stated that there are five areas not yet fully resolved by the new procedures, and these are:

- No indications of responsibility for preparation of management reports
- Continued frequent solicitations for low-sulfur import coals
- No indication of supplier performance measures that are important
- Improved, but still insufficient procedures on hedging
- Problematic procedures on coal inventory measurement

(Exhibit N-97, p. 90)

[8] Exhibit N-97, p. 52

[9] Exhibit N-97, pp. 89-90

[35] Liberty also expresses concern that NSPI will use long-term solicitations to obtain coal pricing information rather than to seriously undertake actual fuel procurement, and the solicitations may be issued too frequently. Such solicitations may send the wrong message to potential fuel suppliers who "...will lose interest in submitting prices when they begin to suspect lack of intent to enter commitments...."[10]

SEB

[36] SEB, in its Closing Argument, states the following concerning the Fuel Procurement Policies and Procedures Manual:

> It became apparent during the proceeding that NSPI is seeking to have the Board approve its Fuel Procurement Policies and Procedures Manual (the "Manual") (Ex. N-167) as filed on September 14, 2005. Furthermore, in particular NSPI is seeking to have its Fuel Procurement Strategy set out at Section 1.2 of the Manual approved by the Board.
>
> SEB respectfully submits that this is inappropriate at this time, and would essentially be providing NSPI with a "blank cheque" with respect to fuel procurement. In particular, as NSPI has yet to hire the high level in-house expertise which the Board ordered in its 2005 Decision, whoever may eventually fill that role has had no input into the Manual or the Strategy contained in the Manual.
>
> If the Board grants NSPI the approval it is requesting, it appears that NSPI would then argue in all future rate proceedings that as long as it was within the parameters of the portfolio strategy set out in the Manual, its procurement decisions would not be subject to challenge. NSPI has simply not demonstrated to date that it can be given such latitude.
>
> . . .
>
> Although both Mr. Marston and Mr. Gubbins concede that in the long term and rationally applied, NSPI's portfolio approach is a reasonable step towards building a prudent fuel procurement strategy, the evidence of neither suggests that NSPI is yet near this stage. Further, the continuing lack of in-house expertise with respect to solid fuel procurement strongly mitigates against the Board granting any approvals with respect to the Manual or NSPI's proposed Strategy at this time.
>
> (SEB, Final **Confidential** Fuel Related Argument, pp. 56-57)

[10]Exhibit N-97, p. 91

Avon

[37] Avon, in its Closing Submission, refers to Dr. Manfred Raschke's, of International Strategic Information Services, criticism of the lack of transparency of the decision-making process concerning the fuel procurement procedures, and stated the following:

> At no time did NSPI produce Minutes of the FST meetings or NSPI management signatures indicating approval to proceed with commitments to suppliers. Instead, there are memos from EVA evaluating procurements and in certain circumstances "a record of decision". However, even the EVA records demonstrate a certain casual approach to record keeping and it is unclear whether the memos had been received, reviewed and considered before or after the FST meeting where the dates do not correspond with procurements and decisions.
>
> There continues to be an absence of experience in international coal procurement on the FST. NSPI has been diligent in keeping the Board and Intervenors updated with respect to its efforts to retain in-house expertise. We offered as a suggestion during the course of the hearing that with a continued lack of success in this regard, other options may be considered such as secondment of an individual within NSPI to another organization where he or she could "apprentice" the trade. We also encourage NSPI to identify and address any barriers to retaining an expert in-house.
>
> NSPI is seeking the Board's endorsement of its Fuel Procurement Policies and Procedures Manual. Whether or not the Board chooses to approve the particular document, it is clear that judgment is required at every step of implementation of the policy – the timing for tenders, the volumes to be tendered, and the make up of the fuel mix. This was conceded in cross-examination of Mr. Tedesco.
>
> (Avon, Redacted Closing Submission, p. 22)

[38] In concluding, Avon stated that:

> With respect to NSPI's Fuel Procurement Policies and Procedures, NSPI should be directed to improve upon its procedures for documenting decisions and recommendations and it should continue with its efforts to retain in-house expertise or develop expertise through secondment or other means.
>
> (Avon, Redacted Closing Submission, pp. 59-60)

[39] Avon, in its Rebuttal Submission, went a step further and submitted that the Fuel Procurement Policies and Procedures Manual should not be approved.

[40] Avon stated that:

> NSPI is looking for specific approval of its Fuel Procurement Policies and Procedures Manual. In their pre-filed evidence, Messrs. Antonuk, Spangenberg and Adger discussed their review of the revised Fuel Procurement Policies and Procedures Manual as filed on September 19, 2005. This Board will recall Liberty's testimony in the prior case and its detailed recommendations with respect to NSPI's fuel procurement policies. It is evident that NSPI has made strides in establishing its Manual and developing a portfolio approach, however deficiencies remain.
>
> Liberty stated with respect to the new Manual:
>
> > Liberty's testimony in the prior case listed 19 specific deficiencies in fuel procedures. The new procedures have satisfactorily resolved 14 of them. Our major concerns about objectives of fuel procurement and portfolio strategy have been satisfactorily resolved in the new procedures. The five areas not fully resolved by the new procedures include:
> >
> > - No indications of responsibility for preparation of management reports.
> > - Continued frequent solicitations for low sulphur import coals.
> > - No indication of supplier performance measures that are important.
> > - Improved, but still insufficient procedures on hedging.
> > - Problematic procedures on coal inventory measurement.
>
> Furthermore, as pointed out by the Liberty Group, while the adoption of policies and procedures is a good first start, what is more important is whether the policies are communicated and used with rigour. Because of the lateness in implementing the changes, neither Liberty nor the Board has been able to determine how NSPI will operate under its new Manual.
>
> We have pointed out in our submissions of December 14, 2005, our concerns with respect to the lack of transparency of the decision-making process, the inadequate documentation and the continued inability of NSPI to hire a senior fuel procurement manager with international coal market and coal procurement expertise.
>
> We have concerns with respect to NSPI's request for blanket approval of its Fuel Procurement Policies and Procedures Manual. First, approval at this time, is premature as NSPI is still on a learning curve in developing its approach to prudent fuel procurement. There remains work to be done, the most significant of which is the retention of a senior fuel procurement manager who will have views on the appropriate contents of NSPI's Manual. Second, one can anticipate that this Manual, like many policies within NSPI, will be a living

> document. It would be inappropriate for the Board to "approve" the Manual as a whole requiring it to be fixed until such time as NSPI or the Board brings it back for further review. We suggest that at this stage the Board may wish to give direction and guidance on the general approach embodied in the Manual, with a reaffirmation that NSPI remains responsible to exercise independent judgment on the implementation of the Manual and as always, its decision-making will be assessed on the standard of prudence.
>
> (Avon, Rebuttal Submission, pp. 1-3)

Province

[41] The Province, in its Closing Submission, noted that NSPI has made considerable efforts towards improving its fuel procurement practices. It referred to the fact that NSPI has significantly revised its Fuel Procurement Policies and Procedures Manual. The Province noted that Liberty also commented on the significant improvements that NSPI made in this area:

> Q. And if I might just interrupt, to be fair you have found that significant improvements have been made in many, if not most, of your recommendations from last time.
>
> A. (Antonuk) Yes, and based on that, and based on more subtle things, attitude, atmosphere, reading the transcripts, I would now say I am optimistic. I don't know if the company saw the light because they're good guys and girls or whether they just felt the pain from the – – and I don't care, I don't think it matters. I've definitely gone from kind of probably no sense of optimism, maybe not pessimism but no sense of optimism, to thinking that "if they get this job filled, I think they're going to get there, and I think they're going to get there quickly." It's – – that's a fuzzy thing and you know, I can't be very analytical about it, I think that's the main – – you know, I like the portfolio but the main thing I think is different from last year is that I do have that sense that they're going to get there now, and they're going to get there at a pace that – – you know, we always want good things to happen sooner, but I think they're going to get there at a pace that's going to work if they can, you know, get over this problem with finding the right person.
>
> (Transcript, November 29, 2005, pp. 2443-2444)

[42] The Province notes that there are two significant areas where improvement is required. The first was alluded to in Liberty expert witness John Antonuk's comments

above, relating to the hiring of a specialist in coal procurement, and the second one relates to the lack of transparency in decision-making. The Province stated:

> Regarding the employment of an experienced specialist in coal procurement matters, NSPI advised that it has retained a recruitment firm to assist it and has courted a few prospects. For various reasons, however, nothing has come of this. While NSPI is continuing with these efforts, it is also looking at other alternatives, such as retaining a company with considerable experience in coal acquisition.
>
> It will be important for NSPI to continue with these efforts and it seems likely that successfully completing this task will be one of the things that is necessary in order for NSPI to take its fuel procurement practices to the next level. This seems to be a key ingredient according to the portion of evidence from the Liberty fuel panel set out above.
>
> Given the difficulty it is having filling this necessary position at this point in time, NSPI should continue to build up internal expertise. It should also actively seek secondment opportunities or other training. When it deals with its fuel consultants, and once it does hire its specialist, NSPI should ensure that there are appropriate knowledge transfer and succession planning measures in place. This appears to be NSPI's intention.
>
> The lack of transparency in NSPI's fuel purchase decisions is troublesome. NSPI's response to Liberty IR-20 provided copious amounts of documentation regarding various RFP processes undertaken by NSPI to procure fuel. More recently, the documentation involved with these processes has included evaluations done by Ms. Medine, although it would appear that sometimes these evaluations are in draft form and not completed until after Fuel Strategy Table meetings. The most significant concerns that were expressed during the hearing seem to centre around the lack of independent NSPI analysis on procurement decisions and the absence of detailed documentation relating to Fuel Strategy Table meetings and decisions. Instead, what appears is simply a Record of Decision, that simply notes the decision points that have been made without elaboration or justification.
>
> Dr. Rashke [sic] described NSPI's decision-making process as "totally obscure". He characterized the fuel strategy table as a "black box". ...
>
> . . .
>
> Other consultants share these concerns. Mr. Marston described the minutes of Fuel Strategy Table Meetings as "sparse at best". In its prefiled evidence, Liberty also expressed concern about the lack of documentation surrounding NSPI's decision-making processes:
>
> **Q. What documentation formed the basis for this evaluation?**
>
> A. Liberty IR-20 asked a number of questions related to NSPI's fuel and fuel transportation procurement. Included were questions relating to the RFP, vendor lists, vendor responses, NSPI analysis and evaluations, recommendations to management, evidence of proper management review and approval, copies of agreements, and delivery-tracking information necessary to confirm contract

compliance. Our experience in examining many such files at other utilities led us to anticipate that the responses would provide substantial insight into the adequacy of NSPI's decision-making processes.

Q. Did NSPI provide the requested information?

A. Partly.

Q. What information was not provided?

A. NSPI provided the information in five large, three-ring binders. In no case was the requested delivery tracking information provided. In many cases, it was not evident that the proper level of management had reviewed and approved the evaluations and recommendations made by NSPI staff or EVA. In most cases, the files did not contain evaluations and recommendations made by NSPI staff. Instead, it appears that NSPI relied on the evaluations and recommendations of EVA. It was therefore not possible to assess the nature and quality of the analysis and evaluation skills of NSPI staff.

Liberty went on to note that the condition of the information that was provided by NSPI "did not measure up to what Liberty is accustomed to seeing in the equivalent files of utilities that have sufficiently organized contract administration systems". In addition to the foregoing, Liberty also expressed a concern that NSPI's hedging policies and procedures were not sufficiently detailed in its Fuel Procurement Policies and Procedures Manual.

The Province was pleased to note that, in its Rebuttal Evidence, NSPI has undertaken to continue its efforts to revise and develop its formal policies and procedures manual, and in particular, its offer to work with Liberty or alone as the Board sees fit to further refine its hedging policies and procedures, and to provide whatever procurement documentation the Board determines is appropriate. This issue requires follow-up, but NSPI seems determined to address the concerns that have been raised.

(Province ,**Confidential** Closing Submission, pp. 11-14)

3.2.4 Findings

[43] The Board has carefully reviewed the evidence pertaining to NSPI's fuel procurement procedures and the Fuel Procurement Policies and Procedures Manual. The Board notes that Liberty stated in its Direct Evidence that NSPI has made significant and positive changes to its fuel portfolio strategy. Liberty indicated that the new strategy "... is

reasonable, and responds well to Liberty's recommendations in the prior case, ... and includes an appropriately defined mix of long-term, mid-term, and short-term fuel contracts."[11]

[44] The Board recognizes the effort expended by NSPI in implementing many improvements in its fuel procurement procedures, and in the Manual, in the relatively short period of time which has elapsed since the Board's March 31, 2005 decision. The Board is pleased with the dedication shown by NSPI towards improving its procedures in this very important area of NSPI's operations. The Board also notes that there appears to be general acceptance by the intervenors that NSPI has made significant improvements in the fuel procurement area.

[45] However, Liberty also observes that while NSPI had satisfactorily dealt with many of the specific deficiencies in fuel procurement procedures, which Liberty commented on in the last rate case, a number of deficiencies still remain, including those set out in paragraph 34 above.

[46] Liberty, during questioning by the Board, stated that while the new Procedures Manual goes some distance in addressing Liberty's concerns, it does not fully resolve them. Liberty stated:

> We'd like to see the procedures better, we'd like to see the controls tighter, but we'd also and, I think more urgently, like to see the person put in place and ... if it's the right kind of person, we expect he or she is going to say "We need to tighten up these procedures. We need to have more transparency with how we make our decisions on specific procurement."
>
> (Transcript, November 29, 2005, p. 2416)

---

[11]Exhibit N-97, pp. 30 and 35

[47] The Board notes that SEB, in its Final Confidential Fuel Related Argument, has recommended against approving the Manual at this time. One of the reasons advanced by SEB for not approving the Manual now is that "... NSPI has yet to hire the high level in-house expertise which the Board ordered in its 2005 rate decision, whoever may eventually fill that role has had no input into the Manual or the Strategy contained in the Manual."[12]

[48] Avon, in its Rebuttal Submission, also argued against providing blanket approval of the Manual at this time. Avon states that:

> ... approval at this time is premature as NSPI is still on a learning curve in developing its approach to prudent fuel procurement. There remains work to be done, the most significant of which is the retention of a senior fuel procurement manager who will have views on the appropriate contents of NSPI's Manual ... It would be inappropriate for the Board to "approve" the Manual as a whole requiring it to be fixed until such time as NSPI or the Board brings it back for further review. We suggest that at this stage the Board may wish to give general direction and guidance on the general approach embodied in the Manual, with a reaffirmation that NSPI remains responsible to exercise independent judgment on the implementation of the Manual and as always, its decision-making will be assessed on the standard of prudence.
>
> (Avon, Redacted Rebuttal Submission, pp. 2-3)

[49] NSPI has requested that the Board approve its Fuel Procurement Policies and Procedures Manual, and confirm that the strategy is being appropriately implemented. While the Board is in general agreement with the Fuel Portfolio Strategy set out in Section 1.2 of the Manual, the Board is not prepared to approve the Manual at this time, nor is it able to confirm that the strategy is being appropriately implemented. The Board has concerns about the significant deficiencies noted and commented on by Liberty and other

[12] SEB, **Confidential** Fuel Related Argument, p. 56

intervenors in this hearing. These deficiencies include a lack of managerial approvals of material fuel purchases, including coal, petcoke, and heavy fuel oil, a lack of adequate evaluations by NSPI staff of various solicitations, a lack of appropriate Fuel Strategy Table documentation surrounding its approval of purchases, a lack of adequate procedures surrounding the procurement of purchased power, and inadequate procedures surrounding the hedging function. Further, in the light of the lack of appropriate approvals, the Board expects that there will be a thorough review of the existing approval protocols set out in the Manual with a view to tightening them up considerably. There may be other aspects of the Manual which need to be strengthened. The Board agrees with Avon that more work is required on the Manual, and that the new fuel procurement manager may suggest significant refinements which ought to be made to the Manual.

[50] The Board is pleased that NSPI, in its Redacted Rebuttal Evidence, has committed to working with Liberty to further refine and improve its hedging policies and procedures, and to provide whatever procurement documentation the Board recommends.

[51] The Board directs that NSPI implement, as soon as possible, all the recommendations by Liberty set out in this decision, and that NSPI file a report by August 31, 2006, outlining the status of the recommendations which were implemented, and those recommendations, if any, which were not implemented. The Board further directs that NSPI liaise with Liberty in the implementation of these recommendations, which are set out in section 3.0 above. The Board notes that there are other directives issued to NSPI by

the Board with respect to the work performed by Liberty, and these directives are found elsewhere in this decision.

[52] In the meantime, notwithstanding that the Manual is not finalized and has not received approval, and the Board has not approved the Fuel Portfolio Strategy, NSPI must proceed with the implementation of its proposed fuel strategy. The Board expects NSPI to use its judgment both with respect to the changes it proposes to the Manual, and with respect to the implementation of the fuel strategy.

[53] In its March 31, 2005 decision, the Board directed NSPI to engage a fuel procurement expert with respect to coal acquisition. This has not occurred. While the Board understands that NSPI has been diligently working to identify and employ such an individual, the Board wishes to convey to NSPI its concern over the lack of progress in this very significant area of NSPI's operations. The proposed expenditure for coal in the 2006 test year, as contained in Appendix A of Exhibit N-2, is $295.4 million, which is by far the largest of any other proposed expenditure for the 2006 test year. It is absolutely critical that NSPI obtain the necessary sophisticated knowledge in coal procurement procedures.

[54] The Board notes that NSPI has been using the services of EVA, on a temporary basis, pending acquisition of the coal expert. While EVA appears to be highly regarded in the international coal community, this is only a short-term measure, and it does not, by itself, ensure the acquisition of the necessary knowledge and skills by NSPI staff.

[55] Accordingly, the Board directs NSPI to continue expeditiously with its efforts to obtain a solid fuel expert. Failing that, NSPI is directed to consider and evaluate other

options which would permit it to acquire the necessary skills to enable it to acquire coal on a competitive basis in the international market. The Board notes that during the hearing other options were suggested. Avon, for example, suggested in its Closing Submission, that consideration could be given to the secondment of an NSPI individual to another organization to acquire the necessary expertise. NSPI is directed to file a quarterly status report with the Board concerning this matter, commencing April 30, 2006. Further, the Board directs that NSPI liaise with Liberty with respect to its progress in finalizing this matter.

3.3 Carryover of Imprudency

3.3.1 Overview

[56] In its rate decision dated March 31, 2005, the Board adopted the standard for determining prudency as defined by the Illinois Commerce Commission:

> ... prudence is that standard of care which a reasonable person would be expected to exercise under the same circumstances encountered by utility management at the time decisions had to be made....Hindsight is not applied in assessing prudence....A utility's decision is prudent if it was within the range of decisions reasonable persons might have made. ... The prudence standard recognizes that reasonable persons can have honest differences of opinion without one or the other necessarily being imprudent.
>
> (Board Decision, March 31, 2005, p. 43)

[57] In the same decision, the Board made the following comments in finding that NSPI's imprudence in its fuel procurement should be set at $18 million for the 2005 test year:

> The Board has carefully considered the evidence heard with respect to NSPI's fuel procurement strategy and actual practices. There is no question that, in the 2002 rate

decision, the Board stopped short of finding NSPI's fuel procurement to be imprudent. The Board understood that with the closure of Devco, and the end of the majority of NSPI's coal supply coming from domestic sources, NSPI had to begin purchasing much of its fuel supply in the international market. The Board believed that NSPI, at that time, was relatively inexperienced in international coal markets and that the Company should be provided with a fair opportunity to make the changes necessary, in both its organizational structure and in fuel procurement practices, to address this important change in its coal supply procurement.

. . .

The Board has carefully reviewed NSPI's defense of its coal procurement strategy since 2002. As NSPI points out, it hired Ms. Medine as an expert in this area; it developed a Fuel Procurement and Procedures Manual which was completed in July of 2004; and it has complied with the Board's 2002 directives to return the coal procurement function to NSPI from Emera. NSPI asserts that it has taken reasonable and necessary steps to improve fuel procurement. According to NSPI, the fact that it currently has no long-term imported coal supply contracts does not fairly represent its revised procurement strategy. As NSPI explains it, during the period of time in question, mid or long-term coal supply contracts were inadvisable, either because of limited interest on the part of suppliers or unduly high prices.

The Board acknowledges that certain of NSPI's fuel procurement processes in 2002 have changed considerably since that time. In 2002, NSPI was relatively inexperienced in terms of importing coal. The Board's findings as to whether NSPI's coal procurement practices in 2002 were imprudent were based on whether the strategy and practices used by NSPI were reasonable and prudent under the circumstances. As noted earlier, at that time, the Board did not find NSPI's coal procurement to be imprudent as it believed NSPI should be given a reasonable opportunity to react to the fairly abrupt end to its reliance on domestic coal supply. This "opportunity" should have involved NSPI quickly acquiring the necessary in-house expertise for imported coal purchasing and expediently revising its purchasing practices to reflect the new reality of the international coal market supply.

It is clear that NSPI took several important steps toward this goal. In early 2003, NSPI engaged Ms. Medine as an external coal consultant and began to develop a Fuel Procurement and Procedures Manual. Ms. Medine's advice regarding the need to have a mixed balance of short, mid and long-term coal supply did not change since her 2002 analysis. Her evidence at this hearing is consistent with her earlier advice. What she could not confirm was whether NSPI had acted quickly and effectively enough to actually implement recommended and necessary improvements in its fuel procurement activity.

. . .

The Board has reviewed the case law cited by the intervenors and NSPI on the question of the acceptable legal standard for a finding of imprudency. As SEB notes, **s. 45(2)** of the **Act** identifies that expenses which the Board may allow a utility to charge must be "... reasonable and prudent and properly chargeable ...". The Board agrees with Avon and SEB that, while expenses are generally presumed to be prudent, when questions are raised with respect to prudency, the burden falls to the utility to satisfy the regulator that its actions were prudent and reasonable.

While the Board recognizes that the definition of imprudence varies somewhat among the jurisdictions cited, there are several fundamental principles which are common. These include:

- Were the utility's decisions reasonable in the context of information which was known (or should have been known) at the time?
- Did the utility act in a reasonable manner and use a reasonable standard of care in its decision-making process?
- The imprudency test should relate to the circumstances at the time in question and not to hindsight.

While several cases were cited on this issue by the parties, NSPI referred in particular to a decision of the Illinois Commerce Commission noted earlier. Following a review of the cases, the Board finds that the definition of imprudence as set out by the Illinois Commerce Commision [sic] is a reasonable test to be applied in Nova Scotia.

Accordingly, the Board has focused on NSPI's performance with respect to fuel procurement on the basis of the circumstances confronting NSPI in late 2002 and 2003. In the context of that test, the Board believes the circumstances at the time are reflected in the 2002 hearing and decision. NSPI faced a significant change in its coal supply. It lacked high-level in-house expertise in the international coal market. It defended allegations of imprudence in coal procurement in 2002 and, while the Board did not make a finding of imprudence, it categorized NSPI's coal procurement as "... lacking in sophistication ..." and "... sufficiently lax so as to undermine NSPI's ability to ensure ... that coal was obtained at the lowest possible price...".[13] In terms of the process for decision-making used since 2002, it has been criticized by Liberty witnesses as lacking in efficiency and accountability. NSPI does not appear to have quickly retained high-level in-house expertise in the international coal market. It is compelling that all of the fuel experts, including Ms. Medine, confirmed that coal prices declined in late 2002 through to mid-to-late 2003. NSPI did not obtain a single long-term coal supply contract during this time.

The issue, in the Board's opinion, is not NSPI's stated intention to improve its practices but the timeliness and effectiveness with which actual implementation of the new approach was achieved. **NSPI, in the Board's view, failed to address its imported coal procurement problems quickly or efficiently enough to adequately protect itself or its ratepayers. Had it done so expeditiously following the 2002 rate hearing, the Board is satisfied that, based on the evidence at this hearing, it was possible for NSPI to create a balanced portfolio of short, mid-term and long-term imported coal at reasonable prices**. Instead, NSPI appears to have slowly implemented the necessary changes to its procurement practices. It remains unclear to the Board whether the corporate philosophy actually changed, and whether the procedures and practices recommended by Ms. Medine are yet fully implemented, particularly with respect to the need for long-term coal supply contracts which exceed terms of twenty-four months.

There is no question that, following the directives issued in the Board's 2002 decision, NSPI had a number of changes to be implemented concerning fuel procurement. It is possible that, in its effort to comply with other Board directives, the necessary changes to its procurement strategy were not dealt with as urgently as should have been the case. However, the practical reality of the need for many of the changes ordered in the 2002 decision was that NSPI had inappropriately transferred core utility functions to Emera without the approval of the Board. To the extent that compliance with the Board's 2002 directives may have had an impact on the alacrity with which NSPI implemented fuel procurement

[13] Board 2002 Rate Decision, October 23, 2002, pp. 27-28

process changes in late 2002 and early 2003, any delay in this regard is attributable to the decisions made by the Utility and Emera. Any financial impact as a result of delay in implementing these changes, specifically with respect to the higher cost of imported coal in 2005, should not be borne by ratepayers.

NSPI now faces a spot market for coal supply that has spiked. Consequently, NSPI and its ratepayers are confronted with higher than necessary fuel costs. The Board finds that NSPI has been imprudent in its fuel procurement practice and, accordingly, it is not fair or reasonable to permit the total of these costs to be passed on to ratepayers. The Board wishes to make it clear that, in its view, this is not a reflection on the integrity or intentions of individuals, particularly those who were part of NSPI's fuel decision-making process. It does, however, reflect a corporate philosophy which did not change with the urgency and purpose required in the circumstances. NSPI, as a result of its management decisions, now faces changing and higher market prices. It will pay higher coal prices because it is almost completely subject to the vagaries of the short-term market for imported coal.

While the Board finds that NSPI has been imprudent in its fuel procurement practice, it does not believe that the approximately $30 million reduction, which was suggested by a number of the parties, is an appropriate amount.

The primary reason the Board does not agree with the suggested $30 million reduction is the relatively limited period of time during which coal prices declined. Even if NSPI had acted as quickly as it should have to change its procurement strategy and build a balanced portfolio of short, mid and long-term contracts, it had, at best, several months to do so. Considering that part of this time would be required to implement the necessary changes, NSPI had a relatively short period of time to take advantage of the decline in imported coal prices.

The Board believes that an $18 million reduction in fuel costs, rather than $30 million, strikes a reasonable balance on this issue... [Emphasis added]

(Board Decision, March 31, 2005, pp. 46-49)

[58] Liberty and many of the intervenors during the current hearing contend that the consequences of NSPI's imprudence extend to the 2006 test year.

3.3.2 Submissions - NSPI

[59] In its Rebuttal Evidence, NSPI set out its views concerning the allegations of imprudence made against it by a number of the consultants in their pre-filed evidence.

[60] NSPI indicated that the evidence of the intervenors and Liberty should have considered the high and volatile world prices ... "in light of the expeditious and transparent manner in which the Company has responded to Board and customer concerns, including adopting a detailed fuel supply portfolio strategy."[14]

[61] NSPI quoted the following from Liberty's Direct Evidence:

> NSPI has established an appropriate fuel supply portfolio strategy, and has taken substantial efforts in building a portfolio that corresponds to it. The short time since the decision in the prior case addressing assembly of this new portfolio makes understandable that the portfolio is not yet fully assembled. NSPI has stated that it intends to complete assembly of the desired portfolio in approximately 24 months; Liberty feels that every effort should be made to accomplish this objective.
>
> (Exhibit N-97, p. 32)

[62] NSPI stated that three issues dominated the fuel-related evidence presented by the intervenors in this case, being NSPI's forecast which it used to estimate the price of uncommitted tonnages, its long-term commitments, and the continuation of the 2005 disallowance concerning the imprudence factor.[15]

[63] NSPI noted that several of the consultants engaged in the current hearing were of the view that there should be a continuation of the $18 million imprudence finding of the 2005 rate case, with the result that the test year fuel costs should be reduced by $18 million. NSPI pointed out that "... there is a misconception that the Company was penalized by $18 million. In fact, NSPI was harmed by almost three times that amount." NSPI reasoned that it had requested a fuel adjustment mechanism, which the Board

[14]Exhibit N-153, p. 6

[15]Exhibit N-153, pp. 9-10

refused, and NSPI estimates that "... it will experience a shortfall of approximately $50 million in comparison to actual fuel costs, only $18 million of which the Board found to be imprudent."[16]

[64] NSPI also stated in its Rebuttal Evidence that the Board did not specify how it calculated the $18 million imprudence disallowance in the 2005 rate case, and suggested that, in EVA's experience, this was not the norm for regulatory bodies.

[65] NSPI's Rebuttal Evidence went on to state:

> While the Board did not share how it derived the disallowance, the Board was quite clear in its opinion that it did not find NSPI to be imprudent for its failure to enter into contracts in 2002. Paragraph 82 of its decision states:
>
>> The Board acknowledges that certain of NSPI's fuel procurement processes in 2002 have changed considerably since that time. In 2002, NSPI was relatively inexperienced in terms of importing coal. The Board's findings as to whether NSPI's coal procurement practices in 2002 were imprudent were based on whether the strategy and practices used by NSPI were reasonable and prudent under the circumstances. As noted earlier, at that time, **the Board did not find NPSI's coal procurement to be imprudent as it believed NSPI should be given a reasonable opportunity to react to the fairly abrupt end to its reliance on domestic coal supply.** This "opportunity" should have involved NSPI quickly acquiring the necessary in-house expertise for imported coal purchasing and expediently revising its purchasing practices to reflect the new reality of the international coal market supply. [Emphasis added in original]
>
> In paragraph 96, the Board goes on to state:
>
>> The primary reason the Board does not agree with the suggested $30 million reduction is the relatively **limited period of time** during which coal prices declined. Even if NSPI had acted as quickly as it should have to change its procurement strategy and build a balanced portfolio of short, mid and long-term contracts, it had, at best several months to do so. Considering that part of this time would be required to implement the necessary changes, **NSPI had a relatively short period of time to take advantage of the decline in imported coal prices.** [Emphasis added in original]

---

[16]Exhibit N-153, p. 18

> Based upon these findings, EVA estimates that the period of imprudence to be perhaps February through July of 2003 as shown below. EVA notes that during this period, NSPI purchased all of its 2004 requirements, ahead of schedule and at an enormous cost savings to NSPI ratepayers.
>
> (Exhibit N-153, pp. 19-20)

[66] NSPI notes that Colin V. Gubbins, of the McCloskey Group; Nancy Brockway, of NBrockway & Assoc., a former US utility regulator and consumer advocate; Dr. Raschke and Liberty all concluded that the 2005 disallowance should be continued into the 2006 test year and, in some cases, be higher than the 2005 disallowance.

[67] NSPI continued:

> Those parties recommending a continued or escalating adjustment all suggest that the Board found NSPI's failure to commit to multi-year contract tonnages in 2002 and 2003 to be imprudent. While the Board is the ultimate arbiter of its finding, EVA found no evidence in the Board decision for that to be the case. In fact, as noted above, EVA finds [the] opposite to be true, i.e. the Board did not find NSPI was imprudent for failing to enter into multi-year agreement in 2002 and therefore any lingering impacts from such failure are not relevant to the current Application.
>
> The methodologies employed by the three consultants making this recommendation vary.
>
> (Exhibit N-153, pp. 20-21)

[68] During cross-examination by Board Counsel, Emily Medine, a principal in the firm of Energy Ventures Analysis ("EVA"), and NSPI's fuel expert, stated that she disagreed with the opinion of those experts who say there is a continuing adverse impact on 2006 results due to the imprudence of NSPI in not securing any long-term contracts for coal in late 2002 and 2003. Ms. Medine cited a number of reasons why she disagreed with the opinions of the other experts:

- Ms. Medine stated that she was not sure how the $18 million was calculated in 2005:

> ...my experience in imprudence findings is that there's generally a calculation and, therefore, we can look at the calculation and see whether it's applicable to future years. My sense was that the disallowance was sort of not specifically tied to an event but to general concerns, and I think the company heard that and has responded. So I don't see it tied to a specific event....
>
> (Transcript, November 28, 2005, p. 2194)

- Ms. Medine stated that with respect to the contracts, when a calculation is done "... you need to have some assumptions, and I don't know what assumptions to use in figuring out whether to continue to go forward or not."

- In addition, Ms. Medine explained that the way she read the 2005 decision, there was no particular finding of imprudence in 2002:

> ... so using foregone opportunities for 2002 to calculate a new number did not seem appropriate to me. ... I didn't find any particular activity in 2002 that the Board found to be imprudent, so I have a hard time understanding how you go back to 2002 and look at foregone opportunities, which would have been a contract that the company could have entered, and calculating a number related to that....
>
> (Transcript, November 28, 2005, pp. 2194-2195)

[69] The following exchange between Board Counsel and Ms. Medine is instructive:

> Q. And I'm not asking you to agree with the calculations made by any of those experts. My question to you really was more whether there is anything in your opinion which would lead to the conclusion that while contract supply for 2005 was available to NSPI in 2002 or 2003 that such supply was not available for 2006.
>
> A. The best evidence is what offers were available to the company, and as I said, the only offer in 2002 that had tonnage going through 2006 was the **[confidential]** offer and that was a relatively small tonnage in 2006.
>
> Q. And that was the one used by Dr. Raschke?

A. Dr. Raschke in his evidence just did a calculation. It was only in his opening statement that he then reverted his evidence to a recommendation, but certainly in his evidence itself it was never a recommendation of a disallowance, he just did a calculation.

Q. Is it your evidence that if NSPI had, I guess, called for RFPs for multi-year contracts in 2002 and 2003, proper ones, that they would not have been able to secure supply for 2006?

A. We're simply moving into the world of hypothetical, which in my experience isn't a basis for disallowance. I mean, maybe, if, would have, could have, should have. I don't know the answer to it. I know that when we went out for multi-year we got some respondents that did give for three years, some that gave for one year, some that gave for two years. If you go back and force the market to respond to terms that you want, you know, in theory you should get at a number a bid, but we have no idea how much of a premium somebody would charge the company in this hypothetical world where we would have insisted that we go out and buy for five years or whatever number you'd like to come up with....

Q. What is the difference between 2006 -- and this is what I want you to speak to -- the difference in that respect between 2006 and 2005?

A. Well, as I said, I can't speak to what happened in 2005 because I don't understand how the number was derived. I think in 2006 we are three or four years out from 2002 and we still could have done a multi-year agreement and the agreement would have expired by 2006. I think we're beyond any period of potential imprudence related to a decision or non-decision in 2002.

(Transcript, November 28, 2005, pp. 2196-2199)

[70] In its Reply to the Closing Argument, NSPI stated that the Board must decide whether the imprudence assessed by the Board in its 2005 decision continues to cause damage in 2006, and if so, what is the extent of the damage:

... It is the submission of NSPI that, on the evidence, no damage continues into 2006. NSPI urges the Board to search carefully for the contract opportunity that was not accessed by the Company and to search carefully for the evidence that can be used to calculate the alleged ongoing loss. NSPI submits there is no such evidence. As such, this cannot be a mechanism to reduce an otherwise justified increase in cost recovery.

It is simply not acceptable, in light of the general principles of ratemaking outlined above, to accept speculation, unproven assumptions, inferences or ‘leaps’ as a basis to disallow millions of dollars of revenue to the Company.

(NSPI, Redacted Reply to Closing Argument, p. 8)

3.3.3 Submissions - Intervenors and Board Counsel Witnesses

SEB

[71] In his opening statement, Colin Gubbins, an expert witness appearing on behalf of SEB, stated that past imprudence in NSPI's purchasing strategy has forced NSPI into buying coal at a time when the market for coal has been overheated. It is Mr. Gubbins' view that NSPI's ratepayers should not have to pay for this imprudence.

[72] Mr. Gubbins stated that, had NSPI put in place long-term contracts in 2002 and 2003, it could have saved $45.98 million in 2006. According to Mr. Gubbins, "...The main reason for this disparity is the significant gap that exists between the prices available in 2003 and the estimates provided by Hill and Associates."[17]

[73] Richard Marston, of Marston & Marston Inc., also appearing on behalf of SEB, in his Direct Evidence, stated that in implementing a strategy of staying close to the market, "...NSPI declined to enter into reasonably priced long-term coal agreements in 2002 and 2003 that would have removed significant fuel cost risk through at least 2006".[18]

[74] SEB, in its Final Confidential Fuel Related Argument, stated that "... Each of Mr. Gubbins, Mr. Marston, the Liberty Group and Dr. Raschke have indicated that the failure of NSPI 'to take advantage of the decline in imported coal prices' (2005 rate decision, para. 96) has had a continuing impact for NSPI's 2006 forecast fuel costs...."[19]

---

[17]Exhibit N-179, p. 2

[18]Exhibit N-90, pp. 6-7

[19]SEB, Final **Confidential** Fuel Related Argument, p. 13

[75] SEB indicated that Mr. Gubbins has calculated the continuing impact of the prior imprudent behaviour to be $30.4 million with respect to the 2006 test year fuel costs. SEB stated that "... As Mr. Gubbins specifically noted, NSPI's failure to enter into longer term contracts in late 2002/early 2003 has an even more significant impact in 2006 than in 2005, due to the fact that NPSI [sic] has had to purchase coal at an even higher price to cover its 2006 commitments than its 2005 commitments."[20]

[76] SEB took issue with NSPI's comments in its Closing Argument that the Board "... was quite clear it did not find NSPI to be imprudent for any failure to enter into long-term contracts in 2002." It is SEB's view that:

> ... NSPI's interpretation of the 2005 Decision appears strained at best. Because of the clear impact of the failure to have entered into a term arrangement in 2002/2003, NSPI is struggling to find an interpretation that would suggest their failure to act in the past has no impact on the present. The record is clear that this is simply not correct.
>
> (SEB **Confidential** Fuel Related Rebuttal Argument, p. 10)

[77] SEB also took issue with NSPI's assertion that the actual fuel disallowance in 2005 was much larger than the $18 million because the Board did not approve NSPI's proposal for the fuel adjustment mechanism. According to SEB, the disallowance was $18 million, and the Board "... did not approve a fuel adjustment mechanism because it did not feel it was appropriate for NSPI at that time...."[21]

---

[20]SEB, Final **Confidential** Fuel Related Argument, p. 15

[21]SEB, Final **Confidential** Fuel Related Rebuttal Argument, p. 11

Avon

[78] In its Closing Submission, Avon stated that the experts and consultants dealing with the fuel issue all believe that the 2006 test year fuel costs are impacted in a negative manner by the past imprudence. Avon summarized the evidence with respect to the past imprudence as follows:

> ... The Liberty Consultants recommended that NSPI's fuel expense for the rate year 2006 should be reduced "because of the continuing harm suffered from past failure to adopt a robust portfolio strategy after its decision not to install scrubbers in 2001 and the resulting missed opportunities to procure long-term fuel supplies in the past at more economical prices."
>
> In its evidence, the Liberty Consulting Group prepared a calculation assuming that in 2002 and onward NSPI had a portfolio strategy in place to secure the 3.5 million tonnes of solid fuel required in 2006 and that conformed to the strategy it is now describing in its current Fuel Procurement Policies and Procedures Manual. During the cross-examination of the Liberty Panel, it was acknowledged that the calculation did not account for the domestic coal contract with Nova Construction. Accordingly, Liberty recalculated its Exhibit LCG3 to summarize the 2006 cost of not having a balanced coal supply portfolio to be $23,300,460.
>
> (Avon, Redacted Closing Submission, p. 3)

[79] In commenting on Dr. Raschke's calculation of an amount for imprudence, Avon stated that his approach was the most conservative, and he calculated imprudence by referring to a "... single specific contract which was available to NSPI but not taken up to fulfill its uncommitted tonnage." Avon quotes from Dr. Raschke, as follows:

> It is also important to remember that in 2006 NSPI's fuel costs still reflect the mistakes it made in the past in its coal purchasing. While in April 2005 it entered into a long-term contract with **[confidential]** while the market was still at or near record highs, in May 6, 2002, it had received a very much lower offer ... which it turned down....
>
> (Avon, Redacted Closing Submission, p. 4)

[80] Dr. Raschke calculated the imprudence to be $8.06 million.

[81] In its Rebuttal Submission, Avon stated that there is unanimity among the experts that there is ample evidence to support an ongoing impact of past imprudence. Avon suggested that Liberty has "... offered a reasonable alternative for calculating the value of the disallowance, being appropriately conservative with respect to pricing and volumes. We submit a disallowance of $23.3 million is appropriate."[22]

Province

[82] The Province, in its Closing Submission, stated that it is necessary to determine if NSPI's failings in late 2002 and early 2003 continue to have cost consequences for the 2006 test year, and if so, to what extent. The Province suggested that:

> When answering these questions, the Board should reflect upon the circumstances that prevailed during late 2002 and early 2003. In the circumstances of this case, the Province does not believe that it is, or was necessary for the Board to have linked a finding of imprudence to the failure of NSPI to enter into a specific contract based on an offer that it had in hand during the relevant time frame. This is because the issue is not only what offers had been made to NSPI at the time, but what offers might have been made had NSPI conducted itself appropriately. To a greater extent, the issue is one of lost opportunity.
>
> . . .
>
> The Province submits that given the Board's past finding that "it was possible for NSPI to create a balanced portfolio of short, mid-term and long-term imported coal at reasonable prices" in late 2002 and early 2003, the benefit of low prices that should have been obtained at that time would still be influencing the budget in 2006....
>
> . . .
>
> Consultants retained by the Board, Stora Enso/Bowater, Avon Valley et al. and the Consumer Advocate all recommended continuing an imprudence disallowance into 2006. Mr. Gubbins noted that because the differential between coal prices in 2002/2003 and 2006 has widened, an imprudence allowance would be higher in 2006 than that awarded by the Board last year.

---

[22]Avon, Redacted Rebuttal Submission, p. 10

> He recommended disallowance in 2006 of approximately $46 million. Dr. Raschke uses less volumes in his calculations and recommends a disallowance in 2006 for past imprudence of $8.06 million. Ms. Brockway recommended maintaining the $18 million disallowance into 2006. Liberty recommended a disallowance of $23,300,460.
>
> (Province, **Confidential** Closing Submission, pp. 5-7)

[83] While the Province believes that it is important to recognize that NSPI has made significant improvements in its fuel procurement practices over the past few years, it noted that "... continuing the Board's past imprudence finding into the 2006 rate case would not be a negative commentary on NSPI's more recent fuel procurement activities, but an acknowledgment that its sins of the past are continuing to have cost consequences that should not be borne by ratepayers."[23]

[84] The Province did not suggest a specific amount for an imprudence disallowance, although it expressed the view that the Board ought to continue the imprudence finding into 2006 based upon the assessments by the various consultants. It also agreed with Dr. John Stutz, a regulatory expert and Vice President of the Tellus Institute, and retained by Board Counsel, who stated that "... if the Board determines that it is appropriate to maintain an imprudence allowance into 2006, then it would be beneficial to provide additional guidance on whether the circumstances leading to the Board's past imprudence finding will continue to exert an influence on NSPI's fuel budget beyond 2006. If so, it would be further advisable to define parameters on how the excessive costs in the fuel budget are to be assessed in future years."[24]

---

[23]Province, **Confidential** Closing Submission, para. 15

[24]Province, **Confidential** Closing Submission, para. 14

Liberty

[85] In its Direct Evidence, Liberty indicated that NSPI is suffering significant harm from its past failure to adopt a portfolio strategy, and Liberty concluded that, as a result of NSPI's failure to enter into long-term commitments as far back as 2002, 2006 fuel costs will be higher than they otherwise would have been.

[86] Further, it expressed the view that, notwithstanding NSPI's adoption of a portfolio strategy "... The magnitude of that harm has not diminished as much as might have been expected in light of NSPI's change to a portfolio strategy, because 2006 fuel costs now appear to be significantly higher than they did during the last case."[25]

[87] Liberty concluded, in its Direct Evidence, that the fuel expense for the 2006 test year should be reduced by a total of $23,695,740 as a result of NSPI's past failure to adopt a "... robust portfolio strategy ... and the resulting missed opportunities to procure long-term fuel supplies in the past at more economical prices".[26] Subsequently, Liberty reduced their imprudence disallowance to a total of $23,300,460.[27]

Dr. John Stutz

[88] Dr. Stutz was asked by the Board during his testimony whether he thought there should be a finding of imprudence to the extent that 2006 coal was not bought in earlier years when prices were lower. He replied as follows:

---

[25]Exhibit N-97, p. 8

[26]Exhibit N-97, p. 11

[27]Undertaking U-64

> ... Let me say to begin that I think it's a very thorny issue, so if you'll permit me, I'm going to address it in three parts. So the first question is, should the coal have been bought earlier and in a fashion which is what we now call a portfolio approach. I believe you answered that question in your last decision. You said basically that should have been done. That was the basis for your finding of imprudence in the last case.
>
> Second question is, is there a continuing harm now from not doing that. And there I think we need you need to rely on experts. Liberty, who have been consistent proponents of the portfolio approach, would tell you there is a continuing harm, and so all I can say is I've listened to all the evidence and I find what they have to say about that point reasonably persuasive, that is, that there is as a qualitative matter a continuing harm.
>
> Now we get to the real thick of it. Do we know how much harm is continuing. And, frankly, I think that's a swamp. I think it requires a fair amount of assumption because you have to imagine what portfolio would have been put in place back at that time in order to assess the harm. Liberty has done that. The company has pointed out and, I would say, it's a fair argument that there were numerous assumptions that underlie that calculation. I think the difficult area for the Board, it will have to exercise its judgement, in my view, is to decide whether and to what extent they can quantify that harm, either as Liberty has done it or by other means, to assess an imprudence penalty.
>
> So I think, just to recap, yes, there was imprudence back then. In my view, the experts have made a case that the harm continues. The key question is, can you get a number. And I think it will ultimately be a matter of your judgment.
>
> (Transcript, December 2, 2005, pp. 3589-3590)

3.3.4 Findings

[89] In its rate decision of March 31, 2005, the Board dealt extensively with the issue of imprudence. It explained why it had ruled, in its 2002 rate decision, that there was no imprudence, and why in the 2005 rate decision, that there was imprudence. Given the significance of these findings with respect to the issue now before the Board, the relevant sections from the 2005 rate decision are set out in section 3.3.1 above.

[90] After considering the record, the Board accepts the evidence of those experts who are of the opinion that there is a continuing harm in 2006 as a result of NSPI's failure to implement a portfolio strategy commencing in 2002. The Board is satisfied that, for the same reasons as the Board found in its decision of March 31, 2005, NSPI had an

opportunity at that time to begin implementing an appropriate fuel procurement strategy. If NSPI had taken advantage of that opportunity as it should have done, it would have been able to obtain coal for 2006 at costs significantly less than those which it now forecasts for the 2006 test year. The additional expense involved should not be borne by the ratepayers because it was imprudently incurred.

[91] The question then becomes, how can these costs be determined or measured? The Board concurs with Dr. Stutz's observation that this is something of a "swamp", which requires the exercise of judgment rather than the pretext of mathematical precision. The Province made a similar point in its Closing Submission:

> When answering these questions, the Board should reflect upon the circumstances that prevailed during late 2002 and early 2003. In the circumstances of this case, the Province does not believe that it is, or was necessary for the Board to have linked a finding of imprudence to the failure of NSPI to enter into a specific contract based on an offer that it had in hand during the relevant time frame. This is because the issue is not only what offers had been made to NSPI at the time, but what offers might have been made had NSPI conducted itself appropriately. To a great extent, the issue is one of lost opportunity.
>
> (Province, Redacted Closing Submissions, para. 7)

[92] The Board notes that the imprudence estimates calculated by the fuel experts range from $8.1 million in the case of Dr. Raschke, to $23.3 million in the case of Liberty, and to $30.4 million in the case of Mr. Gubbins. Each expert has calculated a different figure using different methodologies and assumptions. There is no consensus among them as to the correct amount.

[93] NSPI challenges some of the assumptions made by the experts. The difficulty in determining an appropriate amount for imprudence is the result of NSPI's lack

of activity, during the period commencing in 2002, when the Company should have been taking steps to implement a diversified portfolio of coal contracts, but failed to do so. On this issue, the Board concurs with the comments made by Mr. Antonuk of Liberty during the hearing:

> A. (Antonuk) First of all, I can't - - we didn't do our analysis based on saying the company had a duty to be prudent when the Board told it to be prudent. And the duty for a company to act prudently is an internal responsibility. So I think it would be wrong to suggest that somehow their only obligation is to respond to what you tell them to do and when you tell them to do it, because you don't run the company day to day or even, in most cases, year to year. But here obviously rate cases are pretty frequent. So I guess I have trouble understanding why there is all this focus on when you told them what. From our perspective, we look at what we think reasonable management would have done under the circumstances if they were self-motivated to do the right thing rather than sort of just responding to what you told them. So I've read the transcripts, this is the first time I've seen this one, so that all leaves me cold when I hear "Well when did the Board tell you this? How long should you have had to respond to the Board?" Our whole view of it is what should management have been doing on its own at the time. We believe that the trigger event for starting to look at long-term low-sulphur coal supplies was the analysis in July ---
>
> A. (Spangenberg) '02.
>
> A. (Antonuk) — yeah, and that should have gotten them started. The fact that they didn't get started is why we don't have what Ms. Medine and Mr. Connors were referring to as offers. We weren't buying coal then. It's certainly not our job to come in here and say - or our burden to come in here and say "Well we were trying to buy coal for NSPI and this is what we got offers for." Because that's the level at which you have to have offers. You know, fuel offers are unique to time, unique to quantity, unique to delivery point. So the real issue here is the company, in our opinion, didn't do what it should have done, therefore it didn't have offers. What do we do? We're not going to go and look at what some company in Arizona got offered for coal at that time frame because we'd argue that's irrelevant. What we tried to do is say what's the best information that the company got in response to what it did do.
>
> . . .
>
> And remember, what this all comes down to is not that Liberty failed to solicit coal in 2002, it's that the company did. So the lack of information is certainly not our fault. The lack of information is because they were not doing what they should have been doing. So what we're trying to do is use the best information available to say what would have happened had they done that. And I look at N-216 and I say I think you have to take a pretty darn narrow view of the world to say that the company who

> submitted this was not going to be able to supply in 2006 the very same quantities that they were willing to offer in 2003 through 2005....
>
> (Transcript, November 29, 2005, pp. 2456-2459)

[94] As noted in the evidence quoted above, the difficulty in assigning a reasonable disallowance for imprudence is the result of NSPI's failure to take appropriate action to build a diversified portfolio in a timely manner. In the end, the Board must determine what amount is reasonable in the circumstances.

[95] In reviewing the specific recommendations for an imprudence disallowance, the Board considers that Mr. Gubbins' recommendation is on the high side, and he relied on more aggressive assumptions in his calculations than either of the other two experts. The Board believes that an imprudence disallowance in the mid-range between the amounts recommended by Dr. Raschke and Liberty is just and reasonable in the circumstances. Accordingly, the Board sets the imprudence disallowance for the 2006 test year at $15,700,000.

[96] To avoid any uncertainty going forward, the Board wishes to make it clear that the impact of NSPI's past imprudence for the failings discussed in this decision is now spent and will not extend beyond the 2006 test year. This is because, even if NSPI had entered into a multi-year contract in 2002 and 2003, as the Board considers it should have done, the Board is satisfied that such contract would have likely run its course by the end of 2006.

3.4 Long-Term Contract

3.4.1 Submissions - NSPI

[97] In April of 2005, NSPI entered into a multi-year contract to acquire low sulphur import coal, which NSPI states was in accordance with its portfolio strategy. NSPI's Rebuttal Evidence sets out its position with respect to this contract as follows:

> ... NSPI solicited the market, evaluated the alternative bids, negotiated with a short list of bidders and then selected [the supplier]. According to Liberty, "NSPI properly handled the solicitation, including a sufficient number of qualified potential suppliers, conducting bid evaluations, and making a decision that appears sound from the information that NSPI provided. NSPI procured the least-cost supply offered."
>
> Nevertheless, SEB and Avon's consultants heavily criticized this transaction. Mr. Marston states "Nothing in the 2005 Decision justifies NSPI's decision to enter into a long-term, high priced contract near a well-recognized market peak with indifference to market conditions and expectations."(Page 9 Marston evidence) Mr. Gubbins believes the commitment **[confidential]** ran counter to the evidence he had provided the Board. (Page 4 Gubbins evidence) Dr. Raschke states that "having adopted an appropriate strategy, NSPI has erred in implementing it." (Page 48 Raschke evidence)
>
> This transaction demonstrates very clearly a point NSPI made in its Rebuttal Testimony in the 2005 Application. Experts disagree. Even reasonable experts disagree. The Board's consultant, Liberty, believed that NSPI should immediately enter into long-term contracts as part of a contract portfolio. SEB's and Avon's experts believed that NSPI should have a contract portfolio but should delay entering into long-term agreements until there was a market adjustment. Not surprisingly then, the Liberty consultants applauded NSPI's contract **[confidential]** SEB's and Avon's experts found it imprudent.
>
> While the Board in its opinion did not contain a specific finding on this matter, it was clear to NSPI that the Board believed NSPI should have a contract portfolio and did not disagree with its own staff's consultant, Liberty, that such contracts should be committed to in a timely manner.
>
> NSPI attempted to be responsive to all evidence submitted in the 2005 Application in accordance with its own obligations to procure fuel in a responsible manner as follows:
>
> - NSPI entered into one multi-year contract at the most competitive price at the time the coal was selected with a reputable supplier of high quality coal that provided for the maximum volume optionality such that it could reduce volumes should the market adjustment occur. Further, NSPI believed that this coal provided unique arbitrage opportunities ... The agreement is **[confidential]** not a long-term agreement, which as NSPI's policies and procedures state is desirable for contracts during a high-priced market period.

- NSPI pursued **[confidential]** contracts with suppliers with indexed pricing precisely because of its recognition of the potential market adjustment. The pricing in the agreements was not only to be tied to an index but it would give NSPI the unilateral right to convert to fixed pricing in the event that (1) pricing spiked or (2) pricing fell to very low levels ...

- NSPI expanded its testing program to include tests **[confidential]** such that when the market adjustment occurred it would be prepared to maximize competition by having a larger number of sourcing options.

It is quite telling that the SEB and Avon consultants did not applaud NSPI for its efforts to incorporate their world view into the procurement process by minimizing the multi-year commitment, seeking contracts with indexed pricing, and conducting multiple tests of non-traditional sources.

(Exhibit N-153, pp. 15-18)

[98] In its Closing Argument, NSPI contended that it acted prudently in signing the three-year contract and asserted that its decision to do so must be assessed in the context of the following facts:

- NSPI had been heavily criticized by consultants and intervenors during the rate hearing in November of 2004 for failing to implement a portfolio strategy with multi-year contracts in a timely manner;

- NSPI had issued a request for proposals for low-sulphur coal in January 2005 and concluded that the multi-year offers were not attractive in the context of softening world coal prices. Another RFP was issued for April 2005 and the bid prices then received were lower than the January 2005 bid prices;

- Coal prices fallen substantially from their peak in July 2004, but remained volatile;

- Hill & Associates issued its price forecast in March 2005 that predicted continued high prices through 2006;

- NSPI had advice from its fuel consultant, Emily Medine of EVA, that recommended NSPI purchase this coal because it had the lowest evaluated costs of the eight coal bids and **[confidential]** is the premium product in the Atlantic market which may lend itself to arbitrage opportunities;

- The **[confidential]** contract was a medium term contract consistent with NSPI's policies and procedures to use medium term contracts rather than long term contracts during higher priced periods;

- The **[confidential]** contract at minimum contract levels accounted for only about 10% of NSPI's solid fuel requirements on a tonnage basis in 2006 and 2007 and five percent in 2008;

- The **[confidential]** contract was only one element of the portfolio being negotiated at that time. NSPI also initiated contract negotiations with two other suppliers for multi-year agreements based upon index pricing, thereby providing diversification of pricing mechanisms for the contract commitments in the portfolio consistent with NSPI's portfolio strategy; and

- As a result of the competitive bids for **[confidential]** at the time, NSPI decided to undertake testing programs for these coals to determine if they could be purchased in the future (consistent with NSPI's policy and procedures regarding previously untested coals).

(NSPI, Redacted Closing Argument, pp. 13-15)

[99] NSPI is of the view that it ought not to be found imprudent as a result of its April 2005 contract for the purchase of low-sulphur coal. In support of its position, it pointed out that both Dr. Raschke and Liberty were of the view that the contract was not imprudent.

3.4.2 Submissions - Intervenors and Liberty

SEB

[100] SEB, in its Final Confidential Fuel Related Argument, maintained that the overriding concern is that NSPI appears to have entered into the April 2005 long-term contract with little, if any, consideration of the market.

[101] SEB expressed the view that, based on Ms. Medine's evidence, NSPI felt the "need" to quickly enter into a multi-year agreement, and that this "need" impacted NSPI's evaluation of the bids received in April 2005:

The first paragraph under the heading "Bid Evaluation" in Exhibit N-169 is very telling:

> Under normal circumstances a term bid is evaluated both against its competition as well as the expectation for market prices. This is not a normal circumstances given NSPI's commitment to develop its portfolio and **the need to enter into a term agreement at this time**. Therefore, a "traditional" contract evaluation is not performed in which the contract alternatives are compared simply against market [Emphasis added in original]

. . .

Ms. Medine summarized NSPI's position at Transcript, Page 811 as follows:

> So, it had nothing specifically to do with whether the Company was coming back or not ["it" being the implementation of a fuel procurement portfolio] but there was clearly evidence in the proceeding in the summaries — in the submissions that NSPI's customers — and it was confirmed by the Board in its decision in March — wanted more portfolio strategy implemented quickly.

(SEB, Final **Confidential** Fuel Related Argument, p. 24)

[102] SEB referred to a comment by Mr. Gubbins in his Direct Evidence, emphasizing an observation made by him in the 2005 rate case:

> From the standpoint of NSPI's present highly exposed position, long-term contracts should now only be considered after the coal market returns to a more balanced level of supply/demand.
>
> . . .

Mr. Gubbins' testimony, and SEB's position on this matter, could not have been made clearer during the 2005 proceeding or in SEB's argument in that case. Their view was that from the standpoint of NSPI's then existing highly exposed position, long term contracts should only be considered after the coal market had returned to a more balanced level of supply/demand, which was simply not the case in April of 2005. There was no reference anywhere in SEB's argument to NSPI "immediately" or "quickly" entering into a portfolio (Transcript, page 1706)

(SEB, Final **Confidential** Fuel Related Argument, pp. 25-26)

[103] SEB commented that:

In this proceeding, Mr. Gubbins specifically noted:

> A. It's certainly not consistent with the long-term aim of having a portfolio strategy, and I think my point I would always make is you shouldn't be where you are now. Therefore the strategy you've got in place is certainly a long-term strategy, that you've got to take time to get there, and you've got to make sensible purchasing decisions

> in the period to getting there. I mean, you're in a period of very high prices still. In fact, the prices have come off quite considerably. This makes it very important that you don't just rush into a strategy that says you have to have long-term contracts because somebody, you think, has said you've got to have long-term contracts. You've got to go through something which makes sense. You've got to have a sensible coal purchasing programme, and then you move into the long-term strategy that you're talking about when the market conditions are right and when they're stable, when you can see something - - you can actually see what's happening. I think you've pointed out the fact that there's been tremendous uncertainty around the whole time. That is not the time to go into long-term contracts. (Transcript, pages 1267-1268)

(SEB, Final **Confidential** Fuel Related Argument, p. 26)

[104] The following quote from SEB's Final Confidential Fuel Related Argument sets out, in some detail, its views of the contract entered into by NSPI in April, 2005:

> As the foregoing discussion indicates, the record in this proceeding simply does not justify the entering into of the **[confidential]** contract as a prudent decision by NSPI considering the then existing market prices for imported **[confidential]** coal. SEB respectfully submits that the record in this proceeding has clearly demonstrated significant doubt as to the prudence of entering into the **[confidential]** contract, and as explained earlier the burden has shifted to NSPI to demonstrate that this contract was both reasonable and prudent. As described in Appendix A the jurisprudence imposes a clear requirement that NSPI produce evidence of what its decision was based upon, and not only does it bear the burden of proving that its decisions were prudent, but it must also put forward evidence of what activities it undertook to underpin those decisions. SEB submits that NSPI has not demonstrated to the Board through the Hearing process that "ratepayers money [has been] wisely and frugally spent" as the Board required in its October 23, 2002 Decision (see Appendix "A").
>
> SEB respectfully submits that NSPI has failed to discharge is [sic] burden of demonstrating that its contracting decision was prudent, in that it has not provided a record which demonstrates the decision "to be the result of a logical process, guided by a reasonable set of considerations, encompassing relevant information known or which should have been known at the time" (see Appendix A). In fact, the exact opposite is demonstrated by the record. NSPI read the Board's 2005 Decision to mean that it had to move "quickly" to develop a portfolio of contracts. SEB submits that nothing in the Board's 2005 Decision suggests this is the case. In fact, the issue with respect to timing raised by the Board in the 2005 Decision was NSPI's failure to act in a timely fashion in entering into longer term contracts in the late 2002/2003 time period which was the basis for the Board's $18 million disallowance discussed above. The Board was concerned that NSPI had not entered into longer term arrangements at a time when market prices were low; there is no indication in the 2005 Decision that it was suggesting that NSPI should subsequently enter into longer term arrangements when market prices were high.

Furthermore, as noted by Mr. Antonuk's comments earlier in this Submission (Transcript, page 2456), the utility and not the Board is charged with the burden of making reasonable and prudent management decisions.

NSPI appears to have fundamentally misunderstood the Board's findings with respect to the 2005 imprudence disallowance and furthermore, and more importantly, with respect to the **[confidential]** contract, felt that the 2005 Decision somehow mandated that it develop longer term contracts as part of a portfolio strategy notwithstanding market conditions.

This "need" to act "quickly", the lack of an evaluation against market, and little or no supporting documentation from NSPI's management or in-house fuel procurement department, does not provide a basis for NSPI to be able to support a finding of prudence with respect to the entering into of the **[confidential]** contract.

As Mr. Gubbins initially indicated in his Direct Testimony (Ex. N-90) at pages 6 and 7, and in the Spreadsheet attached to his response to NSPI IR-3 (Ex. N-137), the appropriate disallowance to be made on account of the **[confidential]** contract was $5.8 million. His revised spreadsheet incorporating the **[confidential]** calorific correction discussed previously shows a proposed disallowance of $4.1 million.

Mr. Gubbins specifically noted at page 6 of his Direct Evidence (Ex. N-90) as follows:

> In April 2005 NSPI entered into a long term contract to purchase **[confidential]** coal ...
>
> We would question the wisdom of this decision since it goes directly against the advice that we gave in the 2004 hearing. The coal market is cyclical, having peaked in July 2004, but still being at very high levels in April 2005. Since this date prices have declined further in spite of increasing oil prices (see figures 1 and 4), illustrating that coal prices are not entirely linked to overall energy prices but determined by their own dynamics in the market place. Figures 1, 4 and 5 illustrate the cyclicality of coal prices with cycles traditionally 5 to 6 years in duration as we indicated last Fall. Figure 5 shows that there is a close correlation between changes in demand and prices ... The cycles appear to be getting shorter and volatility greater. NSPI therefore entered into a long term contract when, although softening, prices were still high. In our view the prudent course would have been to have waited and continue with a short term purchasing strategy as we indicated last Fall.

The trend line for imported ... coal has continued to be downward since the date of the filing of Mr. Gubbins' evidence.

Interestingly, as noted above, Dr. Raschke although not stating that the contract was imprudent per se, pointed out that the costs to other NSPI ratepayers of the decision to enter into the **[confidential]** contract were "considerable"....

NSPI contends that they find support for their decision in the evidence of the Liberty Group. The Board should note however that NSPI finds favour with Liberty's conclusions when they are in accord with NSPI, but yet does not accept any of Liberty's suggested adjustments when they are not in accord with the utility (Transcript, pages 2001-2003). Furthermore,

> Liberty appears to favour a portfolio approach to contracting and therefore felt it was appropriate for NSPI to commence the development of that portfolio, but they note the fundamental lack of support in the record for NSPI's decision-making as previously noted. It is in fact NSPI's failure to rationally support its decision to enter into the **[confidential]** contract, together with the contract's pricing *vis a vis* market trends for 2006, that support the requirement for a disallowance. SEB submits that the cross examination of the NSPI fuel panel, subsequent to the filing of Liberty's evidence and the examination of Dr. Raschke, further demonstrated the inadequacy and irrationality of the decision-making which surrounded the **[confidential]** contract.
>
> (SEB, Final **Confidential** Fuel Related Argument, pp. 27-30)

AVON

[105] Avon, in its Rebuttal Submission observed that NSPI has made advances in developing and implementing a portfolio strategy; however, whether or not the strategy is being implemented in an appropriate manner is a different consideration than whether a particular coal contract is prudent.

[106] Avon took issue with NSPI's assertion that Dr. Raschke had somehow endorsed the April 2005 contract, or that he was of the opinion that it was reasonable for NSPI to take immediate steps to implement the portfolio strategy. Avon argued that Dr. Raschke had merely pointed out that it appeared NSPI concluded it should act quickly to implement the portfolio strategy; however, according to Avon, Dr. Raschke never agreed that this was a reasonable thing to do.

LIBERTY

[107] In its Direct Evidence, Liberty had this to say about the April 2005 multi-year contract:

A. NSPI's April 2005 solicitations sought **[confidential]** tonnes per year of long-term low-sulfur coal supply through 2008. NSPI recognized this solicitation as its first attempt to add a long-term solid fuel supply contract to its portfolio, in response to the Board's March 2005 decision. NSPI properly handled the solicitation, including a sufficient number of qualified potential suppliers, conducting bid evaluations, and making a decision that appears sound from the information that NSPI provided. NSPI procured the least-cost supply offered. This procurement was the only long-term solid-fuel supply agreement entered during the 2004/2005 period, but NSIP [sic] did make shorter term purchases.

(Exhibit N-97, pp. 30-31)

[108] Liberty stated, during cross-examination, that it believes NSPI acted prudently in entering into the April 2005 contract, and it disagreed with those consultants who were of a contrary view:

Q. And are you aware that some of the consultants on behalf of some of the customers have suggested that the company acted imprudently in entering that **[confidential]** multi-year deal?

A. (Spangenberg) I'm aware of that.

Q. Would you - - is it true that Liberty does not share that view but instead believes that Nova Scotia Power acted prudently in entering the **[confidential]** multi-year agreement?

A. (Spangenberg) Yes.

(Transcript, November 29, 2005, pp. 2365-2366)

3.4.3 Findings

[109] The Board has carefully considered the matter of the April 2005 contract. The importance of having a balanced portfolio strategy for fuel procurement was discussed at length in the last rate hearing. In the 2005 rate decision, the Board commented as follows:

[65] Colin V. Gubbins of the McCloskey Group, Richard Marston of Marston & Marston Inc. and Sharon Hennings of Brubaker and Associates Inc. all gave evidence on behalf of SEB with respect to fuel. Both Mr. Gubbins and Mr. Marston provided their views with respect to world coal markets and NSPI's fuel procurement practices in pre-filed direct evidence and in their testimony at the hearing. Both experts take a similar view of NSPI's procurement strategy. They do not believe it is appropriate. In their opinion, NSPI has not, since 2002, adequately pursued a balanced portfolio of short, mid-term and long-term coal supply contracts and, consequently, customers are not adequately protected against price volatility. They were critical of NSPI's solicitation of the market between 2002 and 2004 for long-term contracts. They noted that coal prices had reached low levels in late 2002 and that Ms. Medine's evidence in the 2002 hearing, which indicated that NSPI should pursue a balanced portfolio of short, mid and long-term contracts, was correct. In their view, NSPI did not act quickly or effectively enough to follow this advice.

[66] Mr. Gubbins and Mr. Marston generally agree that NSPI had a window of opportunity in late 2002 and early 2003 to lock in reasonably priced, long-term coal supply contracts. They indicated that NSPI overlooked this opportunity and, instead, focused on shorter term contracts. As a result, NSPI and its ratepayers are exposed to a sharp increase in coal prices and, had NSPI acted prudently, this price increase could have been reduced. Mr. Marston, in Exhibit N-71, indicated that NSPI relies primarily on market timing in solid fuel purchases, rather than clear guidelines or price objectives. His opinion is that the solid imported fuel costs projected by NSPI for 2005 are "... based on an unreasonable and imprudent fuel procurement strategy and are unreasonably high because of NSPI's over-exposure to short-term and spot contracts." Mr. Gubbins advises that, despite the reference to 24 months as the preferred maximum length of fuel supply contracts noted in NSPI's new manual, long-term contracts are generally understood in the industry to be between three and five years in length.

[67] Dr. Manfred Raschke, of International Strategic Information Services, gave fuel evidence on behalf of Avon. He is also of the view that a balanced portfolio of short, mid-term and long-term coal supply contracts is necessary to avoid high risk exposure to coal price volatility and is essential for a prudent fuel procurement strategy. He indicated that, in his opinion, NSPI does not have a balanced portfolio for coal supply and, as a result, NSPI and its customers are vulnerable to spot markets and price volatility. Dr. Raschke also pointed out that had NSPI moved quickly to adopt a balanced portfolio in late 2002 and early 2003 (which was Ms. Medine's advice during the 2002 rate case) it could have reduced the impact of the high 2005 coal costs it now faces.

[68] Liberty expert witnesses were John Antonuk, Donald T. Spangenberg, Jr., Dennis Kalbarczyk and John B. Adger, Jr. They took a similar view with respect to NSPI's fuel procurement strategy. Mr. Spangenberg indicated that his review of NSPI centred on fuel management, particularly coal. He testified that, in his opinion, NSPI did not use a balanced portfolio approach to secure coal supplies and that NSPI's fuel procurement procedures, as well as the structure of its organization and internal expertise relating to this issue, are inadequate.

(Board Decision, March 31, 2005, pp. 32-34)

[110] In its 2005 rate decision, the Board set out Liberty's recommendations concerning the fuel portfolio strategy:

> Mr. Spangenberg's recommendations are:
>
> 1. NSPI should immediately conduct an overall re-evaluation of its generating system to determine the optimum way of meeting new requirements for control of SO_2 emissions, as well as emissions of other pollutants of concern, from its generating plants. Such re-evaluation should incorporate a long-term view, not just the next several years. The recommended study should consider not only all fuel supply options, but also integration of fuel supply options with capital expenditures for alteration, modification or expansion of its generating units in order to achieve the lowest possible costs for generation of power, consistent with other issues of reliability, environmental concerns and legal issues.
>
> 2. Consistent with item #1 above, NSPI should immediately revise its fuel portfolio strategy to incorporate a balance of both short-term (or spot) and long-term fuel contracts with terms ranging from one up to seven years, with expiration dates not all occurring at the same time.
>
> 3. NSPI should adopt a consistent policy of annual solicitations for long-term coal supply that are accompanied by production quality model runs for at least seven years into the future in order to determine actual fuel requirements. Such model runs should also provide the base for evaluation of proposals received from coal suppliers in order to conduct analysis of variances, such as fuel switching costs to comply with the lower SO_2 emission requirements.
>
> 4. NSPI should revise its coal solicitation process to make it an aggressive one that conveys the image of a utility operating from a position of professionalism and strength. RFP language must be clear and correct, and RFP's must be very clear about the specific fuel supply needs of the future, in terms of tonnes of coal required for each year in the future up to a maximum of seven years. Do not leave tonnages and years of supply at the discretion of fuel suppliers. NSPI must demonstrate it is a professional and serious fuel buyer that knows what it wants, and when it wants it.
>
> (Board Decision, March 31, 2005, p. 36)

[111] The Board concluded that "... The prudency and effectiveness of a balanced portfolio of short, mid-term and long-term coal contracts was unquestionable...."[28]

[112] The Board also stated:

> The issue, in the Board's opinion, is not NSPI's stated intention to improve its practices but the timeliness and effectiveness with which actual implementation of the new approach was achieved. NSPI, in the Board's view, failed to address its imported coal procurement problems quickly or efficiently enough to adequately protect itself or its ratepayers. Had it done so expeditiously following the 2002 rate hearing, the Board is satisfied that, based on the evidence at this hearing, it was possible for NSPI to create a balanced portfolio of short, mid-term and long-term imported coal at reasonable prices. Instead, NSPI appears to have slowly implemented the necessary changes to its procurement practices. It remains unclear to the Board whether the corporate philosophy actually changed, and whether the procedures and practices recommended by Ms. Medine are yet fully implemented, particularly with respect to the need for long-term coal supply contracts which exceed terms of twenty-four months.
>
> (Board Decision, March 31, 2005, pp. 47-48)

[113] There is no question that the message to NSPI from the Board's 2005 rate decision was that a balanced fuel portfolio had to be implemented as soon as possible. The Board stated that the issue was not NSPI's intention to improve its practices, but its timeliness and effectiveness in achieving the new approach. Liberty had specifically stated that NSPI should "... immediately revise its fuel portfolio strategy to incorporate a balance of both short-term and long-term contracts ..."

[114] The Board's decision was issued on March 31, 2005, and NSPI entered into its first multi-year contract in April of 2005. Coal prices had fallen somewhat at the time, and although they were still fairly high, there was no assurance that NSPI could achieve more favourable prices by waiting out the market. Certainly, the forecasts of various

---

[28]Board Decision, March 31, 2005, para. 80

experts were no guarantee which way coal prices would trend. The absence of a balanced portfolio left NSPI in a particularly vulnerable position. NSPI acted with dispatch in entering into the contract. One of the advantages of a portfolio approach to coal purchases is that it balances high costs with low costs and does not rely on outguessing the market. The adoption of a balanced portfolio approach will, by its very nature, result in some contracts being entered into during periods of relatively high prices. It would be dangerous, in the Board's view, to undermine a balanced portfolio strategy by insisting that all multi-year coal contracts be entered into only during periods of relatively low prices. The reality is that no one knows, except with the benefit of hindsight, whether prices are going to go up or down at any particular point in time. Otherwise, there would be no need to have a balanced portfolio strategy in the first place.

[115] Accordingly, the Board finds that the April 2005 contract was not an imprudent transaction.

3.5 Affiliate Activity

3.5.1 Submissions - NSPI

[116] In its Rebuttal Evidence, NSPI outlined the nature of the relationship between NSPI and Emera Energy Services (EES), an affiliated company to which NSPI sells its natural gas:

> As in the last rate application Board staff consultants have commented on the contract with Emera Energy Services (EES) for resale of natural gas contracted to NSPI.
>
> This contract has built-in transparency and has been a significant benefit to NSPI customers.

NSPI previously advised the Board that the contract term was being extended so as to not prejudice the gas supply contract arbitration. NSPI has also informed the Board that a reputable third-party will supervise a new solicitation, and participate in the evaluation of bids that come forward during this solicitation.

NSPI disagrees with the characterization that it does not treat gas resales as a core utility function. In competitively identifying a third party to buy and resell its natural gas NSPI structured the arrangement so that it maintained control over the following:

- The amount of gas sold or burned;
- The amount of gas sold monthly or. [sic] Daily;
- Management of the gas cuts from NSPI's supplier;
- The ability to hedge the volume and price of gas.

The contract provides a premium value over the gas market price- -an advantage to NSPI's customers. The contract does not take away from the underlying market value. NSPI has the mechanisms to participate in the value the gas market can provide.

None of the above stated functions is controlled by the affiliate. NSPI, through daily and monthly instructions, directs EES. EES, as bound by the contract, pays NSPI pursuant to the agreed pricing structure which is fully transparent. NSPI still maintains full responsibility for the sale of its natural gas. The contract does not take away NSPI's ability to manage supply cuts, generation requirements, monthly versus daily pricing and with financial hedging.

NSPI decided to enter a term arrangement to sell its natural gas, for exactly the reasons Liberty stated were not considered. As referenced in documentation provided in the last rate application outlining the evaluation of the bids for the resale of natural gas, NSPI was concerned that sophisticated buyers were taking advantage of the fact that NSPI must either sell its gas or burn it. To protect value for customers NSPI needed an arrangement that locked in the value of the market. The RFP and resulting contract did that, securing a premium to an M3 published index in the winter months and no less than market driving other months. In comparison bids from other counterparties offered less value. Given uncertainties with supply and demand the EES contract offered the best price and flexibility.

(Exhibit N-153, pp. 48-49)

[117] NSPI, in its Closing Argument, reiterated that the resale of natural gas has been a significant benefit to NSPI's customers, and that NSPI intends to continue to dispose of its excess natural gas in this manner. It stated that "Now that the arbitration process is complete, NSPI is arranging for a reputable third-party to supervise a new

solicitation, and participate in the evaluation of bids that come forward during this solicitation."[29]

[118] At the hearing, Counsel for NSPI clarified its intent to select a reputable third-party to supervise the new solicitation. James L. Connors, Q.C., Counsel for NSPI, stated that "...The correspondence which has gone to the Board which refers to a third party is a proposal, and the company is now actively pursuing this, to select an independent third party who would administer the RFP process for gas sales next year. So, in other words, what's under way is the picking of an expert independent company who will then be the ones who run the RFP..."[30]

[119] During cross-examination of the NSPI Fuel Panel by David MacDougall, Counsel for SEB, Ralph Tedesco, NSPI's Chief Operating Officer, outlined the process underway for the selection of the independent third party, and he stated that the Company had, after identifying somewhere between 12 and 16 third parties, narrowed the field to two who would be offered the opportunity to administer the solicitation process. Mr. Tedesco also confirmed that EES was not one of the two finalists with respect to the solicitation contract.[31]

[120] In its Closing Argument, NSPI discussed the transparency of the sale of its natural gas, and quoted the evidence of Chris Huskilson, President and Chief Executive Officer of NSPI, as follows:

[29] NSPI, Redacted Closing Argument, p. 93

[30] Transcript, November 29, 2005, p. 2423

[31] Transcript, November 25, 2005, pp. 1993-1994

> Mr. Chair, just for clarification, I would like just a couple of clarifying points on this if you don't mind. First of all, I think it should be clear to the Board that all these transactions are being done at market transparent pricing, so it - - again, that's a very recognizable and transparent way to do business, for sure. The second thing is that any transaction that's done in this light is done such that things like the credit exposure is being transferred between the company, Nova Scotia Power, and the affiliate. So there's a significant credit exposure that Nova Scotia Power doesn't have to bear. And ultimately, that – you know, that is part of – one of the reasons why Nova Scotia Power would want to do this. And just the last point is that when you look at these transactions, they don't actually bear on setting the forward price of electricity or the future test year because all of those things are done based on the way that we look at market forward prices and so on, and any of these transactions only happen after the price of electricity is set.
>
> (NSPI, Redacted Closing Argument, p. 93)

[121] NSPI stated that Liberty has put forth no evidence to show that NSPI's customers experienced any loss of benefit or harm as a result of NSPI's dealings with EES.

> If there were any doubt about the clear benefits that are provided to customers by this particular contract with an NSPI affiliate, Liberty would certainly be presenting a recommendation to reduce the test year revenue requirement accordingly. No such recommendation has been made ... NSPI submits that the contract with its affiliate, EES, is in the best interests of customers.
>
> (NSPI, Redacted Closing Argument, p. 95)

[122] NSPI referred to Undertaking U-84 which provided a summary of the net income accruing to EES as a result of selling the gas which it purchased from NSPI. NSPI pointed out that the summary indicates that the net income arising from such sales is a very small percentage of EES's overall business.[32]

[32]NSPI, Redacted Closing Argument, p. 94

3.5.2 Submissions - Liberty

[123] In its Direct Evidence, Liberty discussed affiliate transactions relating to heavy fuel oil (HFO) and natural gas.

[124] With respect to the acquisition of HFO, Liberty indicated that it found the same type of problems which existed in the solicitation process for coal and petcoke. It stated that:

> ... We reviewed the solicitation that the Company conducted for its 2005 requirements for HFO. We found documentation problems similar to those for coal and petcoke procurement. All eight firms on the original bidders list for the solicitation received the RFP. However, the documentation does not provide any analysis of bids; it contained only a purchase order approval signed by NSPI management. The documentation does not discuss why the award to **[confidential]** constituted the best supply option for NSPI, and there is no management approval documentation providing authority to proceed with the award of business to this supplier.
>
> (Exhibit N-97, pp. 62-63)

[125] Liberty reviewed the HFO transactions between NSPI and Emera Fuels, an affiliated company. It concluded that there were purchases in significant amounts by NSPI from Emera Fuels in both 2004 and early 2005. Liberty also concluded that NSPI sold HFO to Emera Fuels. Liberty stated that:

> The response to Liberty IR-20 gives reason to suspect that these procurements do not follow normal processes with respect to competitive purchases and management approvals. There is, moreover, the question of whether they otherwise took place at arm's-length, considering that they involved an affiliate.
>
> (Exhibit N-97, pp. 64-65)

[126] Liberty expressed concern over these transactions, and suggested that the misgivings which it expressed in the last rate case about affiliate transactions have been

substantiated and broadened as a result of its findings in the present case. Liberty concluded that:

> ... a utility should not buy or sell what it otherwise would not, just because an affiliate happens to have or need the commodity in question...
>
> We can think of no practical way to measure what, if any, affect [sic] affiliate transactions of this type will have on expenses in a future year. We can, however, state that they have the potential, based on what we have observed at other enterprises that permit purchase and sale transactions between utility and non-utility affiliates, to have a significant impact on utility costs.
>
> It is for these reasons that we recommended before and continue to recommend an audit of affiliate transactions and relationships within Emera, as they affect NSPI costs and operations.
>
> (Exhibit N-97, pp. 65-66)

[127] Liberty noted that Emera had recently sold Emera Fuels. Thus, Emera Fuels is no longer directly affiliated with NSPI, and it may be that all transactions between NSPI and Emera Fuels will cease before the commencement of 2006. However, Liberty pointed out that sometimes there are transitional provisions which provide for a continuation of existing relationships, and it recommended that this matter should be reviewed in the next year to determine if there are any effects on NSPI operations from any ongoing transactions with the new owners of Emera Fuels.[33]

[128] Liberty also discussed the arrangement whereby NSPI sells to EES the natural gas that NSPI has available under contract, but which it does not use for generating electricity.

[129] Liberty stated in its Direct Evidence:

---

[33]Exhibit N-97, pp. 67-68

Q. WHAT IS YOUR OPINION OF THESE ARRANGEMENTS?

A. The descriptions of the competition process and the resulting arrangements in the response to Liberty IR-99 were neither clear nor accurate (although NSPI corrected the inaccurate information in responses available on October 3, 2005). Our examination indicates that NSPI did not conduct a sufficiently competitive process in making its decision. This process and the arrangements that resulted from it were not consistent with good utility practice or evidently compliant with the Company's obligations under the Final Code of Conduct, Paragraph 6.1 of which provides that the Company will "... not ... offer any preference or favoured treatment to NSPI's affiliates ...".

Q. CAN YOU DESCRIBE HOW MARGINS AVAILABLE TO NSPI CHANGED BEFORE AND AFTER ENTERING THE ONE-YEAR AGREEMENT WITH EES?

A. Exhibit LCG-9 attached to this evidence presents information extracted from the parent company's Annual Report for 2004. The table shows that NSPI substitution of HFO for natural gas in fueling its power generation allowed the sale of gas for more than it cost, thereby producing a net negative gas cost. After EES became the exclusive purchaser of NSPI's gas, however, the benefit of such gas sales fell by half. At the same time, EES's margins were doubling.

. . .

Q. WHAT DO YOU MAKE OF THE FACT THAT THE ARRANGEMENT WITH EES AVOIDS THE NEED FOR NSPI TO SELL THE GAS IN THE U.S. MARKET?

A. The utility could and should sell its own gas, crediting all of the realized margins to its fuel-cost accounts, absent clear evidence that the intervention of a marketer like EES adds value in excess of the costs or lost margins that also come with the use of that marketer. The sales at issue here are reasonably typical off-system sales, which are routinely conducted by many utility companies in the U.S. Moreover, one should question whether the U.S. location of gas sales is the full reason behind the use of a marketer, given that EES appears to be using some of the gas purchased from NSPI to make sales within Canada.

. . .

Q. WOULD IT BE REASONABLE FOR NSPI TO SELL ITS GAS DIRECTLY TO PARTIES SUCH AS THOSE WITH WHOM EES EVENTUALLY TRANSACTS?

A. Yes. EES has a track record in the business, but it is a short one. It also has a staff, but duplicating its size and level of experience would not be that hard for NSPI. We have examined natural gas distribution utilities that make comparable off-system sales with very small staffs. Typical is a company we recently examined; it uses a staff of five people to conduct all of that company's gas-supply planning and capacity and commodity contracting. Those same five people also conduct a secondary-market program (off-system sales and capacity-release transactions) that involves about three times the volume that EES sells for NSPI. Our brief review of EES staffing confirms that they use a similarly small staff. Liberty has performed similar reviews at a number of other utilities, all of whom have secondary-market programs, with comparable findings. Making off-system sales is just not that hard.

. . .

Q. ASSUMING FOR THE MOMENT THAT NSPI SHOULD NOT SELL THE GAS ITSELF, WHAT SHOULD IT DO IN SELECTING ANOTHER PARTY TO CARRY OUT THAT FUNCTION FOR IT?

A. It should secure an arrangement through arm's-length bidding.

Q. WHAT DID YOU LEARN ABOUT WHETHER NSPI CONDUCTED SUCH A PROCESS?

A. We examined the documentation that NSPI provided about its solicitation process. That documentation exhibited a number of anomalies.

. . .

Q. WHAT DID YOU CONCLUDE ABOUT WHETHER THE DEALINGS WITH EES TOOK PLACE AT ARM'S LENGTH?

A. We concluded that the available information gave substantial reason to conclude that NSPI did not make an even-handed effort to give all the potential buyers an opportunity to compete on a comparable basis. Rather, the appearance from the documentation was that NSPI first took from three third parties their opening or "sticker price" positions, and only then asked its affiliate to stake out a position. Then, it took that position, which did not offer clearly superior terms and conditions, as a basis for deciding to negotiate with its affiliate to the exclusion of the others. In other words, EES appears from the documentation to have gotten an opportunity to make a refined offer that NSPI compared against the opening or first positions of the competitors.

(Exhibit N-97, pp. 69-78)

[130] Liberty also expressed the view that the arrangement between NSPI and EES did not accord with the Board's findings in the 2002 rate case. It stated that:

We believe that the agreement with EES raises problems under the 2002 order in the following respects:

- It treated gas sales as not representing a core utility function
- It transfers a major portion of that function to an affiliate
- It took away a key part of NSPI responsibility for gas sales
- It did so without substantial information addressing EES capabilities relative to other providers
- It did so without a full consideration of customer risk, conflict, and harm

- It reduced income available to NSPI

- The agreement with EES did not result from bidding or from what may be described as real competition

- It did so without prior Board approval.

We believe that the agreement fails to comport with good utility practice in the following respects:

- There was no apparent structured process for determining NSPI's capabilities to generate substantial margins through internal conduct of the function or any estimation of the difference in net benefits to be produced by such internal conduct

- There was not a sufficiently competitive process for awarding the business, assuming that it should have been conducted outside NSPI

- The affiliate received substantial advantages in what was not an arm's-length selection process.

(Exhibit N-97, pp. 83-84)

[131] With respect to Liberty's recommendation that there should be an audit of affiliate transactions as they impact NSPI costs and operations, Liberty explained this further in response to questions from the Board:

Q. Just on that point, I believe one of your recommendations is that there be an annual audit of affiliate transactions.
A. (Antonuk) Not necessarily annual, but periodic.

Q. What sort of -- when you talk about an audit of affiliate transactions, you have comments in here concerning affiliate transactions. In your view, how would an audit of affiliate transactions differ from, in essence, what you have done in order to be able to make your comments that you made in here about the affiliate transactions, how would that differ?
A. (Antonuk) Well, the first thing it would do is typically it would proceed over the course of probably more like a 5 to 6 month period, so that there could be a more, from an audit perspective, orderly and careful flow of information than is ever going to be possible in a rate case with the deadlines that, from an affiliate's audit perspective, frankly just don't work. You know, if you've got only so much time to ask a DR and you can't follow it up and you can't go back and sit down with management and say "What about this? Here's my concern about that", you can't have -- you just can't get to the bottom of these issues realistically in a rate case construct primarily because it's a -- forgive me for saying this, it's kind of a legal-driven process rather than a business and management-driven process. And also because a rate case, for good

reasons, has to operate on deadlines. The other thing it would do is it would not limit you to looking at things that do or don't have a direct impact in a test year but still may be influencing over the long term utility costs in a very significant way, you know, cost allocations, for example. You know, whether common organization structures exist to serve utility/non-utility affiliates and whether, in fact, the company's allocating cost properly. When they're dealing with third parties, you get the code of conduct issues, and an affiliate's audit usually also goes into those and validates that the company's not only meeting the express limits of the code of conduct but it's also doing what it needs to do to encourage third parties to believe that there is true competition. So it's those kinds of issues. Those audits often end up coming back and having relevance in a rate case if you find something wrong and there happens to be a rate case, you know, that shortly proceeds [sic] it. But the real benefit of them, I think, is it gives a Commission or, in your case, a Board, confidence over the long run that the utility is being run as a utility and not as an entity that exists to provide profit opportunities for affiliates.

. . .

Q. Excuse me, your recommendation doesn't just -- is not just confined to energy affiliates, is it?

A. (Antonuk) No, I don't think it should be. No, it should not be. It should address them all, although when you're doing a work plan for an affiliate's audit, if the non-energy stuff is minor in terms of potential consequence, you would -- obviously your work plan would call for very little time on that. And, like I said, we have not gone through that process of sort of saying where are all the risks. I think we do have a pretty good handle on where the energy risks are, and a lot of them are addressed in the report. The other thing an affiliate audit does, which I think is something that's very hard for a lot of people to see, is this. When you have affiliates who are dealing with a third party community like energy buyers and sellers, and a utility that's dealing with them, you may not see any transactions between the utility and the affiliate, but what we have found in the past sometimes is what you do see is there's a third party out there, maybe a big supplier, who's given the affiliate a good deal and is charging the utility more. Now, I'm not saying that's common, you know, most people don't do that, but we have discovered that. But that's something where you would have to look even where there aren't direct transactions between a utility and a non-utility affiliate and say is there some common third party out there that's providing a vehicle for distribution of costs or revenues in a way that's inappropriate. And I'm not suggesting there's -- you know, that we have reason to think that there's any of that kind of conduct going on here, but it is one of the things that as a matter of due diligence we believe needs to be checked periodically.

Q. Given your time frame, 5 to 6 months, it likely wouldn't be practical to do this on a yearly basis.

A. (Antonuk) No, and we don't think they're necessary on a yearly basis. You know, I guess it's in my interest to say frequently, but, you know, if they're on -- using people who come in and do a good look every three or as long as five years is fine provided whoever's doing that is leaving the staff with kind of, you know, a checklist to use in between to let the staff see if any of the base lines of performance or transactions are changing in the interim. So you could go with maybe a five-year cycle and then have the staff just run through the diagnostic checklist with the company every maybe 18 months or even 2 years.

Q. In your view, is this a significant recommendation? I mean, is this something you feel strongly about that should be done?
A. (Antonuk) Yes. And that's based both on our general belief in the importance of them, and also in the specific things we've seen here, even more so the latter in this case is the specifics we've seen.

(Transcript, November 29, 2005, pp. 2433-2438)

[132] During Mr. Connors' cross-examination of Liberty, he asked about any proposed adjustments to the revenue requirement as a result of affiliate transactions:

Q. Thank you. Now, Mr. Adger, you've made some comments with regard to affiliate transactions and some questions about certain aspects of the historical relationships. Would you agree that your company has not proposed any adjustment to the test year revenue requirement with regard to those matters?
A. (Adger) That's correct.

Q. And would you also agree with me that relations between Nova Scotia Power and any affiliates within 2005 you're not suggesting that that affected in any way customer rates in 2005?
A. (Adger) I think I have to qualify a response to that, because we remain concerned that the structure for the sale of Nova Scotia Power's gas that it receives from **[confidential]** is -- does not maximize the value of those gas sales. However, the rates were set based on some estimate of it, so that lack of value maximization affects Nova Scotia Power but not the customers in 2005.

(Transcript, November 29, 2005, pp. 2467-2468)

[133] Mr. Connors also asked Liberty about its recommendations that there be periodic audits of affiliate transactions:

Q. And are you aware that a chartered accountant firm independent of the company already conducts an annual audit of compliance with the code of conduct?
A. (Adger) I was not specifically aware of that but ---

Q. No. And are you aware -- so I take it then you would not be specifically aware that that company has provided reports for the past year and before that we've had several annual reports filed with the Board in that regard by that accounting firm?
A. (Adger) I would expect that to be the case. I would say, though, that it has been our experience that accounting firms sometimes don't find things that people with more expertise in those kinds of transactions found.

Q. Would the SEC have more expertise in the area of affiliate transactions?

A. (Antonuk) No.

Q. Not at all?
A. (Antonuk) No. Well, I can't comment on their expertise. Their level of scrutiny, I think, is pretty weak, though, over affiliate transactions.

Q. I see. So, if I suggested to you that the company underwent a regular audit of affiliate transactions in the past year by the SEC, an audit that took place over a number of months, you're going to say that the outcome of that is something the Board shouldn't pay attention to?
A. (Antonuk) No, let's get on the straight -- on the same question. I thought you meant the United States Securities and Exchange Commission.

Q. That's exactly who I'm talking about.
A. (Antonuk) Yeah. I don't think their audits of affiliate transactions are particularly effective at finding the kind of things we're talking about.

Q. I see.
A. (Antonuk) We've looked at many of them.

Q. You understand, but were you aware of the fact that there has been an affiliate audit?
A. (Antonuk) I would not expect there not to be, I'm just saying that I don't see how it bears on what we were talking about.

Q. I see.
A. (Antonuk) We know that's the case with the utilities we've examined, and if you look at our reports there are a lot of things we find that they don't -- never even choose to look at.

Q. If I suggest to you the affiliate audit conducted by the SEC raised none of these issues ---
A. (Antonuk) I'd say that's pretty typical of every -- virtually every Liberty report you see where we find material problems. That's why I said I don't think the SEC is very deep or effective at looking at these issues. Their concern isn't utility customers.

(Transcript, November 29, 2005, pp. 2468-2470)

[134] Liberty expressed concerns that the arrangement between NSPI and EES was not entered into on an "arm's-length basis":

> ... the available information gave substantial reason to conclude that NSPI did not make an even-handed effort to give all the potential buyers an opportunity to compete on a comparable basis .... In other words, EES appears from the documentation to have gotten

> an opportunity to make a refined offer that NSPI compared against the opening or first positions of the competitors.
>
> (Exhibit N-97, pp. 77-78)

[135] Liberty stated that the process and arrangements with EES were not consistent with good utility practices and, further, were not in compliance with the Company's Code Of Conduct.[34]

[136] Liberty suggested that NSPI should be selling its own gas, and "... crediting all of the realized margins to its fuel-cost accounts, absent clear evidence that the intervention of a marketer like EES adds value in excess of the costs or lost margins that also come with the use of that marketer."[35] Alternatively, Liberty expressed the view that, if NSPI does not sell its own gas, but selects another party to do it, then NSPI should do so through an arm's-length bidding process.[36]

3.5.3 Findings

[137] The Board has considered whether or not it should direct NSPI to re-assume the selling function for its natural gas not utilized in the generation of electricity. NSPI has stated in its Rebuttal Evidence of November 7, 2005, that it needs "... an arrangement that locked in the value of the market. The RFP and resulting contract did that, securing a premium to an M3 published index in the winter months and no less than market driving

[34]Exhibit N-97, p. 69

[35]Exhibit N-97, pp. 70-71

[36]Exhibit N-97, p. 73

[sic] other months..."[37] NSPI argues that EES offered greater value than others did, and given the uncertainties with supply and demand, the best price and flexibility was obtained with the EES contract.

[138] The Board notes that Undertaking U-84, which sets out the details of the margins earned by EES on its sales of natural gas and power, indicates that the income arising from the gas EES has purchased from NSPI is a very small percentage of EES's total business. It is clear to the Board, based on Undertaking U-84 and other evidence filed during the hearing, that the resale of NSPI's gas constitutes a very small component of EES's operations, and that in order for NSPI to assume the task of selling its own natural gas, it would be obligated to establish the necessary internal infrastructure, including employing the necessary number of employees possessing the skills to deal effectively in the natural gas markets.

[139] NSPI has committed to engaging in an RFP process to select a new party to handle its natural gas, and that the selection of the new party will be based on an objective assessment of the RFP responses by an independent third party. It is possible that EES, or another affiliate of NSPI, could be chosen to handle the NSPI natural gas contract; however, the choice will be made on an arm's-length basis by an independent third party.

[140] Given these circumstances, the Board is not prepared at this time to require NSPI to assume direct responsibility for selling its surplus natural gas. However, the Board will monitor the transactions and the relationship between NSPI and the company selected

---

[37] Exhibit N-153, p. 49

to handle NSPI's natural gas, particularly if the arrangement should be with an affiliated company.

[141] Liberty has recommended that NSPI conduct a study to determine the feasibility of establishing an in-house capability to sell its own gas.

[142] The Board agrees with this recommendation and directs that NSPI carry out such a study and to file it with the Board by August 31, 2006.

[143] Liberty also recommended that periodic audits be carried out on affiliate transactions and NSPI's relationships with Emera and Emera subsidiaries.

[144] In its 2005 rate decision, the Board stated:

> The Board also notes the concerns expressed with respect to other affiliate transactions involving energy and fuel. It is evident from the issues raised that reviewing NSPI's annual filing on affiliate transactions solely by an accounting firm, however well qualified, is likely insufficient. Accordingly, in addition to the form of review on this information performed in the past, the Board, in future, will also retain fuel audit experts to examine and express their opinions on these types of affiliate transactions, including export sales and natural gas sales.
>
> (Board Decision, March 31, 2005, pp. 63-64)

[145] Liberty outlined, in oral evidence, how the audit of affiliate transactions and relationships should be conducted. Primarily, it envisages an audit carried out every three to five years which would take a few months to complete. This would allow the audit to proceed in an orderly and thorough manner, which would not be possible if it were being conducted as part of a rate case. The audit, which would review significant transactions with all affiliates, would be designed to review items which may not directly impact test year figures, but which may have significant long term cost implications for NSPI.

[146] In Liberty's opinion, the real advantage of these periodic audits is that they will provide the Board with meaningful assurances that NSPI is being run properly as a utility, and not as a vehicle "... that exists to provide profit opportunities for affiliates."[38]

[147] The Board accepts the recommendation of Liberty to implement a process of detailed, periodic audits of affiliate transactions. Due to Liberty's extensive knowledge of NSPI, gained as a result of its work during the last two years, the Board will retain Liberty to carry out the first audit. During 2006, the Board will request Liberty to prepare a detailed work plan for the first audit, including the estimated time and budget, as well as an appropriate commencement date. The Board directs that the work plan be filed with the Board by June 30, 2006 for Board approval. The Board intends this audit to be carried out on a professional basis by experienced experts in utility matters, including the energy and fuel functions, as well as affiliate transactions. NSPI will be consulted during this process and its opinions solicited. The Board, in planning the commencement date for the first audit, will give consideration to other time commitments which may be facing NSPI.

[148] The reason the Board considers this audit to be an important step is because NSPI's parent, Emera, has become a large multi-faceted organization, with many affiliates, and NSPI engages in numerous transactions with some of these affiliates. In order to properly carry out its mandate pursuant to the **Public Utilities Act**, the Board must be able to satisfy itself that these inter-affiliate transactions are being conducted in accordance with

---

[38]Transcript, November 29, 2005, p. 2435

the Code of Conduct and that they are also properly accounted for in the records of NSPI, thereby ensuring that NSPI is receiving all profits to which it is justly entitled.

[149] The detailed audit of affiliate transactions is not meant to replace the annual reporting required under the Code of Conduct. Rather, these annual filings will be extremely useful in the design of the work plan for the audit of affiliate transactions, and the Board will ensure that there is no duplication of effort between PWC and Liberty, with respect to the periodic audit of affiliate transactions.

3.6 Point Tupper Marine Terminal

3.6.1 Submissions - NSPI

[150] In its Direct Evidence, NSPI provided a brief outline of the Point Tupper Marine Terminal ("PTMT"):

> The Point Tupper Marine Terminal (PTMT) is a bulk unloading facility located adjacent to the Point Tupper generating station. PTMT can accommodate gearless vessels, or bulkers, which were previously not an option for NSPI. This option increases competition among coal suppliers and provides access to lower cost supplies of coal, and can result in suppliers revising bids to compete with alternative supply basins. The location and design of the terminal were chosen to:
>
> - Substantially reduce demurrage charges through faster unloading capability;
> - Eliminate rail transportation costs from the port to the Point Tupper plant; and
> - Allow for bulkers which usually have lower transportation costs and allow shipments from more distant ports.
>
> The PTMT began commercial operation early in 2005, receiving the first vessel as part of the commissioning process in January, ahead of schedule. Following competitive bids, NSPI chose Savage CANAC Corporation, the Canadian affiliate of a leading US service provider

> in the bulk material handling industry, to manage the operation of the marine terminal. The parties entered a 10-year contract starting April 1st, 2005....
>
> (Exhibit N-1, pp. 58-59)

[151] In its Rebuttal Evidence, NSPI furnished additional information about the PTMT, including why it was built:

> When NSPI began to import coal in 2001, there were no coal import facilities in the Strait of Canso to support delivery to the Trenton and Port Tupper generating stations. NSPI was able to negotiate an agreement with Martin Marietta to unload coal at its aggregate operation in Aulds Cove. The Martin Marietta facility was relatively small and not equipped to handle large vessels. Only self-unloading vessels could be unloaded at the Martin Marietta facility and demurrage was always due as the vessels could not be unloaded at the standard contract rate of 2,500 tonnes per hour. Coal from the Martin Marietta facility had to be railed or trucked to Point Tupper and Trenton. Further, there was very limited storage at the Martin Marietta facility.
>
> As noted in EVA's review of NSPI operations, NSPI negotiated a 30-month agreement with Martin Marietta that started in October 2002. The agreement provided "sufficient time for NSPI to determine its best long-term for supplying Trenton and Point Tupper." EVA noted "(t)he Martin Marietta facility as configured provides a good stop-gap alternative for NSPI but may not make sense long-term because of the inherent inefficiencies in how the vessels are unloaded and its limited storage capacity." In order to increase storage at the Martin Marietta facility, a second pad was added on an area away from the port and rail link but was not desirable as NSPI incurred an extra cost every time it was used.
>
> NSPI conducted a systematic process for identifying alternatives to the Martin Marietta facility. NSPI advertised for parties interested in providing terminal services and/or bidding to develop a terminal at Point Tupper. NSPI determined the least cost strategy to be a terminal at Point Tupper, and selected a third party to own and operate it.
>
> As the Board is aware, NSPI's plan for the terminal faced certain challenges when it was not able to consummate an agreement with the selected third party. NSPI, following discussions with the Board, decided to go forward with the terminal outside of the traditional capital approval process in order for the terminal to be completed in a timely manner. NSPI estimated that it would incur \$3 to \$4 million in additional costs in 2005 if it delayed development of the facility. At the time, NSPI committed to attempt to divest the terminal once it was operational or return to the Board to ask that the cost of the facility be put into rate base.
>
> The Board, in a letter dated January 22, 2004 noted that "the Board has no objection to NSPI constructing the terminal outside rate base. At such time as NSPI applies to the Board to have the terminal included as part of rate base, or applies to the Board to have the terminal sold and leased back to NSPI the Board will determine whether or not the proposed transaction, and its related costs, is appropriate after performing its normal review procedures." NSPI proceeded with the terminal and completed construction in a timely

> manner such that the unloading of vessels destined for Trenton and Point Tupper was accommodated by PTMT upon the expiration of the Martin Marietta agreement.
>
> While NSPI has not abandoned its efforts to sell the terminal, it has entered into a 10-year operating agreement with Savage for its operations. The Savage contract was produced for review as part of this proceeding.
>
> . . .
>
> NSPI is still marketing PTMT and hopes to sell it to a third party. Absent that, NSPI will ask the Board to put the capital into rate base. In the interim, capital recovery on PTMT is appropriate given the undisputed value it has provided NSPI with respect to both direct saving, which NSPI estimates to be **[confidential]** in 2006 alone when NSPI is purchasing relatively little of its fuel requirements from non-traditional sources, and indirect costs related to the increased competition in coal supply.
>
> (Exhibit N-153, pp. 43-47)

[152] In its rate application, NSPI has included in the fuel expense an amount of $2.3 million, which represents the equivalent to a capital charge recovery on the terminal. These funds are not being paid to Savage, but represent a capital recovery charge on the terminal. In essence, the charge represents a recovery to NSPI for its capital related expenses in carrying the facility. The facility has not been approved for addition to rate base, as set out above.

[153] NSPI, in its Closing Argument, stated that "... NSPI is seeking to recover in its fuel expense a $2.3 million proxy fee for capital recovery while NSPI uses the full capacity of the PTMT for the benefit of customers."[39]

[154] NSPI took issue with both Dr. Raschke and Sharon Hennings, of Brubaker and Associates Inc., with respect to their proposed disallowances relating to the PTMT and, in particular, "... relating to the inclusion of a proxy for capital cost in the fuel expense

[39] NSPI, Redacted Closing Argument, p. 41

calculation. Neither consultant has expertise in marine terminal design, capacity, and operation, and both appear to understand the significant benefits to NSPI and its customers that PTMT delivers."[40]

[155] In UARB IR-61, NSPI set out the breakdown of the $2.3 million capital recovery charge. It includes an estimate for depreciation, interest expense on the short-term debt to finance the PTMT, a rate of return on the equity component invested in the terminal, and the related income tax effects.

[156] With respect to the claim by Ms. Hennings that NSPI does not utilize 100% of the capacity and thus should not be able to recover the total amount of the capital expense, NSPI, in its Closing Argument, quoted from its response to SEB IR-197:

> In order to minimize demurrage, PTMT was designed such that belted self-unloading Panamax vessels could off load at a rate of 3,000 tonnes per hour. The unloading capacity of the crane used for bulker-type vessels was designed for approximately 800 tonnes per hour, which balances terminal capital costs and demurrage charges for this type of vessel. PTMT must agree to allow delivery of nominated ships within a period the length of which is negotiated between the parties. The more distant the source, the longer the period must be. For example, a 20-day window is not uncommon for deliveries from Indonesia. In order to avoid demurrage, NSPI minimizes the overlapping of delivery windows, which limits the number of ships that can be accommodated. **The PTMT maximum design capacity for storing solid fuel is 164,000 tonnes. This capacity is just sufficient to unload vessels and maintain the flow of solid fuel to the plants. The inventory storage and daily feed storage areas for the Point Tupper station is 44,000 tonnes.** The Point Tupper unloading area under the unloading trestle is 50,000 tonnes. The Trenton unloading storage area under the trestle holds 70,000 tonnes, which allows for a full bulker Panamax vessel to be unloaded when the area is empty. The Trenton storage volume is transferred via a rail shunt to the Trenton generating station five days per week. The terminal is not designed to handle commodities other than solid fuels. [Emphasis added in original]
>
> (NSPI, Redacted Closing Argument, p. 44)

---

[40] NSPI, Redacted Closing Argument, p. 41

[157] NSPI stated that the above information makes it clear that Ms. Hennings' views concerning the capacity of PTMT are incorrect.[41]

3.6.2 Submissions - Intervenors and Liberty

SEB

[158] Ms. Hennings, an expert witness appearing on behalf of SEB, discussed the PTMT in her Direct Evidence:

> Q. Please provide background information about NSPI's Point Tupper Marine Terminal.
>
> A. Point Tupper Martine Terminal (PTMT) was completed in early 2005, at a total cost of $34.6 million, (Avon IR-56). NSPI is the current owner of PTMT, (NSDOE IR-64). NSPI is currently trying to sell PTMT, and it has not been its intention to own the terminal. NSPI claims that the costs included in the 2006 forecast for PTMT are justified by savings on its Point Tupper and Trenton coal receipts, as compared with its coal receipts using the dock at Auld's Cove.
>
> Q. Could the PTMT handle more than the current requirements of Point Tupper and Trenton?
>
> A. Yes, the PTMT could handle several times the current requirements of these generating plants...
>
> Q. What ratemaking treatment is available for the capital costs of the PTMT?
>
> A. For an asset included in the utility's assets, regulatory bodies sometimes eliminate part of the investment costs from rate base if the utility has built excess capacity that is not both used and useful. The used and useful criteria could be applied to the PTMT annual cost of capital of $2.30 million per year.
>
> NSPI has constructed an asset that it has proposed to charge as though it is part of rate base. It has calculated both depreciation and rate of return in developing a cost of $2.3 million to pass to ratepayers. From the bid information in the request for proposals when NSPI attempted to sell this asset, it has at least 50% more capacity than will be used during 2006 for utility purposes. Based on the delivery capability of this asset, it is capable of several times more delivery capacity than necessary for utility operations. The entire PTMT facility may only have NSPI as its sole customer during the year, so PTMT will likely qualify as being used by NSPI. However, only

[41] NSPI, Redacted Closing Argument, p. 44

> part of the shipping capacity is useful to NSPI. Thus, PTMT has excess capacity for utility purposes. The cost of this excess capacity should not be passed through to ratepayers in 2006.
>
> Q. What level of elimination of capital costs are you advocating?
>
> A. NSPI's $2.3 million proxy for the cost of capital should be reduced by at least one third ... Based on the delivery capability of the asset the Board may wish to consider an even greater reduction.
>
> (Exhibit N-91, pp. 2-5)

[159] SEB, in its Final Confidential Fuel Related Argument, stated that NSPI is seeking to recover not only the operating costs which it pays to Savage, but also the $2.3 million related to the capital costs of the PTMT. SEB believes that the Board should adopt the recommendation of Dr. Raschke that no capital recovery be allowed to NSPI in the 2006 test year because none of the PTMT's capital costs have been included in rate base. SEB also indicated that, although Ms. Hennings had recommended only a partial disallowance, she could also support Dr. Raschke's recommendation.

[160] SEB explained these points as follows:

> NSPI has indicated that it has not abandoned its efforts to sell the terminal, and it has not yet applied to the Board as contemplated in the Board's letter of January 22, 2004. Accordingly, NSPI's inclusion of $2.3 million on account of capital for the PTMT in fuel costs is merely a back door route to recovery of its capital where the Board has not yet conducted a review of the capital expenditures for PTMT and has not included it in rate base. In these circumstances, SEB submits it is highly inappropriate to allow for this capital cost recovery as a part of fuel expense.
>
> Depending on whatever arrangements NSPI may ultimately enter into by way of sale and leaseback, NSPI could easily end up over-recovering its costs from ratepayers. The Board is simply not in a current position to allow for this recovery, as it specifically stated in its January 22, 2004 letter. Section 35 and subsection 35A(1) of the Act require NSPI to obtain Board approval for any new construction, improvements or betterments in or extensions or additions to its property used or useful in furnishing, rendering or supplying any service which requires the expenditure of more than $25,000, or approval of an annual capital expenditure program.

Subsection 42(1) of the Act provides that the Board shall fix and determine the appropriate rate base for NSPI, and subsection 42(2) indicates that in establishing a rate base the Board shall determine the value of the physical assets of the public utility in accordance with the provisions of the Act, and sets out various factors that the Board should consider.

To date the Board has not determined "whether or not the proposed transaction, and its related costs, is appropriate", nor has it conducted its normal review in this regard. In these circumstances NSPI's claim for capital cost recovery is not supportable, and indeed likely not permissible.

However, if the Board is somehow of the view that it is appropriate and permissible for NSPI to recover a portion of its capital through its fuel costs, SEB submits for the reasons specified in Ms. Hennings' Direct Evidence, pages 2 through 5 (Ex. N-90), that the $2.3 million be reduced by one-third, i.e. $767,000. It appears that PTMT will certainly not be fully utilized, and various bidders who responded to NSPI's RFP to own and/or operate PTMT appear to be of the view that the facility could accommodate up to **[confidential]** million tonnes of coal and also possibly be utilized as a trans-shipping or off-loading base for other customers (see Ex. N-205). In essence, as described above under the description of the "used and useful" test, PTMT is not fully "used and useful" for NSPI's regulatory purposes, and NSPI should not be entitled to a return on its fully booked cost in 2006.

(SEB, Final **Confidential** Fuel Related Argument, pp. 54-55)

[161] SEB submitted that it would be completely inappropriate to allow a utility to recover the costs of an asset not in rate base:

With respect to the argument that PTMT has not been approved for recovery in rate base, NSPI states at page 45 that:

> It is appropriate from a regulatory rate making perspective to include recovery of the operating component as well as a proxy for the capital component of the investment within the context of the fuel expense.

NSPI provides no citation to support this bold assertion, and no evidence of where such treatment has been allowed. SEB respectfully submits that this would in fact be completely inappropriate from a regulatory rate-making perspective.

(SEB, Final **Confidential** Fuel Related Rebuttal Argument, pp. 16-17)

Avon

[162] Avon, in its Closing Submission, had the following to say with respect to the PTMT:

NSPI has constructed the Point Tupper Marine Terminal (PTMT) for the stated purpose of accommodating larger vessels and expanding the range of supply sources for import coal. At the present time, NSPI has been trying to sell the PTMT and it has not applied to the Board to have the terminal included as part of the rate base. NSPI has entered into a ten year operating agreement with Savage Canac for operation of the PTMT.

NSPI has accounted for the payments to Savage Canac valued at **[confidential]** for PTMT and **[confidential]** for Trenton in its fuel costs and in addition, it is seeking to recover $2.3 million as equivalent to a capital cost. It is this latter amount which we dispute.

. . .

Dr. Raschke has submitted that NSPI should not be permitted to include in its fuel costs any of this $2.3 million capital recovery for PTMT. While NSPI's rebuttal evidence suggests that Dr. Raschke has not offered evidence with respect to the actual capital costs and NSPI's prudence or imprudence in building the facility, the fact of the matter is, this is not the forum to do so. If and when NSPI applies to have the PTMT brought into rate base, it is at that time that Dr. Raschke may have something further to say.

. . .

Sharon Hennings offered an alternative recommendation with respect to the PTMT suggesting that the "used and useful" criteria could be applied to disallow at least 1/3 of the claimed cost on the basis that PTMT has excess capacity for utility purposes.

Ms. Hennings also confirmed in her testimony that she supported the recommendations of Dr. Raschke that capital recovery be disallowed for the PTMT in 2006 because the capital costs have not been included in the rate base, indicating that his recommendation is supported by the letter of January 22, 2004, from the Board. This letter was referred to by NSPI in its rebuttal evidence and filed subsequent to Ms. Hennings' evidence.

It is telling that the PTMT amortization costs, "equivalent to capital costs" were included in forecast 2005 results even though NSPI did not apply for these costs to be included in rates and the Board made no direction in this regard.

There is no regulatory precedent for including the PTMT amortization costs as an equivalent to capital in the fuel budget. We respectfully submit these ought to be disallowed in their entirety.

(Avon, Redacted Closing Submission, pp. 19-21)

Province

[163] In its Closing Submission, the Province expressed significant reservations concerning NSPI's claim for a $2.3 million capital recovery:

NSPI is seeking $2.3 million for what it characterizes as a fuel expense which is the equivalent to capital recovery on the Point Tupper Marine Terminal. NSPI's position is that if the Point Tupper Marine Terminal were owned by a third party, capital recovery would be included in lease payments, and thus form an operating expense that would flow into its fuel costs. It argues that since the Point Tupper Marine Terminal is generating transportation related savings in excess of the $2.3 million claimed, its capital related recovery is justified. It is troublesome that NSPI is seeking capital recovery on an unapproved capital asset, and that the amount that it seeks to recover in 2006 along is well in excess of the $1 million threshold for identifying capital projects that require separate review and approval.

Expected savings generated by a capital asset might provide justification for the approval and construction of the asset, but they should not be used as a justification for capital recovery without approval. While NSPI's position might very well turn out to be correct, that a cost benefit analysis would support this capital asset, the Province does not believe that the Board has been provided with a cost benefit analysis of the same quality as would be expected to support an application for a capital project. The Province is also not certain that all of the potential costs associated with the facility have been thoroughly presented. For example, the facility supports the Trenton generating station and there may very well be additional costs incurred given that the Point Tupper facility is further away from Trenton than the Martin Marietta facility at Auld's Cove.

The argument that capital costs would be imposed on NSPI if the facility was owned by a third party is also not satisfactory. If that third party was Emera or another NSPI affiliate, surely such an arrangement would warrant close regulatory scrutiny. It should not be any different when the asset is owned by NSPI's unregulated split personality.

The $2.3 million claimed by NSPI is derived from the asset value and a depreciation rate that has not been approved by the Board and that could be varied by the Board, if and when NSPI ever does see fit to move forward with a proper regulatory review of this asset. Without a proper regulatory review one cannot be certain that the claimed $2.3 million is not an over recovery, regardless of the level of operational savings that the asset purportedly generates. The Province submits that NSPI's capital recovery relating to the Point Tupper Marine Terminal should be tied to a directive that it proceed to apply to the Board for approval to include the asset in its rate base. Furthermore, the Board should provide that any capital gain, should the facility be sold in the interim, be credited to NSPI's regulated personality.

(Province, Redacted Closing Submission, pp. 22-23)

Liberty

[164] Liberty, in its Direct Evidence, reviewed the solicitation and evaluations in connection with the appointment of Savage to operate the PTMT:

Q. APART FROM THE LONG-TERM COAL CONTRACT SOLICITATIONS THAT YOU HAVE JUST BEEN DESCRIBING, PLEASE LIST ANY OTHERS THAT YOU EXAMINED.

A. We reviewed the solicitation and evaluations associated with the selection of Savage to own and operate the new Point Tupper Marine Terminal. While the solicitation was on the basis of selecting a new owner for the terminal, NSPI currently still owns the terminal.

Q. WHAT DID YOUR REVIEW SHOW WITH RESPECT TO SUFFICIENCY OF THE SOLICITATION PROCESS?

A. Liberty found the solicitation process associated with the Savage agreement to be appropriate. The substantive documentation that NSPI provided showed the solicitation and the response from bidders to be comprehensive and thorough. Liberty did observe, however, that the documentation associated with the Savage solicitation and award process contained the same administrative deficiencies as described above related to coal and petcoke procurement.

The original bidders list contained 19 firms, four of which responded. The Savage proposal was clearly the most comprehensive, and offered the lowest operating costs. Liberty found a clear summary of the issues related to each of the bids from all suppliers. NSPI did express some reservations about the Savage bid. At this point in the documentation, the information became sketchy. It was not possible to determine how or whether NSPI resolved its concerns with Savage. The only point that was clear was that the competition narrowed to two providers, but no basis for this was provided. The crucial point is that the documentation provided contains no analysis indicating why the business was ultimately awarded to Savage. In addition, as with the majority of coal and petcoke procurements, there is no management approval documentation supporting the award to Savage.

(Exhibit N-83(a), pp. 48-49)

[165] In cross-examination by Mr. Connors, Liberty confirmed that it was not recommending a disallowance of any of the PTMT charges.

3.6.3 Findings

[166] The Board has considered the evidence surrounding the PTMT. The main concern is related to the capital recovery charge of $2.3 million which NSPI wishes to recover as part of its fuel costs for the 2006 test year.

[167] Dr. Raschke was of the view that NSPI should not be permitted to include any of the $2.3 million in its fuel costs because the PTMT is not in rate base. Ms. Hennings, on the other hand, was of the opinion that the PTMT has excess capacity, and that there should be a disallowance of a portion of the $2.3 million cost associated with the facility, based on the "used and useful concept". She stated that

> ... regulatory bodies sometimes eliminate part of the investment costs from rate base if the utility has built excess capacity that is not both used and useful. The used and useful criteria could be applied to the PTMT annual cost of capital of $2.30 million per year.
>
> (SEB, Exhibit N-90, Evidence of Sharon K. Hennings, p. 4)

[168] The Province expressed reservations about allowing a recovery concerning an asset which has not been approved for inclusion in rate base.

[169] Liberty did not recommend any disallowance with respect to the $2.3 million capital recovery. However, the Board notes that Liberty criticized the documentation associated with the solicitation and award process, finding that it contained the same type of administrative deficiencies as observed in the coal and petcoke procurement process.

[170] To the Board's knowledge, NSPI's request for a capital recovery charge in relation to a non-rate base asset is extremely unusual and perhaps unprecedented. The **Public Utilities Act** clearly contemplates that all assets of a utility which are used and useful in supplying a regulated service shall be included in the rate base fixed by the Board with respect to that particular service. Furthermore, **s. 45** of the **Act** provides that a public utility is entitled to earn a just and reasonable return on the rate base fixed by the Board, and to recover reasonable and prudent operating expenses. There is nothing in **s. 45** or

elsewhere in the **Act** which entitles a public utility to recover capital-related charges in relation to assets which it owns outside of its approved rate base. Accordingly, in the Board's view, it would be improper to allow the recovery of the $2.3 million in fuel expense. Otherwise, a utility could hold assets outside its rate base even though those assets were being used to provide a regulated service. It could recover the capital-related charges through rates even though the Board had never approved the value of the asset for inclusion in rate base, or for depreciation purposes. Having proceeded in this fashion, the utility could then sell the asset without having to allocate to its customers any of the profits realized on the sale. This would be an intolerable situation which, in the Board's view, is simply not compatible with the intent or express provisions of the **Act**.

[171] The Board hastens to add that it is not suggesting any improper motive on the part of NSPI. The evidence clearly indicates that NSPI built the PTMT with the intention of selling it. In the meantime, it has entered into a contract with a third party to operate the terminal and the Board is satisfied that NSPI's customers are benefitting from the arrangement. Moreover, despite the evidence of Ms. Hennings, the Board is not persuaded that the terminal was designed to have excess capacity, although this question need not be definitively addressed unless and until NSPI applies to have the PTMT included in rate base. Should NSPI make such an application, the Board is prepared to consider at that time whether, in determining the amount to be included in rate base, an allowance should be made for deferred capital charges having regard to the fact that the

terminal has, since the commencement of its operation, been devoted exclusively to the receiving and unloading of coal for NSPI's Trenton and Point Tupper generating plants.

3.7 Natural Gas Resale Benefit

3.7.1 Submissions - NSPI

[172] NSPI has a long-term contract with a supplier for the purchase of natural gas. When the cost of natural gas exceeds the cost of other fuel types burned by NSPI in its generation facilities, the Company resells the natural gas and applies the proceeds to reduce its overall fuel costs.

[173] During the hearing, as previously indicated, NSPI announced it had reached a settlement with its supplier on the pricing and supply arrangements of natural gas, as well as other issues under the long-term contract. The settlement avoided the risk to both parties of an arbitrated resolution. While the details of the settlement are of an extremely confidential nature (and were treated as such during the confidential sessions of the hearing), the Company did issue the following public news release to the media, investors and financial institutions:

> **New Gas Pricing Agreement Reached by Nova Scotia Power**
>
> Halifax, NS, November 21, 2005 - Nova Scotia Power Inc. (NSPI) announced today that it has reached an agreement with its supplier on pricing for natural gas under an existing long-term natural gas purchase agreement.
>
> As a result of the agreement, NSPI will lower its 2006 fuel forecast by $22 million. This will reduce the Company's 2006 rate application from an average increase of approximately 15 per cent to approximately 13 per cent. NSPI has filed supplementary evidence with its regulator, the Nova Scotia Utility and Review Board (UARB).

> "This agreement is good news for Nova Scotia Power customers," said Chris Huskilson, President and Chief Executive Officer of Nova Scotia Power. "Given market conditions similar to today, the customer benefits from this agreement will continue for several years."
>
> The financial benefits of the agreement will vary based on world energy prices. Nova Scotia Power will propose to the UARB that should its 2006 fuel costs be lower (as a result of this agreement) than the amount the regulator ultimately provides for in the rate decision, the difference will be refunded or credited to customers.
>
> The agreement provides NSPI with natural gas at a discount to current world market prices. By having the option to resell the gas, NSPI and its customers can gain financial benefit.
>
> The contract - which began in 2000 and runs until 2010 - calls for up to approximately 61,600 MMBtus of natural gas per day to be supplied to Nova Scotia Power. The contract was subject to a price re-determination on November 1, 2004. With both Nova Scotia Power and its supplier unable to come to terms last year, the matter was referred to binding arbitration. The two companies reached agreement in advance of any arbitration decision. The UARB has been provided with details of the agreement which is confidential for competitive reasons.
>
> "This agreement is more than a year in the making," added Mr. Huskilson. "Customers are being asked to cover skyrocketing fuel costs - it's only fair they receive the benefit of this fuel contract gain by Nova Scotia Power."
>
> This agreement also results in a favourable adjustment to NSPI's fuel expense for 2005. Consequently, as a result of this agreement and other factors, including warmer weather in the fourth quarter, NSPI has revised its financial forecast earnings for 2005 and now expects earnings to be approximately $15-20 million lower compared to 2004.
>
> (Undertaking U-43)

[174] On a confidential basis, NSPI filed with the Board, and with intervenors who signed confidentiality agreements, Supplementary Evidence setting out the terms of the settlement and its estimated impact upon the 2006 test year fuel forecast.[42] While NSPI stated that the settlement will not eliminate all uncertainty respecting the Company's future gas supply costs, or the expected margin that can be obtained on the resale of any gas not consumed by the Company, it recognized that stakeholders would like some assurances that if results turn out better than originally forecast, the benefits would accrue to NSPI's

[42]Exhibit N-187

customers. After NSPI provided its estimate of the natural gas resale benefit that it expected would be applied against its 2006 fuel budget, it proposed:

> For every dollar that NSPI's resale gas margin reduces NSPI's 2006 actual fuel expense below the allowed fuel expense in the approved rates pursuant to the filing before the Board, NSPI will, at the direction of the UARB, either refund such amounts to its customers or reduce future revenue requirements.
>
> (Exhibit N-187, p. 5)

[175] NSPI's Fuel Panel resumed its testimony after the natural gas settlement was filed with the Board. In a Supplementary Opening Statement, Mark Sidebottom, NSPI's Director of Fuels, Energy and Risk Management, reported:

> The agreement covers the full term of the contract. It will give NSPI and its customers greater certainty in future years. As a result of the favourable negotiating outcome, we have reduced our fuel expense for 2006 by $22 million. This works out on average to an approximate two percentage point reduction in our rate request, from an average of 15 percent to 13 percent overall. That said, the precise value of the contract still depends on natural gas prices, and gas production levels.
>
> The negotiations surrounding the natural gas contract involved a substantial amount of effort using both internal and external resources. This result is good for our customers.
>
> ...
>
> With respect to the natural gas agreement, NSPI recognizes the possibility this contract may result in a greater value than $22 million improvement in fuel expense.
>
> The company proposes that any additional savings from this contract above and beyond the fuel budget ultimately set in rates, should be provided to customers as a refund or a credit.
>
> This is consistent with our position that our intention is to recover our actual fuel expense, no more and no less.
>
> (Exhibit N-188)

[176] In cross-examination by John P. Merrick, Q.C., the Consumer Advocate, NSPI's Policy Panel elaborated upon the mechanism NSPI suggests be adopted to account for any additional benefits achieved under the new contract (i.e., over the level of

the $22 million improvement to the original fuel costs estimated by NSPI), and how it would be applied if there was a finding of imprudence by the Board:

> Q. (Merrick) Is it the position of the company that if there is any surplus revenue from gas sales over and above the **[confidential forecast margin]** that was identified in the supplemental hearing then it will not be used to offset or reimburse the company for any deduction that might be made for imprudence?
>
> A. (Huskilson) I think I can state the proposal that the company has made, and I think that is consistent with the proposal. And that is that we have said that gas revenues margin are to be set at the additional 22 million dollars ($22,000,000) which I think is **[confidential forecast margin]**, I believe, million dollars now, and that any value that we received over and above that number would be deducted from the approved amount for fuel expense that was approved by this Board and as long as we had costs below that. That's what we proposed, and that's what we continue to propose.
>
> Q. And would that include costs that you might incur but not be allowed to recover in rates because of an imprudence deduction?
>
> A. (Tedesco) If the fuel expense, just to pick some numbers, were set out, say, 500 million dollars ($500,000,000) and there was, for the sake of discussion, a ten million dollar ($10,000,000) disallowance, then the fuel budget would be set at four hundred and ninety million dollars ($490,000,000). The gas, again, sake of discussion, say added twenty million dollars ($20,000,000) of value to customers, so that would then lower the fuel budget then would be set at four hundred and seventy million dollars ($470,000,000). To the extent we came in below 470 million dollars ($470,000,000), then yes, the benefit of the gas contract would accrue to customers. To the extent we came in above 470 million dollars ($470,000,000), then no, it would not.
>
> Q. When you say "we came in," it would be your total expenses coming in below that number.
>
> A. (Tedesco) That's correct.
>
> Q. Including expenses that, for rate setting purposes, might have been deducted for imprudence -- a penalty for imprudence.
>
> A. (Tedesco) Correct.
>
> Q. So that the short answer to my question is that if there were deduction for imprudence, the company would still look to apply gas revenue against that before it would turn anything back in.
>
> A. (Tedesco) Yes, if we came in below. And I think the idea here would be there are bad things, there are good things. We think the gas contract is a good thing. It is not unreasonable that one, under those circumstances, should offset the other. Otherwise, we're simply playing a one-sided game.
>
> (Transcript, December 1, 2005, pp. 3202-3204)

[177] The Policy Panel provided further insight on this issue in response to questions from Board Counsel:

Q. And you then had a discussion with Mr. Merrick about the company's proposal for dealing with the gas resale benefits in excess of **[confidential forecast margin]**?
A. (Huskilson) Yes, sir, we did.

Q. You recall that. And to be certain that I understand the answers you gave to Mr. Merrick on that question, I want to put a simple hypothetical to you. And I emphasize that it's a hypothetical. Assume for the sake of argument only that the Board were to make an imprudence disallowance of ten million dollars ($10,000,000) on fuel in this proceeding. Now assume also that your fuel cost projections for 2006, except for the gas resale benefit, prove to be spot on. In other words, all your other fuel assumptions are correct. Thirdly, assume that the gas resale benefit in 2006 actually turns out to be **[confidential forecast margin plus $10 million]**, which is precisely ten million higher than the base estimate of **[confidential forecast margin]**, which you've asked to be built into the fuel budget. Now, in those circumstances, under the company's proposal, would any of the ten million dollars ($10,000,000) in extra gas resale benefits flow to customers or would it all go to the company?
A. (Tedesco) In the hypothetical that you've described, the way that ten million dollars ($10,000,000) would flow would be to pay the company's fuel costs, and that would be no different than our fuel budget today. So for instance, as already exists in our budget, as we've demonstrated in an earlier undertaking, coal is slightly below forecast, HFO is slightly above forecast. There is no argument that the cost of HFO – I haven't heard anyone say, "Well we should adjust the company's fuel budget upward nine or ten million dollars because of the cost of HFO." What we are saying is that the proposal that we've put forward is precisely consistent with how the Board has set rates in the past. The strip that we have used for gas is our assumption that was the gas price assumption presented in our filing. Based on that filing, we have estimated benefit of the gas contract of **[an additional]** twenty-two million dollars ($22,000,000). If it turns out it's less, that's at the company's risk. If it turns out it's more, that's at the company's benefit. In either case, the customer is not harmed once the fuel budget is set.

Q. Mr. Tedesco, I understood all of those parts. I just wanted to be sure, under the company's proposal, what happened to that ten million dollars ($10,000,000).
A. (Tedesco) You've characterized it correctly.

...

Q. In other words, the upshot is -- and I realize that it can be characterized a number of ways, and I'm not disagreeing with what Mr. Tedesco has said -- but the effect of it is, in this hypothetical which I posed, the company would recover its full fuel budget including the ten million dollars ($10,000,000) that was found to be imprudent prior to any gas resale benefits flowing to customers. That's the bottom line.
A. (Tedesco) Well, it's -- I wouldn't characterize it that way.

Q. I realize you wouldn't ---
A. (Tedesco) It's really ---

Q. --- but that's what would happen. Nothing would go to customers until the amount -- the excess exceeded ten million.
A. (Tedesco) That's right. But it would be no different than the risk that we take on today. There is nothing to say that fuel -- that gas prices will change in such a way that we may end up under-recovering. There is nothing to say that the gas deliveries -- as I said earlier, we believe we have a very aggressive assumption on gas deliveries. There is nothing to say that those deliveries will not show up. These are risks that the company takes on, and as I said last night, what we're -- really all we're asking for is we'll take the good with the bad. We don't want to be punished for doing something good.

(Transcript, December 2, 2005, pp. 3282-3286)

[178] In its application filed July 5, 2005, NSPI's projection for the gas resale margin was based on the May 2005 forward price strip for natural gas. Following the announcement of its settlement, NSPI updated its estimate of the anticipated resale margin that may be achieved under the settlement. At the request of Board Counsel, NSPI provided an update using the May 2005 forward price strip (increasing the benefit by $22.6 million) and using the November 2005 forward price strip (increasing the benefit by $64.1 million).[43]

[179] In the testimony of Dr. Stutz, discussed in greater detail below, he proposed setting up a reserve fund, equal to any excess of the actual gas resale margins for 2006 (above the amount included in rates), to be distributed to the benefit of the Company and its customers following consideration, in a future rate hearing, of results achieved during the 2006 test year.

[180] NSPI submits that Dr. Stutz's proposal imposes all the risk of future natural gas price fluctuations upon the Company. In cross-examination, the Policy Panel

[43] Supplemental Stutz IR-8 (updated November 25, 2005) and Undertaking U-58 (filed December 6, 2005)

expressed the following concerns about his proposed reserve fund, and its future distribution:

A. (Tedesco) Dr. Stutz's proposal is different from ours.

Q. (Merrick)Would you have any objection to Dr. Stutz's proposal?
A. (Tedesco) Yes, I would.

Q. And what would be the basis of your objection?
A. (Tedesco) Again, the company is simply looking to recover its fuel costs, both good and bad, and whatever they may be and wherever they may be set, to the extent we beat that target, then we would agree those costs should accrue to customers. It's not fundamentally different, in my mind, than some of the proposals that have been put forth during the hearing by some to say, well, we should reduce the fuel budget, certain [coal] contracts are below forecast, while ignoring that certain other oil contracts are above forecast.

A. (Huskilson) And I think, Mr. Merrick, I think it would be important to say that the proposal that the company has made is very similar to the circumstance that it finds itself in today or has found itself in the past. And so we would see that that proposal is not changing the circumstance the company has always had, whereas the proposal -- this proposal looks like it does change those circumstances. And so that's why we would take issue with it.

A. (Tedesco) I think we need to be very conscious of we're in an environment with volatile fuel costs. We find ourselves today in a circumstance in part because of imprudence, in part because of dramatically higher fuel costs where we have, indeed, a bow wave. To continue to scoop or seek to scoop only the good and ignore the bad I think only builds that bow wave for future years.

(Transcript, December 1, 2005, pp. 3206-3207)

[181] The Policy Panel reiterated these concerns in cross-examination by Board counsel:

Q. (Outhouse) ...You have said, as I understood Mr. Huskilson to say yesterday to the Board, be very careful how you price that gas under the contract because if ... you set that margin too high, then it could come back to haunt us if we don't realize that margin, and the company could be seriously harmed, as I understood you, Mr. Huskilson.
A. (Huskilson) That's exactly right. And so the proposal that we have made allows the company to have some protection around that issue, but also allows some opportunity for customers to see the benefit of that. And so we thought that that was balanced. If the proposal that Dr. Stutz was making was a two-sided proposal, one that would say, "We're going to set up an account for the gas contract" and pluses or minuses would be flowed through, that would be a different kind of arrangement

which would be more aligned to the kind of suggestion the company has made. And that would be a different arrangement that might make more sense.

...

Q. Dr. Stutz's proposal does not create any down-side risk on the gas contract for the company.
A. (Huskilson) Yes, it does.

Q. How?
A. (Huskilson) Because the **[confidential forecast margin]** is not assured.

Q. No. But that's the company's proposal too.
A. (Huskilson) I understand.

Q. So his proposal doesn't add to that risk.
A. (Huskilson) No, it doesn't add to that risk, but it takes another risk component -- or adds another risk component to the company, which is the overall fuel situation. And that increases the risk. So the company was willing to take the risk that the **[confidential forecast margin]** was a good number based on the fact that there was a balance on the other side.

Q. Mr. Tedesco?
A. (Tedesco) It would certainly be our hope and position that this issue be moot. And I say that from the perspective of we do not believe there has been imprudence. If indeed there is no imprudence, there is no issue with the company's proposal, and any benefits will accrue 100 percent to customers.

(Transcript, December 2, 2005, pp. 3290-3296)

[182] Another aspect of the settlement of issues surrounding NSPI's natural gas agreement is its impact upon the long-term receivable. The existing agreement includes a price adjustment clause respecting natural gas purchases over a period of three years. Under the clause, the Company pays for the natural gas purchases at an agreed upon contract price, but at the end of three years is entitled to receive a rebate based on the application of a price cap. The savings achieved as a result of the price cap are reflected in the long-term receivable, which has been estimated by NSPI. The Company submits

that, if the Board decides to increase the natural gas resale benefit, then there should also be a corresponding adjustment in the long-term receivable.

3.7.2 Submissions - Dr. Stutz and Intervenors

Dr. Stutz

[183] In his testimony, Dr. Stutz proposed a different mechanism for the treatment of the natural gas resale benefit, if it ultimately exceeds NSPI's post-settlement estimate of the benefit:

> Finally, let me turn to the Gas Resale Margin. Recent developments discussed in the confidential portion of these hearings have led NSPI to increase the benefit from the gas resale included in its proposed test year required revenues. The Company has also proposed that, to the extent that additional gas resale margins reduce NSPI's actual total fuel expense below the amount approved by the Board for inclusion in rates, the difference will, following Board direction, be applied to benefit ratepayers.
>
> The Company's revised estimate of gas resale benefits reflects the uncertainty in the amount of gas it may sell and the margin it will earn per unit volume sold. It would be reasonable to assume that the Company has taken care not to overestimate the revised benefits included in its base rates. It is also reasonable to assume that actual gas resale margins may exceed those that the Company proposes to include in its required revenues. Thus, the treatment of additional gas margin revenues could be important.
>
> The Company's proposal for the treatment of additional gas margin revenues does not permit the Board to decide now how the benefit of such revenues would be divided between the Company and its customers. To provide the Board the opportunity to make that decision, I recommend that the Board direct the Company to set up a reserve fund equal to the excess, if any, of actual gas resale margins for 2006 above the amount included in rates. The Board need not decide how the fund will be used now, nor whether the fund will benefit NSPI, its customers, or both. That can be decided in the general rate proceeding to be held in 2006 or at whatever time the Board finds it appropriate.
>
> (Stutz Opening Statement, Exhibit N-244; Transcript, December 2, 2005, pp. 3514-3515)

Avon

[184] Avon raises three issues with respect to the incorporation of natural gas costs and resale benefits into NSPI's fuel budget for the 2006 test year. First, it asks the Board to review the settlement between NSPI and its natural gas supplier to ensure that the benefits arising under the settlement are allocated fairly between the Company's shareholders and ratepayers. Avon notes that the settlement addressed two issues, namely, compensation to NSPI relating to deliveries of natural gas prior to December 16, 2005, and the establishment of a price and supply arrangements respecting future deliveries of natural gas. The latter would benefit NSPI's customers, while the former would accrue to the benefit of the shareholders. Avon cautions that the negotiation of both items in one settlement raises issues about whether NSPI received additional compensation respecting deliveries of natural gas prior to December 16, 2005, at the expense of terms related to future pricing of natural gas under the contract.[44]

[185] In cross-examination by Robert G. Grant, Q.C., Counsel for Avon, Mr. Tedesco acknowledged that there was a relationship between the settlement of issues respecting both past and future deliveries of gas:

> ... I would characterize that [compensation for deliveries prior to December 16, 2005] as absolutely instrumental to receiving the assurances that we did for [future] gas deliveries.
>
> (Transcript, November 24, 2005, p. 1585)

[186] Second, Avon also expressed concern about the reasonableness of NSPI's revised forecast for the natural gas resale margin under the negotiated settlement. While

[44]Avon, **Confidential** Closing Submission, pp. 14-16

Avon acknowledges that the forecast based on the November forward price strip may be too optimistic, it stated that NSPI's revised forecast based on the May 11, 2005 forward price strip was unreasonably low. In light of these two extremes, Avon suggested that the Board establish an amount for anticipated gas revenues "based on its realistic view of the current gas markets".[45]

[187] Finally, Avon described NSPI's proposed refund or deferral account as "illusory" because any surplus would first be used to offset deficiencies for other fuel types in NSPI's fuel budget, including the imprudence disallowance, before customers would benefit from any improved gas margin.[46] In Avon's view, such a mechanism detracts from the punitive nature of an imprudence disallowance.

[188] However, Avon did express support for deferring any surplus gas resale margin, stating that any such excess ought to accrue to the benefit of customers either by way of a refund or a reduction of future revenue requirements.[47]

Consumer Advocate

[189] The Consumer Advocate highlighted the two suggested methods for dealing with the anticipated natural gas resale benefit. In his Closing Submission, the Consumer Advocate suggested that one approach would have the Board factor the natural gas resale benefit into NSPI's fuel budget, for the purpose of setting rates. Applying this approach,

---

[45] Avon, Redacted Closing Submission, p. 18

[46] Avon, Redacted Closing Submission, p. 13

[47] Avon, Redacted Closing Submission, p. 18

the Consumer Advocate noted that the risk/benefit would lie with the Company's shareholders, as it should be under rate-setting principles. However, the Consumer Advocate submitted that if this method is to be adopted for the purpose of setting rates, then the Board should revise upward the gas resale benefit estimated by NSPI since, in his view, it is clearly too low.

[190] In the alternative, the Consumer Advocate concurs with Dr. Stutz's suggestion that a reserve fund be set up to capture any gas resale benefit to the extent it exceeds NSPI's revised estimate. The Consumer Advocate opposes NSPI's suggestion that any surplus benefit from the resale of natural gas should be applied against other fuel costs, including an imprudence finding. Such risks, in the opinion of the Consumer Advocate, should properly be borne by the Company's shareholders.[48]

Province

[191] In its Closing Submission, the Province reiterated its qualified support for a fuel adjustment mechanism, noting that the development of a FAM should be undertaken carefully and with stakeholder involvement in its design and implementation. The Province suggested that steps should be taken towards the implementation of a FAM once NSPI has hired an in-house coal expert and made its procurement decision-making process more transparent.[49]

---

[48]Consumer Advocate, Redacted Closing Submission, pp. 7-8

[49]Province, Redacted Closing Submissions, pp. 21-22

[192] With respect to NSPI's suggested mechanism for dealing with any excess natural gas resale benefit, the Province suggests that a better approach is for the Board to incorporate the anticipated revenues from gas resales into the Company's total fuel budget, using the best information available to the Board with respect to the likely pricing of natural gas in the 2006 test year. The Province is reluctant to adopt the mechanism proposed by NSPI because, in its view, the natural gas resale benefit to be realized is likely to exceed that projected by NSPI, given the most up-to-date forward price strip available to the Board at the conclusion of the hearing. The Province observes that the difference could be approximately $40 million if the November 2005 forward price strip (rather than the May 2005 forward price strip) accurately predicts the state of the natural gas market in the test year. In that event, the Province notes that ratepayers would be making a considerable prepayment against future rates, or possible rebate, something which current ratepayers facing a proposed double digit increase should not be asked to absorb.[50]

CME

[193] The CME opposes NSPI's proposal to offset any surplus natural gas resale benefit against a shortfall in its overall fuel budget and against any imprudence disallowance. In its Closing Submission, the CME challenges NSPI's proposed assignment of risks between NSPI and its customers with respect to the fuel budget:

> 41. The present lack of a fuel clause is not relevant and it is worthy of note that until fuel procurement has achieved a level of sophistication in design and execution satisfactory to NSPI, the Board and ratepayers a fuel clause or fuel adjustment mechanism (FAM) is unlikely to be implemented because it has to be a proper balancing of the risk.

---

[50] Province, Redacted Closing Submissions, pp. 19-21

> 42. Also, it is the position of the CME that risk should not be **symmetrical** as indicated by Mr. Tedesco. NSPI receives a good rate of return. Encapsulated in that rate of return is a premium for risk. It has in the past, and should be in the future, be responsible for the operations of the business and the risks that go with it including fuel procurement. It is the beneficiary of a known rate of return (notwithstanding an imposed limited). The relationship of risk is not symmetrical. The impetus for ratepayers approving a FAM or such other mechanism is for the benefit of predictability, leveling of fluctuations and in some cases, sharing of risk but it is not one of symmetry. Any acceptance under a FAM or such other mechanism is based on the good operations of such a mechanism. Any other shift would remove the incentive from the operator.[Emphasis added in original]
>
> (CME, Redacted Closing Submission, p. 23)

SEB

[194] SEB also opposed the mechanism proposed by NSPI. In its Confidential Fuel Related Argument, SEB submitted that NSPI's gas resale benefit should be set based on the November 2005 forward price strip filed in Undertaking U-58. SEB stated that NSPI's forecast for the gas resale benefit (based on the May 2005 forward price strip) is not reasonable because there is more current information filed with the Board. SEB argued that it would be unreasonable to allow NSPI to apply any surplus gas resale benefit to offset increases in its remaining fuel budget, describing as patently unreasonable NSPI's suggestion that any such surplus gas resale benefit should also be used to offset an imprudence disallowance.[51]

[195] SEB reiterated its position that customers should get the immediate benefit of the gas resale margin, rather than deferring the benefit to a future test year:

> In its Closing Argument NSPI attempts to paint the picture of deferring the potential value of the gas contract as a good thing, so as to possibly alleviate the burden of a future rate increase. As NSPI's two largest customers, SEB have no interests nor do they think it is appropriate to delay, a potential benefit so as to alleviate future rate increases. This is

---

[51] SEB, **Confidential** Fuel Related Argument, pp. 50-51

> particularly so in the face of the extraordinary increase proposed for SEB by NSPI in this proceeding. SEB's position is that customers should get the full benefit of the natural gas resale margin, and that this should be done by way of application of the current third party available indices.
>
> (SEB, **Confidential** Fuel Related Rebuttal Argument, p. 17)

[196] SEB encouraged the Board to ensure that it is satisfied with the accounting treatment of the natural gas contract and the long-term receivable contained in NSPI's evidence. Further, SEB expressed concern that, following the announcement of the natural gas settlement, Undertaking U-76 showed a greater long-term receivable at the end of 2005 than the amount shown in Appendix A of the original filing, implying that 2005 purchased gas costs were overstated compared to the contractual cap. SEB suggested that this demonstrates an unfair allocation of the settlement to shareholders and that the overstatement should be available to customers of NSPI as a refund.[52]

3.7.3 Findings

[197] As a result of the settlement reached between NSPI and its natural gas supplier, the Company expects to achieve better results on the resale of its natural gas than originally forecast when it filed its application on July 5, 2005.

[198] There are various issues which arise with respect to the natural gas component of the fuel budget, including: 1) what price should be attributed to the commodity and what volume can NSPI expect to receive, in order to determine what

---

[52]SEB, **Confidential** Fuel Related Argument, p. 53

natural gas resale benefit should be incorporated into NSPI's total fuel budget; 2) whether the Board should approve a deferral mechanism as proposed by NSPI or, alternatively, a reserve fund, as proposed by Dr. Stutz; 3) whether the benefits of the natural gas settlement were appropriately allocated between NSPI's shareholders and customers; and 4) whether the long-term receivable should be adjusted to reflect the Board's findings respecting the gas resale benefit.

[199] The first issue requires the Board to determine the amount of the natural gas resale benefit to be incorporated into NSPI's total fuel budget.

[200] Based on its review of the record, the Board is satisfied that NSPI's estimated impact of the settlement (increasing the benefit by $22.6 million) is too conservative, while the revised estimate based on the November 2005 forward price strip (increasing the benefit by $64.1 million) is too optimistic. Having regard to the highly volatile nature of the natural gas market, and the potentially significant impact that this amount can have on NSPI's fuel budget, the Board recognizes that caution is required. Nevertheless, weighing the relevant evidence, virtually all of which is confidential, the Board finds that it is reasonable to adopt a gas resale benefit $35.8 million higher than that contained in the original filing of July 5, 2005, thereby decreasing NSPI's original fuel budget by the same amount. The Board notes that this results in a gas resale benefit for 2006 which is very comparable to the gas resale benefit actually realized by NSPI in each of 2004 and 2005. The Board sees nothing in the material produced at the hearing which would indicate that NSPI will not be able to achieve at least an equal gas resale benefit in 2006.

[201] The determination of the natural gas resale benefit impacts upon the Board's consideration of the deferral mechanism proposed by NSPI and the reserve fund suggested by Dr. Stutz.

[202] While the Board recognizes that NSPI's proposed deferral mechanism is not, strictly speaking, a fuel adjustment mechanism ("FAM"), its effect is similar, in some respects, in terms of its potential impact upon NSPI's proposed fuel budget.

[203] Following the Board's review of the evidence and submissions, it considers that there are various issues which detract from the approval of a deferral mechanism or reserve fund at this time.

[204] In its March 31, 2005 decision, the Board refused to incorporate a FAM proposed by NSPI:

> [131] The Board shares the views of the intervenors with respect to the FAM proposed by NSPI. The Board recognizes that FAMs exist in many other jurisdictions and can, potentially, be a positive and useful regulatory tool. However, in view of the Board's findings with respect to imprudence and inadequacies in NSPI's fuel procurement practices, it would be quite inappropriate to approve a FAM at this time. The Board does not believe it is in the public interest to transfer the risk of fuel price volatility to ratepayers when NSPI's ability to achieve the best possible fuel price is in question.
>
> [132] Further, the Board is of the view that transferring such risk from shareholders to ratepayers could diminish the incentive for NSPI to quickly and thoroughly improve its fuel procurement process. This is particularly the case since the FAM proposed by NSPI would transfer 100% of the risk to ratepayers. Accordingly, the Board rejects the proposed FAM. Further, in view of the Board's concerns in this area, should NSPI apply for approval of a FAM in future, the Board will order an independent audit of NSPI's overall progress and performance with respect to the necessary fuel procurement improvements. This audit would include, as recommended by Liberty, "... a more detailed examination..." of fuel and energy transactions and relationships with affiliates and would form part of the evidence the Board would consider in any future FAM application.
>
> (Board Decision, March 31, 2005, para. 131-132)

[205] While the Board has concluded in this decision that NSPI has made significant improvements in its fuel procurement procedures, the Board still has reservations about incorporating, at this time, an adjustment mechanism with respect to NSPI's fuel budget. As noted above, there remain elements of the Company's Fuel Procurement Policies and Procedures Manual which require improvement, most notably as it relates to natural gas, and improving the transparency of its decision-making in relation to its fuel. In these circumstances, the Board is reluctant to vary from its current regulatory practice of setting the fuel budget.

[206] There are further reasons for the Board's conclusion. First, Dr. Stutz's proposal contemplates an adjustment mechanism which is limited to variances in one type of fuel, rather than the range of fuel types comprising NSPI's portfolio. In the view of the Board, any such adjustment mechanism, if adopted, should apply to all fuel types collectively. Further, NSPI's proposal would allow it to recover any shortfall in its overall fuel budget, including imprudency. In the opinion of the Board, this is not an equitable proposal for customers in that they would not likewise benefit if NSPI were to achieve better results than the fuel budget approved by the Board. In other words, NSPI's shareholders would be afforded the opportunity to offset any costs above the approved budget for 2006, while customers would not be entitled to benefit if the Company was able to achieve better results in its remaining fuel budget than currently forecast. Moreover, setting the natural gas resale benefit at the level proposed by NSPI, accompanied by either the deferral mechanism proposed by NSPI or the reserve fund proposed by Dr. Stutz,

would, in the opinion of the Board, provide little incentive to NSPI to improve upon the forecasted benefit.

[207] Furthermore, and most importantly, in a test year where customers are facing a significant rate increase, the Board is loath to defer any potential benefits from the gas resale benefit to a future test year.

[208] Accordingly, the Board concludes that the gas resale benefit should be increased by $35.8 million above that contained in NSPI's original application dated July 5, 2005, and that no deferral mechanism or reserve fund should be implemented at this time.

[209] Avon and SEB asked the Board to consider whether the benefits of the natural gas settlement between NSPI and its supplier were appropriately allocated between the Company's customers and shareholders. As noted by Avon in its Redacted Closing Submission, the settlement addressed two issues, namely, compensation to be received by NSPI for deliveries of natural gas from its supplier prior to December 16, 2005, and the establishment of a price and improved supply arrangements respecting future deliveries of natural gas, but only to the extent that gas is available to the supplier. Customers will benefit from a fair price and improved supply arrangements for future deliveries which likely will be resold into the market with the revenue applied against NSPI's fuel budget. On the other hand, shareholders will benefit from compensation for deliveries of natural gas from the supplier prior to December 16, 2005.

[210] As noted previously, the settlement between NSPI and its supplier was reached in the midst of the hearing. The terms of the settlement were filed in a confidential exhibit. The Board concurs with Avon and SEB that NSPI must satisfy the Board that the benefits of the settlement were fairly allocated between the customers and shareholders.

[211] The Board observes that the dispute between NSPI and its natural gas supplier involved complex contractual issues. The two parties were both sophisticated entities, each of which thought that their respective positions were sufficiently strong to lead them to pursue a ruling from an independent arbitration panel. Subsequent to the arbitration, but before the arbitration decision was issued, the parties reached their agreement.

[212] In commercial disputes like the one under consideration, there is never any guarantee of success. A claim may be denied by the court or tribunal, or decided in a manner not anticipated by either party to the dispute. Both NSPI and its supplier no doubt made some compromises in reaching the terms of settlement.

[213] The Board is satisfied from its review that the settlement clearly involved the two issues identified by Avon. While the shareholders of NSPI benefitted from a lump sum payment, representing compensation for deliveries of natural gas from the supplier prior to December 16, 2005, the settlement also benefitted customers because NSPI negotiated terms with respect to the supply arrangements and price of natural gas for future deliveries. This will benefit NSPI customers in 2006 and beyond because it provides greater certainty with respect to price and volume. In the absence of this negotiated settlement, it is not

possible to determine with any certainty whether NSPI would have been successful on either of these two points at arbitration.

[214] It is difficult to ascertain whether the benefits from the settlement were scrupulously allocated between the shareholders and the customers of NSPI. However, the Board is satisfied that the issues relating to deliveries of natural gas prior to December 16, 2005 and the fixing of future prices and supply arrangements were inextricably related to one another such that it would not have been practical or reasonable to reach a settlement between the parties without addressing both issues concurrently. The Board is satisfied that NSPI, to the extent possible, attempted to segregate those issues in its negotiations with the supplier. It is very possible that an arbitration decision respecting issues of pricing and volume for future gas deliveries could have been less favourable for NSPI customers than that achieved under the negotiated settlement.

[215] Having reviewed the terms of the negotiated settlement, the testimony related to it, and the submissions of the parties, the Board is persuaded that the settlement reached with the supplier benefits NSPI's customers and that there was a fair and reasonable allocation of the benefits accruing under the settlement between shareholders and customers.

[216] In its Compliance Filing, NSPI should address the Province's concerns with respect to the long-term receivable, as set out in paragraph 68 of its Closing Submission.

3.8 Fuel Costs

3.8.1 Submissions - NSPI

[217] The primary issue is the accuracy of NSPI's original fuel forecast. NSPI, in calculating the cost to be ascribed to coal required for the test year but not purchased at the time of the application, based its value on the forecast prepared by Hill & Associates. A number of the intervenors took the position that it would have been more appropriate to price the uncommitted coal using EVA's forecast, which was generally lower than Hill's. In the eyes of the intervenors at least, the EVA forecast was also more accurate, since it correctly predicted the downward trend in coal prices which subsequently occurred.

[218] With respect to the forecasts, NSPI argued that it has been difficult to forecast fuel prices with any degree of accuracy in the past few years. In this regard, NSPI emphasized that there was no evidence in the 2005 rate case predicting either the magnitude or the duration of the price spike which occurred.[53]

[219] NSPI continued:

> Nevertheless, in the current case, intervenor consultants now purport to see the global coal market clearly and have concluded that it is falling. They hold strong opinions on what price forecast NSPI should use and which one it should not use. This certainty about 2006 is less impressive, when one is reminded of the collective failure of these consultants to predict the magnitude and duration of the market price event that started in late 2003 and has continued to this date.
>
> . . .
>
> Certain intervenors asked why NSPI did not use the lowest possible forecast price available to estimate its balance of the year prices. The answer is simple. The EVA forecast was not offered as an alternative to Hill. In fact, until February 2005, EVA had not published a forecast of South American coal in its FUELCAST/COALCAST Service. EVA recommended that NSPI use the Hill forecast because Hill & Associates has an international reputation with respect

[53] Exhibit N-153, pp. 11-12

to South American coal. It publishes multiple multi-client reports on this coal region including the annual forecast report upon which NSPI relied.

(Exhibit N-153, p. 11)

[220] NSPI stated that:

... Now that the coal market price is below the budget amount, several of the intervenors would like an adjustment to all uncommitted tonnes at the time of the Application. This is similar to a request in the 2004 Application that NSPI adjust its foreign exchange requirements for un-purchased coal due to the strengthening of the Canadian dollar. As with coal, NSPI has policies regarding currency hedging. The Board did not accept this recommendation, which suggests a recognition that that the continued hedging was appropriate and an ex post facto adjustment related to the decline in the foreign exchange was inappropriate for committed hedges. The same philosophy is appropriate with respect to solid fuel hedges.

(Exhibit N-153, p. 15)

[221] In its Closing Argument, NSPI submitted:

It has been the practice of the Board to set rates based upon the forecasts as filed, provided they are reasonable. The evidence demonstrates that NSPI used reasonable forecasts, professionally prepared by experts in the field. Prices for committed and uncommitted fuel in the NSPI application are accurate and proper for rate-making purposes.

Nova Scotia Power has relied upon a forecaster with an international reputation. No other party to the proceeding offered an alternative forecast that provided comparable data with sufficient documentation so as to be a suitable substitute for the Hill forecast.
. . .

The evidence shows that the overall fuel costs anticipated by NSPI for 2006 are appropriate, even in light of volatile fuel markets. As indicated in NSPI's response to U- 29, changes in the cost of one fuel are just as likely to be offset by changes in the cost of another. ...

(NSPI, Redacted Closing Argument, pp. 18-19)

[222] In its Reply to Closing Argument, NSPI maintained that the overall fuel budget, as filed, represents a realistic number, notwithstanding that parts of the forecast may be higher or lower than the proposed budget:

The fuel budget contained in NSPI's 2006 application is based upon the best information available at the time of the application, in accordance with the ratemaking principles of this jurisdiction. No Intervenor offered into evidence an alternative price forecast which contained any detail or applicability to be useful to the Board. Ms. Medine completely explained that the

> EVA forecast of quarterly spot prices is not an appropriate forecast for NSPI's 2006 fuel costs. The evidence confirmed that parts of NSPI's forecast may be higher or lower than the budget but overall represent a realistic number.
>
> Further, NSPI customers are protected from over recovery in two ways. First, NSPI is capped with respect to earnings should fuel costs come in lower than expected. Second, NSPI customers could receive a refund if natural gas revenues are higher than forecast subject to NSPI recovering its fuel costs.
>
> (NSPI, Redacted Reply to Closing Argument, p. 7)

3.8.2 Submissions - Intervenors and Liberty

SEB

[223] In its Final Confidential Fuel Related Argument, SEB submitted that:

> ... NSPI's fuel forecast should be adjusted to take account of the fact that NSPI is utilizing a very high forecast for 2006 imported ... coal tonnage which was not committed at the date of the application. NSPI utilized the March 2005 Hill & Associates Forecast notwithstanding that it was substantially higher than the forecast for 2006 available to NSPI from its consultants EVA.
>
> (SEB, Final **Confidential** Fuel Related Argument, p. 38)

[224] Mr. Gubbins adjusted the balance of the uncommitted coal, to reflect the difference in the price forecast prepared by Hill & Associates as compared with the forecast prepared by Mr. Gubbins' firm, McCloskey Group. Mr. Gubbins stated that the Hill price forecast for 2006 was too high. The adjustment calculated by Mr. Gubbins is $9.45 million.

[225] According to SEB, it is clear from the record that the current prices for coal support the use of a lower forecast. As an example, SEB quoted from Mr. Gubbins' opening statement in which he suggested that prices on November 11, 2005, as reported

in the McCloskey Coal Report, were significantly lower than the prices used by NSPI in its forecast.[54]

AVON

[226] Avon, in its Closing Submission, contended that the use of the Hill forecast was inappropriate. This is because the prices forecast by Hill were too high and thus overstated the fuel requirements for 2006.

[227] Avon argued that the Hill forecasts are demonstrably wrong, and "... fail to reflect the cyclicality in the international coal market which all experts agree exists,. . . and this Board should be wary about using long-term forecasts for near term coal commitments. Certainly, even NSPI's consultants Ms. Medine and Daniel Walton, agreed that shorter term forecasts are more accurate than long as a general rule."[55]

[228] Should the Board agree that the Hill long-term forecasts are inappropriate to use for the test year, then Avon suggested that there are several options which the Board could use. One option is for the Board to take the uncommitted volume as of the date that NSPI filed its rate case and substitute a more representative cost estimate based on either the EVA forecast, as Dr. Raschke did, or the McCloskey forecast, as Mr. Gubbins did. The impact of using the EVA forecast, according to Dr. Raschke, would be to reduce the fuel

---

[54]SEB, Final **Confidential** Fuel Related Argument, p. 39

[55]Avon, Redacted Closing Submission, pp. 8-10

budget by approximately $28.2 million. Using the McCloskey forecast reduces costs by about $10 million.[56]

[229] Avon also indicated that:

> The Board may account for commitments made since the rate filing and replace the balance of the uncommitted tonnages and options with the appropriate "plug" number - whether EVA forecast or McCloskey. Undertaking U - 29 sets out NSPI's most current volumes, replacing its forecasted figures with committed prices...
>
> (Avon, Redacted Closing Submission, p.11)

[230] In its Closing Submission, Avon presented a calculation prepared by Dr. Raschke which, according to Avon, demonstrates that "... even if all of NSPI's current contracts are accepted the coal costs claimed for 2006 are still too high by at least $14.8 million..."[57]

[231] Avon maintained that "It would be inappropriate for NSPI to have the benefit of a unreasonably high cost per MMBtu when it is based on a demonstrably wrong long-term forecast and when its own contracts subsequently entered into show this."[58]

[232] In its Reply Submission, Avon revised its proposed adjustment to the fuel costs from the $14.8 million figure previously recommended to a recalculated figure of $21.3 million. Avon stated:

> At our request, Dr. Raschke reviewed the transcripts of the NSPI fuel panel and using the information regarding the current contracts and their options, recalculated the savings to NSPI from its contracts entered into since May 1, 2005, assuming the negative exercise of

---

[56] Avon, Redacted Closing Submission, pp. 10-11

[57] Avon, **Confidential** Closing Submission, pp. 11-12

[58] Avon, **Confidential** Closing Submission, pp. 11-12

> the contract options. The recalculated figure is $21,277,636 versus his previous assessment of $14,768,533. His revised calculations are appended as Appendix "A".
>
> NSPI's fuel budget is not reasonable; it is unrepresentative and the forecasted coal cost number is demonstrably wrong. Avon respectfully submits that the Board ought to disallow $21.3 million from NSPI's 2006 fuel budget based on the fact that NSPI has entered into lower priced contracts replacing its uncommitted volumes forecasted at higher levels. If the fuel budget is approved as stated, it would offer a windfall to NSPI shareholders, who would benefit from the fact that contracts have been committed at lower prices.
>
> (Avon, Redacted Reply Submission, p. 6)

Province

[233] The Province, in its Closing Submission, took no position concerning whether NSPI's original fuel price forecasts were appropriate. However, it stated that the fuel budget should be revised because it no longer accurately reflected the 2006 fuel costs likely to be incurred.[59]

[234] The Province pointed out that a number of circumstances, which have occurred since the original test year estimates were prepared, cause the original projections to be less relevant to the 2006 test year. These events include savings achieved on coal contracts entered into since the application was filed, at prices less than original forecast, and HFO prices which have increased over those originally forecast by NSPI. The Province noted that:

> ... Liberty has taken the position that the gains that NSPI is likely to realize in improvements to its solid fuel forecasts will be offset by the likely higher HFO prices. In Liberty's view, these factors amount to a wash, though no specific calculations were provided to support that opinion.
>
> (Province, **Confidential** Closing Submission, pp. 17-18)

---

[59] Province Redacted Closing Submission, p. 15

[235] The Province made no specific recommendation with respect to this issue.

Liberty

[236] Liberty stated, in its Direct Evidence, that NSPI's estimate of solid fuel costs for the 2006 test year "... has turned out to be too high, as recent NSPI purchases have reduced the amount of uncommited tonnages and at prices less than NSPI had estimated."[60]

[237] In its pre-filed evidence, Liberty concluded that there should be a reduction of $10,378,294 in fuel expense for the 2006 test year, because NSPI... "has been able to secure at lower than estimated prices much of the fuel that was uncommitted at the time of the Company's filing."[61] Liberty explained that these reduced costs related to low sulphur coal and petcoke.

[238] In its opening statement at the hearing,[62] Liberty indicated that it was no longer recommending the reduction in question. Liberty stated that, because the net effect of price changes in heavy fuel oil (HFO), petcoke and coal, when the currently uncommitted fuel is eventually acquired, is uncertain and cannot be quantified at this time, it believes that the change should be treated as a wash. During cross-examination, Mr. Grant asked Liberty to confirm that "... you are comfortable with the concept that whatever savings will be made on the remaining uncommitted solid fuel, that will be offset by

[60] Exhibit N-97, p. 8

[61] Exhibit N-97, p. 11

[62] Exhibit N-214

increases in prices in HFO over budget". Liberty replied that "... We're comfortable that the net of the changes on all solid fuel and HFO would be an offset to current budget."[63]

3.8.3 Findings

[239] The Board observes that Undertaking U-29, filed by NSPI on November 28, 2005, provided an estimate of the effects of commitments to date in HFO, coal, and petcoke, as compared with the forecast in the original filing. Undertaking U-29 indicated that reductions in cost were realized on the coal and petcoke commitments entered into since the application was filed, while increases were experienced in the cost of HFO. As a result of these changes, NSPI asserted its total fuel cost has increased from the $478.9 million reflected in the filing, to $481.7 million, an increase of $2.8 million to November 28, 2005, the date of the Undertaking.

[240] After considering the evidence in relation to this matter, including the issue of volume options, the Board is not persuaded that there should be any adjustment to the

[63] Transcript, November 29, 2005, p. 2338

coal, petcoke, and HFO portions of the fuel budget, and agrees with Liberty's recommendation in this respect.

[241] Accordingly, the Board sets NSPI's fuel budget for the test year as follows:

Total Estimated Fuel Costs as per original filing	$478,900,000
Less Additional Natural Gas Resale Benefit determined by Board	(35,800,000)
Less PTMT Disallowance	(2,300,000)
Less Imprudence Disallowance	(15,700,000)
Approved Fuel Budget	$425,100,000

4.0 FINANCE

4.1 Return on Equity

[242] The capital to finance NSPI's generating, transmission, distribution and other assets comes from equity investors, as well as through the issuance of debt. The return on equity (the "ROE") earned by the Company represents the income earned by the equity investors. In the 2005 rate decision, the Board approved an ROE at 9.55% for the purpose of setting rates, with an earnings range set at 9.30% to 9.80%. While NSPI contends that this ROE is very close to that granted elsewhere in Canada for utilities which do not face comparable fuel and generation risks borne by the Company, NSPI is not proposing any change with respect to ROE in the present case, considering the recent decision by the Board on this issue.

[243] The proposed ROE was not the subject of comment by any of the intervenors at the hearing. While the NDP Caucus raised the issue of an appropriate ROE in its Closing Submission, there was no evidence to support a change in the ROE.

4.1.1 Findings

[244] The Board is satisfied that the ROE should be maintained at 9.55% for the purpose of setting rates, with the earnings range set at 9.30% to 9.80%.

4.2 Capital Structure

[245] In the 2005 rate decision, the Board also approved an increase in the common equity ratio for ratemaking purposes from 35% to 37.5%. This increase, which was supported by a majority of the intervenors in the 2005 rate case, was considered desirable by the Board to strengthen the Company's balance sheet in the current economic climate and also reflective of Emera's common equity ratio. For the 2006 test year, NSPI proposes that the common equity ratio for ratemaking purposes continue at 37.5%. The proposed common equity ratio was not the subject of comment by any of the intervenors at the hearing.

4.2.1 Findings

[246] The Board is satisfied that the common equity ratio for ratemaking purposes should be maintained at 37.5%.

5.0 RATE BASE

5.1 Overview

[247] In the 2005 rate decision, the Board noted a consensus among the intervenors that NSPI should change the way it calculates the rate of return to a return on rate base methodology. Accordingly, the Board approved a change to NSPI's long-standing practice of calculating its return on the equity portion of total capitalization and directed that NSPI use a return on rate base methodology for its next rate application. The Board further directed NSPI to file in its next rate application all information and explanations necessary to enable the Board and intervenors to clearly understand the basis of NSPI's calculations. The Board noted that NSPI should also reconcile its calculations of return on rate base to calculations using the return on equity methodology.

[248] The main issue which arose from the adoption of the rate base methodology was calculating the cash working capital ("CWC") allowance. Kathleen C. McShane, Senior Vice-President of Foster Associates, Inc., filed evidence and testified at the hearing on behalf of NSPI with respect to the determination of the CWC allowance. In NSPI's Rebuttal Evidence, she defined CWC allowance and how it is typically determined:

> The cash working capital allowance reflects the average amount of capital provided by investors above and beyond investments in plant and other separately identified rate base items, including other components of working capital (e.g., materials and inventory), that bridges the gap between the time expenditures are made to provide service and the time payment is received for that service. The rate base in its entirety represents the amount of investor-supplied capital required to provide service; the cash working capital component needs to be compatible with the determination of the other elements of the rate base.
>
> The cash working capital allowance is typically measured using a lead/lag study. The purpose of a lead/lag study is to provide a measure of the amount of investor funds used in sustaining utility operations from the time expenditures are made until the time payment is received.

> A lead/lag study recognizes that the utility renders service prior to receipt of payment from ratepayers, but that there is generally also a delay in payment for goods and services acquired by the utility. The lead/lag study analyzes transactions throughout the year to determine the net lag days between the date service is rendered and payment is received (revenue lag), and the time lag between the time expenditures are recorded and payment is made for such expenditures (expense or payment lag). In some instances, revenue may be received prior to payment for the related expense. In that case, there will be a net lead (or alternatively, a negative net lag).
>
> (NSPI, Rebuttal Evidence, Exhibit N-153, pp. 58-59)

[249] NSPI projects that it will require $29.4 million to be included in the rate base for CWC allowance in the 2006 test year.[64]

[250] Ms. McShane described NSPI's methodology of determining its CWC allowance as an approach focusing on the operating or "above-the-line" expenses of NSPI. She states that this approach excludes non-cash expenses (e.g., depreciation) and return on capital.[65]

[251] Several intervenors have raised issues with the calculation of the CWC allowance. Specifically, they have questioned NSPI's exclusion of items like HST, securitized accounts receivable, interest expense and preferred dividends. They have also challenged some of the lead/lag assumptions made by NSPI. Further, at least one intervenor has questioned NSPI's reconciliation of its return on capitalization versus its return on rate base, as it believes the result should be the same in each case. These issues are examined, in turn, below.

---

[64]NSPI Application, Exhibit N-2, Appendix A, Table 17

[65]NSPI Rebuttal Evidence, Exhibit N-153, p. 61

5.2 HST

5.2.1 Submissions - NSPI

[252] In its original application, NSPI did not include HST in its calculation of the allowance for CWC.[66]

[253] In his testimony, Greg Blunden, NSPI's General Manager of Finance, indicated that the Company's approach was to include only operating expenses and that it excluded items like HST and payroll taxes that may flow through their accounts. Stating that there are only a couple of days difference between the collection and remitting of HST, it was felt that the exclusion of HST would have no material impact upon the CWC requirement.[67]

[254] During questioning by Board counsel, Mr. Blunden was asked to calculate the impact of the HST upon CWC. In its response to Undertaking U-35, NSPI calculated the "possible impact" of the timing difference between the collection and remittance of net HST, concluding that it could reduce the cash operating working capital by $4.4 million for the 2006 test year. Multiplying this amount by the weighted average cost of capital (i.e., 8.21%), the total revenue requirement would be reduced by $400,000.[68]

[255] In its Closing Argument, NSPI confirmed that the revenue requirement would be reduced by $400,000 if the CWC were to be adjusted for the collection and remittance

[66]Exhibit N-2, Appendix A, Table 17

[67]Transcript, November 22, 2005, p. 1010

[68]NSPI, Undertaking U-35, Attachment 1

of HST. However, it added that if the rate base is to be adjusted in this fashion, then other adjustments to the rate base should also be made for items like the 2005 Q1 tax deferral and the increase in the long-term receivable.[69]

5.2.2 Submissions - Intervenors

[256] In his Direct Evidence, Mark Drazen, who appeared on behalf of Avon, submitted that HST should be included in the determination of CWC allowance.

[257] On the assumption that HST must be remitted within 30 days following the end of the month in which it is collected, Mr. Drazen determined that NSPI had use of the money for 45 days on average (15 days in the month of collection plus 30 days thereafter) or 12.3% of the year. Based on the net HST remitted in the amount of $75.7 million,[70] Mr. Drazen determined that the CWC allowance would be reduced by $9.3 million ($75.7 million x 12.3%).[71]

[258] While Avon acknowledged, in its Closing Submission, that Ms. McShane was not involved in NSPI's initial calculation of the CWC allowance, it noted that she did not identify HST for inclusion in the lead/lag study in her rebuttal testimony filed on behalf of NSPI.[72]

---

[69] NSPI, Redacted Closing Argument, p. 77

[70] Identified by NSPI in response to Avon IR-54, Attachment 1

[71] Drazen, Pre-filed Evidence, Exhibit N-95, p. 9

[72] Avon, Redacted Closing Submission, para. 131-133; McShane, Rebuttal Evidence, Exhibit N-153, p. 58

[259] Mr. Grant cross-examined Ms. McShane on the inclusion of HST during the hearing, challenging her on this issue relative to her pre-filed evidence in a recent Hydro Quebec rate hearing in which she identified HST as an appropriate item for inclusion in the CWC allowance. However, it was not identified in NSPI's application.[73] Further, she acknowledged that Newfoundland and Labrador Hydro, a client on whose behalf she testified during their 2001 rate application, included HST in its lead/lag study, reducing the CWC requirement for that utility.[74] She also agreed HST is typically included in lead/lag studies.[75]

5.2.3 Findings

[260] Based on its consideration of this matter, it appears that the issue to be determined by the Board relates to the extent of the HST's impact upon the CWC allowance, rather than a question of its exclusion from the CWC. While HST was not originally included by NSPI in the determination of its CWC requirement, it appears from the testimony of Mr. Blunden that its exclusion was related to the belief that it would not have a material impact upon the determination of the CWC requirement.[76]

[261] The Board concurs with Mr. Drazen that HST should be included in the determination of the CWC requirement. Inherent in this finding is a recognition that the

[73] Hydro Quebec Pre-filed Evidence, Exhibit N-173, p. 6; Transcript, November 22, 2005, p. 970

[74] Exhibit N-174, pp.4-5; Transcript, November 22, 2005, p. 973

[75] Transcript, November 22, 2005, p. 967

[76] Transcript, November 22, 2005, p. 1010

Company does have use of the money between the time it is collected from customers and the time it is ultimately remitted to government. This treatment of the HST also appears consistent with the treatment afforded to HST in other jurisdictions such as Quebec and Newfoundland and Labrador, as acknowledged by Ms. McShane in cross-examination.[77] Further, the Board notes Ms. McShane's testimony relating to Hydro Quebec to the effect that Hydro Quebec's methodology to determine cash working capital focuses on operating or "above-the-line" expenses.[78]

[262] Moving beyond the threshold of determining that HST is appropriately included in the CWC allowance, NSPI and Avon differ upon the magnitude of its impact. Using information provided by NSPI in response to Avon IR-54, Attachment 1, Mr. Drazen calculated the reduction of CWC allowance as being $9.3 million. NSPI, on the other hand, calculated the reduction of the CWC allowance as only $4.4 million, resulting in a reduction of the revenue requirement by $400,000.[79] The Board observes that NSPI did not cross-examine Mr. Drazen during the hearing with respect to his calculation of the HST's impact upon the CWC allowance. According to Mr. Blunden, the distinction between the two methodologies focuses on the revenue lag, i.e., Mr. Drazen assumed the HST is not remitted until after it is collected from customers, while NSPI undertook its analysis on the basis that HST remittances are triggered based on when customers are invoiced.[80]

---

[77]Transcript, November 22, 2005, p. 967

[78]Hydro Quebec Pre-filed Evidence, Exhibit N-173, p. 7

[79]NSPI Undertaking U-35

[80]Transcript, November 22, 2005, pp. 1009-1010; see also Avon IR-54

[263] Upon reviewing this matter, the Board notes that NSPI, in calculating the working capital impact of including an adjustment for the HST, based its calculations on the model employed by Newfoundland and Labrador Hydro. The model employed by NSPI calculates the payment lag for each type of the expenditures on which NSPI pays HST, as well as for the customer billing on which NSPI collects HST. The Board believes this is a realistic manner of calculating the HST impact on CWC and, accordingly, accepts NSPI's calculation of $400,000 as a reduction in the 2006 revenue requirement.

5.3 Interest Expense and Preferred Dividends

5.3.1 Submissions - NSPI

[264] On behalf of NSPI, Ms. McShane stated that interest expense and preferred dividends should not be included in the determination of CWC allowance. In her view, the determination of CWC should focus on operating or "above-the-line" expenses of NSPI, to the exclusion of non-cash expenses (e.g., depreciation) and operating income (i.e., return on capital). She submitted that any lead/lag study which includes interest expense must also include all sources of investor supplied funds, such as allowances for depreciation expense and return on equity. She stated that incorporating interest expense and preferred dividend payments into the CWC requires the adoption of a broad or "global" approach to measuring the full extent to which investors finance the revenue requirement of the Company. In such instances, she argued that leads and lags on all elements of the return of, and on, capital must be taken into account. In her submission, the inclusion of

interest and preferred dividend payments, to the exclusion of depreciation expense and common equity return, is equivalent to "cherry-picking", which results in an understatement of the actual CWC requirement.[81]

[265] In support of her position, Ms. McShane relies, in part, on the rejection of the "global" approach by other regulators in Canada, including the Régie de l'Énergie du Québec. She cites two of its decisions:

> In D-99-11 (Gaz Metro), the Régie concluded,
>
> > Following the analysis of the evidence submitted, the Régie is of the opinion that only the operating costs should be taken into account in the calculation of the working capital. According to the Régie, the global approach over-estimates the requirements by considering not only the cash flows related to the distribution service but by also taking into account the return on equity and retained earnings which advantages the shareholders. A lead-lag study, according to the global methodology, would increase significantly the cash working capital, without, however, assuring that such a result would accurately reflect reality. The Régie considers that it is preferable to limit the lead-lag study analysis to only the income statement items directly related to the service itself. Moreover, the Régie notes that few rulings have been issued on this subject up until now.
>
> In D-2001-55 (Gazifère), the Régie stated,
>
> > the Régie, in its decision, takes account of the conclusion of Bonbright to the effect that any method produces approximate results and that the objective is to determine an amount which is reasonable, without a degree of refinement that causes the costs to be higher than the associated benefits:
> >
> > > 'None of the methods for calculating the working capital allowance will produce a result that is precisely correct. The purpose of the calculation should be to arrive at an amount that is reasonable and contains no obvious defects, and which is not so time-consuming to compute that the cost exceeds the benefit.'
> >
> > The Régie accepts the distributor's demonstration that the depreciation expense is a valid element of the global method. Depreciation does not generate a cash expenditure; however, the recovery of the depreciation expense is delayed for the period of the revenue lag. Meanwhile, the

---

[81] McShane Pre-filed Evidence, NSPI Rebuttal Evidence, Exhibit N-153, p. 61

> investors continue to provide the funds for a certain portion of the depreciation expense.
>
> With regard to the inclusion of interest expense and dividends proposed by OC/ACEF, the Régie considers that these payments are made from funds that belong to the investors and arise from the manner of financing, which is taken into account in the capital structure. If one were to consider that the delay in the payment of interest and dividends constitutes a source of funds, it is also necessary, according to the Régie, to consider all of the other elements of the capital structure and thus ultimately to examine whether the global method is well-founded.
>
> The Régie considers that it would not be fair to order Gazifère to use the global method. This method introduces, according to the Régie, certain complexities that have not been fully studied.
>
> The Régie is of opinion that the evidence submitted is insufficient to justify such a fundamental change in the methodology used to calculate working capital. The current methodology having the advantage of having been tested, it is up to the intervenor OC/ACEF to demonstrate, in a convincing way, that the current method is no longer appropriate. In the opinion of the Régie, this demonstration was not made. The Régie considers that it would not be appropriate to adopt the methodology suggested by OC/ACEF.
>
> (NSPI Rebuttal Evidence, Exhibit N-153, pp.67-69)

[266] Ms. McShane noted that adoption of the “global” approach in NSPI’s case would increase its CWC requirement, primarily because the equity return is earned by common equity investors when the service is provided, but the collection of the return is delayed until payment is received from ratepayers (i.e., the net lag on the equity return would be equivalent to the revenue lag resulting from the collection of NSPI’s billings, which the Company states is 42 days).

[267] Ms. McShane testified that the Alberta Energy and Utilities Board has been using the “global” approach in the calculation of CWC allowance since 1988. Adopting NSPI’s figures with respect to revenue and expense lags, Ms. McShane estimated that

using the “global” approach would increase NSPI’s CWC allowance by as much as $13 million over its present estimate of $29.4 million.

[268] In cross-examination by Mr. Grant, Ms. McShane agreed that in the case of Newfoundland and Labrador Hydro, the utility adjusted its interest expense downward to account for the timing of payments on bonds.[82]

5.3.2 Submissions - Intervenors

[269] Both Mr. Drazen and James T. Selecky, of Brubaker & Associates, Inc., contend that interest expense and the payment of preferred dividends should be taken into account in the calculation of CWC allowance. They each noted that the Company collects revenues from its customer billings throughout the year, but the payments of interest occur as late as semi-annually, in the case of long-term bonds, and quarterly, in the case of preferred dividend payments. In both cases, they note that NSPI collects its revenues in advance of the time it is required to pay the interest and preferred dividends. Thus, in their view, these funds represent a source of working capital which should be taken into account in reducing the CWC requirement.[83]

[270] Mr. Drazen, when challenged on his methodology in cross-examination by René Gallant, Counsel for NSPI, noted that other utilities like Fortis BC and Centra Manitoba include interest expense and preferred dividend payments in their calculation of

[82]Transcript, November 22, 2005, pp. 977-979

[83]Drazen Pre-filed Evidence, Exhibit N-95, pp. 9-10; Selecky Pre-filed Evidence, Exhibit N-91, pp. 4-5

the CWC, to the exclusion of other elements such as depreciation and common equity return. He added that Ms. McShane identified these two utilities, in her pre-filed evidence, as adopting this methodology. Mr. Drazen also noted that in hearings involving Newfoundland and Labrador Hydro, the regulator approved a practice which takes into account the recovery of revenues from customers to pay interest, thereby reducing the cost of the utility's debt. While he acknowledged that this methodology is different than what he suggests, the final result, he stated, is exactly the same as that calculated using his proposed methodology.[84]

5.3.3 Findings

[271] With respect to this issue, NSPI submits that interest expense and the payment of preferred dividends should not be taken into account in the calculation of CWC allowance. Alternatively, in the event that the Board finds that these expense items should be included, Ms. McShane asserts that such a finding would require the Board to adopt the "global" approach, taking into account depreciation expense, as well as return on common equity. To do otherwise, she suggests, amounts to "cherry-picking" the items which will be included in the calculation.

[272] For Mr. Drazen and Mr. Selecky, the issue simply comes down to the fact that NSPI collects its revenue from customers before it is required to pay interest expense and

---

[84]Transcript, December 1, 2005, pp. 3189-3190

preferred dividend payments. In their view, NSPI's use of these funds in the intervening period effectively reduces its CWC requirement.

[273] In their submissions, Avon and SEB both submit that interest expense and preferred dividend payments should be taken into account in the determination of CWC allowance, but not depreciation expense or common equity return. Avon highlighted the distinction between these expenses as follows:

> 147. It is submitted that the global approach advocated by Ms. McShane does not accurately measure the Company's need for utilization of cash which is the function of the allowance for CWC. Depreciation is not a cash obligation of the company. For the payment of dividends on common equity there is a discretion on the part of the company with respect to the time and amount. Payments of preferred dividends, by contrast, are cash payments, the time and amount of which are subject to terms agreed to by investors. Similarly, interest payment upon debt is a cash payment required in accordance with the terms agreed to between the company and the holders of its debt.
>
> (Avon, Redacted Closing Submission, p. 32)

[274] While maintaining that the inclusion of interest expense and preferred dividend payments should not be considered without adopting the "global" approach, Ms. McShane acknowledged on cross-examination by George T.H. Cooper, Q.C., Counsel for SEB, that there is a distinction between these and other expenses included in the "global" approach, in that depreciation expense is not a cash obligation and that the payment of common equity return is subject to the discretion of the Company in terms of the timing and amount of dividends paid on common shares. Further, she acknowledged that revenue

collected by NSPI for payment of interest expense and preferred dividend payments do contribute to the cash NSPI has available to it to earn a return.[85]

[275] The Board has considered the evidence of Mr. Drazen and Mr. Selecky that interest expense and preferred dividends should be taken into account in calculating the CWC. The Board understands the reasons why they argue in favour of their inclusion in the CWC calculations. However, the Board notes that other regulators have considered this matter, and have disagreed with the inclusion of interest and preferred dividends in the calculation of CWC.

[276] Ms. McShane, in NSPI's Rebuttal Evidence of November 7, 2005, quoted from a National Energy Board decision of August 1986, which dealt with this matter:

> With regard to the payment of interest on long-term debt and preferred share dividends, the Board is of the opinion that these items, which are not a function of operations but of the financing of the Company, are components of the rate of return. Furthermore, they relate to contractual obligations entered into between Westcoast's shareholders and the Company's other investors. As such, they do not involve the day-to-day operations of the Company, and do not properly belong in the calculation of the cash working capital allowance. (National Energy Board, Reasons for Decision, Westcoast Transmission Company Limited, August 1986)
>
> (Exhibit N-153, p. 70)

[277] The NEB, in its decision, was dealing with whether interest expenses and preferred dividends ought to be included in the calculation of the cash working capital allowance. It states that cash working capital allowance is intended to measure the cash requirement for the day-to-day operations of the Company. The NEB was of the view that interest on long-term debt and preferred share dividends are not a function of the day-to-

[85] Transcript, November 22, 2005, pp. 931-935

day operations, and thus do not belong in the calculation of cash working capital. Rather, they are a function of the financing of the Company, and thus are components of the rate of return. In addition, according to the NEB, these items relate to contractual obligations entered into between the Company's shareholders and other investors.

[278] Ms. McShane, in Exhibit N-153, also set out the views of the Régie de l'Energie du Québec, as contained in two cases concerning the same matter. The views of the Régie can be summed up with the following quote:

> With regard to the inclusion of interest expense and dividends proposed by OC/ACEF, the Regie considers that these payments are made from funds that belong to the investors and arise from the manner of financing, which is taken into account in the capital structure. If one were to consider that the delay in the payment of interest and dividends constitutes a source of funds, it is also necessary, according to the Régie, to consider all of the other elements of the capital structure and thus ultimately to examine whether the global method is well-founded.
>
> The Régie considers that it would not be fair to order Gazifère to use the global method. This method introduces, according to the Régie, certain complexities that have not been fully studied.
>
> (Exhibit N-153, pp. 68-69)

[279] Ms. McShane makes the case that if the interest on long-term debt and the preferred dividends are to be included in the calculation of the CWC, then the calculation must also include depreciation expense and return on equity:

> ... If the cash working capital allowance is to be interpreted in the broad or "global" sense of measuring the full extent to which investors have financed the revenue requirement, leads and lags on all elements of the return of and on capital must be taken into account. Inclusion of interest payments alone, to the exclusion of depreciation expense and common equity return, amounts to "cherry-picking", and will understate the cash working capital requirement....
>
> (Exhibit N-153, p. 61)

[280] According to Ms. McShane, were the CWC calculations to include depreciation and all return on capital items, there would be an increase in the CWC of $6.60 million, rather than a decrease as proposed by Mr. Drazen and Mr. Selecky.

[281] Based on the evidence, the Board is not persuaded that the methods advocated by Mr. Drazen and Mr. Selecky should be adopted for purposes of calculating CWC in this rate case. The Board agrees with the observation of the Régie that "... this method introduces ... certain complexities that have not been fully studied." For the Board to move in that direction, a more detailed consideration of the "global" approach would be required. Accordingly, the Board accepts the recommendation of Ms. McShane concerning this matter.

[282] At a future rate hearing, should additional evidence be presented concerning the "global" approach and the inclusion of interest expenses and preferred dividends in the calculation of CWC, the Board would be willing to reconsider the matter.

5.4 Securitization of Accounts Receivable

5.4.1 Submissions - NSPI

[283] NSPI maintains that the funds received from its accounts receivable securitization program should not be taken into account in determining the Company's CWC allowance.

[284] Under this program, NSPI sells a "co-ownership interest" in a portion of its accounts receivable to a trust. The trust, in turn, pledges its co-ownership interest as

security in order to obtain funds from investors, which the trust lends to NSPI. NSPI pays securitization fees to the trust in an amount equivalent to interest charges on a conventional short-term loan (i.e., $2.4 million for the 2006 test year[86]). The trust pays a portion of the securitization fees back to the investors, who are ultimately repaid their original loan by NSPI, through the trust.

[285] Accounting rules allow the securitization transaction to be treated as a sale of receivables. For reporting purposes, the affected accounts receivable are removed from the balance sheet, along with the associated short-term debt, which is paid from the proceeds of the accounts receivable transferred to the trust.[87]

[286] Ms. McShane submits that customers of NSPI benefit in two ways from this arrangement. First, by reducing the amount of capital on NSPI's balance sheet, the Company reduces its liability for Large Corporation Tax. This tax saving is reflected in the revenue requirement and passed along to NSPI's customers. Second, the securitization allows NSPI to lower the costs of its short-term financing, because the security for the loan is comprised of relatively liquid assets.[88] The Board infers that the reduced costs of the short-term financing results in lower interest expenses for NSPI.

[287] In Ms. McShane's opinion, the securitization is substantively the same as using accounts receivable as collateral for a short-term credit facility. In obtaining short-term financing in this fashion, she maintains that NSPI has not reduced its revenue lag

[86]NSPI Application, Exhibit N-2, Appendix A, Table 10

[87]NSPI, Rebuttal Evidence, Exhibit N-153, p. 79

[88]McShane, Pre-filed Evidence, NSPI Rebuttal Evidence, Exhibit N-153, p. 73

and, thus, not reduced its CWC allowance. In her view, the fundamental difficulty with the intervenors' suggestion that the securitization reduces the CWC allowance is described as follows:

> To claim that the accounts receivable securitization program reduces NSPI's revenue lag is tantamount to claiming that any utility whose short-term credit facilities are secured by accounts receivable has reduced its revenue lag. Utilities require short-term debt because there is a lag between rendering service and receiving payment. The short-term debt is the investor-financing that bridges the gap. It is a circular argument to then claim that because the utility has obtained the short-term debt to bridge the gap, the lag between provision of service and receipt of revenues has been reduced. To claim that the revenue lag is reduced by the securitization program (thus reducing the cash working capital requirement), is equivalent to claiming that NSPI does not need the short-term debt, a clearly erroneous conclusion.
>
> (NSPI, Rebuttal Evidence, Exhibit N-153, p. 73)

[288] During its testimony at the hearing, the Finance Panel reiterated NSPI's position that the funds obtained from the securitization program should not be included in the CWC allowance. Ms. Zeda Redden, NSPI's General Manager, Finance, testified that the program merely replaces the debt owed to one group of investors (i.e., short-term debt holders) with new debt owed to the trust. Thus, in her view, the transaction does not affect CWC. She added that NSPI still retains all of the risk with respect to the collection of the accounts receivable which have been securitized. Further, she noted that financial institutions such as banks and rating agencies consider the securitization to be outstanding debt, which is taken into account in conducting their credit assessments.[89]

---

[89]Transcript, November 22, 2005, pp. 936-937; NSPI Rebuttal Evidence, Exhibit N-153, p. 80

5.4.2 Submissions - Intervenors

[289] Both Mr. Drazen and Mr. Selecky are of the view that the securitization program should be taken into account in the calculation of NSPI's CWC requirement. Both witnesses noted in their Direct Evidence that NSPI expects to securitize about $53.75 million of accounts receivable per month,[90] representing approximately 60% of its monthly revenues.[91] Further, they note that NSPI's customers are charged the projected annual cost of $2.4 million to implement the securitization program. This amount is imputed as interest expense and included in the Company's revenue requirement.

[290] Mr. Selecky suggests that the monies received from the securitization program effectively reduces NSPI's CWC requirement:

> ... the securitization of the receivables provides the Company with cash that reduces its short-term debt. Therefore, NSPI has cash available quicker than it otherwise would. The availability of this cash reduces the revenue lag days utilized to calculate its cash working capital requirement.
>
> (Selecky Direct Evidence, Exhibit N-91, p. 7)

[291] Both Mr. Selecky and Mr. Drazen accounted for the impact of the securitization program by reducing the revenue lag to be used in the calculation of the CWC. Mr. Selecky estimated that NSPI would experience a 10 day lag in receiving the securitized funds, resulting in a weighted revenue lag of 22.8 days.[92] In the absence of information from NSPI with respect to the timing of receipt of monies from the securitization

---

[90] SEB IR-213, Attachment 1

[91] Drazen Pre-filed Evidence, Exhibit N-95, p. 11; Selecky Pre-filed Evidence, Exhibit N-91, p. 7

[92] Selecky Pre-filed Evidence, Exhibit N-91, p. 8

program, Mr. Drazen assumed that the Company received the monies immediately upon request, resulting in an average revenue lag of 19.2 days.[93] Both Mr. Drazen and Mr. Selecky then incorporated the revised revenue lag into their calculation of the CWC allowance (see Appendix C).

[292] The Board observes that the significant decrease in the revenue lag calculated by both Mr. Drazen and Mr. Selecky effectively results in a negative CWC requirement, albeit in varying degrees because of the different assumptions made by both witnesses with respect to other expense lead/lag items discussed elsewhere. Mr. Drazen indicated that this caused him no concern since it is simply a reflection that the Company's cash flow is such that revenues are collected before the monies have to be paid out. He described this as "money in the bank", stating that it is a source of financing for the Company. He noted that other utilities have shown a negative CWC in their filings.[94]

[293] In cross-examination by Mr. Gallant, Mr. Drazen and Mr. Selecky each acknowledged that the securitization of accounts receivable by a company is different than the practice of "factoring" (i.e., the sale of) receivables. They agreed that the latter results in the creation of revenue from the sale of a future revenue stream, while securitization results in the creation of debt. They were also unable to identify any other jurisdiction where securitization, as opposed to "factoring", is approved by regulators.[95]

---

[93]Drazen Pre-filed Evidence, Exhibit N-95, p.12

[94]Drazen Pre-filed Evidence, Exhibit N-95, p.13

[95]Transcript, December 1, 2005, pp. 3193-3194 (Drazen); Transcript, December 2, 2005, pp. 3319-3320 (Selecky)

5.4.3 Findings

[294] The Board has considered the respective submissions relating to the treatment to be afforded the securitization of accounts receivable in the determination of CWC allowance. In this regard, the Board reviewed the evidence of Ms. McShane, Mr. Drazen and Mr. Selecky, along with the submissions of the parties.

[295] The Board accepts the evidence of Ms. McShane that the securitization transaction is substantively similar in nature to a utility that pledges its accounts receivable as collateral to obtain a short-term credit facility. In effect, the transaction simply substitutes the debt owed by NSPI to one group (i.e., short-term bond holders) by debt owed to another group (i.e., the trust). Securitization is distinct from a sale or "factoring" of receivables because, under the securitization program, NSPI continues to bear the risk of ultimately collecting the accounts receivable and the short-term debt must be repaid. No debt is issued under 'factoring", which instead produces revenue from the sale of a future revenue stream. The Board concludes that the securitization program does not reduce NSPI's revenue lag and, accordingly, the transactions should have no impact on the CWC allowance requirement.

[296] The Board notes that the transactions benefit NSPI's customers through reduced Large Corporation Tax and also, the Board infers, through lower financing charges[96].

---

[96]NSPI reports the securitization fees as deductions to Other Revenues (Exhibit N-2, Appendix A, Table 1

5.5 Other Lead/Lag Assumptions

5.5.1 Submissions - NSPI

[297] NSPI states in its application that this marks the first opportunity in some time for the Company to carry out a lead/lag study, noting that the amount of CWC was not relevant to the setting of rates based on the capitalization methodology previously applied by the Board. NSPI submits that it has undertaken a rigorous approach to the determination of CWC in this rate application.[97]

[298] The Company asserts that its lead/lag assumptions are reasonable, submitting that a CWC allowance of $29.4 million should be included in the rate base.

[299] Following the conclusion of the hearing, NSPI raised a further issue with respect to the calculation of the rate base, asserting that during the course of the hearing it became apparent, in NSPI's view, that the 2006 rate base is understated by $30.0 million due to the exclusion of the 2005 Q1 tax deferral and the potential increase of the long-term receivable associated with the gas contract achieved as a result of the November 16, 2005 settlement. It submits that if the rate base is to be adjusted as requested by the intervenors, then adjustments to the 2005 Q1 tax deferral and the long-term receivable must also be taken into account, increasing the revenue requirement by approximately $2.0 million.[98]

---

[97]NSPI Rebuttal Evidence, Exhibit N-153, p. 83

[98]NSPI Redacted Closing Argument, p. 71 and p. 77

5.5.2 Submissions - Intervenors

[300] In evidence filed on behalf of Avon, Mr. Drazen challenges some of the lead/lag assumptions made by NSPI in the determination of its CWC requirement. A table showing a summary of Mr. Drazen's conclusions respecting lead/lag assumptions, along with those of NSPI and Mr. Selecky, is contained in Appendix C to this decision. His determination of NSPI's CWC requirement for the 2006 test year is negative $54.8 million. Using the same methodology to calculate the 2005 CWC requirement, he averaged the two figures at negative $51.1 million, compared to NSPI's claimed average of positive $29.4 million.

[301] In addition to Mr. Drazen's inclusion of the HST, the securitization of accounts receivable, as well as interest and preferred dividends in the calculation of the CWC, which have already been discussed, part of the difference is accounted for by differing lead/lag assumptions. In his Direct Evidence, Mr. Drazen indicated that NSPI shows a longer revenue lag and shorter expense lags than it did in the 2005 rate case. He notes that these two factors combine to increase the net lag in recovery, resulting in a larger CWC requirement.[99] NSPI's lag assumptions for the 2005 and 2006 rate case, along with the estimates of Mr. Drazen and Mr. Selecky for the 2006 test year, are contained in the following Table which was compiled by the Board[100]:

---

[99]Drazen Pre-filed Evidence, Exhibit N-95, pp. 7-8

[100]Drazen Pre-filed Evidence, Exhibit N-95, p. 7 and p. 13

PROPOSED REVENUE AND EXPENSE LAGS				
	2005 Rate Case	2006 Rate Case	Drazen 2006	Selecky 2006
Revenue - monthly	31.0 days	36.0 days	-	-
- bi-monthly	53.0	53.0	-	-
Weighted Average	42.0	42.0	38.9 days	42.0
Labour	21.0	15.0	21.0	15.0
Non-labour operating	50.0	45.0	50.0	45.0
Fuel & purchased power	29.4	30.4	29.5	30.0
Grants in lieu of taxes	**	(91.0)	(91.0)	(91.0)
Income taxes	**	30.0	53.0	30.0
** Not included in study				

[302] Backing out the impact of the securitization program, which the Board has concluded should not be taken into account in determinating the CWC allowance, Mr. Drazen's projected revenue lag should be adjusted to 38.9 days, rather than the 19.2 days contained in his Direct Evidence. In support of this conclusion respecting 38.9 days, Mr. Drazen noted that NSPI revised its 50/50 split of monthly and bi-monthly billings (which produces an average lag of 42 days) to a 64/36[101] split (which produces a weighted average of 38.9 days).[102]

[303] Further, in Mr. Drazen's opinion, NSPI has not explained the reasons for reducing most of the expense lags from those suggested by NSPI in the 2005 rate case, noting that the expense lag relating to fuel and purchased power is the only expense lag

[101]NSPI Application, Exhibit N-2, Appendix A, Table 17, lines 15-26

[102]Drazen Pre-filed Evidence, Exhibit N-95, p. 11

which has increased, albeit by a marginal amount. He recommends that the expense lags remain at the 2005 levels.

[304] With respect to NSPI's inclusion of income taxes and grants in lieu of taxes in the CWC calculation, Mr. Drazen stated that this is consistent with his recommendation during the last Rate hearing. He also noted that the average expense lag of negative 91 days for grants in lieu of taxes is virtually identical to the number recommended by him in last year's rate case. However, with respect to income taxes, Mr. Drazen asserts that the average lag should be 53 days rather than the 30 days estimated by NSPI. In support of this submission, Mr. Drazen refers to Avon IR-48(f), Attachment 1, in the 2005 rate case, which outlined that 83% of income taxes are paid monthly, with the balance of 17% being paid the following February. While he acknowledges that the ultimate amount paid depends on the Company's performance, he states that an iterative process is required to determine the actual amount to be paid for income taxes.[103]

[305] Mr. Drazen also suggests that other sources of working capital may include a reserve for bad debts and the amortization of deferred financing charges (defeasance costs). However, he indicated that NSPI had not provided sufficient information to assess these two other potential sources of working capital.[104]

---

[103]Drazen Pre-filed Evidence, Exhibit N-95, p. 8

[104]Drazen Pre-filed Evidence, Exhibit N-95, p. 14

[306] In support of his assertion that NSPI's stated rate base is overstated, Mr. Drazen compiled an analysis of NSPI's rate base, comparing the amounts shown in the 2005 and 2006 rate applications.

[307] With respect to the revenue lag, Mr. Selecky adopted the 42 day lag estimated by NSPI and deducted therefrom a number of days to account for the securitization program, resulting in a weighted revenue lag of 22.8 days. Given the Board's exclusion of the securitization program from the determination of CWC, the Board observes that Mr. Selecky agreed, at least implicitly, with NSPI's 42 day revenue lag.

5.5.3 Findings

[308] The 2006 test year marks the first time that the determination of CWC allowance is relevant to the setting of rates. Prior to this point, CWC was not a factor in establishing rates under the capitalization methodology. However, it is a component of the rate base approach to be followed in this application.

[309] The Board is mindful of Mr. Drazen's observation that, compared to other rate base items, CWC is one of the most difficult to determine because it is not tied to a specific expenditure.[105] As noted by Mr. Blunden in his testimony, the determination of CWC is merely intended to serve as a proxy for actual working capital, which fluctuates throughout the year. He stated that, with the exception of CWC, all other items in the rate base can

---

[105] Drazen Pre-filed Evidence, Exhibit N-95, p. 5

be traced back to the Company's external audited financial statements.[106] Against this backdrop, the Board considers it important that this topic be broached with some caution.

[310] Four issues arise from the evidence and the submissions with respect to the lead/lag assumptions for the determination of the CWC allowance: 1) the determination of the appropriate revenue lag (42 days versus 38.9 days); 2) the appropriate expense lag for income taxes (30 days versus 53 days); 3) whether the other expense lags should be set at the levels estimated by NSPI during the 2005 rate case[107] or at the new estimated levels; and 4) whether other potential sources of CWC should be considered.

[311] Removing the impact of the securitization program upon the revenue lag, Mr. Drazen calculated 38.9 days for the revenue lag, compared to the 42 days adopted by NSPI and, without discussion of the point, by Mr. Selecky. Mr. Drazen used information provided by NSPI to calculate a weighted average of 38.9 days. He noted that the Company confirmed, during last year's rate hearing, that the correct split between monthly and bi-monthly billings was 50/50, yielding an average lag of 42 days. However, in the present rate application, NSPI revised the monthly/bi-monthly split to 64/36,[108] but maintained the 42 day lag. Mr. Drazen indicated that this revised split reduces the weighted average from 42 days to 38.9 days.

[312] NSPI provided no evidence to explain why revising its split of monthly and bi-monthly billings from 50/50 to 64/36 would not alter the weighted average of 42 days, nor

---

[106] Transcript, November 22, 2005, pp. 946-947

[107] Undertaking U-34 (2005 Rate application SEB IR-222)

[108] NSPI Application, Exhibit N-2, Table 17, lines 15-26

did it cross-examine Mr. Drazen on his calculation. Accordingly, the Board accepts Mr. Drazen's calculation of the revenue lag as being 38.9 days.

[313] Similarly, Mr. Drazen referred to Avon IR-48(f), Attachment 1, in the 2005 rate case, in determining that the average lag for income taxes should be 53 days rather than the 30 days estimated by NSPI. That IR response noted that 83% of income taxes are paid monthly, with the balance of 17% being paid the following February. He acknowledged that the ultimate amount paid for income taxes depends on the Company's performance and more information would be required to determine the actual timing for the payment of income taxes. NSPI did not provide any evidence during this application to revise its answer to last year's response to Avon IR-48(f) (even though Mr. Drazen made specific reference to it in his pre-filed evidence), nor did counsel for NSPI cross-examine Mr. Drazen on the point. In the absence of further evidence on this issue, the Board accepts Mr. Drazen's evidence that the expense lag with respect to income taxes should be 53 days rather than 30 days.

[314] In the present application, NSPI has reduced the expense lags for labour, non-labour and fuel from those it provided during the 2005 rate case. Mr. Drazen indicates that the expense lags should remain as described by NSPI during the 2005 rate case until further information is provided. He states that the decreases in these expense lags were not explained by NSPI. The Board concurs with Mr. Drazen.

[315] Based on the above findings, the CWC requirement would be $12.25 million (averaged with 2005 F). The Board's conclusions with respect to the determination of NSPI's CWC allowance are summarized in the following Table:

SUMMARY OF BOARD FINDINGS 2006 Cash Working Capital Requirement (Dollars in Millions)					
Category	**Lag Days (a)**	**Net Lag Days (b) [38.9 days - (a)]**	**% of Year (c) [(b)/365]**	**Annual Cost (d)**	**CWC [(c) x (d)]**
Revenue lag	38.9				
Labour	21	17.9	4.90%	$119.3	5.85
Non-labour operating	50	(11.1)	(3.04)	90.5	(2.75)
Fuel & purchased power	29.4	9.5	2.60	479.0*	12.45
Grants in lieu of taxes	(91)	129.9	35.59	32.6	11.60
Income taxes	53	(14.1)	(3.86)	84.4	(3.26)
HST					(4.4)
Total					**19.49**
Less customer deposits					(7.0)
CWC requirement- 2006					**$12.5**
Note: 2005 CWC was calculated at $12.0; Average is **$12.25**					

*$479.0 million is the fuel budget in original filing

[316] The Board notes the comments of Mr. Drazen that there may be other potential sources of CWC such as a reserve for bad debts and the amortization of deferred financing charges (defeasance costs). The Board reiterates that this rate case provided the first occasion to conduct a meaningful review of the Company's CWC requirement. The Board is not prepared to make any further adjustment based on other potential sources of CWC at this time, but will continue to monitor this issue in subsequent rate hearings.

5.6 Total Rate Base

[317] NSPI has requested that its Average Regulated Rate Base for 2006 be set at $2.840 billion. Of that amount, $29.4 million is the CWC allowance. The Board has reduced the CWC allowance to $12.25 million which has the effect of reducing the rate base.

[318] The only other adjustment to rate base which appears to be justified on the evidence is to account for the increase in the long-term receivable resulting from the settlement between NSPI and its natural gas supplier. The settlement was reached after the application was filed and provides significant benefits to customers in the form of reduced fuel costs. The Board therefore approves an increase in the average rate base of $14.45 million to reflect the difference between the long-term receivable estimated in the original rate filing and the amount shown in U-76, which takes the settlement into account. To the extent that the Board's decision to increase the estimated natural gas resale benefit for the test year has the effect of further increasing the long-term receivable, then the Board will allow recovery of a return to reflect that increase. NSPI should include the amount of such increase , if any, in its Compliance Filing.

[319] NSPI also requested that the Board include an amount in rate base for the 2005 Q1 tax deferral. However, the amount of the tax deferral has not been finally determined as yet and, in the Board's view, it would be premature to include any amount

in rate base at this time. Carrying charges on the deferred taxes can be dealt with after the amount is determined and the Company applies to the Board for their recovery.

6.0 OPERATING, MAINTENANCE AND GENERAL EXPENSES (OM&G)

6.1 Overview

[320] NSPI projects a $27.8 million increase in Operating, Maintenance and General (OM&G) costs for the 2006 test year compared to the 2005 Compliance Filing. The proposed increases for each of the four operating groups are set out in the following Table compiled by the Board, based on information set out in NSPI's application[109]:

OM&G COSTS - Proposed increases (Dollars in Millions)			
	2005C	**2005F**	**2006**
Power Production	$66.0 M	$70.4 M	$75.3 M
Customer Operations	65.3 M	67.6 M	77.0 M
Corporate Support	37.1 M	36.8 M	44.4 M
Corporate Adjustments	13.6 M	5.6 M	13.1 M
Total OM&G	**$182.0 M**	**$180.4 M**	**$209.8 M**

[321] In its application, NSPI states that the proposed increases reflect greater costs associated with its enhanced storm response and storm proofing of its transmission and distribution system, extra spending on power production, maintenance and operations, wage increases, higher pension expense, higher regulatory costs and increased investment in demand side management. These issues are discussed below.

---

[109] Exhibit N-1, pp. 70-105 and Exhibit N-2, Appendix B, p. 1

6.2 Power Production

6.2.1 Submissions - NSPI

[322] Power Production includes expenditures associated with the operation and maintenance of NSPI's generation facilities, as well as general costs for fuel procurement and management. For the test year 2006, NSPI proposes to increase these costs by $9.25 million over the 2005 Compliance Filing. The primary components of this proposed increase include $4.0 million for increased labour costs associated with the new union agreement and non-union labour increases, $1.8 million to implement new succession planning and apprentice programs, $3.2 million associated with maintenance and scheduled outages, $1.0 million associated with fuel procurement and management, and net savings of $0.8 million achieved from other related accounts.

[323] With respect to the maintenance of the Company's machinery and equipment associated with its generation fleet, NSPI states that it requires an additional $3.2 million comprised of maintenance and plant outage costs required to maintain and improve the reliability and availability of the generation assets. It notes that increased investment in maintenance is essential as the age and expected output of the generation facilities increase. NSPI further notes that OM&G costs will increase in the short to medium term until some point in the future when further capital must be invested in generation facilities, followed by a corresponding decrease in OM&G spending.[110]

[110] Exhibit N-1, p. 80 and 84

[324] In support of its projected $1.8 million increase for succession planning and apprenticeship programs, NSPI cites a demographic study indicating that the Company risks losing almost 50% of its trade workforce to retirement in the next five years. Accordingly, it proposes to implement succession planning to actively assess the Company's ability to sustain and replenish its critical organizational roles over time. It also proposes to develop apprenticeship programs to allow the transfer of skills and knowledge to NSPI's employee base, resulting, it asserts, in a stable workforce in future years.[111]

[325] During his testimony, Rick Janega, NSPI's General Manager, Power Production, stated that the costs of approximately 6 to 8 apprentice positions are currently reflected in rates. These apprentices are involved in multi-year training programs so they enter NSPI's workforce over a number of years. He testified that the proposed spending increase represents an increment of an additional nine auxiliary power engineers at a total annual cost of $750,000.[112] The remaining $1.05 million cost of the succession planning program relates to training and professional development of about 25 supervisors and managers at thermal generating stations and seven engineering staff in Generation Services.[113]

[326] As noted above in this decision, NSPI continues its efforts to improve its fuel procurement and management activities within the Company. The $1.0 million increase associated with this effort includes increased labour expenses associated with developing

---

[111]Exhibit N-1, p. 83

[112]Transcript, November 28, 2005, pp. 2282-2283; see also PWC IR-12

[113]PWC IR-12

the fuel team and hiring a senior coal expert, contracting services used to supplement fuel procurement and management, as well as consulting services relating to procurement strategy and fuel forecasting.[114]

6.2.2 Submissions - Intervenors

[327] In their submissions, none of the intervenors specifically addressed the proposed $9.25 million increase in Power Production costs. Further, the proposed increases under this category were not seriously challenged during cross-examination of NSPI witnesses.

6.2.3 Findings

[328] The Board has considered the evidence concerning the proposed increase for Power Production costs in the amount of $9.25 million. As noted above, this evidence was not seriously challenged during cross-examination of NSPI's witnesses, nor was it the specific topic of comment during submissions following the hearing.

[329] The largest component of the proposed increase in Power Production costs is directly attributable to increased labour costs resulting from a new contract between NSPI and its union representing 1,146 unionized employees, which was signed on December 2, 2004 and effective from April 1, 2003 until July 31, 2007. There is also a wage increase of 4.0% for all non-union labour. Similar union and non-union labour

---

[114] Exhibit N-1, p. 85

increases have been proposed across all OM&G operating groups, including Power Production, Customer Operations and Corporate Support. While projected labour increases respecting prior years were reflected in Corporate Adjustments, there has been a corresponding downward adjustment in the Corporate Adjustments account for the 2006 test year to account for the assignment of labour increases to the other OM&G categories.[115] The Board approves the labour increases proposed for Power Production in the amount of $4.0 million.

[330] Further, in the face of a demographic study which suggests that NSPI risks losing 50% of its trade workforce to retirement in the next five years, the Board determines that it is prudent, but not to the degree proposed by the Company, for NSPI to expand its succession planning and apprenticeship programs to ensure that valuable skills and knowledge can be transferred to a stable employee base and that the Company is able to sustain important organizational capacity into the future. The Board notes that the proposed increase to be included in the test year represents a marked increase in spending for this activity. In the view of the Board, an additional amount of $1.0 million per year (rather than $1.8 million) should adequately address such issues for the 2006 test year. NSPI's Compliance Filing shall reflect this reduction of $800,000.

[331] The Board also approves the proposed $3.2 million increase destined for maintenance and scheduled plant outage costs. While customers of NSPI benefit from these expenditures as NSPI maintains and improves the reliability and availability of its

[115] NSPI Application, Exhibit N-1, p.103

generation fleet, the customers also benefit from another result of these expenditures - NSPI is able to forego, in the short to medium term, significant capital investment in new generation facilities.

[332] Finally, the Board approves NSPI's proposed costs of $1.0 million associated with the implementation of its fuel procurement and management practices to comply with previous directions of the Board on this topic. In prior rate decisions, the Board has directed that NSPI make fundamental changes in its fuel procurement function. As discussed, NSPI's activities continue in furtherance of these directions. The $1.0 million cost increase approved by the Board will help ensure that NSPI achieves the lowest possible fuel costs, to the ultimate benefit of its customers.

6.3 Customer Operations

6.3.1 Submissions - NSPI

[333] Customer Operations includes expenditures associated with Regional Operations (transmission and distribution systems), Transmission and Distribution Assets (fleet, vegetation management), the Ragged Lake control centre, and Customer Service Administration (call centre and billing). For the test year 2006, NSPI proposes to increase these costs by $11.7 million over the 2005 Compliance Filing. The primary components of this proposed increase include $4.0 million with respect to enhanced storm response procedures, $5.2 million for increased vegetation management, $3.5 million for increased

labour costs, $1.3 million for improvements in customer service and to the call centre, and net savings of $2.3 million achieved from other related accounts.

[334] NSPI's proposed cost increase for enhanced storm response represents an increase from $1.4 million presently included in rates to $5.4 million allocated for storm response in the 2006 test year. The Company notes that its approach to storm response has significantly changed since events like Hurricane Juan and the November 2004 snow storm. As a result, NSPI has implemented the Emergency Services Restoration Plan ("ESRP"), which incorporates many of the recommendations suggested by the Board's consultant, John Sherrod. In its application, NSPI described its increased activities related to storm response:

> The key elements of the ESRP include a centralized and integrated decision-making team, more and earlier advance preparation, and a more timely deployment of resources in response to a major outage event. When NSPI determines that approaching, severe weather is likely to result in significant customer outages, it responds with the plan's methodical, advance preparation phase. This includes movement of NSPI and in-province contract resources. NSPI power line crews and field operation support staff are put on stand-by in staging areas around the province, based on where the Company believes they will be best positioned for rapid deployment during and immediately following the storm. Call Centre and head office support staff are placed in hotels connected to the NSPI Call Centre in downtown Halifax.
>
> Advance mobilization also includes contract power line and tree crews from within the province being placed in accommodations near areas that could be affected by outages. This advance deployment results in increased labor, meal, accommodation and fuel costs, which are incurred even if the storm does not result in customer outages.
>
> The ESRP provides the basis for the Company's response to anticipated significant outage events. Based on experience implementing the plan, NSPI has more effectively responded to significant outages. The experience gained through 2004 and 2005 indicate that the additional resources required to better track and prepare for severe storms, staff the call

> centre in advance of severe weather, and restore power more quickly to customers results in an incremental cost of $4 million annually.
>
> (Exhibit N-1, p. 89)

[335] In support of its request that a total of $5.4 million be included for storm response in the revenue requirement, NSPI indicates that it has averaged $5.3 million in storm response costs since 2002.[116] Further, NSPI indicates that it spent $5.8 million in 2004 in responding to storms[117], and it expects 2005 storm response costs to exceed the Company's original forecast of $5.0 million "by a wide margin"[118].

[336] In its Reply to Closing Argument, NSPI emphasizes that it is not appropriate to compare its present request for $5.4 million for 2006 with the $5.8 million figure expended in 2004, the year which saw significant weather events like White Juan and the November 2004 snow storm. It notes that the ESRP was not in effect until the end of that year. Thus, it asserts, the cost of increased storm response activities is not fully reflected in 2004 spending levels. In response to Consumer Advocate IR-36, the Company states:

> The Emergency Services Restoration Plan (ESRP) represents a material change in the nature of NSPI's storm response. Since the adoption of the ESRP (during 2004), significantly increased resources are now engaged earlier by NSPI in order to prepare for impending storms. When bad weather is forecast, NSPI makes a decision to deploy. The weather may or may not materialize or may not cause the amount of damage predicted. NSPI will bear the costs regardless. This includes activation of out-of-province line worker crews, overnight lodging for call centre personnel, re-deployment of NSPI line worker crews within the province and advance logistics activation. In this mode of operation, whether or not these resources are ultimately required, costs are incurred.
>
> (Consumer Advocate IR-36)

---

[116]Undertaking U-6

[117]NSPI Application, Exhibit N-1, p. 90

[118]NSPI Redacted Reply to Closing Argument, p. 13

[337] In their testimony, witnesses for NSPI explained that the ESRP sets out an appropriate response level depending on the projected severity of an impending storm. For planning purposes, storms are categorized according to anticipated severity with Level 1 storms being at the low end of the scale and Level 4 storms being the most serious. The ESRP assigns anticipated costs to the various storm levels, with the preparation for, and response to, Level 3 storms being the most costly. The preparation for a Level 3 storm is projected to cost $375,000, while an actual response to a Level 3 storm, if required in the end, is budgeted at $1,850,000. NSPI projects that storm response costs could range from a minimum of $3,725,000 to a maximum of $7,800,000, the difference being mainly attributable to the estimated occurrence of one Level 3 storm (on the low side) versus three Level 3 storms (on the high side).[119] For the 2006 test year, it projects $5.4 million for storm response. NSPI notes that, under the ESRP, no projected costs are assigned to Level 4 storms like White Juan and the November 2004 snow storm, which occur relatively rarely.

[338] In its application, NSPI also proposes to increase its spending on vegetation management from $5.2 million, currently reflected in rates, to $10.4 million for the 2006 test year. It asserts that the increased spending will focus on improving reliability on both the transmission and distribution systems, with $7.2 million forecasted to be spent on the distribution system, and the remaining $3.2 million allocated for spending on the

[119]Undertaking U-6

transmission system.[120] The proposed additional spending on the transmission system will, according to NSPI, allow for the treatment of an additional 700 hectares of the transmission corridor with a combination of mowing and herbicide applications, while the proposed investment on the distribution system will be directed towards increased reactive and proactive vegetation management. NSPI estimates that approximately 70% of the total spending on the distribution system will be allocated to rural feeders.[121] The Company states that its spending on vegetation management for the distribution system will be prioritized based on a Dollar per Avoided Customer Interruption basis.

[339] Improved customer service and communications are the basis on which NSPI seeks an additional investment of $1.3 million in 2006 rates. This figure is comprised of $500,000 in telephony technology improvements (including enhancements to and testing of the high volume call answer (“HVCA”) and interactive voice response (“IVR”) telephone systems), $300,000 for increasing quality assurance in the customer service area (e.g., process documentation, complaint investigations, and training programs to target specific areas identified through quality monitoring), and $500,000 for improved outage communication processes. This latter figure of $500,000 includes $150,000 on additional customer research to ensure outage processes are better matched to customer expectations and $350,000 on additional proactive communications to be conducted

[120] Undertaking U-9

[121] Undertaking U-9

annually to assist customers with storm preparedness for major weather events and to manage customer expectations regarding communication and restoration of power.[122]

6.3.2 Submissions - Intervenors and PWC

[340] A number of the intervenors opposed the proposed spending increase for vegetation management, noting that the proposal for 2006 effectively doubles the current budget for this activity. Many who opposed this increased expenditure submitted that NSPI had not shown the Board why this significant increase was justified. In its Closing Submission, the Consumer Advocate submitted:

> 50. One of the basic requirements to be met by NSPI in applying for an increase in rates is to show that each of the proposed expenditures is required and is the most economical or lowest expenditure that is needed. That requirement is particularly important when, as at present, significant rate increases are being sought at a time when both NSPI and its ratepayers are under financial pressure.
>
> 51. NSPI witnesses should expect that they will be required to justify proposed expense increases. That requirement is not satisfied merely by making the request for rate recovery of additional expenses. NSPI must demonstrate to the Board that it has conducted an internal evaluation and prioritization of its needs and that the requested expenses truly are necessary.
>
> (CA, Redacted Closing Submission, para. 50-51)

[341] In terms of the request for increased spending on vegetation management, the Consumer Advocate submitted that NSPI's justification for this increase is not demonstrated. The Consumer Advocate asserted that the Company provided very little information in its responses to Information Requests about the need for the requested level of increased spending on this activity and the benefits arising therefrom. In response to

---

[122]NSPI Application, Exhibit N-1, p. 91

Consumer Advocate IR-37, NSPI responded to the request for information on its vegetation management spending as follows:

> NSPI's vegetation management expenditures are aimed at reducing vegetation conditions which are creating reliability problems (reactive) and those which have the potential to create reliability problems (proactive).
>
> These expenditures are not different from past practices, rather it is for performing greater amounts of vegetation management, consistent with past practices to improve reliability.
>
> Expenditures would be prioritized to provide the best return on the investment. This prioritization takes into account safety concerns, the number of customers involved and the nature and extent of the reliability impact.
>
> ...
>
> NSPI is projecting this level of increased spending over the foreseeable future. No final decisions or commitments have been taken or made with respect to the projected additional expenditures. This work is dependent on monies being approved." [Emphasis added]
>
> (Consumer Advocate IR-37)

[342] The increase in vegetation management spending is also opposed by Avon, noting that the proposed total spending of $10.4 million on this activity is further suspect in light of the fact that NSPI has recently consolidated its vegetation management activities with one third party contractor, achieving 20% savings on its costs. Thus, factoring in this savings, the projected budget for the 2006 test year would, in effect, be 20% over the proposed $10.4 million amount.[123]

[343] Avon also notes that during the Board's Power Outage Review earlier in 2005, NSPI indicated that tree trimming and widening of easements were the most cost effective means of improving the reliability of the system, estimating that these activities would cost an additional $5 million.[124] Despite this estimate, Avon highlighted that the

---

[123]Transcript, November 14, 2005, pp. 195-196

[124]Transcript, November 14, 2005, pp. 189-191

additional $5.2 million now requested by NSPI only relates to tree trimming within existing easements rather than a widening of easements as proposed during the Power Outage Review.[125] Avon added that in NSPI's 69 KV Right-of-Way Widening Assessment filed with the Board in November 2005 pursuant to the Power Outage Review, NSPI described in detail its widening activities by corridor and kilometer, and estimated a budget of $500,000 for 2006 with respect to this work.[126] In contrast, Avon noted that no such plan was submitted during this rate hearing with respect to the proposed expenditures associated with vegetation management.

[344] Other intervenors also expressed concern about the extent of the increase sought by NSPI with respect to vegetation management. In its Closing Submission, the CME submits that the proposed increase "is too rich for what is required at the present time and it certainly is not timely with respect to the magnitude of the potential rate increased [sic] facing all Nova Scotians."[127] It urges the Board to ensure that any increased expenditures that it approves are indeed necessary and that the expenses are "matched" to the work that is actually required.

[345] HRM notes that the $10.4 million budget proposed for the 2006 test year is more than double the figure which was identified in the Capital Project Authorization filed by NSPI in 1999 and approved by the Board in 2001. It questions whether NSPI's request

---

[125]Avon, Redacted Closing Submission, p. 43

[126]Undertaking U-7

[127]CME, Redacted Closing Submission, p. 13

for this increase in vegetation management is driven by the Company's reduction of Power Line Technicians.[128]

[346] The Province, however, is supportive of NSPI's request for additional spending of $5.2 million on vegetation management. It states that these costs are to be incurred in response to concerns raised during the Power Outage Review following the November 2004 storm, noting NSPI's response to Consumer Advocate IR-37, in which the Company expected the additional expenditures for vegetation management to result in a 25% improvement in tree related customer interruptions and a 30% improvement in related customer hours of operation. Nevertheless, the Province asked the Board to maintain a "watchful eye" to ensure that these expenditures translate into improved reliability.[129]

[347] Similarly, SEB submits that the Board should carefully examine NSPI's reasons for this increased spending before approving the Company's request.

[348] In its Report, PWC notes the Company's assertion that the proposed vegetation management expenses will help contain, but not reduce, spending in OM&G. While NSPI provided an estimate of improved reliability factors resulting from the additional investment in vegetation management, PWC claims that the Company did not provide an estimate of the savings to be achieved with respect to reduced outage and repair costs in future years. Given that lack of information, PWC is unable to conclude whether the additional $5.2 million is reasonable.[130]

---

[128] HRM, Redacted Closing Submission, p. 17

[129] Province, Redacted Closing Submission, p. 25

[130] PWC, Pre-filed Evidence, Exhibit N-84, p. 21

[349] With respect to NSPI's request for an additional $1.3 million investment for improved customer service relating to telephony technology improvements, improved outage communication processes and increased quality assurance, the Province expressed concerns respecting the frequency of the expenses being sought by NSPI. In particular, it questioned whether a $250,000 stress test of the Company's telephony systems and monies for research on outage communications are necessary on an annual basis, given that NSPI's request, if approved, would effectively include these charges in rates. While acknowledging that this may not be an issue in 2006, the Province submitted that it should be considered in greater detail in future rate hearings.[131] PWC also concluded in its Report that certain of the expenses related to telephony technology appear to be one-time costs and recommended that they be included in the revenue requirement over several years.[132]

6.3.3 Findings

[350] For the 2006 test year, NSPI requests an additional $11.7 million in spending for Customer Operations.

[351] The Board approves the labour increases for Customer Operations in the amount of $3.5 million resulting from the new labour agreement discussed above.

---

[131] Province, Redacted Closing Submission, pp. 25-26

[132] PWC, Pre-filed Evidence, Exhibit N-84, p. 23

[352] NSPI proposed an additional increase of $500,000 respecting succession planning for power line technicians. For the reasons described above respecting Power Production succession planning, the Board reduces the proposed spending increase from $500,000 to $300,000.

[353] With respect to the costs related to enhanced storm response, none of the intervenors seriously questioned the necessity for increased spending in this area. NSPI's request would increase projected expenditures in this category from the current level of $1.4 million per year to a total of $5.4 million in 2006 rates.

[354] The Board is mindful that NSPI has greatly enhanced its storm response activities since major storm events like Hurricane Juan and the November 2004 storm.

[355] As witnesses for NSPI described in their testimony at the hearing, the Company implemented its ESRP by late 2004, providing for advance preparation and more timely deployment of resources in response to a major power outage event. As noted in its evidence, not all forecasted weather events ultimately occur as projected. However, under the ESRP, advance preparation and mobilization are required in all instances.

[356] The Board is satisfied that NSPI's storm preparedness and response under the ESRP represents a marked improvement in service by the Company over that which is currently reflected in rates. Further, the Board is satisfied that the $5.4 million is representative of the current level of expenditures being incurred by NSPI on an annual basis for these activities. While present rates provide for annual spending of $1.4 million with respect to storm response, NSPI has averaged $5.3 million per year in storm response

costs since 2002[133]. Based on the implementation of its ESRP, with its consequent impact on the degree of preparation which hinges on the predicted severity of upcoming storms, the Board finds that the proposed annual cost of $5.4 million for NSPI's storm response is reasonable and appropriate. Moreover, based upon the Board's findings in its Power Outage Review, it is clear that NSPI's customers desire NSPI to provide these enhanced storm response activities. The Board commends NSPI for its efforts in implementing the ESRP and it approves the additional $4.0 million directed to this initiative.

[357] While the issue of vegetation management also arose in the context of the Power Outage Review, there was a difference of opinion among the parties at the hearing with respect to the necessity for increased spending for such activities. NSPI asserts that increasing expenditures on vegetation management to $10.4 million will improve reliability on both the transmission and distribution systems, but some of the intervenors note that this proposed increase will double the level of vegetation management currently reflected in rates.

[358] Having reviewed the evidence, it appears that the primary concern of the intervenors relates to NSPI's failure to fully justify the extent of the spending commitment being requested for this activity. For instance, in its Closing Submission, Avon notes that, following the Board's direction in the Power Outage Review, NSPI filed its 69 KV Right-of-Way Widening Assessment Report outlining in detail its proposed activities for 2006 by

---

[133] Undertaking U-6

corridor and kilometer for widening the right-of-way along its transmission system .[134] In the report, NSPI provided a budget of $500,000 for its request, which the Board notes is intended to be a capital expenditure rather than an operating expense. While this particular $500,000 expenditure is not within the scope of this rate hearing, Avon identifies this report as the basis for its argument that NSPI failed to set out any similar detail with respect to its proposed increase for vegetation management from $5.2 million to $10.4 million.

[359] Likewise, the Consumer Advocate argues that NSPI's application is deficient in this regard. In its Closing Submission, the Consumer Advocate highlights the response provided by NSPI to CA IR-37, wherein the Company states that the increased spending is to be directed to conducting a greater level of vegetation management, consistent with past practices to improve reliability. In its IR response, NSPI adds that no final decisions or commitments have been taken with respect to the additional monies until they are approved by the Board.

[360] The Board observes that evidence to the same effect was given by witnesses for NSPI during the hearing. In cross-examination by Nancy G. Rubin, Counsel for Avon, Dan Muldoon, NSPI's General Manager of Customer Operations for Transmission and Distribution, confirmed that the Company had not compiled the details of the proposed spending:

> Q. Now, have the specifics of the plan been set out anywhere?

---

[134] Undertaking U-7

A. (Muldoon) In general we have put together elements of the plan to focus on more proactive reliability-based trimming, as well as sustainability. The specifics on span by span, feeder by feeder, we're currently gathering that data through our inspection programmes now to put the plan together.

Q. And when do you anticipate that plan will be complete?
A. (Muldoon) We'll have that plan complete probably by the end of this year for implementation in 2006.

Q. So you're looking for approval of it now prior to the time that we have a chance to review the plan and the budgets and the work being done.
A. (Muldoon) The plan that we have would be -- would fully support the 10.4 million dollar span that we have in our 2006 ---

Q. My question had to do with the timing of it. You're looking for approval of spending, 10.4 million dollar spending, prior to the time that we get to see the details of that spending.
A. (Muldoon) That is correct.

(Transcript, November 14, 2005, pp. 196-197)

[361] Mr. Muldoon was further asked on cross-examination by Mary Ellen Donovan, Counsel for HRM, about NSPI’s proposed spending target in 2006 of 70% for the distribution system and 30% for the transmission system:

Q. When you built that number, did you develop a document that showed the basis upon which you developed that number that could be provided in an undertaking here?
A. (Muldoon) I believe we could. I think we have those dollars targeted towards the large programme elements. We wouldn't have specific feeder by feeder or segment by segment or span by span detailed data as of yet, but in general we would have a good idea where that money is to be directed to meet our customers' changing needs and expectation around storm-proofing the system.

(Transcript, November 14, 2005, pp. 209-210)

[362] In her testimony, Nancy Tower, NSPI’s Chief Financial Officer, reasserted Mr. Muldoon’s view that the Company is confident about where the additional expenditures for vegetation management can be directed. In response to questioning by Mr. Merrick, she stated:

...

A. (Tower) Mr. Merrick, if I could, I was previously – before being Chief Financial Officer was Vice-President, Customer Operations, and had responsibility for vegetation management as part of that. One of the things the customers have told us and having sat through the storm hearing, it was clear to me, certainly, that customers wanted increased reliability in the province. We would have a list of every feeder in the province, perhaps even by feeder segment, numbers of customers on it and the reliability that that feeder is currently experiencing. We would also -- we would prioritize each year depending on how much vegetation spending we had, and we would cut the list at a certain point depending on where the spending was knowing how much reliability that would give us. To get more reliability, we had to do more spending. We know exactly where we would go on the next feeder, and the next feeder segment, and where in the province with the five million dollars ($5,000,000). So it's very clear to us and we have a plan that would probably span a number of years out.

(Transcript, December 1, 2005, pp. 3227-3228)

[363] In assessing the request for additional spending on vegetation management, it is instructive to consider the Board's findings in the recent Power Outage Review. In that decision, the Board accepted various consultants' findings about vegetation management and its impact upon NSPI's transmission and distribution systems.

[364] In relation to the transmission system, Liberty concluded that NSPI's transmission maintenance practices were substantially in accord with good North American utility practices and that these practices did not contribute to the structure failures or outages occurring during the November 2004 storm:

> [36] With regard to the maintenance and design of NSPI's transmission structures, Liberty essentially found no areas of concern:
>
>> Liberty assessed NSPI's design of the failed transmission structures and sky wires and found them in accordance with the appropriate standards. The wind and ice conditions in the November storm created loadings on the structures and sky wires that exceeded design loadings by at least 200 percent. Liberty also found that NSPI's transmission inspection program complies with good utility practices and that transmission maintenance substantially complies with good utility practices. Neither transmission system inspections nor maintenance contributed to the effects of the

> November storm. Liberty concluded that although tree contact caused some storm transmission outages, NSPI's transmission vegetation management program is substantially consistent with good utility practices. NSPI needs to complete its program to widen and side-cut transmission system right-of-ways.
>
> (Exhibit N-19, p. 4)

> [37] Liberty found that NSPI's efforts in this regard conformed with North American utility practice. It also stated:
>
> > Liberty found no evidence that NSPI's staffing, maintenance, or inventory practices had any appreciable effect on the severity of the outages caused by the November storm.
> >
> > (Exhibit N-19, p. 15)
>
> (Board Power Outage Review, August 5, 2005, para. 36-37)

[365] During its inspection of the transmission system, Liberty made specific observations with respect to right-of-way clearance. In its report, Liberty stated that:

> Liberty observed that NSPI has numerous right-of-way issues to address, especially on its 69 kV lines. During its aerial assessment of the NSPI transmission system, Liberty observed that about 10 km of 69 kV line L-5532 from Digby to Big Falls routes along the road. Side clearances on this section appeared to be less than the 10 m required for its 69 kV lines located on right- of ways. A tree caused an outage on this line during the November storm, and was the fifth and last interrupted transmission path to Annapolis Valley. This caused the interruption of all remaining load and hydro generation in the valley. In addition, Liberty observed other locations, particularly in the western part of the province, where NSPI had not yet trimmed the 69 kV and 138 kV right-of-ways to full width.
>
> (Board Power Outage Review, August 5, 2005, para. 44)

[366] In its findings on the transmission infrastructure, the Board commended NSPI for its design, construction and maintenance practices. However, it noted Liberty's concerns with respect to the right-of-way clearance relating to certain transmission lines:

> [64] Finally, the Board notes Liberty's comments regarding the completion of ROW clearance relating to certain transmission lines, particularly in the western part of the Province. Liberty stated that:
>
> > In some locations, NSPI's 69 kV and 138 kV lines do not center in the right-of-ways. In 2004, NSPI started widening right-of-ways up to 10 feet on its 69 kV system, with permission, to provide the standard clearance from the lines to the right-of-way edges. It expended about $146,000 in 2004 for

> 69 kV right-of-way widening. It plans to spend about $350,000 in 2005 for right-of-way widening on radial 69 kV lines, those that most affect costumer [sic] service.
>
> (Exhibit N-19, p. 18)
>
> [65] Accordingly, the Board directs NSPI to file an assessment report, by November 30, 2005, describing the work that has been or will be performed to implement the completion of the transmission ROW clearance, and giving a timetable and estimated cost assessment.
>
> (Board Power Outage Review, August 5, 2005, para. 64 - 65)

[367] As a result of that direction by the Board, NSPI filed its 69 KV Right-of-Way Widening Assessment Report, which was filed in this hearing as Undertaking U-7.

[368] With respect to NSPI's distribution system, John Sherrod acted as the Board's consultant. While not specifically addressing vegetation management, John Sherrod's conclusions included:

> ...
>
> 3. The damages caused to NSPI distribution facilities by the subject storm are consistent with what would be expected with facilities in normal condition subjected to such weather factors.
>
> 4. The NSPI distribution inspection processes, both routine and post-event, appear adequate and appropriate to good asset management.
>
> 5. The damages resulting from the subject storm were not a result of any deficiency in NSPI inspection and maintenance processes.
>
> 6. The staffing levels of NSPI power line technicians (PLTs) as maintained for the past ten years and available at the time of the subject storm are within customary limits in the industry and did not have a negative impact on maintenance of NSPI distribution facilities or on storm outage response.
>
> 7. The NSPI Customer Average Interruption Duration Index (CAIDI) has increased over the past ten years coincident with the PLT staffing level reduction, and this issue should be addressed.
>
> (Board Power Outage Review, August 5, 2005, para. 78)

[369] The Board accepted Mr. Sherrod's assessment of the condition of NSPI's distribution system and again commended NSPI for its efforts in constructing, inspecting and maintaining the distribution system. However, at paragraph 216 of its Power Outage Review, the Board noted that NSPI's distribution system in the Digby County area and the western part of the province had not specifically been inspected. As a result of concerns expressed by customers from across the province during the hearing, the Board engaged Liberty to conduct field inspections of the areas referred to by members of the public and report their findings respecting the condition of NSPI's distribution system to the Board before November 30, 2005.[135]

[370] In the view of the Board, the results of the Power Outage Review provide a useful context for the assessment of NSPI's request for a doubling of its vegetation management budget. Liberty's report on NSPI's distribution system has since been filed with the Board in late 2005. The Board is now awaiting a response to the report from NSPI. In the circumstances, the Board considers it appropriate to defer any additional spending on vegetation management for NSPI's distribution system until a full evaluation is undertaken of Liberty's report. While the Board is mindful that NSPI is able to identify feeders upon which such monies could be expended, the Board determines that such activities would be premature given the pending deliberations following the filing of Liberty's recent report. The review of Liberty's report will also provide NSPI with the opportunity to outline the Company's estimates of the reduced outage and repair costs that can be

[135] Board Power Outage Review, August 5, 2005, para. 234

anticipated from increased vegetation management (a measure of the program's success recommended by PWC in its Report)[136]. Thus, in relation to vegetation management on NSPI's distribution system, the Board does not approve any increase in spending for the test year. The current level of expenditure for the distribution system shall remain at $3.6 million.

[371] With respect to additional spending to be directed to vegetation management on NSPI's transmission system, the Power Outage Review did identify specific areas of concern. In light of the significance of NSPI's transmission infrastructure, as well as the areas of concern outlined in the Power Outage Review, the Board approves the additional spending for vegetation management proposed by NSPI with respect to its transmission system. Based on NSPI's response to Undertaking U-9 filed during this hearing, the Board infers that the level of increased spending proposed for the transmission system is an additional $1.6 million. Accordingly, the Board approves this additional amount for vegetation management on NSPI's transmission system, over and above what is already reflected in current rates (i.e., for a total of $3.2 million).

[372] Accordingly, for the test year, the amount of spending for vegetation management approved by the Board shall be a total of $6.8 million ($3.2 million for the transmission system and $3.6 million for the distribution system). In approving this amount, the Board takes into account the fact that NSPI has recently negotiated a 20% saving with respect to all vegetation management activities as a result of outsourcing the

---

[136]PWC Pre-filed Evidence, Exhibit N-84, p. 21

work to one third party contractor. This means that, in comparison to previous years, this approved budget should yield a 20% increase in services for the same cost.

[373] NSPI has also requested an additional $1.3 million to improve communication with its customers. In its Power Outage Review, the Board directed NSPI to undertake various measures to improve its communications with customers, including improvements to its telephony technology, the conduct of a stress test on its system, reviewing the "call overflow management system", and developing a communications plan to improve the Company's interaction with its customers respecting the reporting of power failures and the restoration of service.[137] The Board also determined that a major problem during significant power failures was the inability of NSPI's customers to advise the Company of power outages, to inquire about the problem, and to determine the estimated restoration time. The Board directed NSPI to report its progress on these various issues by September 30, 2005. The Company's request for an additional $1.3 million stems, in part, from these issues raised during the Power Outage Review.

[374] The need to improve NSPI's HVCA and IVR telephone systems was highlighted in the Power Outage Review. The failure of these two systems contributed to many of the communication problems which arose during the November 2004 snow storm. Based on its findings during that Review, the Board determined that NSPI's customers expect these systems to accommodate their needs during power outages. The Board

[137] Board Power Outage Review, August 5, 2005, para. 187 - 200

approves the amount of $500,000 with respect to enhancements to the HVCA and IVR telephone systems, as well as the testing of the systems.

[375] However, the Board is not satisfied that NSPI's request for the remaining $800,000 is warranted with respect to increased customer research respecting outage communication processes, additional proactive communications with respect to storm preparedness and increased quality assurance in the customer service area. Both the Province and PWC questioned the annual nature of these requested expenditures, PWC adding that some of the expenses appeared to be one-time costs. While the Board concurs that some increased expenditure in these areas is justified, it does not accept NSPI's view that an $800,000 increase is required on an annual basis, particularly in the context of the significant rate increase being requested by the Company. In these circumstances, the Board reduces the additional $800,000 amount for these remaining activities to $300,000 per year.

[376] In summary, the Board approves $500,000 with respect to telephony technology improvements and $300,000 with respect to improved outage communication processes and increased quality assurance in the customer service area.

6.4 Corporate Support Groups (excluding DSM)

6.4.1 Submissions - NSPI

[377] Corporate Support Groups include expenditures associated with providing services for regulatory compliance, accounting, internal controls, governance,

administration, investor relations, human resource management, stakeholder communications, procurement, and information technology.

[378] For the test year 2006, NSPI proposes a net increase in these costs by $7.3 million over the 2005 Compliance Filing. The primary component of this proposed increase stems from the Company's proposed increase of $5 million related to the Marketing and Sales Group and its Demand Side Management ("DSM") initiatives. The Board's discussion of the issues surrounding DSM are contained elsewhere in this decision. The remainder of the net increase related to the Corporate Support Groups is comprised of various other increases and decreases proposed to be allocated to various function groups falling under Corporate Support. During the hearing and in closing submissions, the intervenors focused their attention on a proposed net increase of $400,000 requested for Investor and External Relations and Environment ("Investor and External Relations"), as well as an additional $2.0 million sought with respect to Regulatory Affairs. In its report filed in advance of the hearing, PWC raised a third issue respecting a net increase of $470,000 being claimed by NSPI's Finance Group for compliance with securities regulators.

[379] With respect to Investor and External Relations, NSPI identified a $492,000 increase in advertising costs over 2005 Compliance expenditures, resulting in a net increase of $400,000 with respect to the Investor and External Relations Group. It indicated that this amount will be directed to "communication designed to better engage

and educate customers about issues important to the overall operation of the utility". It identifies these issues as follows:

> The issues covered in this communication would include, but would not be limited to: DSM (energy efficiency and conservation); changes in environmental regulations, environmental progress; renewable energy; global energy prices; and storm preparedness. The functional delivery of the DSM program remains entirely within Customer Service.
>
> (Avon IR-20)

[380] NSPI states that the $492,000 amount is allocated to various forms of communication, including $150,000 for ongoing development of the next generation of web-based interactive communications with customers and other stakeholders.

[381] NSPI also proposes an increase of $2.0 million in spending for Regulatory Affairs of the Corporate Support Group, increasing its $2.6 million spending level in the 2005 Compliance Filing to $4.6 million for the 2006 test year. The Company asserts that the $2.0 million increase is comprised of additional Board assessment fees, additional NSPI and Board consulting and legal fees associated with "increased regulatory activity" and the additional cost of a consumer advocate.[138] In their testimony, witnesses for NSPI indicated that the $1.6 million increase is associated with the Company's 2007 rate application, which it expects to file in 2006. A further amount of $400,000 is also claimed for an increase in the 2006 Board assessment.

[382] In addition to the above $2.0 million increase, NSPI seeks to recover as part of the 2006 test year costs a further $2.0 million with respect to the costs of the present 2006 rate application conducted in 2005, and an increase of the Board assessment charge

[138] NSPI Application, Exhibit N-1, pp. 96-97

to NSPI in 2005. This $2.0 million is included in the Corporate Adjustments account of the rate application. Noting that the 2006 rate application costs and the increased Board assessment for 2005 were not provided for in 2005 rates, NSPI, in effect, seeks to defer the expenses from 2005 and include them as costs of the 2006 test year. In NSPI's view, this treatment is consistent with previous deferrals of operating expenses and allows the matching of the revenue (i.e., 2006 revenue) with the associated costs (i.e., the 2006 rate hearing conducted in 2005 and the incremental portion of the Board assessment incurred in 2005).[139]

[383] NSPI also seeks a net increase of $470,000 to ensure regulatory compliance with the Ontario Securities Commission ("OSC") following the OSC's adoption of new governance and audit regulations contained in guidelines approved by the Canadian Securities Administrators in February 2005. Both NSPI and Emera must adhere to these regulations, which require the Chief Executive Officer and the Chief Financial Officer to provide certification with respect to disclosure controls and internal controls respecting financial reporting. Moreover, the certification requires a more rigorous attestation process by external auditors.[140]

[384] The additional compliance costs associated with the new OSC regulations total $941,000. This figure is comprised of $565,000 for consulting costs attributed to work needed to comply with the new governance regulations and $376,000 for external legal

---

[139]Province IR- 53; PWC IR-21; Exhibit N-1, p. 104

[140]NSPI Application, Exhibit N-1, p. 95; PWC IR-25

and audit costs associated with the review of the regulations.[141] Half of the projected increase of $941,000 is to be allocated back to Emera through Corporate Support Transfers, leaving a net increase of $470,000 for NSPI.

6.4.2 Submissions - Intervenors and PWC

[385] Avon opposes both the $492,000 incremental increase with respect to advertising under Investor and External Relations, as well as the recovery, in the 2006 test year, of the costs for the hearing held in 2005 respecting a rate increase for 2006.

[386] With respect to the proposed $492,000 incremental increase for Investor and External Relations advertising, Avon submits:

> 218. It seems evident that there is some element of double-counting given that NSPI is also seeking $5 million associated with DSM which has, as its largest component, communications and promotions as well as an incremental increase of $4 million for storm response which likewise has, as a large component, communications, (although denied by NSPI).
>
> 219. While a half million dollars may not seem like much in the grand scheme of Nova Scotia Power's overall revenue requirements, it is indicative of the cavalier approach which NSPI has adopted in putting together its revenue requirement. Intervenors are unable to assess the reasonableness of the expenses and particularly, where line items such as advertising suggest duplication and a significant increase over prior spending, it is respectfully submitted that NSPI must do more to discharge its burden to show that these expenses are reasonable and properly chargeable.
>
> 220. If NSPI wishes to spend money on communications which have the effect of promoting NSPI and generating goodwill in the community, then it may do so. However, similar to the Board's decision with respect to sponsorships, as reaffirmed in the 2002 rate case, this should not be included in the revenue requirement to be recovered from ratepayers.
>
> (Avon Redacted Closing Submission, p. 46, para. 218 - 220)

[141] NSPI Application, Exhibit N-2, Appendix B, p. 7 of 52

[387] In its Closing Submission, Avon also opposes NSPI's proposed recovery of its costs for both the 2005 and 2006 rate applications in the same test year.

[388] Avon argues that it is "manifestly unfair" to ask ratepayers, in the same test year, to bear the burden of the costs associated with both the 2006 rate case (held in 2005) and 2007 rate case (contemplated for 2006). In response to NSPI's assertion that this can be treated as an "amortization of deferred operation costs", Avon states that a request for the deferral of costs for a rate hearing is unprecedented. Citing **Philadelphia Electric Co. v. Pennsylvania Public Utilities Commission**, 502 A(2d) 722 (1985), Avon submits that a utility is not entitled to seek recovery of a shortfall in a prior rate hearing's expense line item unless such expenses were extraordinary, unanticipated and of a non-recurring nature.[142] Avon observes that regulatory expenses are clearly a line item for which NSPI sought and received rate revenue in a prior test year (i.e., 2005) and that the costs for the 2006 rate application (held in 2005) were not unforeseen, extraordinary or non-recurring.

[389] The Province also opposes the recovery of $2.0 million in the 2006 test year with respect to regulatory expenses incurred in 2005 for 2006 rates. It questions NSPI's submission about matching expenses with revenues in the same test year. Further, the Province suggests that the costs of a rate application should be "levelized" over the number of years the rates resulting from that application are expected to remain in effect.

[142] Avon Redacted Closing Submission, pp. 44-45

Otherwise, it observes that the full costs of a rate application could remain in rates for future years in which no rate case is undertaken.[143]

[390] The proposed increase related to regulatory costs is also opposed by the CME. In addition to its view that the costs of two annual rate applications should not be recovered in the same test year, the CME echoes Avon's concern that the proposed increase in costs should be fully documented and justified.

[391] Finally, both Avon and the Province submit that, if the Board considers it appropriate to approve the expenses occurred in 2005 for recovery in 2006, the same treatment should be accorded to the rate application being contemplated by NSPI in 2006 with respect to 2007 rates.

[392] PWC reviewed NSPI's request for a net increase of $470,000 relating to its compliance with the new OSC regulations. While PWC suggested that some of the one-time documentation and setup costs could be deferred over the period of benefit, it did not object to inclusion of such costs in the test year given their relative magnitude. However, it noted that on July 29, 2005, following the filing of NSPI's application for this rate hearing, a one year delay in the implementation of the regulations was announced. In a response to PWC IR-43 respecting this delay in the implementation of the regulations, NSPI confirmed that it intends to complete the documentation and testing of its internal controls in 2006, as planned, but that it may defer the increase in audit fees that NSPI will incur to

[143] Province Redacted Closing Submission, para. 63-64

2007. PWC submitted that these cost deferrals should be estimated and excluded from the 2006 test year.[144]

6.4.3 Findings

[393] In addition to the issue of the proposed increase for DSM, the intervenors raised three issues with respect to the proposed spending increase for Corporate Support Groups: 1) the incremental increase of $492,000 related to Investor and External Relations' communication and advertising expenses, and 2) the $2.0 million proposed increase related to Regulatory Affairs. PWC raised a third issue, 3) the necessity of including all of NSPI's request of $470,000 for increased regulatory compliance respecting more stringent governance and audit requirements.

[394] In response to Avon IR-20, NSPI confirmed that the proposed increase of $492,000 for advertising is to be directed to forms of communication which would "better engage and educate customers about issues important to the overall operation of the utility". It noted that the issues to be covered include matters relating to DSM, changes in environmental regulations, renewable energy, global energy prices and storm preparedness.

[395] In the opinion of the Board, most of the issues sought to be canvassed by NSPI in its increased advertising relate to activities already contemplated in other sectors of the Company's operations and, as such, constitute an overlapping or double counting

[144] PWC Pre-filed Evidence, Exhibit N-84, p. 19

of expenses claimed elsewhere in rates. For instance, communications related to storm preparedness are, and should be, part of the proposed spending increase for storm response under Customer Operations and all communication expenses associated with DSM should be budgeted within the DSM envelope. Further, the Board concurs with Avon's submission[145] that other expenses related to promoting the Company's corporate image and enhancing its goodwill in the community should not be included in the revenue requirement being sought from customers.[146]

[396] Thus, the Board denies the Company's request for a $492,000 increase for advertising activities carried out by the Investor and External Relations group, and the Board directs that OM&G expenses be reduced accordingly.

[397] NSPI seeks a $2.0 million increase for the 2006 test year to cover the estimated regulatory costs associated with an increase in the 2006 Board assessment, and a rate application expected to be filed in 2006 with respect to 2007 rates. In addition, under the Corporate Adjustments category, NSPI also seeks a further $2.0 million for regulatory expenses incurred in 2005 associated with the present rate case and the increased 2005 Board assessment. The Board considers it appropriate to consider these requests together.

[398] NSPI asserts that the $2.0 million amount being claimed for each of the present and upcoming rate cases, as well as the increased Board assessment for 2005

---

[145] Avon, Redacted Closing Submission, para. 220

[146] Board 2002 Rate Decision, para. 138-139

and 2006, are not currently reflected in rates. The 2005 Compliance Filing shows that $2.6 million is allocated for Regulatory Affairs spending. In its application, NSPI states that the $2.0 million increase is comprised of additional Board assessment fees, additional NSPI and Board consulting and legal fees associated with "increased regulatory activity" and the additional cost of a consumer advocate.[147]

[399] The Board has serious reservations about NSPI's request to defer the expenses incurred in 2005 with respect to the present rate case and the increased Board assessment for 2005. While the Board is mindful that expenses for the hearing were incurred by the Company with respect to 2006 rates, it has been NSPI's practice to write-off these expenses in the year in which they were incurred. In the Board's opinion, it is not reasonable to burden ratepayers with the cost of two rate hearings and two increased Board assessments in the same test year, which would be the case were the Board to permit NSPI to roll such costs forward into the 2006 test year.

[400] In the case of NSPI, it appears that the costs associated with rate applications will be of a recurring nature. While NSPI has not filed a rate application in each and every year, such applications are becoming rather common and, if an application is filed in 2006 with respect to 2007 rates (as witnesses for NSPI have indicated is likely), then it will mark the fourth such application since 2002. In fact, in presentations to outside parties, NSPI has anticipated annual rate filings, at least until 2008.[148] Further, given the

---

[147]NSPI Application, Exhibit N-1, p. 97

[148]NSPI presentation to Standard & Poor's, Exhibit N-30, SEB IR-95, Attachment 5, p. 16

environment of rising fuel costs over the past few years, the possibility of rate applications, including one in 2005 for the 2006 test year, could, in the opinion of the Board, have reasonably been foreseen by NSPI and, therefore, should have been estimated in the 2005 test year figures. Lastly, NSPI's regulatory costs were included as an expense line item, for which the Company sought and received revenue from rates. Such expenses typically come in above or below projections. The Board does not require NSPI to refund any surplus related to a particular expense category[149], nor does it consider it appropriate for NSPI to seek a deferral of any shortfall in relation to an expense item which could have been reasonably anticipated.

[401] For the above reasons, the Board denies NSPI's request to defer the costs of the 2005 rate hearing to the 2006 test year. Accordingly, this proposed deferral under the Corporate Adjustments category is not approved and the Compliance Filing for 2006 shall be adjusted to reflect this finding.

[402] However, the Board does approve NSPI's request for additional spending of $1.6 million associated with the anticipated rate application to be filed in 2006 for 2007 rates. In doing so, the Board is mindful that the approved increase of $1.6 million for Regulatory Affairs is a significant increase and, as noted by the Province, the full costs of a rate application will be included in rates in future years even when no rate case is undertaken.

---

[149] For example, NSPI's interest expense is expected to be about $5 million less than projected in 2005, see Transcript, November 22, 2005, p. 1024

[403] Upon review, it appears that the Board's annual assessment currently reflected in rates is $593,000 (the 2000 assessment)[150] and that, for the year ending March 31, 2005, the annual assessment increased to $997,457. This increase is not currently reflected in rates. The Board approves the increase of $400,000 for inclusion in 2006 rates with respect to the March 31, 2006 year end. However, for the reasons explained immediately above, the Board denies NSPI's request to recover the increased assessment relating to March 31, 2005. In support of this conclusion, the Board observes that NSPI would have had an estimate of the annual assessment for March 31, 2005, prior to the filing of its 2005 rate case, which was filed on May 28, 2004[151], and revised on June 23, 2004[152]. It should be noted that the annual assessment has increased gradually since 2000. Consequently, it was certainly possible for NSPI to have made a reasonable estimate of the 2005 assessment when it applied to increase rates for that year.

[404] New governance and audit regulations adopted by the OSC will result in higher regulatory compliance costs. In its application, NSPI projected these costs to be a net amount of $470,000 for the 2006 test year. After NSPI's application was filed, a one year delay in the implementation of these governance and audit regulations was announced. In response to PWC IR-43, NSPI stated that it intended to complete the documentation and testing of its internal controls in 2006, as originally planned. However, it indicated that it may defer the increase in audit fees to be incurred by the Company to

---

[150] NSPI Application, Exhibit N-1, p. 97

[151] Board 2005 Rate Decision, March 31, 2005, para. 7

[152] Board 2005 Rate Decision, March 31, 2005, para. 4

2007. PWC recommended that NSPI estimate the amount of this cost deferral and that such costs be excluded from the 2006 test year.[153] The Board concurs with the opinion of PWC. It directs that half of the proposed net increase be deferred to 2007, resulting in a net increase approved for this activity of $235,000 ($470,000 less 50% recovered from Emera).

[405] In conclusion, the Board approves the increased OM&G spending proposed by NSPI for Corporate Support Groups in the amount of $7.3 million over the 2005 Compliance Filing, subject to reductions of $492,000 respecting advertising and communication expenses by the Investor and External Relations group; $4.45 million with respect to DSM as set out elsewhere in this decision; and a net amount of $235,000 respecting implementation of new governance and audit regulations by the OSC.

[406] While the Board approves the $1.6 million expenditure increase under Regulatory Affairs respecting a 2007 rate case expected to be filed in 2006, the expenses for the rate hearing held in 2005 are denied under Corporate Adjustments. Further, for the same reasons, the increase of $400,000 relating to the increased Board assessment for 2005 is denied. However, the estimated increase of $400,000 for 2006 is approved.

---

[153] PWC, Pre-filed Evidence, Exhibit N-84, p. 19

6.5 Corporate Adjustments

6.5.1 Submissions - NSPI

[407] This category comprises expenses which are not specifically assigned to a business unit or functional area, including year-end payroll accrual, incentives, deferred severance, capital overhead contributions and pension expenses. While there is a proposed decrease of $500,000 for Corporate Adjustments from $13.6 million (2005 Compliance Filing) to $13.1 million for the 2006 test year, a significant component of this expense category relates to pension expense which is proposed to increase from $26.0 million (2005 Compliance Filing) to $31.7 million for the 2006 test year. This represents an increase of $5.7 million in pension expense. The basis for this increase is explained by the Company in its application:

> Pension expense is projected to be $31.7 million in 2006 compared to $26.0 million in 2005C, an increase of $5.7 million. The primary reason for the increase in pension expense is the adoption of updated mortality tables used by actuaries to determine pension funding and a lower discount rate used to value outstanding obligations. The updated mortality assumptions show that on average, people are living longer, which results in pensions being paid for longer periods of time. This shows up as an increase in pension expense. Additionally, the discount rate estimated is presently 5.5% versus 5.75% in 2005C. NSPI's actuary, Paul Chang of Morneau Sobeco has provided the Company with the appropriate discount rate for CICA 3461 reporting purposes. Based on single "A" bonds, the current discount rate as of May 31, 2005 that would be used to determine CICA 3461 expense for NSPI is 5.5%.
>
> (Exhibit N-1, p. 105)

[408] In PWC IR-23, NSPI provided a reconciliation of the pension expense from the 2005 Compliance Filing to the 2006 test year, accounting for the factors described above:

Pension Expense - Reconciliation of Benefit Cost	
2004 Actual Benefit Cost	**$21.9 M**
Exclude impact of Amendment No. 12 Change in discount rate (6% to 5.75%) based on “AA” corporate bonds Other factors	$ 0.9 M $ 2.7 M $ 0.5 M
2005 Compliance Benefit Cost (prior to Amendment No. 12)	**$26.0 M**
Include impact of Amendment No. 12 Change in definition of high quality debt instrument used to determine discount rate from AA corporate to A corporate	$(1.9) M $(2.7) M
2005 Forecast Benefit Cost	**$21.4 M**
Change in discount rate (6% to 5.5%) based on “A” corporate bonds Change in mortality table Other factors	$ 5.4 M $ 4.5 M $ 0.4 M
2006 Forecast Benefit Cost (per Rate Case)	**$31.7 M**

6.5.2 Submissions - PWC and Intervenors

[409] PWC was retained by Board Counsel to review, among other issues, the pension expense. In its report filed as Exhibit N-84, PWC concluded that the policies followed by NSPI in forecasting pension expense for the 2006 test year are reasonable:

> Changes in two major actuarial assumptions account for most of the $10.3 million increase in pension expense in 2006.
>
> Effective in 2006, NSPI’s assumptions with respect to mortality of pension plan beneficiaries is based upon an updated mortality table giving recognition to the fact that people are living longer and will draw pension benefits for a longer time. This is a fairly common, recent change made by other companies with defined benefit pension plans and was approved for adoption by the Canadian Institute of Actuaries in 2005. We consider the change reasonable and appropriate.
>
> The total impact of this change upon the pension benefit obligation is estimated to be $26.4 million. This higher liability will be expensed over 10 years and in 2006, $4.5 million will be recognized in pension expense.
>
> At December 31, 2005 a discount rate will be assumed for purposes of valuing the pension and post-retirement benefit liability at December 31, 2005. For regulatory and test year

purposes, NSPI has assumed a rate of 5.5% will apply for 2006, based upon rates at May 31, 2005. This 0.50% reduction in the discount rate from 2005, causes an overall increase in the liability of $51.6 million and an increase in pension expense in 2006 of $5.4 million.

Management also makes assumptions concerning expected remaining life of employees, retirement age, salary increases, mortality, etc. NSPI's actuary has provided an opinion respecting the reasonableness of these assumptions for the 2006 test year.

For general purpose financial statements and rate regulation purposes, pension expense is being measured in accordance with generally accepted accounting principles...
. . .

Discount Rate

The discount rate used to determine the present value of liabilities in the pension plan and the current service cost for each period has decreased from 5.75% in the 2005 rate case to 5.50.% in the 2006 test year. This 2006 assumption was based on the interest rate on high quality bonds at May 31, 2005. The discount rate applicable to NSPI's 2006 pension expense will be determined based upon market interest rates on high quality bonds as at December 31, 2005. Since May, 2005, bond yields have decreased by 25 to 50 basis points and forecasts indicate further declines in the months ahead.

Thus, the discount rate used of 5.50% for the Test Year is, in our opinion, likely at the high end of the current range of 5.00% to 5.50%. The lower the discount rate the higher the liability, and the higher the expense. Lowering the discount rate also results in an initial actuarial loss on the accrued benefit obligation, which must be included for amortization into expense.

...

CONCLUSION

Major assumptions with respect to expected rate of return on assets and forecasted discount rate for liability valuation are at the high end of reasonable ranges. Reductions in either of these rates would result in higher pension expense and ultimately a higher rate request. In our opinion the policies followed by NSPI in forecasting pension expense for the Test Year are reasonable.

(PWC, Pre-filed Evidence, Exhibit N-84, pp. 10-13)

[410] The Board did not receive any comment from the intervenors on the pension expense issue.

6.5.3 Findings

[411] In support of its proposed increase for pension expense, NSPI filed an actuarial report outlining the basis for this increase. PWC, the Board's consultants, have reviewed the actuary's analysis and conclusions. Following its review, PWC filed a report stating that the pension expense is being measured in accordance with generally accepted accounting principles, that the assumptions being made by NSPI with respect to pension expense are reasonable and that the policies followed by NSPI in forecasting pension expense for the 2006 test year are reasonable and appropriate.[154]

[412] No significant concerns were raised by any of the intervenors at the hearing.

[413] In the circumstances, the Board accepts the evidence of NSPI and PWC that the forecasted pension expense for the 2006 test year is reasonable. The Board approves the increase in the amount of the pension expense from $26.0 million in the 2005 Compliance Filing to $31.7 million for the 2006 test year, an increase of $5.7 million.

[414] With respect to the remainder of the Corporate Adjustments sought by NSPI, the Board approves all of the said adjustments, except the proposed deferral of $2.0 million associated with regulatory expenses incurred by the Company in 2005, as discussed in the preceding section. Accordingly, the Board directs NSPI to reduce the Corporate Adjustments budget from the proposed amount of $13.1 million to $11.1 million for the 2006 test year.

---

[154]PWC, Pre-filed Evidence, Exhibit N-84, pp. 9-13

6.6 Summary of OM&G Findings

[415] The following table contains the disallowances made by the Board with respect to OM&G:

OM&G DISALLOWANCES (Dollars in Millions)		
Power Production		
Succession planning Subtotal	$ 0.8	**$0.8**
Customer Operations		
Vegetation management Communication processes Succession planning Subtotal	$3.6 0.5 0.2	**$4.3**
Corporate Support		
DSM Advertising costs OSC compliance Subtotal	$4.45 0.49 0.24	**$5.2**
Corporate Adjustments		
2005 Regulatory costs Subtotal	$2.0	**$2.0**
TOTAL		**$12.3**

[416] A summary of the overall impact of the Board's findings respecting OM&G is shown in the following table compiled by the Board:

TOTAL OM&G COSTS - Approved increases (Dollars in Millions)					
	2005C	**2005F**	**2006 Proposed**	**Board Disallowance**	**2006 Board Approved**
Power Production	$66.0 M	$70.4 M	$75.3 M	$0.8 M	$74.5 M
Customer Operations	65.3 M	67.6 M	77.0 M	4.3 M	72.7 M
Corporate Support	37.1 M	36.8 M	44.4 M	5.2 M	39.2 M
Corporate Adjustments	13.6 M	5.6 M	13.1 M	2.0 M	11.1 M
Total OM&G	**$182.0 M**	**$180.4 M**	**$209.8 M**	**$12.3 M**	**$197.5 M**

[417] Thus, the Board approves an increase in OM&G expenses from $182.0 million (2005C) to $197.5 million for the 2006 test year.

6.7 OM&G - Operations Review

6.7.1 Submissions - NSPI

[418] For the 2006 test year, OM&G expenses are proposed to increase from $182.0 million in the 2005 Compliance Filing to $209.8 million for 2006, an increase of $27.8 million (15.3%). As indicated above, the Board reduced the 2006 test year expenses to $197.5 million, thereby reducing the increase to 8.5%.

[419] NSPI maintains that it is effectively monitoring its OM&G costs. It states that OM&G expenditures have been stable over past years as base costs have been

maintained on a relatively flat basis through a variety of cost containment measures. In NSPI's submission, the increases proposed for 2006 are driven by new investments.[155]

[420] NSPI also notes that the Company's success in managing its OM&G costs is supported by earlier reports filed with the Board in 2003 and 2004. It points out that these reports provided details with respect to various aspects of its OM&G management, including financial processes and procedures for controlling expenditures, cost containment strategies, an overview of OM&G expenditures by type, an analysis of OM&G expenditures by operating units, and comparisons to external benchmarks. It maintains, as stated in its report filed on September 2, 2004:

> NSPI's OM&G performance benchmarks extremely well when compared to its Canadian peers, as demonstrated in this report.[156]

[421] NSPI outlined various cost containment strategies undertaken by the Company to control OM&G expenses, including improved matching of resources to the work required, ensuring that the most competitive resources are used to complete tasks, investing for the lowest long term cost, setting targets and conducting tracking to achieve continuous improvements.[157]

[422] During the hearing, the Policy Panel described NSPI's approach to managing its OM&G costs in response to questions posed by Mr. Grant:

> Q. Do your customers wish to see NSPI increase its efficiencies and productivity?

---

[155]NSPI Redacted Closing Argument, p. 65

[156]NSPI Application, Exhibit N-1, p. 72

[157]NSPI Application, Exhibit N-1, pp. 73-77

A. (Tedesco) I think they have a right to expect that,and I think the record is clear that, in fact, over the last several years that's precisely what we have done.

Q. In your budgeting process, do you indicate to your managers targets which you would like to see them hit in terms of reducing costs?

A. (Tower) Having worked for Mr. -- both Mr. Huskilson and Mr. Tedesco as Vice-President of Customer Operations and being responsible for virtually half of the costs at Nova Scotia Power, I'd like to give you a bit of flavour of budgeting and the kind of culture that exists at Nova Scotia Power, and I think this follows on -- Mr. Chairman, follows on a bit from your question to Mr. Blunden yesterday. So -- and just by way of example, back in the fall of 2003 would have been a typical budget round, as we would call it. We were under significant pressure to reduce costs. And at that time, I would have been working directly for Mr. Huskilson. And I, like the other Nova Scotia Power executive, would have been pushed pretty hard to come up with cost savings as much as we possibly could. Mr. Tedesco was arriving in January and we wanted to make sure that we had a budget that we felt was as stretchy, is a word that we would use, as it could possibly be. And so we put something together that we thought was challenging for us and would be challenging for our teams. In January, 2004, Mr. Tedesco arrived and his -- the first thing that he did was ask us to cut those OM&G costs even further. And while we had -- you know, we had believed that we had cut as far as we possibly could, we had to look for even more savings as a result of Mr. Tedesco's direction. And we did -- we did look for those and we did get them. Things in my organization such as putting a single power technician in a truck, for example, and putting a shift on and using the truck for two shifts is something that we've done. Looking at automatic meter reading to determine whether it makes sense. Looking at sole sourcing our vegetation contract. *I would tell you that pursuit of OM&G savings is not an event at Nova Scotia Power. It is just something that we do all the time*. And, in addition, certainly our last general increase for staff overall would have been in January, '03. So we're asking our staff -- we're asking our managers and our staff to do this at a time when we've held their salaries fairly constant. So I just wanted to give that flavour because it is something that we are -- and with the cost pressures that we face as a result of our fuel increase, it is something that we've lived with and we've continued to look for each and every day that we work there. And I would say we do balance that, though, with customer service to make sure that we don't go any further than we need to and ensure that we provide the customer service that we need. One of the things that we've done is to understand very clearly our unit costs and understand our customer service levels and understand when we take costs out what that does to service. And so it is -- *it does become a balance, but at the end of the day I would tell you and if you'd ask many of the people that worked for me, cost saving is something that we do.* And I have continued that with me as I -- in my role as Chief Financial Officer, to ensure we're in a -- you know, we're budgeting again this year. This is the time of year that we do it. And certainly that philosophy would ring loud and clear.

A. (Tedesco) I would just add to that that Mr. Merrick asked me, and I don't know if you were in the room at the time, Mr. Grant, whether or not there were additional things that we could do this year. And I think my answer was something to the effect that

> this year in particular we have all the incentive we need to do whatever we can to control costs. *And it was my judgment that controlling costs further from where they currently exist would cause deterioration in the service, and I still hold that judgment*. [Emphasis added]
>
> (Transcript, December 1, 2005, pp. 3065-3069, emphasis in original)

[423] NSPI submits that a special cost reduction initiative or exercise was not specifically undertaken in anticipation of this rate application because of its existing cost containment and control measures, which it describes as significant.[158]

6.7.2 Submissions - Intervenors and PWC

[424] A number of intervenors expressed concern about the proposed increase in OM&G costs. In its Closing Submission, Avon asked the Board to "engage management consultants to review NSPI's control of its OM&G expenses with a view to identifying best utility practices and further potential savings."[159] Avon suggested that this would be an opportune time to conduct such a review, given the size of recent rate requests and the fact that the Company anticipates further rate applications in 2006 and 2007.

[425] The Consumer Advocate also expressed disappointment about NSPI's alleged failure at the hearing to show that it had taken reasonable and necessary steps to control costs and to demonstrate that the increased expenditures are justified:

> ... NSPI argues that it has discharged the burden of showing that it has taken reasonable and necessary steps to control costs and to ensure that the increased expenses being sought for recovery in rates are justified.

---

[158]NSPI, Redacted Closing Argument, p. 69

[159]Avon, Redacted Closing Submission, para. 166

> What is missing in the testimony of the NSPI witnesses and in the final submission is any description of a procedure set up by the Company to screen, evaluate and prioritize whether the increased expenses are necessary and justified. For example, it would be reasonable for a company, seeking to increase its prices, to establish some process internally to evaluate the need for increased prices. All that the Board is left with in this application is evidence of the expenses for which recovery is sought. There is no basis to assess why those expenses were chosen, what other possible expenses were excluded and who and how the need for the expenses was evaluated.
>
> NSPI should be put on notice that in future applications in which it is seeking recovery of additional expenses, it will be expected to show an internal assessment process to verify the need for the amount of the expenses.
>
> (CA, Redacted Rebuttal Submission, para. 24-26)

[426] While other intervenors did not specifically request a review or report with respect to the control of OM&G expenses, a few of the intervenors expressed concern about the necessity and justification for some of the increases, to the extent that they asked the Board to closely monitor the spending of the Company with respect to its activities.[160]

[427] In a report filed on behalf of Board counsel, PWC expressed concern about NSPI's OM&G costs going forward into future years. It noted that the OM&G cost per customer, in constant dollars, is projected to increase by over 12.5% from $383.4 million in the 2005 Compliance Filing to $431.6 for the 2006 test year.[161]

[428] Noting that NSPI failed to provide requested information respecting OM&G costs for 1996 - 2003 and forecasts for 2007 - 2008, PWC stated:

> Given such limitation, we are unable to comment on the reasonableness of the 2006 level of OM&G cost per customer or in total, as comparisons with the historical or forecasted future

[160] Province Redacted Closing Submission, para. 58 (Enhanced Storm Response), para. 59 (Vegetation Management) and para. 60 (Telephony/Communications); CME Redacted Closing Submission, para. 24 (Vegetation Management & Storm Response) and para. 25 (Regulatory Costs)

[161] PWC, Pre-filed Evidence, Exhibit N-84, p. 14

trends are an important indicator in that regard. In particular, we have not been able to establish whether certain of the 2006 forecast OM&G costs are one year 'spikes' in costs or whether they are expected to continue at 2006 levels going forward.

As noted above, NSPI has asserted that 2007 and 2008 OM&G costs are expected to continue at or above 2006 levels. Should the growth in customer base remain low, this statement suggests possible future increases in OM&G per customer in the near term.

The lack of availability of forecasts for 2007 and 2008, the fact that NSPI does not have detailed OM&G forecasts, the very high level forecast provided in response to PwC IR 22 along with the underlying stated assumptions, as well as the significant increase in the forecast filed, all raise concern about the level of OM&G costs going forward.

Conclusions

We believe that it would be prudent for NSPI to provide, in support of future rate cases, detailed five year forecasts of OM&G costs. The review of such forecasts, we believe, would increase overall transparency, and allow the Board to see the quantification of certain forward-looking plans and programs such as capital vs. maintenance plans for each of the production facilities, DSM costs, regulatory costs, vegetation management and other storm response costs. It will also identify expected problem area where cost control measures may be implemented in a proactive manner.

We also recommend, due to the sharp increase in OM&G costs and OM&G costs per customer, that NSPI undertake a detailed benchmarking study to compare its costs, by category, to the costs being incurred by other similar utilities.

(PWC, Pre-filed Evidence, Exhibit N-84, pp.15-16)

6.7.3 Findings

[429] In past decisions, the Board has expressed concern about the control of OM&G expenses by NSPI. In its 2002 rate decision, the Board stated:

[133] The Board has significant concerns with respect to whether NSPI has reduced corporate expenses to the fullest extent feasible and whether there are adequate controls on spending.

[134] The Board's authority in this area is found in Sections 42(2) and 45(1) and (2) of the Act which are set out earlier in this decision. The difficulty faced by the Board is that there is simply insufficient information available to determine whether the expenses outlined in Appendix 1 of Exhibit N-1 are appropriate to be charged to ratepayers and are as low as prudently possible. NSPI is requesting ratepayers to bear these and other costs through a significant increase in electricity rates. It is, therefore, incumbent on the utility to satisfy the Board, through the public hearing process, that ratepayers' money is wisely and frugally spent. No such assurance is evident from the information which has been filed.

[135] Further, the Board is concerned that NSPI's internal budgeting procedures are not sufficiently thorough to ensure expenses are as low as possible.
...

[136] The Board believes that it is incumbent on NSPI management to be able to demonstrate that it has made every effort to operate on a cost efficient basis when it seeks to increase electric rates in Nova Scotia. Intervenors have raised valid questions concerning certain expenses. NSPI has not provided an adequate response. As a result, the Board is not satisfied that NSPI management has made every reasonable effort to eliminate unnecessary expenses.

[137] Further, the Board understands that a "benchmarking" process is utilized by NSPI in setting overall spending levels. While this is a useful procedure, it should not be used to the exclusion of other methods of determining the appropriate level of expenses, including a careful and exhaustive review of NSPI's operating expenses in an endeavour to ensure that it is operating as efficiently as possible.
...

[140] The Board's concern in this regard goes beyond the present filing which projects NSPI's 2002 test year expenses. It appears from this rate proceeding that while overall OM&G costs have not increased appreciably in the six years since the last rate hearing, certain corporate expenses have increased significantly. The Board notes that there are no studies, evidence of internal management reviews, or details of cutbacks on OM&G expenses on file with the Board. The Board believes there is a pressing need to demonstrate that cost reductions at NSPI affect the higher levels of the company as well as lower levels.

[141] In view of the Board's concerns in this regard, the Board has determined that NSPI shall undertake a detailed review of the current level of OM&G expenses and submit a report to the Board which demonstrates that NSPI is operating as cost-efficiently as possible. After examining the report, the Board will determine if a further study is required. If further action is required, the Board may appoint an independent consultant to perform the study.

(Board Decision, October 23, 2002, para. 133-141)

[430] During his testimony during this hearing, Mr. Huskilson reiterated the approach taken by NSPI in the review of its costs:

Q. (Merrick) ... earlier about steps that you were taking to cut costs and expenses. Do you agree with that as a component --that that is part of what should be -- that that is a component that should be in every application for a rate increase, that is, that the company has -- puts forward the steps that it has taken to minimize its own expenses and also to minimize the requirement for increased rates? Do you agree that that should be, from here on in, a component of an application?

A. (Huskilson) Well, I would say is I think the -- especially the operating maintenance and general costs, but generally all of the costs of the company need to, I think, have two things happen. No. 1, I think they have to have a regular and solid review, which is something that we clearly did, in my view, in the last rate hearing. As well, the company has worked to report appropriately on those costs and continue to report on those costs. I don't know if that's something that we have to do every time we come before a rate -- a revenue requirement review, and the reason I say that is because there are ways to look at whether the company is doing a good job in that area, things like bench marking and looking at where the company sits against other companies who do the same kind of work. So I think there are mechanisms in which that can be reviewed. But I would say that it is very important that the costs are reviewed in great detail on an ongoing basis and that there is a special review at appropriate time frames.

(Transcript, December 1, 2005, pp. 3219-3220)

[431] The Board questioned the Finance Panel about the Company's review of OM&G costs in the context of NSPI's request for a large rate increase:

Q. (Chair) NSPI is coming to the Board seeking a rate increase, an average rate increase of 13 percent. This is after a rate increase last year. So would you agree that in this situation NSPI has a special responsibility to review all areas of operating costs to see whether or not any cost efficiencies can be achieved?
A. (Blunden) Yes, I would agree with that.

Q. Was that review done in this case?
A. (Blunden) Yes. I mean, NSPI has always focused on reducing its costs to levels -- to the most appropriate level possible. I believe we continue to do that. I think our OM&G report filed a couple of years ago and updated for the last rate application would demonstrate that. There had been a number of individual expense items that seemed to be occurring at this point in time, whether it's the regulatory climate, whether it's through customer expectations on storm response, or changing pension expense, but from our perspective the costs are reasonable and reflective of what's needed to run the business in 2006.

Q. But the result is that after you've done this review your requested rate increase still averages 13 percent. So my question was how did you go about reviewing the -- and let me just back up a bit. When I mentioned operating expenses, the only operating expense we're talking about is what's in OM&G, is that correct? There's no other operating expenses per se. I'm not talking about capital expenditures, I'm talking about operating expenses.
A. (Blunden) Yes, I understood you to mean OM&G expenses, correct.

Q. Yes. So in view of that, then, how did you go about reviewing the OM&G expenses to see whether or not there could be additional savings achieved in order to reduce a requested rate increase? OM&G has increased by, I think, somewheres around 29 million dollars, which is about a 15 percent increase in this year. So I understand that some are higher by necessity, but the question is how did you go about reviewing the different categories of operating expenses to see whether or not you could make cuts or other savings?

A. (Blunden) Certainly as part of our annual business planning process and as part of this rate application we always look at our operating expenses and determine, you know, certainly a starting point from baseline perspective whether we think they're reasonable, and that certainly has not changed. When we look at, in particular, how difficult this year has been from a financial perspective, our baseline OM&G costs are where they're at. The increases that are before the Board at this hearing are -- and are very specific, they're specifically related to pension expense. An example would be as we change the methodology coming up with the discount rate last year, which has had the effect of reducing pension expense by 2.7 million dollars as an example, or they're tied to initiatives like demand side management or storm response. So from a baseline perspective despite load growth -- and our operating expenses may be characterized slightly different than they would be in some companies. Our operating expenses include the variable labour at our plants and our linesmen and those kinds of things. You know, load is up, customers are up, inflation is up and the fact that we've been able to keep our baseline OM&G flat over quite a number of years I think speaks volumes to how well we manage our baseline costs.

Q. But I think what I was trying to get at is whether or not you had -- you went through an internal exercise to look at these expenses and say -- recognizing that from a benchmarking perspective they may be in line with other utilities, but that really wasn't my question. My question was did you have an internal exercise to go through these expense items line by line, item by item, to see whether or not you could, by reorganizing or restructuring some of your internal departments, whether or not you could achieve additional savings in view of the significant rate increase that you're requesting the Board to approve?

A. (Blunden) And I think the only thing I can probably respond to that is it's not -- we didn't undertake a different exercise but it's kind of part of how we do business on a daily basis. Certainly, at least quarterly, if not monthly, we would meet or a couple of us would meet with some of the senior managers in all the operating units and review their year-to-date spending and where there's possibilities for cuts. Anything that we believe is possible to do we have reflected in our 2006 rate application in terms of cost reductions.

Q. I'm not sure that that completely answered my question. Was there an exercise or an activity, a specific activity, internal, to look at these expenditures to see where cuts could be made from -- obviously you can't cut if service is going to be impaired, that's a given, but in any entity there are always some areas where it's a worthwhile exercise to look at these things and take a hard line on the expenditures to see whether or not -- what would happen if you did eliminate some or reduce some or make certain restructuring in your operation. Was that type of an exercise carried out?

A. (Blunden) It has been over a number of years, and what I mean by that is that approach has been taken to all of our OM&G costs over the last number of years, which is why we've been able to maintain them to where they're at. To the extent of where future opportunities, we have not identified -- any opportunities that we have identified have been reflected in this application and we have not been able to identify any additional opportunities that wouldn't have a significant impact on service.

Q. Was anything done in connection with this rate application that was different than what you've been doing every year for the last few years? And, to be fair, I recognize that OM&G has been discussed extensively in the past, but this is somewhat of a different situation. And so was anything done differently this time than what you do every year?

A. (Blunden) No. Again we believe the approach we have taken is an appropriate one and we maintain that approach.

(Transcript, November 30, 2005, pp. 2725 - 2730)

[432] With respect to PWC's suggestion that NSPI should provide multi-year forecasts of projected OM&G spending levels, Mr. Blunden questioned the merit of such an exercise:

A. (Blunden) We do not do detailed OM&G forecasts multi-years out, that's correct.

Q. (Deveau) In terms of PriceWaterhouseCoopers, however, they believe that you should, shouldn't you, because they say at page -- if you refer to page 16, starting at line 4:

> "We believe that it would be prudent for NSPI to provide in support of future rate cases detailed five-year forecasts of OM&G costs. The review of such forecasts, we believe, would increase overall transparency and allow the Board to see the quantification of certain forward-looking plans and programs including..."

And just -- obviously DSM is in there and regulatory costs are in there as well, isn't that right?

A. (Blunden) Yes.

Q. And just further on that point -- and this is arising, I think, from questions that Mr. Merrick and Mr. Mahody asked you in terms of cost-efficiency programs – wouldn't such projections into the future for OM&G costs -- wouldn't they provide a valuable tool for assessing cost-efficiency in the management of NSPI in terms of OM&G costs? And I suppose my final question is, do you agree with PriceWaterhouse's recommendation that such projections should go five years in advance? Sorry, five years into the future.

A. (Blunden) If I could direct you to our rebuttal evidence, on page 84, we -- our intention was to respond to the suggestions made by PriceWaterhouseCoopers. In isolation we believe three-year forecasts or multi-year forecasts of OM&G by themselves is not overly relevant because -- and there's a whole list of things that influence that, whether it's load growth, changes in the regulatory environment, pension expense, those kinds of things. For any of our planning purposes, unless we know of the specific change in an area of our OM&G, we have found over time that increasing it by inflation for management purposes is a reasonable proxy only because a number of the other line items have a much greater likelihood of changing more materially, for example, fuel expense.

Q. But that's not the case in this year, is it, because this year the increase [for OM&G] is quite significant?

A. (Blunden) Yes, and some of the increases that we're experiencing -- and whether it be increased pension expense because of changing discount rates or incremental costs that have been, you know, I guess, the results of storm hearings and those kinds of things -- would not have been things that we would have been able to forecast three years ago. So, those would be examples of multi-year forecasts in OM&G that in isolation wouldn't necessarily be overly relevant.

Q. So, is what you're saying that you don't believe that three or five-year forecasts are helpful at all in assessing expenses into the future?

A. (Blunden) I think in areas where you believe there are going to be step changes in some of your operating costs I think they can be useful, but they are just forecasts. We tend to believe that a more appropriate evaluation of our operating cost structure is looking at where we're at today versus where other utilities are, what our trend has been, so focusing more on actual results and informal comparisons as opposed to future forecasting.

(Transcript, November 30, 2005, pp. 2708-2711)

[433] Following its review of the evidence in this hearing, the Board continues to be concerned about the magnitude of the increase sought by NSPI for OM&G expenses, particularly since it accompanies NSPI's request for a very significant rate increase. In its application, NSPI is seeking an increase of $27.8 million in OM&G costs for the 2006 test year. This represents a 15.3% increase over the 2005 Compliance Filing. Moreover, OM&G spending is not insignificant, representing 24.5% of the total projected cost of operations.[162]

[434] While the Board accepts NSPI's evidence that the Company's management endeavours to contain line expense amounts, it is not persuaded that NSPI has taken sufficient steps to critically examine its entire operation to determine the most efficient use

---

[162] NSPI Application, Exhibit N-2, Appendix A, Table 2 ($209.8 M of $858.0 M)

of its resources. In the opinion of the Board, any large entity should regularly undertake such a review, without reference to, or reliance upon, traditional or existing operational groups. Such a review should focus on developing the most efficient organizational structure as the Utility moves into the future.

[435] Accordingly, the Board directs that an operations review be carried out on NSPI's operations. The review shall encompass a detailed examination of NSPI's organizational structure, its level of OM&G expenditures, and any other pertinent areas which may come to light, with a view to determining whether cost savings and operational efficiencies can be achieved. NSPI is directed to prepare the terms of reference for the operations review and submit them to the Board for approval by May 31, 2006. The terms of reference shall also set out the procedures for identifying and selecting the firm or person who will perform the operations review.

[436] PWC has recommended that future rate applications contain detailed five year forecasts of OM&G costs. The Board accepts this recommendation and directs NSPI to include detailed five year forecasts of OM&G costs in all future rate applications.

7.0 DEMAND SIDE MANAGEMENT

7.1.1 Overview

[437] In the 2005 rate decision, the Board directed the Company to initiate a technical conference process with respect to a Demand Side Management ("DSM") plan.

> [267] The Board has considered the helpful information provided on the matter of DSM during this proceeding. In the Board's view, further work and progress with respect to DSM is both important and necessary. The Board understands the suggestion that a DSM hearing should be held and, indeed, such a hearing may well be ordered in future. At present, however, the Board believes it is more appropriate to direct NSPI to initiate a technical conference process, with interested parties and stakeholders, to pursue an improved and effective DSM program for the Utility.
>
> (Board Decision, March 31, 2005, para. 267)

[438] NSPI stated in this application that it is currently engaged in a number of DSM initiatives which will reduce long term capacity requirements and environmental emissions. NSPI's current annual expenditures for DSM are approximately $0.5 million and it is proposing to increase this amount by $5.0 million annually as outlined in its rebuttal filing.

7.1.2 Submissions - NSPI

[439] NSPI's application outlined the process it followed to prepare its DSM Plan:

> ... , the Company invited a cross section of community leaders with an interest in demand side management to participate on a committee that will design and organize a special forum on energy conservation and efficiency planned for September 2005 in response to the Board's direction.
>
> The Company will incorporate feedback about past technical conferences and its November 2004 Customer Energy Forum to ensure that this technical conference process sets in motion an enhanced program of demand side management that meets the expectations of customers and other stakeholders.
>
> The specific new DSM programs to be implemented by NSPI will ultimately be a function of the ideas generated in the stakeholder consultations, in conjunction with technical feasibility

> and economics. NSPI will pursue opportunities to improve the economics of DSM programs through partnerships with other stakeholders.
>
> NSPI's increased DSM activities will provide tangible benefits to the environment, as well as practical means for customers of all classes to save money in the face of rising energy costs, particularly important to those in lower income situations.
>
> As a result of a number of existing DSM initiatives and awareness programs underway during 2004 and 2005, NSPI estimates a 0.5% reduction in forecast energy requirement for 2006. It is NSPI's view that an additional $5.0 million investment is the minimum required to ensure that the ongoing opportunities for DSM, as part of meeting the future energy needs of Nova Scotia, are fully optimized, and that the expectations of our customers to help them save money and reduce emissions are met.
>
> (Exhibit N-1, pp. 100-101)

[440] NSPI, in its Rebuttal Evidence, provided additional information and also included a copy of its proposed DSM plan "Conservation and Energy Efficiency Plan 2006" (the "Plan").

[441] NSPI is proposing to spend an additional $5 million in the test year on various initiatives included in the Plan. It has stated that if the Plan is approved by the Board the following objectives and results can be expected:

> Approval of this plan will advance energy efficiency and conservation in Nova Scotia. It will:
>
> - reduce electricity usage and save our customers money
> - reduce greenhouse gas emissions and help the environment
> - help build a conservation and energy efficiency culture in Nova Scotia, led by our young people and our schools
> - bring Nova Scotia Power together with community based partners in the province, leveraging the efforts and investments of all in its worthwhile pursuit
> - meet customer expectations that Nova Scotia Power do more to advance energy efficiency and conservation
>
> Specific Results to be achieved for 2007 include:
>
> - 72GWh reduction in annual electricity usage
> - Approximately $7.7 million in annual savings to customers from this reduction in usage

- 16 MW reduction in peak electricity demand
- 50 thousand tonne reduction of green house gases

(Exhibit N-153, Appendix A, p. 2)

[442] NSPI developed the Plan by identifying possible options, engaging a team of industry leaders to identify opportunities with the greatest potential, hosting customer forums, ultimately finalizing each element of the Plan. The Plan includes programs for residential, commercial and industrial customers. The Plan has three kinds of programs: programs led by NSPI; programs led by others; and future program development. Each of these programs has one or more of the following four elements: lighting; price awareness; workshops; and youth education. In addition to a cost benefit analysis, the Plan also provides a cost breakdown for each element of all programs.

[443] A detailed table of the proposed Plan is contained in Appendix D.

[444] The Plan includes the expected load reduction for each element of the Plan, and also provides a sensitivity analysis for variations in the expected load reductions for each element of the program.

7.1.3 Submissions - Intervenors and Dr. John Stutz

[445] Board Counsel's expert, Dr. John Stutz, along with a number of intervenors, were very critical of the Plan. NSPI compiled these criticisms as follows:

> 1. NSPI has not provided enough detail to allow UARB approval (Brockway, PWC, Stutz, Rosenberg, Drazen).
> 2. NSPI's approach to developing its Conservation and Energy Efficiency Plan is not consistent with good practice, and cannot result in a good plan (Brockway).
> 3. The consideration of NSPI's DSM plan should be conducted in a separate hearing process (Brockway, PWC, Stutz).
> 4. NSPI should implement inverted rates to promote energy conservation (Hughes).
> 5. NSPI should direct the entire $5 million investment to give away as many Compact Fluorescent Lamps (CFLs) as possible to NSPI's customers (Hughes).
> 6. The Board should disallow the 0.5% forecasted effect of DSM on 2006 load (Drazen).
> 7. NSPI has not provided a forecast of DSM spending beyond 2006, so it could decide not to spend any additional money in 2007, after obtaining the funding as part of rates (Rosenberg).
> 8. NSPI's proposal harms those customers who do not participate in the programs (Rosenberg, Drazen).
> 9. NSPI should allocate no share of the DSM investment to SEB.
> 10. NSPI could make money by "selling" DSM to customers in return for their first year savings, which are assumed to be twice the DSM investment made by NSPI. This profit margin of 100% would be used to lower rates.
>
> (Exhibit N-153, pp. 87-88)

[446] Avon believes that the Plan is premature and questions the process followed by the Company:

> 176. At its most basic level, we respectfully submit that the request for $5 million for DSM spending is premature in the absence of a well thought out plan which sets priorities based on long term planning and short term goals and does a cost-benefit analysis of the options. NSPI itself in a presentation made to the Energy Research and Development Forum in Antigonish in May of 2004 had stated that the initial step in the establishment of a plan should be consideration of load objectives and development of programs to meet these objectives as measured against an objective analysis. Instead, NSPI's initial step was the establishment of a $5 million budget.
>
> (Avon, Redacted Closing Submission, p. 37)

[447] Avon also questioned whether the Plan benefits the customers:

> 178. For the $5 million expense, NSPI estimates a reduction of forecast load in the range of 72 GWh. The cost for the DSM however is higher than the avoided fuel cost savings. For expenditures of $5 million in 2006, ratepayers can look forward to reduced revenues greater than the avoided generation cost of $1.83 million which will further be required to be made up in rates.
>
> (Avon, Redacted Closing Submission, p. 38)

[448] Avon expressed reservations about the success of the Plan, especially with respect to its emphasis on residential customers:

> 183. 75% of the $5 million in the DSM plan is in the residential sector and about 85% of savings are to come from the residential sector. This is stated to be largely due to the use of compact fluorescent lighting (CFL's) and a grade 5 education program. In cross-examination, Mr. Outhouse challenged the panel with an extract from the Environmental Commissioner of Ontario Annual Report indicating that the commercial and institutional sectors could offer substantial savings. NSPI was unable to point to any hard analysis that showed there were not similar opportunities in these sectors in Nova Scotia.
>
> (Avon, Redacted Closing Submission, p. 39)

[449] The Consumer Advocate submits that the proposed expenditures are not based on a need assessment analysis. He questions the appropriateness of the Plan's elements, their costs and effectiveness:

> 34. The method of developing the program gives little confidence that it is an appropriate expenditure of ratepayers money. The $5 million was not based on any analysis of what was needed to implement specific programs. Rather NSPI chose the amount and then looked for ways to spend it. The amount was arrived at by May, 2005 prior to any effort being made to develop the program itself. It was primarily motivated by an estimate of what NSPI understood to be the typical range of amounts expended by other utilities on DSM programs in relation to their total expenditures. The $5 million was allocated to the various rate classes prior to the development of the program. Having identified the amount to be spent, it was only in July that the company began the process of seeking input for the purposes of identifying elements of the program. After the elements of the program were identified it was either intentional or fortuitous that the original allocation of costs to the rate classifications were as originally allocated.
>
> (CA, Redacted Closing Submission, p. 9)

[450] The Consumer Advocate also expressed concern about the possibility of a conflict of interest on the part of the Company in its implementation of the Plan. He stated that:

> 46. One of the issues to be addressed by the DSM program is whether it should be administered by NSPI or by an independent entity. There are a [sic] areas of concern when a utility itself administers a DSM program.
>
> - There is a conflict of interest. The basic function and purpose of a utility is to sell as much energy as possible. The objective of a DSM program is to reduce the sale of energy. The conflict is illustrated by the fact that the majority of the DSM funding which NSPI has proposed would be administered by the sales and marketing department (see Application page 97).
> - Projecting large energy reductions as a result of a DSM program results in higher rates that then turn into bottom line profits if the reductions are less than projected.
> - There may be a temptation to use DSM funding for essentially a PR program.
> - There may be a temptation to use DSM funding to cover existing administrative and staffing costs.
>
> 47. For those reasons, one of the issues to be addressed is whether it would be practical for an independent entity to administer a DSM program in this jurisdiction.
>
> 48. For similar reasoning, we recommend that the choice of the consultant be either at the discretion of, or approved by, the Board. Input as to the selection of the consultant should be available not only to NSPI but to any interested stakeholders.
>
> (CA, Redacted Closing Submission, pp. 12-13)

[451] The CME is of the view that the Plan is incomplete, and only a limited amount of funds should be approved to complete the Plan:

> 23. It is the view of the CME that only a limited amount of money be allocated for the test year for the design of a DSM program. It is also the view of the CME that there are likely many benefits that accrue to NSPI in the short and longer term and that it could be funded wholly by NSPI and if not, should be amortized over an appropriate period of time.
>
> (CME, Redacted Closing Submission, p. 12)

[452] Ms. Brockway questioned the expertise of the Company to prepare the Plan:

> Q. So, can a utility design an effective DSM program without drawing on individuals with specific utility DSM expertise?
>
> A. In my opinion, a utility cannot design effective DSM programs without drawing on individuals with professional DSM design expertise. Utility DSM efforts are specialized programs. DSM program designers need considerable experience and expertise, whether they are on the staff of the utility, or their expertise is acquired from outside the utility. I am not saying that a utility should draw its program designs only from the conventionally-accepted set of approaches to DSM that are in widespread use among utilities. After all, I am chair of a non-profit devoted to disseminating information on an innovative approach that is not yet in widespread use. However, I am saying that a utility (and its regulator) cannot hope to understand the problem it is trying to solve with DSM programs, and cannot understand the pros and cons of available DSM options, without drawing on expertise regarding the myriad DSM efforts that have been funded by utilities in the last 20 years. [Indeed, a detailed awareness of the reasons for program failure is as useful as awareness of what programs are standard practice.]
>
> (Exhibit N-87, pp. 20-21)
>
> ...
>
> Q. Are you saying the public is not qualified to draft a DSM program?
>
> A. I am saying that drafting a utility DSM Program is as technical an exercise, and requires as much expertise and professional experience, as drafting a plan for installation of a substation, or preparing a load forecast, or designing rates. The expertise is different, but it is needed nonetheless. The devil is in the details, many things that appear intuitively obviously turn out not to work as one might think, and it is all too easy to reinvent a poorly-functioning DSM “wheel” rather than achieve a program design that could work according to its specifications. Reasonable DSM

experts can and do disagree on how best to achieve with DSM goals, but at the very least they can call out these issues to the attention of the Board for its ultimate determination.

(Exhibit N-87, p. 23)

[453] Ms. Brockway outlined some key components which she recommends be explored before the Plan can be evaluated:

Q. Please describe some necessary elements of a DSM plan that the Company has not yet developed.

A. Before a DSM program can be evaluated, certain key components need to be developed. Without limitation, these include (a) determination of the cost-effectiveness standard for measures and programs [which in turn is guided by a clear understanding of the legitimate purposes of a utility DSM effort], (b) the target markets for DSM offerings [e.g. should programs be designed to provide benefits to all customers, even if it is less cost-effective to serve DSM needs of some customers?], (c) budgets for each class and for each program, informed by the overall goals of the initiative and by the cost-effectiveness results for various measures and programs; (d) allocation of costs to classes and subclasses based on principled allocation factors; and (e) cost-effectiveness screening of all measures and programs against the cost-effectiveness test or test that is chosen for the initiative, the program or the measure, as the case may be. It is also important to specify how the program will be evaluated, so that necessary data gathering can commence with program roll-out.

(Exhibit N-87, pp. 18-19)

[454] The Ecology Action Centre argues that the Company placed too much focus on lighting in the Plan, leaving other important areas under-funded and under- recognized:

The EAC supports NSPI in their dedication of five million dollars towards DSM in the upcoming year, and the commitment that NSPI senior staff has displayed to working with other organizations to build a DSM plan which they believe will maximize their investment.

The Ecology Action Centre continues to have reservations about the current heavy focus on lighting in NSPI's DSM plan. NSPI's assertion that breakthroughs in lighting technology and their associated costs have occurred that would allow for energy savings with a small investment is valid. The heavy focus on lighting, however, leaves other important areas under-funded and under-recognized, and risks ignoring more substantial energy efficiency improvements.

> The EAC maintains that Nova Scotians would benefit more, in the long term, from additional DSM initiatives involving retrofits and increased awareness and efficiency in the areas of space and water heating.
>
> At present, NSPI's Conservation and Energy Efficiency Plan is the major method by which changes to Nova Scotian power use may be targeted. These changes are required to support our commitments to Kyoto and to the New England Governors/Eastern Canadian Premiers Climate Change Action Plan. As these commitments have been made on behalf of Nova Scotians, they deserve assurance that the commitments will be met. This program deserves the continued input of Nova Scotians and oversight on their behalf.
>
> The EAC continues to call for a demand side management hearing early in the year 2006 as an ideal opportunity for government and NSPI to work collaboratively on DSM and pollution reduction initiatives.
>
> (EAC, Redacted Closing Submission, pp. 5-6)

[455] The Electrical Consumers Alliance of Nova Scotia was in full support of the Plan at the start of the hearing process. However, based on the evidence provided during the hearing, ECANS tempered that support:

> However, upon reflecting, we agree that a deferral is probably in the best interests of all parties - ratepayers and shareholder.
>
> We are convinced NSPI has the full complement of talent to successfully implement a DSM program. On that, there is no doubt. What is at question is the level and degree to which the contents of this particular DSM concept have been debated in the public forum. It also has not been measured against 'tried and proven' DSM programs in other jurisdictions.
>
> So, taking a small step sideways, we now believe the best value for DSM dollars can be obtained by:
>
> > Locking the $5 million into rates for 2007.
> > Including $500,000 in rates for the year 2006 to allow NSPI to move forward as explained below.
> > Engaging an external DSM consultant to advise all parties on DSM components that are tailored for NSPI ratepayers.
> > Hold technical conferences (both before and after) the consultant prepares his/her report.
> > Including DSM as a formal portion of the hearing to set rates for 2007.

In this way, there can be more certainty that we will save as much as we spend. It is imperative we get DSM right.

(ECANS, Redacted Closing Submission, pp. 13-14)

[456] Halifax Regional Municipality supports DSM, but does not agree with the Plan as proposed by NSPI:

b) Comments on the Energy Conservation Plan

The plan addresses only a start to energy efficiency and conservation. Unfortunately, the plan does not address any load shifting initiatives. A DSM plan needs to address both aspects of DSM, energy conservation and load shifting as recognized by Chuck Faulkner in Exhibit N-162. A DSM plan also needs to have a long term vision to be able to set short term goals. As has been pointed out, a DSM plan should have measurable results and a feedback and reporting mechanism to both consumers and the UARB. HRM believes that there is a shared responsibility between NSPI and its customers to implement an effective DSM Plan; however it is the UARB's responsibility to create the guidelines and incentives to enable DSM to happen effectively. As noted by the Consumer Advocate, NSPI noted that there were aspects of the program that had not yet been developed.

Due to the importance of DSM, the setting of DSM targets, budgets, timelines and the means of measuring DSM success need to be included in any DSM plan. Additional economic incentives that create the climate for a sustainable DSM Plan incorporating measurable energy efficiency and load shifting goals should also be considered for inclusion. As an example, a higher ROE on effective DSM expenditures might be considered.

(HRM, Redacted Closing Submission, p. 12)

[457] HRM indicated that it supports the proposal put forward by the Consumer Advocate and has also suggested that the following items be included in the Plan:

NSPI direct some resources to provide electronic data interchange (EDI) with its largest customers.

NSPI increase the capability of its Smart Meter program to increase the timeframe for available data.

If the DSM Program is to be administered by NSPI, consideration should be given to it being administered by the Generation group and not by Marketing & Sales.

(HRM, Redacted Closing Submission, p. 16)

[458] Dr. Larry Hughes, a professor at Dalhousie University, filed Direct Evidence and a Closing Submission. He recommended against Board approval of the Plan. It is his opinion that the most cost effective way to use the funds is to initiate a program of demand reduction, EnerGuide for house renovations/new construction, and promotion of conservation and energy efficiency. He suggested that the following recommendations could form an alternative DSM program:

> - More of the funds should be devoted to demand reduction: this means a CFL programme that targets those on low-and fixed-income first, replacing all bulbs (those involved in last year's Keep the Heat programme are apparently pleased with them). If $4 million were devoted to this at $4/bulb, 1 million bulbs could be purchased and installed.
>
> - The EnerGuide for Houses programme element should be increased to $520,000 (to include audit costs) and targeted at those on low-and fixed-income who use electric heating.
>
> - The remaining $480,000 should be used to promote conservation and energy efficiency; for example, through advertising campaigns encouraging customers to use less electricity during peak periods.
>
> (Dr. Hughes, Redacted Closing Submission, p. 9)

[459] The Province argued that the Plan provides sufficient details and was developed by input from stakeholders, including feedback from a consumer forum held by NSPI. It is the Province's view that the Plan should be approved with the following modifications:

> 56. Dr. Stutz and Ms. Brockway have suggested that some formal DSM consultant should be involved at the outset. The Province supports the stakeholder driven process that NSPI has undertaken at this stage. The Province believes that, following the initial implementation of NSPI's DSM plan, an independent assessment of the first year's results should be undertaken by a consultant specifically retained for that purpose, to ensure that the DSM program is on track.
>
> (Province, Redacted Closing Submission, p. 24)

[460] The Province also submits that, in case the Board decides not to approve the Plan, it supports partial approval of funds to retain an outside consultant to complete the Plan.[163]

[461] The Nova Scotia NDP Caucus made a presentation to the Board at the evening public session, and submitted a petition signed by approximately 32,563 citizens of Nova Scotia. The petition requested that there be no increase in electricity rates until NSPI and the Province assist the customers of NSPI to save at least 15% on their electricity bill.

[462] The NDP Caucus has indicated that it would like to see further scrutiny of the Plan in a separate hearing in 2006:

> For the NDP, one of the central issues regarding DSM are the intentions of the Board respecting further scrutiny of the issue in detail, as a follow up to the 1992-93 set of hearings and the Board's 1996 discussion of Integrated Resource Planning on DSM in its rates' decision. Our request is that the Board move to convene a separate set of DSM hearings at an early date, certainly some time in 2006.
>
> (NDP, Redacted Closing Submission, p. 9)

[463] SEB, in its Closing Submission, expressed concern about the timing of the submission of the Plan, stating that the Plan did not provide sufficient time to review and cross-examine the Company. SEB also questioned the allocation of DSM costs to below-the-line customers, especially ELIIR customers. SEB's recommendation is that a separate and more focused DSM proceeding be held before the Board approves the Plan.

---

[163] Province, Redacted Closing Submission, para. 57

[464] The Nova Scotia Liberal Caucus, in its Closing Submission, noted that NSPI needs to do more in its Plan to provide real reductions in energy use. It is their view that consultation with professionals in this field is required to achieve the desired results.

[465] Dr. Stutz described his opposition to the Plan as follows:

> ... NSPI has included five million in required revenues to fund its conservation and energy efficiency plan for 2006. The plan was filed on November 7 as part of the company's rebuttal. The plan is 54 pages in length. It contains large amounts of data, and the results of technical analyses. Work papers explaining and supporting the plan have not been filed. There has been no opportunity for parties to submit information requests on the plan or to address it in their evidence. In 2004 and 2005, NSPI spent about five hundred and fifty thousand dollars ($550,000) on energy efficiency and conservation. The 2006 plan calls for a roughly tenfold increase. A thorough review is appropriate. This can best be accomplished through a separate hearing to be held early in 2006. Until such a hearing is held, there is no reasonable basis for approving funding for the 2006 plan. Funding for energy efficiency and conservation at the level of 2004/2005, that is, five hundred and fifty thousand dollars ($550,000), should be approved now to permit work on conservation and energy efficiency to continue. In its decision and order in the hearing just mentioned, that is, the hearing to be held in early 2006, the Board could authorize additional spending in 2006 on the 2006 plan, subject to deferred cost recovery if that proves appropriate.
>
> (Transcript, December 2, 2005, pp. 3511-3512)

7.1.4 Findings

[466] The Board has considered all the evidence provided during the hearing including the comments expressed at the public sessions on November 23-24, 2005, and final submissions.

[467] The Board has reviewed the DSM Plan submitted by NSPI and commends its effort in preparing the Plan, including conducting deliberative polling, forming a stakeholders committee and seeking customer input at the Company’s customer forum. All intervenors and consultants generally agree that DSM is important and that it ought to be pursued. However, most of them have raised issues with the lack of analysis in the

Plan and its late filing. The Plan was filed with the Board as part of NSPI's Rebuttal Evidence on November 8, 2005, and proposes an increase of $5 million annually, a tenfold increase over the current level of spending on DSM.

[468] The Board understands that the Company's request is for the approval of an additional $5 million annually, but it is not seeking approval of the details of the Plan as submitted. Board Counsel clarified this issue during cross-examination of NSPI's witnesses:

> Q. Just to follow up on that point of clarification by Mr. Gallant that NSPI is looking for approval of the budget but not approval of the plan, what control does the Board have over the spending of that $5 million dollars if the plan elements are not vetted and approved?
>
> A. (Tedesco) For this hearing we've put forth our proposal. Upon listening to stakeholders and participants in this hearing, the Board can clearly decide what it thinks is in the best interest of our customers and how best to invest that money.
>
> Q. But you're not looking for approval of any specific plan elements?
>
> A. (Tedesco) The plan represents our recommendation, and as was said a moment ago, we're really looking for input from customers. We sought to put forward a specific plan that identified how we might invest the money based on what we heard or what we thought we heard from customers. We also recognize the Board may have other interests and perspectives that need to be considered, and I would view it as really no different than any other investment of this magnitude that the company might undertake.
>
> THE CHAIR
>
> Excuse me, Mr. Tedesco. How does that differ from if the Board requests -- if NSPI requests the Board to approve a capital expenditure, how do you see the difference between that and this scenario?
>
> MR. TEDESCO
>
> I think the analogy is quite similar, that I would view this in a similar sort of way, that it's a significant amount of money, the company in the case of a capital expenditure would put forward a plan, the Board may have questions about it, the plan may be modified as a result of information that is discussed and provided to the Board, and we understand that and I would look at that as the normal course of events.
>
> THE CHAIR
>
> But the Board would normally approve the capital expenditure after reviewing the economic scenarios, et cetera.

MR. TEDESCO
That's right.

THE CHAIR
But you're not asking in this case the Board to approve this particular plan?

MR. TEDESCO
We're not asking that this specific plan be approved, we're simply seeking to demonstrate that we've put forward -- now we have given some thought to how we would propose investing this money. We also recognize that others may have different opinions.

(Transcript, November 16, 2005, pp. 517 - 519)

[469] A number of intervenors have argued that the Plan was submitted too late in the process, and they did not have sufficient time to review and prepare their evidence in relation to it. They assert that the Plan contains technical information and required input from their experts, who did not have sufficient time due to the Plan's late filing.

[470] The Province, however, supports the Plan on the basis that the Company has followed a stakeholder driven process and that the Plan provides sufficient details for approval by the Board. The Province is recommending approval along with an independent review by an outside firm after the first year of implementation to confirm whether the Plan is on track. The Province has also stated in its Closing Submission that, in the event the Plan is not approved, the Board approve funds to retain an outside consultant to finalize the Plan.

[471] Ms. Brockway opposes the Plan, but recommends approval of $550,000 to retain an outside consultant to finalize the Plan. It is also her view that there are additional opportunities which need to be explored, and which could be more effective than those proposed in the Plan.

[472] Dr. Stutz testified that the Board should approve additional funds in the amount of $550,000. When cross-examined by Mr. Connors, he explained that this amount would keep "... the design and development process moving, and it's out of that that I would expect the consultant and other activities to be funded."[164]

[473] The Board, having considered all the evidence, agrees that approval of the Plan, as submitted by NSPI, is premature at this time. Clearly, the Plan needs additional design work and resources. It is important that DSM move forward, but not without regard to its cost effectiveness. NSPI customers expect that any DSM program will be carefully designed to ensure its maximum impact, and that it is effectively implemented. The Board concurs with Ms. Brockway and Dr. Stutz that a DSM program requires expert input. Accordingly, the Board approves $550,000 in additional funds (and not the $5 million requested by NSPI) to retain an outside consultant and to complete the Plan's design and development.

[474] NSPI is directed to prepare the terms of reference for the consultant and submit them to the Board for approval no later than April 15, 2006. The terms of reference shall contain the procedures for identifying and selecting the consultant who will assist NSPI in the finalization of the DSM Plan. The process of retaining and selecting the consultant will be monitored by the Board.

[475] A number of intervenors have raised the issue as to whether NSPI should be implementing the Plan. This is based on their view that the Company may be in a conflict

---

[164] Transcript, December 2, 2005, p. 3566

of interest position since its business involves the generation and selling of electricity, and pursuing its shareholder interests. The objectives of DSM are demand reduction and energy efficiency, which may conflict with the Company's mandate (i.e., sell more electricity). The Board does not have a view on this issue at the present time and directs that it be part of the mandate of the outside consultant, and that appropriate recommendations be included in that consultant's report.

[476] The Board has considered the suggestion from intervenors that a separate hearing be held on DSM in 2006. NSPI, however, has stated that enough input has been received from its customers and stakeholders with respect to the types of programs they desire, and their anticipated impact. The Board agrees that insufficient time was afforded to intervenors to fully review and evaluate the Plan. In addition, given the resources and time required to allow a fair review, a separate hearing on DSM is appropriate. The Board orders that a separate hearing on DSM be held in the second half of 2006.

[477] The Board understands that to start the hearing process, the Plan needs to be finalized. The Board orders that NSPI complete the Plan and file it with the Board no later than June 30, 2006, utilizing the assistance of the Board approved consultant.

8.0 DEPRECIATION

8.1.1 Submissions - NSPI

[478] NSPI, in its application, forecasts depreciation expenses of $128.8 million for the 2006 test year. This increase is explained by the Company as follows:

> Depreciation expense has increased by $9.0 million to $128.8 million between 2005C and 2006. The increase principally results from:
>
> - The continued phase in of revised depreciation rates previously approved by the Board. The 2006 test year revenue requirement is calculated based on the second year of the four year phase-in of depreciation rates approved by the Board in its Decision dated November 21, 2003 in NSUARB-NSPI-P-879.
> - Capital additions approved by the Board since December 31, 2004.
>
> (Exhibit N-1, p. 106)

[479] The proposed depreciation expense also includes year two of the four year phase-in of new depreciation rates which is estimated at $6.6 million.

> The UARB approved the Settlement Agreement (Decision dated November 21, 2003, and Order dated December 23, 2003, in NSUARB-NSPI-P-879) and ordered an increase in depreciation rates for NSPI's depreciable property. As unanimously agreed by all parties, the Board directed that the increase in depreciation rates would be phased in over four years in equal instalments commencing January 1, 2004. In its decision in the 2005 Rate Application, the UARB deferred the phase-in by an additional year. This reduced the 2005 revenue requirement by $6.0 million.
>
> (Exhibit N-1, p. 106)

8.1.2 Submissions - Intervenors

[480] The Municipal Electric Utilities of Nova Scotia Co-operative, the only intervenor to express a view on this issue, is of the opinion that the postponement of the second year of the four year depreciation rates phase-in is more appropriate this year than last year, given the proposed increase in rates:

> If this was appropriate in a 12.4% increase world (NSPI's request for 2005 rates) surely it is even more appropriate for the 2006 proposal of 14.7%. Depending on future rate increase requirements for 2007 and 2008, how this phase-in is to be finally accomplished should be reviewed once these are known. Delaying the year 2 phase-in again will reduce the additional revenue requirement by some $6.6 million (NSPI Direct Evidence Pg. 107 line 3).
>
> (MEUNSC, Redacted Closing Submission, p. 4)

8.1.3 Findings

[481] In the 2005 rate decision, the Board deferred, for one year, the second year of the four year phase-in of the increases in depreciation rates. The deferral was based on the proposed increase in rates and potential rate shock to customers.

[482] In the present application, the Company is proposing an average rate increase of approximately 13% (modified from 14.79% after the natural gas settlement). In the 2005 rate case, the proposed average rate increase was 12.4%. The Board was concerned about the size of proposed increases and rate shock impact on customers. The Board is faced with a similar dilemma this year.

[483] NSPI, in its closing submission, argues that currently there is a shortfall of about $35 million in depreciation expenses, and that any further postponement will add additional expense to the customers:

> During its March 31, 2005 decision, the UARB delayed the phase-in by one year and some intervenors have suggested through their questions in this rate proceeding that an additional deferral may be appropriate. Based on the most recent depreciation study, annual depreciation expense is at least $35 million less than it should be. As the UARB believes more timely depreciation studies should be carried out (and were in fact carried out), then it should be prepared to accept the increases in depreciation expense that were determined. Otherwise the exercise adds additional expenses without any actionable response. Appropriate recovery of capital expense is not only essential from a cash flow perspective but

> also important component in raising capital to finance the significant capital requirements that NSPI will face over the balance of the decade.
>
> (NSPI, Redacted Closing Argument, p. 84)

[484] The Board appreciates the concern expressed by the MEUNSC with respect to the proposed rate increases and their impact on the customers. The Board, in the 2005 rate decision, deferred the second year phase-in of the four year increase in depreciation rates for one year on the understanding that the increase would be resumed in the following year. The Board is also mindful of the issue raised by NSPI that the new depreciation rates should be in place before major upgrades to the generating stations are completed and become part of the Company's depreciable assets.

[485] The Board, having considered all the evidence, approves the resumption of the four year phase-in of depreciation rates in the 2006 test year.

9.0 RATES

9.1.1 Overview

[486] This section deals with the process to determine customer rates based on the Board's approved revenue requirement for NSPI. The revenue requirement approved by the Board is lower than that applied for by NSPI, making the resulting rates lower than those proposed by the Company. NSPI is directed to incorporate these changes and submit a Compliance Filing for the Board's approval.

[487] NSPI customers fall into two categories, above-the-line ("ATL") and below-the-line ("BTL") or Annually Adjusted Rates ("AAR"). BTL rates are adjusted annually based on pre-defined methods or existing agreements. NSPI normally makes an application to the Board no later than November 1 for approval of rates effective January 1 of the new year.

[488] ATL rates, on the other hand, are only changed by the Board upon application by the Company, and after a full public hearing. Otherwise, they remain the same indefinitely.

[489] The rate changes for all above-the-line (ATL) rates are to be effective March 10, 2006, and the rate changes for all the below-the-line rates are to be effective January 1, 2006.

10.0 ANNUALLY ADJUSTED RATES/BELOW-THE-LINE RATES

10.1 Overview

[490] NSPI submitted its proposed 2006 AARs for approval on August 5, 2005, earlier than the normal November 1 filing date. NSPI described the reason for the earlier filing as:

> ... This is in order to provide the opportunity for full review in conjunction with NSPI's 2006 Rate Application filed with the Board on June 28, 2005, and to enable the rates to be in effect as of January 1, 2006, the normal effective date for AARs.
>
> (Exhibit N-155, August 5, 2005 letter)

[491] NSPI currently has the following AARs available for its customers:

- Mersey System Rate[165]
- Generation Replacement and Load Following Rate (GRLF)
- One-Part Real Time Pricing Rate (1P-RTP)
- Two-Part Real Time Pricing Rate (2P-RTP)
- Extra Large Industrial Interruptible Rate (ELIIR)

10.2 Generation Replacement and Load Following Rate

[492] The Generation Replacement and Load Following Rate ("GRLF") is designed to provide load following and back up service to large customers who own their own generation facilities or otherwise qualify for the rate. These are two separate rates: the Generation Replacement Rate is used in case of interruption to the customer's own

[165] The Mersey System Rate is governed by a separate contract.

generation, and the Load Following Rate is used for additional load required by the customer above its own generation capacity.

10.2.1 Submissions - NSPI

[493] NSPI proposes a 2006 Load Following Rate of $71.60/MWh compared to the 2005 rate of $61.60/MWh.[166] NSPI states that this rate has been computed using the Strategist model to compare a "base case" with a "25 MW decrement case" as in previous years plus a $5/MWh adder. NSPI submits that the reasons for the increase are:

- increases in heavy fuel oil and natural gas prices
- a higher percentage of the time when the marginal cost is determined by oil or gas fired generation

[494] The Generation Replacement Load rate is to be calculated similar to previous years as a sum of a $5/MWh adder and the actual marginal cost for the period of time under which the customer's generation is out of service.

[495] The GR and LF rates are calculated based on the assumption that there is no export of electricity from the system.

10.2.2 Submissions - Intervenors

[496] The Board did not receive any submission commenting specifically on the GRLF rate.

---

[166] Exhibit N-155

10.2.3 Findings

[497] The Board has not received any evidence in opposition to NSPI's proposed GRLF rates and they have been calculated as in previous years. Accordingly, the 2006 GRLF rates proposed by NSPI are approved by the Board effective January 1, 2006.

10.3 Real Time Pricing Rate (1P-RTP)

10.3.1 Submissions - NSPI

[498] NSPI has three "one-part" RTP tariffs, one for each of three voltage levels (Extra High Voltage, High Voltage and Distribution Voltage) at which RTP customers may be served.[167] All three tariffs consist of on-peak and off-peak adders set in advance, plus marginal costs as they occur. The Board annually approves adjustments to these adders. NSPI states that the proposed adders have been calculated using the same methodology as in previous years.

[499] NSPI provided the following comparison of the proposed 2006 adders to those approved by the Board for 2005:

---

[167] Exhibit N-155, August 5, 2005 letter, p. 4

Comparison of On-Peak Adders				
	On-Peak Adder (Cents/KWh)		Off-Peak Adder (Cents/KWh)	
	Proposed 2006	Approved 2005	Proposed 2006	Approved 2005
Extra High Voltage	6.025	5.416	0.292	0.274
High Voltage	6.027	5.665	0.537	0.527
Distribution	8.359	8.171	2.149	2.102

[500] In addition, NSPI submits that some clarification is required of the demand level to be used to compute the transformer ownership credit in the Extra High Voltage 1P-RTP tariff. The demand level is used in applying the transformer ownership credit when 1P-RTP is used along with ELIIR. NSPI explains that when maintenance is scheduled by the customer and, if the customer remains at the normal peak value for an hour after the maintenance is scheduled to commence, the customer receives an unwarranted discount.[168]

[501] NSPI is proposing to clarify this by adding a sentence (to be inserted immediately following the transformer ownership clause in the Extra High Voltage Time of Use, Real Time Price Tariff) as follows:

> When used with the Extra Large Industrial Interruptible Rate (ELIIR), this credit is to be applied to 1P-RTP demand levels which occur when the customer's ELIIR UET is set at normal, and not reduced levels as during shutdown periods as permitted under the ELIIR tariff.
>
> (Exhibit N-155, August 5, 2005 letter, p. 4)

---

[168]Exhibit N-25, UARB IR-16, Attachment 1, p. 27

10.3.2 Findings

[502] There were no intervenor submissions on either the proposed increase in the 1P-RTP adders or the proposed amendment to the tariff. The Board approves the adders and the tariff addition proposed by NSPI to be effective January 1, 2006.

10.4. Two Part Real Time Price Rate (2P-RTP)

[503] The Two Part Real Time Price (2P-RTP) Rate was first approved by the Board in its decision dated November 21, 2003, at the request of NSPI and its customers. The rate was to be initially available to users of the Extra Large Industrial Interruptible Rate (ELIIR) and later to users of the Large Industrial Rate. The Board understands that so far this rate has only been used by ELIIR customers.

10.4.1 Submissions - NSPI

[504] NSPI, in its application, has indicated that the two ELIIR customers are expected to take load under 2P-RTP in 2006. The actual load for 2006 was uncertain, but NSPI has assumed sales of 218 GWh and estimated revenues of $13 million in calculating rates for 2006. The average net rate for 2P-RTP is expected to be $60.80/MWh.

[505] NSPI is also proposing a tariff wording change to address an item identified by NSPI in its July 11, 2005 status report to the Board on AARs.[169] The issue concerns the amount of economic interruption permitted under the ELIIR tariff when a customer uses

[169] Exhibit N-25, UARB IR-16

ELIIR in combination with 2P-RTP. The amount of economic interruption is determined by the amount of operational Tariff Demand (where Tariff Demand is the amount of load subscribed to under the ELIIR tariff) which can be at a lower value than the Tariff Demand used to compute the customer's alternative cost.

[506] It is NSPI's position that, by setting a lower Tariff Demand for operational use, the customer is able to partially escape the obligation to interrupt but keeps the economic benefit of ELIIR pricing.[170] This means a loss to NSPI in terms of its ability to avoid some of the high cost combustion turbine production and these costs then have to be reflected in the revenue requirement for ATL customers. NSPI's proposed solution is to add back these financial costs into the 2P-RTP tariff calculations, thereby charging them to the ELIIR customers.

[507] NSPI proposes that the following wording be added to the "Forecast ELIIR Cost (FEC)" section of the 2P-RTP tariff:

> When a customer utilizing the ELIIR in combination with 2P-RTP nominates a UET_{OP} that is different than the $UET_{CAC,}$ the difference between these UETs (ie: a modified TD) is to be multiplied by the ELIIR economic interruptibility (EI) factor (ie: 0.31 GWh/MW) to determine the change in the quantity of EI energy available. This energy quantity is to be multiplied by the average CT/High Cost Import unit cost (ie: $/MWh) forecast for the year in which the rate will be in effect, to determine the value of the modified EI. This dollar value is then to be subtracted from the FEC to determine a "TD Adjusted FEC" for use in determining the CBLbc required.
>
> (Exhibit N-155 and modified by NSPI response to SEB IR-151)

[508] NSPI states that 'net cost' here means the average cost of CT/High Cost Import less the CBL base rate for energy.

---

[170] Exhibit N-25, UARB IR-16, Attachment 1, p. 26

[509] NSPI stated in its Rebuttal Evidence that it is not proposing to increase the revenue from 2P-RTP, but is merely seeking to achieve the revenue provided by the approved 2P-RTP rate. NSPI explained the issue further as follows:

> This issue revolves around Special Condition 3 of the 2P-RTP Tariff. Special Condition 3 was added to the tariff at SEB's request on the morning of the Hearing at which it was reviewed. NSPI required that the last sentence of this clause be added as a result of this last-minute change to the tariff proposed by SEB. In fact the Hearing was delayed for some time while these negotiations were held.
>
> SEB proposed that the annual quota defining how much energy could be interrupted by NSPI for economic reasons should be calculated using the lower UET_{OP} and not the UET_{CAC}. NSPI recognized that this would result in a reduced availability of economic interruption while at the same time providing a reduced rate to the 2P-RTP customer that would have required a higher level of interruptibility. In order to ensure that ATL customers did not pay more as a result of this, NSPI requested the inclusion of the last sentence of Special Condition 3 which requires that any adjustment of the UET_{CAC} not undermine the value of ELIIR or the three principles which underpin 2P-RTP. NSPI has applied the 2P-RTP tariff consistent with Special Condition 3, requiring 2P-RTP customers to pay for the reduced availability of economic interruptibility in exchange for the lower rate they are provided when they reduce the UET that was used to develop the original CAC rate.
>
> NSPI is not proposing to change the 2P-RTP tariff. The Company is seeking to modify the wording of the tariff to more clearly state the original intent of special condition 3.
>
> (Exhibit N-153, pp. 105 -106)

10.4.2 Submissions - Intervenors

[510] SEB presented evidence from Dr. Rosenberg on the 2P-RTP rate. Dr. Rosenberg does not agree with NSPI's proposal to change the tariff. In his evidence he states:

> ... In the first place the 2P-RTP tariff was meticulously crafted after very extensive negotiations and much give and take on both sides, and with the active assistance of Dr. Stutz. The tariff, which was agreed to by all parties and approved by the Board, explicitly states that:
>
> - The TD_{op} can be, and indeed must be, different than the TD_{CAC}.
> - The RTP energy is not subject to economic interruption
> - No extra charges are contemplated for these imaginary economic interruptions.

> In the second place, NSPI's proposal, if adopted would literally destroy its touted RTP program before it has even been allowed to begin.
>
> (Exhibit N-91, p. 35)

[511] Dr. Rosenberg explained his reason for stating that the 2P-RTP program would be destroyed by providing a computation showing that by switching from ELIIR/2P-RTP to the Large Industrial Interruptible Rate (LIIR), the total charges for a hypothetical customer would be lower under LIIR than under EIIIR/2P-RTP with NSPI's adjustment, plus the customer would not have to incur either economic or priority supply interruptions.

[512] SEB states that:

> NSPI's position on this matter is, with respect, without foundation. As Dr. Rosenberg makes plain in his evidence, both the words of the Tariff and the underlying purpose of the RTP program belie the validity of NSPI's position.
>
> (SEB Submission on Non-Fuel Matters, p. 27)

[513] SEB computes (using the NSPI response to SEB IR-151) that, for the 250 MW load of SEB, the language change proposed by NSPI would result in the customer paying $5.75 million more annually.

[514] SEB requests that the Board clarify that SEB's interpretation of the tariff is correct or, alternatively, reject NSPI's proposal and allow the parties to bring the matter before the Board to argue the issue in a full and complete manner.

10.4.3 Findings

[515] The Board has considered the evidence of NSPI and SEB and understands that the issue is intertwined between the 2P-RTP and ELIIR rates. It is also the Board's

understanding that only ELIIR customers have signed on for the 2P-RTP rate as of the date of hearing.

[516] The Board, for reasons set out later in this decision, has ordered a separate hearing on the ELLIR rate or its successor rate, to fully review the impact of the current situation on the Company and the ELIIR customers.

[517] Special Condition 3 of the 2P-RTP tariff currently reads as follows:

> In the event that the ELLIR rate (with or without 1P-RTP) is used to calculate the Customer's Alternative Cost (CAC), the UET rather than the UET $_{(CAC)}$ will define the level of economic interruption. The UET will be set at a level which will not undermine the value of ELIIR or the three principles which underpin the 2P-RTP.

[518] Special Condition 3 refers to three principles which underpin the 2P-RTP. The three principles are set out in the Board's decision dated August 1, 2003.[171] The Board stated that:

> [143] NSPI's proposed changes to the RTP rates were the subject of discussion prior to and during the hearing in an effort to reach a consensus on an acceptable set of RTP rates. While a specific rate design was not agreed upon, NSPI, SEB and Dr. Stutz, agreed to continue discussions and attempt to develop a rate for presentation to the Board during the next general rate case. This agreement was set out in Exhibit N-22 and reads as follows:
>
> > Nova Scotia Power/Bowater Mersey/Stora Enso/Dr. John Stutz
> >
> > Statement Regarding RTP
> >
> > We have agreed to develop an alternative load shifting rate option, the principles of which are:
> >
> > 1. Under this option the customer who shifts load will never pay more than the customer would have paid under the customer's real alternative rate.
> >
> > 2. The rate will be the customer's best option without shifting, less the value to NSPI of the shift.
> >
> > 3. Above the line customers will be kept whole.

---

[171] NSUARB NSPI-P-878

The parties will continue their discussions and ask the Board not to make a final decision on RTP issues pending the presentation by NSPI of a specific proposed rate option in the next general rate case consistent with these principles.

6.4 Findings

[144] The Board notes that the evidence presented during the hearing focused on the problems associated with the RTP rate. The Board concludes that there are no major concerns with respect to the price signals associated with the other below-the-line rates and, therefore, no modifications to other rates are required at this time. The Board recognizes that there were a variety of concerns presented with respect to the RTP rate and it appears clear that the rate, as presently structured, does not function as intended.

[145] The Board is satisfied that the principles set out in the above Statement form a suitable basis for the development of an acceptable RTP rate design. Accordingly, the Board agrees to defer the RTP rate design issue until the charges for the ELIIR are approved. It is the Board's understanding that the parties will continue to work towards reaching a consensus on the RTP rate design. The Board also agrees with the comments of several Intervenors, who were not involved in the negotiations resulting in the Statement, that "...the next round of RTP discussions involve all existing and former RTP customers, potential new RTP customers and any interested stakeholders". The burden will, of course, be on NSPI to justify its proposed rate to the Board.

(Board Decision, Generic Rate Hearing, August 1, 2003, para. 143-145)

[519] The Board had a follow up hearing in October/November 2003 to consider approval of the Real Time Price Rate Design, AAR's for 2002, 2003, 2004 and ELIIR charges for 2004.

[520] The Board, in its decision dated November 21, 2003[172], noted the process followed by NSPI and intervenors to achieve a unanimous agreement on these issues:

[12] Following a series of meetings between NSPI, SEB and Dr. Stutz, NSPI filed revised Supplementary Evidence (Exhibit N-26), dated November 3, 2003, which outlines a settlement agreement between the parties with respect to the AARs and the development of a new 2P-RTP which would operate in addition to the existing RTP (1P-RTP) rates and provide greater flexibility for customers.

[13] At the hearing on November 4, 2003, Mel Whalen, Director of Regulatory Affairs and Rates for NSPI, read into the record an agreed-upon revision to Appendix A-1 of Exhibit N-26. Mr. Whalen confirmed that Exhibit N-26, with the revision noted, constituted the final

[172] NSUARB-NSPI-P-879

settlement agreement with respect to AARs for the period in question, and the new 2P-RTP. The settlement agreement, including the revision noted by Mr. Whalen, is attached in its entirety as Appendix C to this decision. NSPI also advised that 2P-RTP component of the settlement agreement conforms to the three principles endorsed by the Board in its August 1, 2003 decision on Generic Rate Design, *supra.*

[14] According to Exhibit N-26, the parties agree on the main points of contention with respect to the 2P-RTP, namely the methodology used to establish the Customer Baseline Load ("CBL") and the issue of exports. Further, NSPI's evidence states that:

> NSPI would note that while the proposed settlement agreement was partially arrived at on an issue by issue basis, it was, for the most part, developed as a total package which results in adjustments to both the 2P-RTP proposal and certain of the AAR's.
>
> The issues addressed by this settlement agreement with respect to the AAR's primarily impact 2003 and 2004, neither of which is expected to be a rate case year. The proposed settlement, and its associated financial impact therefore, will not affect any above-the-line customers.

[15] The highlights of the settlement agreement, with respect to the new 2P-RTP, include allowing the customer to propose alternative methods of developing an Annual Hourly Load Shape ("AHLS"), and the CBL, with the burden on the customer to show the resulting AHLS and CBL are reasonable; eligible customers must choose either the 1P-RTP or the 2P-RTP; use of a twenty-minute ahead forecast of system marginal costs, excluding electricity export impacts; and the inclusion of a provision for export margin sharing.

...

[17] Dr. Stutz filed evidence dated October 20, 2003 and October 24, 2003 (Exhibits N-27 and N-28) concerning his recommendations for the AARs and the proposed 2P-RTP. He also gave evidence at the hearing regarding his support for the settlement agreement, as revised. His opening statement (Exhibit N-29) states as follows:

> NSPI and SEB have reached an agreement ("the Settlement") which provides a Two-Part Real Time Price (2P-RTP) rate design and resolves all of the issues related to the Annually Adjustment Rates (AAR's). I participated in the negotiations which led to the development of the Settlement. In my view, the Settlement provides a reasonable resolution of the issues raised in this proceeding for all years through 2004. I urge the other parties to support the Settlement, and the Board to adopt it in its Decision and Order.
>
> The Settlement addresses the issues raised in my evidence and resolves them in a reasonable fashion:
>
> • For the 2P-RTP rate, I recommend adoption of NSPI's proposed rate design with six changes. The settlement adopts NSPI's proposal with all of my changes.

- While the Incremental Export Benefit credit differs in formulation for my proposed Export allowance, it is reasonable. The 15% cap provides a benefit to other ratepayers absent in my proposal.

- I recommended that exports be excluded when calculating GRLF, IEIR and ELIIR charges. The Settlement incorporates this change for 2003, and 2004.

The three points just listed address the major concerns raised in my evidence. The Settlement also provides for a downward adjustment of approximately [$]800,000 to the Mersey and IEIR rates. This adjustment settles a number of remaining issues including items b), c), and d) listed in Appendix B of NSPI's supplemental Evidence. Based on my participation in the negotiations, I believe that such an adjustment was the only way to settle these issues, and that the result produced by the adjustment is reasonable. In particular, without any admission by NSPI or any finding against NSPI on the merits, the adjustment addresses the 2002 AAR's and the interruptible load for 2003 in a fashion consistent with my evidence on these matters. Based on my review of all the issues in this proceeding, including those raised by Dr. Rosenberg in his evidence concerning the 2004 AAR's, I believe the adjustment, together with the other parts of the Settlement, produces a reasonable result.

[18] Those Intervenors who participated in the AAR and RTP rates phase of the proceeding confirmed to the Board that they agreed with the settlement proposal negotiated between NSPI and SEB, with the assistance of Dr. Stutz. Those supporting the agreement include ECANS, CME, MEUNSC, the Province and Quetta. While every Intervenor to the proceeding as a whole is not included in this group, all those Intervenors present for the AAR and RTP phase of the hearing did indicate their support for the settlement.

(Board Decision, November 21, 2003, para. 12-18)

[521] The Board approved the unanimous agreement submitted by all parties and concluded that:

FINDINGS

[19] The Board has carefully reviewed all the evidence presented with respect to the AARs's and RTP rates in this proceeding. The Board particularly notes that those Intervenors, including ECANS, CME, MEUNSC, the Province and Quetta, who have an interest in these matters, support the settlement agreement. The Board also notes that Dr. Stutz, who independently reviewed the agreement, is satisfied that the agreement represents "... a reasonable result." As is the case with the agreement on depreciation, the Board notes that, in the absence of a general rate application, this agreement has no impact on rates for above-the-line customers. The Board also is aware that the agreement achieved is the result of an extensive consultation process between NSPI and the below-the-line customers who are potentially impacted by the adjustments, together with input from Dr. Stutz.

...

> [22] These comments apply equally to this phase of the hearing. In view of the support of the agreement by those Intervenors with an interest in this phase of the hearing, and in view of the evidence of Dr. Stutz, the Board is satisfied that the proposed methodologies for calculating and applying the AARs and the 2P-RTP are fair and reasonable. Accordingly, the Board finds it is both reasonable, and in the public interest, to approve the settlement proposal. The Board accepts the settlement proposal as outlined in Exhibit N-26 and revised by Mr. Whalen (Appendix C), and approves, in principle, the revisions to the AARs and the proposed new 2P-RTP which will result from the application of the revised settlement agreement to the formulation of these rates.
>
> (Board Decision, November 21, 2003, para. 19-22)

[522] The Board understands that NSPI's proposed addition to the 2P-RTP tariff is to satisfy the third principle of the 2P-RTP design that "above the line customers will be kept whole". SEB, on the other hand, is suggesting that if the proposed addition is approved, the cost to ELIIR will rise.

[523] The Board has reviewed its previous two decisions, noted above, in which the 2P-RTP was approved. It is the Board's view that the three principles under which this rate was approved and, unanimously supported by all parties, clearly state that the above the line customers are to be kept whole.

[524] The language in the current 2P-RTP tariff was the subject of detailed discussion. It was supported by both NSPI and SEB when originally implemented.

[525] The Board has decided that ELIIR will be substantially redesigned for 2007. The redesign will affect the 2P-RTP rate used in conjunction with ELIIR.

[526] In light of the unanimous support for the language in the existing 2P-RTP rate and the likelihood of substantial change effective January 1, 2007, the Board has decided not to approve any changes in the tariff wording at this time. The Board approves the 2P-RTP rate in its current form effective January 1, 2006.

10.5 Extra Large Industrial Interruptible Rate (ELIIR)

[527] ELIIR was first approved by the Board in 2003[173] and is available to large industrial customers who have a service voltage of at least 138 kV, and are subject to supply interruptions and economic interruptions as per the Board approved tariff.

[528] SEB is proposing a new BTL rate, known as the FP-DSM/DR rate, as defined below, to replace the ELIIR rate. The new rate is described as being cost-based.[174] Dr. Stutz is proposing that for 2006 an interim ELIIR rate be approved based on the LIIR with credit for economic interruptibility and that the Board hold a hearing in 2006 to approve a new BTL rate, which will be a successor to ELIIR.

10.5.1 Submissions - NSPI

[529] NSPI proposes that, for the period January 1, 2006 to December 31, 2006, the ELIIR monthly customer charge be set at $24,100 and the energy rate be set at $60.80/MWh, assuming an 85% load factor level.[175] NSPI states that the customer charge and energy rate have been calculated using the original formula approved by the Board in 2003, and that the resulting increases are driven by higher fuel costs.

---

[173] NSUARB-NSPI-P-877

[174] Exhibit N-61, p. 14

[175] Exhibit N-155, August 5, 2005 letter, p. 5

[530] NSPI also states that, if ELIIR customers provided accurate hourly demand forecasts on a day ahead basis, benefits would accrue to all customers. NSPI requests that the following Special Condition 5 be included in the ELIIR tariff:

> The customer shall, by 10 am each day, provide NSPI's operations personnel with accurate hourly demand forecasts on a day-ahead basis. These forecasts will provide ongoing 168 hour (7 day ahead) energy requirements. The customer is to alert NSPI of any known changes to this forecast with a minimum of three hours advance notice on the day such changes are required.
>
> (Exhibit N-155, August 5, 2005 letter, p. 5)

[531] NSPI responded to the Forest Product-Demand Side Management - Demand Reduction ("FP-DSM/DR") rate (described below) proposed by SEB as follows:

> The rate proposed by Bowater Mersey Paper Company and Stora Enso Port Hawksbury Limited (respectively 'BMPC" and "SEPH" and collectively "SEB") is not cost based. The rate produces less than the cost of service and provides less BTL revenue.
>
> In order to maintain recovery of the necessary revenue requirement if SEB's rate proposal is accepted, the revenue shortfall must pass to other customer classes. NSPI's estimate of the shortfall in revenue from BTL rates plus associated increases to fuel costs that would result, is an increase to ATL classes of approximately $33-35 million.
>
> Given the legislative entitlement of NSPI to recover its cost of service, approval of the SEB proposal requires the Board to determine if it is appropriate to approve a rate that provides for such an increase to other rate classes. NSPI expects that other customers and stakeholders will have comment for the Board to consider in making this decision.
>
> (Exhibit N-88, pp. 1-2)

[532] Board Counsel explored NSPI's position on what "standard" it used to determine if BTL rates have met the cost of service test. The following exchange occurred during his cross examination of the NSPI's rates panel:

> Q: Now, just turn to page 2, if you would, under Item 2, "Cost of Service," the second paragraph, and this has been restated a number of times in various ways both in your evidence here and in other parts of the pre-filed. It says:
>
> > "The proposed SEB rate would not recover the associated cost of service."

And as I understand it– and we discussed this previously–when you say "cost of service" in the context of this rate, you're talking about the cost of service reflected in the formula?

A: (Boutilier) Yes, and the inputs to that formula which are—

Q: And the inputs to that formula.

A: (Boutilier) ---- based on cost, yes

Q: And that's always the standard that you're referring to when you talk about cost of service and costs being shifted to other customers?

A: (Boutilier) Yes, there are very explicit costs in that formula and NSPI's projection of those costs for 2006 are used explicitly.

(Transcript, November 15, 2005, pp. 367-368)

[533] NSPI addressed both the FP-DSM/DR rate and Dr. Stutz's proposed new rate to replace the current ELIIR in its Closing Argument. NSPI argued that it has computed the 2006 ELIIR rate in accordance with the Board approved formula and forecast costs for 2006. Adoption of the FP-DSM/DR rate as proposed by Dr. Rosenberg is not cost based and would result in the transfer of $33 to $35 million to ATL customers.[176]

[534] As to Dr. Stutz's proposed new rate (see discussion below), NSPI states that it is an inadequate compromise between the ELIIR rate computed by NSPI and the SEB proposal. It would require ATL customers to pay an additional $13.1 million.[177] NSPI referred to Dr. Stutz's statement in which he is proposing "to make an adjustment on an admittedly somewhat ad hoc basis to get a result which I believe is reasonable for 2006."[178] NSPI stated that this ad hoc proposal violates many of Bonbright's principles of a sound rate structure and urged the Board to reject the proposed rate.

[176]NSPI, Redacted Closing Argument, p. 79

[177]NSPI, Redacted Closing Argument, p. 80

[178]Transcript, December 2, 2005, p. 3559

[535] NSPI also recommends that the Board should direct that a proper process of rate design making take place for ELIIR and 2P-RTP in 2006.[179]

10.5.2 Submissions - Intervenors and Dr. Stutz

[536] SEB (Stora and Bowater) are currently the only customers on the ELIIR rate. Witnesses for SEB included Elizabeth Beal, President and CEO, Atlantic Provinces Economic Council, who provided evidence on the importance of the forest industry to the economy of Nova Scotia. Her view is that the forest industry is a vital contributor to the economy of Nova Scotia.

[537] Dr. Rosenberg, on behalf of SEB, filed evidence on September 19, 2005[180], in which he proposed a new rate to replace the ELIIR rate. He also filed evidence on October 17, 2005[181] in which he proposed modifications to the inputs used by NSPI to compute the ELIIR rate.

[538] In addition, Dr. Rosenberg commented on NSPI's proposed Special Condition 5 (day ahead forecasts) for the ELIIR rate, stating that SEB would be willing to make efforts to help NSPI lower its fuel costs in the future, but it would only be fair that it be part of a viable and economic rate.[182]

---

[179]NSPI, Redacted Closing Argument, p. 83

[180]Exhibit N-61

[181]Exhibit N-91

[182]Exhibit N-91, p. 37

Forest Product - Demand Side Management/Demand Reduction Rate (FP-DSM/DR Rate)

[539] Dr. Rosenberg describes SEB's reasons for proposing a new rate as follows:

> Both Stora Enso and Bowater find themselves in a precarious position. As the Board is well aware, these two Companies rely on affordable electricity supply to remain economically viable. Effective April 1 of this year, the Board approved a 5.4% increase for the Above the Line classes, but a 10.4% increase for the ELIIR. On July 5, only four months after that Order, NSPI filed a general rate application requesting an additional 14.7% increase for the Above the Line customers for 2006. On August 5, NSPI filed for a 30% increase for the ELIIR rate. In other words if the NSPI application is approved, **SEB will experience a 40% increase from rates that were in effect just 9 months ago**. From almost any perspective, this constitutes rate shock. Obviously, this situation is untenable. The ELIIR rate is not working and so I am proposing a new below the line rate to supplant the ELIIR. [Emphasis added in original]
>
> (Exhibit N-61, pp. 2-3)

[540] Dr. Rosenberg's opinion is that the ELIIR currently does not provide a discount to ELIIR customers that is commensurate with its value to the NSPI system.

[541] He proposes to replace the ELIIR with a new BTL rate; the FP-DSM/DR Rate. The features of the new rate are described by Dr. Rosenberg as follows:

> Q. ARE YOU BASING YOUR PROPOSED NEW BELOW-THE-LINE RATE ON ANY PARTICULAR ECONOMIC DEVELOPMENT OR LOAD RETENTION RATE?
>
> A. No. I have simply pointed out that rates with those specific objectives are not out of the ordinary. However, I believe the new FP-DSM/DR Rate, if such a rate is approved by the Board, should be based on the particular circumstances, history and predicament of the involved customers, NSPI and the province of Nova Scotia, as well as the evidence in this case of course.
>
> Q. WHAT FEATURES ARE YOU RECOMMENDING FOR THE NEW FP-DSM/DR RATE?
>
> A. I am proposing a rate with the following features:
>
> 1. It will be simpler than the current and 2-Part RTP amalgam, hopefully to avoid the controversies and disagreements that have plagued the implementation of those rates. It will also be more flexible than its predecessor.
>
> 2. It will be set for an initial period of a minimum of three years to provide a degree of stability to both the customers on the rate as well

as to NSPI. Thereafter, following the expiry of each three-year period, the rate can be reset either at the request of NSPI or on the volition of the customers on the rate, for a further three-year period. For the first three-year period, this request can be made any time after July 1, 2008, with an effective date of change no later than six months after the request and no earlier than January 1, 2009; and so on for subsequent three-year periods. Any change, of course, would have to be approved by the Board.

3. It will be completely interruptible, for either supply or economic reasons, with 10 minutes notice for supply and 30 minutes notice for economic reasons, but with limitations on frequency, duration of events, and length between events. There is no compensation to the customer for these called interruptions, but the customer can buy through economic interruptions at actual incremental cost plus $5 per MWh. (It cannot buy through supply-related interruptions.)

4. Unlike the ELIIR, which can only be interrupted for avoiding combustion turbines or importing high-priced energy, the FP-DSM/DR Rate could be economically interrupted for any reason, at the discretions of NSPI.

5. At any time, the utility can offer to buy interruptions at whatever rate the utility believes will be attractive to the customer yet beneficial to the utility. This last feature was suggested by Dr. Stutz at the July 20 meeting on AARs.

6. Customers on the rate will be required to provide hourly forecasts of their load.

7. The rate will pass the due discrimination test. I will explain this test in more detail after I have described the specific rate that I propose.

Q. WHAT AVAILABILITY REQUIREMENTS ARE YOU PROPOSING FOR THIS RATE?

A. I am proposing the same availability criteria that are currently included in the ELIIR, with but four exceptions.

- The ELIIR is currently limited to 275 MW. I would propose that this limitation be excluded for the current rate.
- The ELIIR rate specifies that customers on the rate must be able to provide at least 20 MW of interruption. I propose that the term “20 MW” be replaced by the term “significant blocks” to allow for greater flexibility.
- The ELIIR rate limits the rate to those customers taking service at 138 kV or above. I propose just requiring that customers take service at “transmission voltage” to make the rate more accessible.
- The customer must be reasonably expected to maintain a high monthly load factor, and has demonstrated this ability on a historic basis.

Q. WOULD THE CUSTOMER STILL BE REQUIRED TO PROVIDE CREDIBLE EVIDENCE THAT A SIGNIFICANT PORTION OF THEIR ANTICIPATED USAGE ON THE FP-DSM/DR RATE IS AT RISK?

A. Yes. However, as the FP-DSM/DR Rate is intended to supercede the ELIIR, the new tariff should specify that customers formerly approved by the Board for ELIIR would be considered eligible for this new below-the-line rate as well.

Q. WHAT RATE FORMAT ARE YOU PROPOSING?

A. I propose a rate with just four elements. The first is a demand charge based on a Contract Demand (CD). The contract demand could be changed only once every twelve months with 30 days written notice, with the following limited exceptions:

- By February 28 of each year, the CD could be lowered for the remainder of the calendar year for market reasons, but by no more than 10% of the existing CD.

- The CD could be reduced for a planned shutdown period; such shutdown periods cannot occur more than twice in any calendar year and must be specified three weeks in advance.

- The CD could be changed for a permanent alteration of production capacity or a DSM initiative.

- The CD could be suspended for force majeure reasons.

The Contract Demand charge is intended to make a contribution to NSPI's fixed generation and transmission costs.

The second element is an energy charge that would recover NSPI's average fuel costs (plus variable O&M and losses) if its entire system exhibited a 100% load factor, i.e. a perfectly flat load. This energy charge would apply to all energy (except buy-through energy) up to the Contract Demand.

The third element is an excess energy charge for all energy taken above the Contract Demand in any hour.

The fourth element is a cost based monthly customer charge.

(Exhibit N-61, pp.11-14)

[542] Dr. Rosenberg calculated that the FP-DSM/DR rate as proposed, at an assumed 85% load factor, would produce a combined rate of approximately $46.10 per

MWh.[183] In response to Dr. Stutz's IR-7, he recalculated his proposed rate using the same assumptions as NSPI and it was $48.85 per MWh.

[543] In Dr. Rosenberg's view, his proposed rate is cost based in the same sense as NSPI's witnesses maintained that ELIIR was cost based, when that rate was first being presented to the Board for approval. However, he does note that, if one were to adopt the view expressed by Dr. Stutz in the Generic Rate Design proceeding, then his proposed rate may not be considered cost based.[184]

[544] In response to an information request from NSPI, where the suggestion was made that domestic customers would be subsidizing SEB through increased rates, Dr. Rosenberg's response included the following statement:

> ...He would add, however, that the rate he is proposing can by no means be characterized a request to "subsidize SEB through increased domestic rates", the ultimate amount of which are in any event within the domain of the UARB.
>
> (Exhibit N-77, NSPI-SEB -IR-5)

[545] SEB responded to intervenor objections to the proposed FP-DSM/DR rate. In summary, SEB's position is that the FD-DSM/DR rate is cost based and SEB is not requesting a special discount or a rate driven solely by competitive pressures. It is not requesting a subsidy, but is simply requesting a rate that reflects the actual cost of service.[185]

[184]Exhibit N-61, p. 23

[185]SEB Rebuttal Closing Submission, pp. 2 and 7

Intervenor Responses to the proposed FP-DSM/DR Rate

[546] Many of the intervenors filed evidence in response to the proposed FP-DSM/DR rate, or commented on the rate in their closing submissions. None of these intervenors supported the proposed rate. Many commented on the impact that the FD-DSM/DR would have on ATL rates.

[547] Mr. Drazen filed evidence in response to the proposed FP-DSM/DR rate on behalf of Avon. He summarizes his main points as follows:

> A. *First*, the increase to ELIIR customers is a higher percentage than to other customers because (1) ELIIR was set "below formula" in the previous case and, (2), ELIIR is by design more fuel intensive than other rates. *Second*, the rate proposed by Dr. Rosenberg's September evidence is not an accurate reflection of the cost of serving the ELIIR loads. Overall, the FP-DSM/DR proposal shifts a large amount of costs from ELIIR customers to the above-the-line (ATL) customers.
>
> (Exhibit N-100, p. 2)

[548] Ms. Brockway filed evidence for the Consumer Advocate responding to the proposed FP-DSM/DR rate. In her evidence, Ms. Brockway uses both the SEB response to Dr. Stutz IR-8 and NSPI's filed evidence[186] to conclude that the adoption of the FP-DSM/DR rate would transfer costs to the ATL customers and would result in a higher rate increase for these customers.

> ...The proposal of the below-the-line customers should be rejected unless they meet a heavy burden of demonstrating that such subsidies to their rates are not unjustly discriminatory, unfair, and otherwise violative of sound ratemaking criteria.
>
> (Exhibit N-99, p. 2, lines 19-22)

---

[186]Exhibit N-88

[549] She concluded that the Board should not approve the FP-DSM/DR rate based on the state of the evidentiary record.[187]

[550] Dr. Stutz provided evidence on the proposed FP-DSM/DR rate. His recommendation is that the rate not be approved. The key points of his evidence are as follows:

> - The FP-DSM/DR does not provide either reasonable cost recovery or an appropriate credit for economic interruptibility.
> - For a non-cost based rate to be approved there needs to be evidence that the rate provides the minimum cost reduction required to retain load. Based on the information available, it is not possible to determine if the FD-DSM/DR rate satisfies this requirement.
>
> (Exhibit N-98, p. 2, lines 5-11)

[551] In their Closing Submissions, Avon, ECANS, MEUNSC and the Province all opposed the FP-DSM/DR rate. Many commented on what they saw as a transfer of costs from BTL customers to ATL customers.

[552] Avon states:

> [251] The Forest Products Rate is a non-starter. It is lower than the current rate when both fuel and non-fuel costs have risen. It is devoid of any reasonable justification, any reasonable connection to the cost of serving SEB and has no prospect for public acceptability by the above the line customers who would be required to provide a massive subsidy to Stora Enso and Bowater.
>
> (Avon, Redacted Closing Submission, p. 53)

[553] ECANS' position is stated as:

> ... More pointedly, if SEB are granted special status by having access to rates at less than cost, then any shortfall will be assigned to Above-the-Line customers. In NSPI's N-88, a $33 million transfer of costs would result in a 3%+ increase in the ABL classes. This is not acceptable.

---

[187] Exhibit N-99, p. 9

> If SEB need lower electricity rates to remain competitive in their markets, they should look to Government and the taxpayer to address the challenge. Economic subsidization is not within the Board's mandate.
>
> (ECANS, Redacted Closing Submission, pp. 14-15)

[554] In his Closing Submission, the Consumer Advocate takes the position that it will not address the FP-DSM/DR rate on the basis that the design of a new rate part way through the proceeding is "rate design on the fly", and is not the appropriate regulatory approach.[188]

ELIIR Modifications/Replacement

[555] Dr. Rosenberg's evidence recommends a number of changes to the NSPI computations of the ELIIR rate. The changes were proposed in the eventuality that the FP-DSM/DR rate is not accepted or not accepted prior to January 1, 2006.[189] Dr. Rosenberg states that his computed reduction still results in rates that are far too high to characterize as competitive and these reductions do not lessen the need for the FP-DSM/DR rate.[190]

[188] Consumer Advocate, Redacted Closing Submission, p. 15, para. 59

[189] Exhibit N-91, p. 23, lines 18-22

[190] Exhibit N-91, p. 31, lines 13-19

Dr. Stutz's ELIIR Adjustment

[556] As previously mentioned, Dr. Stutz recommends that a successor to the ELIIR should be developed. In his evidence, Dr. Stutz provided some comments on the type of rate that should replace ELIIR:

> ... ELIIR and FP/DSM-DR both provide a credit in exchange for interruptibility. However, they do not specify the credit directly. Rather, they build it in through the design of their charges. Instead, one should begin with LIR, the cost-based rate on which SEB would take service if it were not interruptible and add an explicit economic interruptibility credit to the existing rider for supply interruptibility. A rate designed this way would be preferable to ELIIR or FP/DSM-DR because the value of interruptibility would be stated clearly and directly. Development of this rate should include a thorough review of the value of supply and economic interruptibility. If LIR with the appropriate credits for interruptibility does not meet SEB's business needs, SEB could ask the Board to add a separate rider for load retention.
>
> (Exhibit N-98, p. 9, lines 6-16)

[557] Dr. Stutz 's position, as outlined in his opening statement, is that the time has come to set a firm schedule to replace ELIIR with a new rate.[191] He added that this issue should be settled by the end of 2006. Dr. Stutz's opening statement provided further detail on what adjustments are required to the NSPI's filed ELIIR rate and how the rate may be computed from the Large Industrial Interruptible Rider (LIIR) rate:

> A key feature which distinguishes ELIIR from the Large Industrial Interruptible Rider (LIIR) is economic interruptibility. To be fair to those served on ELIIR and to other ratepayers, the cost of service on ELIIR needs to be roughly equal to the cost of service on LIIR less the likely cost of buy-through. ...Thus, based on the assumptions in NSPI's filing, an adjustment of about $6.30 to NSPI's proposed ELIIR energy charge is needed. This adjustment simply allows the savings due to economic interruptions to pass through to the customers on ELIIR who made the savings possible.
>
> (Exhibit N-244, p. 3)

[191]Exhibit N-244, p. 2

[558] During cross-examination by Al Dominie of MEUNSC, Dr. Stutz explained that he recommends a two step process for dealing with ELIIR: first, to put an appropriate ELIIR charge in place for 2006; and the second, is to replace ELIIR with a new rate. The first step is what needs to be accomplished as part of this proceeding.[192]

[559] Dr. Stutz filed Exhibit N-241, which provided a computation and proposed ELIIR rate for 2006. The resulting average adjusted ELIIR rate is $54.89/MWh.

[560] During cross-examination by Mr. Grant, Dr. Stutz stated that the savings to SEB under his proposed ELIIR rate for 2006 using a rate of $54.89/MWh versus the proposed NSPI ELIIR and 2P-RTP rates would be approximately $13 million.[193] Dr. Stutz provided details of the computation (along with some comments on the computation) in response to Undertaking U-88. He did not agree with the characterization by Mr. Grant that this would transfer $13 million to ATL customers. It is his view, that "we're simply setting the rate correctly".[194]

[561] Dr. Stutz was also cross-examined on the impact of his proposed ELIIR adjustments on other ratepayers. The following exchange occurred between Dr. Stutz and Mr. Grant:

> Q: Thank you. Dr. Stutz, have you calculated whether rate payers who are not on the ELIIR rate would be better off having Stora Enso Bowater under the rate as you propose to modify it than not at all?
>
> A: I haven't calculated it, but I think it's clear that they're better off with them than without them. And the reason I say that is that my rate charges them based on the LIR, which is an above the line, cost based rate, and the difference is a credit which, by design,

---

[192]Transcript, December 2, 2005, p. 3546

[193] Transcript, December 2, 2005, p. 3530

[194] Transcript, December 2, 2005, p. 3547

their economic interruption finances. So unless it's undesirable to have customers on the LIR rate, it follows that it's economically desirable to have them on my version of ELIIR.

Q: It's clear, though, is it not, that for the other rate payers it's preferable to have Stora Enso Bowater on the existing ELIIR rather than on the EIIIR as you've proposed?
A: Absolutely.

(Transcript, December 2, 2005, p. 3534)

[562] Dr. Rosenberg addressed Dr. Stutz's proposal in his opening statement:

... I acknowledge that Dr. Stutz's top-down approach to a replacement to the ELIIR formula could be workable and may engender less controversy than the bottom up approach that I had proposed in my FP testimony. In fact, in my Rebuttal testimony I showed how such a top-down approach could be used to fashion the FP DSM/DR rate by subtracting the value of interruptibility from a suitably adjusted Large Industrial Rate, and how the result of such a top-down approach compared to the rate that I had initially derived. I use the words "suitably adjusted" because it is necessary to first distinguish between the physical cost of serving the FP customers, as opposed to serving LIR customers, before we can even begin to account for the value of interruptibility.

(Exhibit N-235, p. 2)

[563] Dr. Rosenberg went on to state that:

While I have adopted Dr. Stutz's recommended value-driven methodology (adjusted as I have recommended), to derive the overall dollar figure for the rate, I maintain my recommendations for the form of the replacement for ELIIR i.e. I continue to recommend the FP rate form.

(Exhibit N-235, p. 2)

[564] In general, other intervenors took the same position on Dr. Stutz's proposed rate as they did on Dr. Rosenberg's FD-DSM/DR rate. For example, ECANS states that neither proposal is acceptable[195], the Consumer Advocate states there should be no

[195] ECANS, Redacted Closing Submission, p. 14

adjustment to the ELIIR rate, or alternatively, less than that proposed by Dr. Stutz[196], and Avon submits that Dr. Stutz's adjustment should not be made for 2006[197].

10.5.3 Findings

[565] NSPI is proposing that the new ELIIR monthly charge be $24,100 and the energy rate be $60.80 per MWh (at 85% LF) effective January 1, 2006 to December 31, 2006. This results in an approximate combined ELIIR rate of $61.19 per MWh. NSPI states that the main reason for the increase in the proposed ELIIR rate is substantially higher fuel costs in 2006. It further submits that the proposed rate is based on the formula approved by the Board and that any changes to the formula should be reviewed in a separate hearing in 2006 for a rate to be effective in 2007.

[566] SEB has taken the position that the proposed 2006 ELIIR rate, calculated based on the current formula, is not workable and does not achieve the results it was intended to achieve. SEB has proposed the new FP-DSM/DR rate, which it claims is based on the actual cost of service for this customer class.

[567] Dr. Stutz is of the view that the ELIIR should be replaced with a new rate to directly reflect credits for economic interruption. He is suggesting that a reasonable solution would be to start with LIIR and create a formula to apply appropriate credits. He is also of the view that a separate hearing should be held in 2006 and a new rate be approved no

[196] Consumer Advocate, Redacted Closing Submission, p. 2

[197] Avon, Redacted Closing Submission, p. 55

later than the end of 2006. In the meantime, he recommends a temporary ELIIR rate of $54.89/MWh for 2006.

[568] All other intervenors have objected to the suggestions by SEB and Dr. Stutz because they would result in a shift in the revenue requirement from the BTL customers to the ATL customers without following the normal due diligence process for approving new rates.

[569] The Board has carefully considered the evidence and submissions on this issue. The Board concludes that the FP-DSM/DR rate proposed by SEB is not cost based and would create an undue burden on ATL customers. Accordingly, the Board is not prepared to approve the FP-DSM/DR rate.

[570] It is clear to the Board that ELIIR is not working as it was originally intended to by both NSPI and SEB. For whatever reason, it does not appear to provide reasonable compensation for economic interruptibility. Therefore, the Board will hold a separate hearing in 2006 to consider a replacement for ELIIR, which will become effective January 1, 2007. The Board directs NSPI to file an application for a new rate to replace ELIIR, after consultation with its customers, no later than June 30, 2006.

[571] For the current year, the Board has been presented with two cost based approaches for setting the energy charge in ELIIR. NSPI supports the use of the formula in the existing tariff. The Board understands that Dr. Stutz recommends beginning with the LIR - that is the Large Industrial Rate at an 85% load factor, less the transformer ownership credit and the value of the interruptible supply credit of $3.43 per month per kVa. Dr. Stutz

then subtracts the value of economic interruptibility, which he calculated at $8.43 per MWh. Each of these approaches has strengths and limitations. The ELIIR formula has been approved but, for 2006, does not appear to provide reasonable compensation for economic interruptibility. Dr. Stutz's approach is conceptually correct, but does not provide a fully developed alternative for ELIIR. To give weight to each approach, the Board directs NSPI to set the ELIIR energy charge by averaging the results produced by the two approaches.

[572] In setting the ELIIR energy charge, the Board directs NSPI to use the fuel budget, and all other items having an impact on ELIIR, as approved in this decision. The Board also directs NSPI to iterate its rate calculations, to ensure consistency between the LIR charges used to set ELIIR and those to be paid by customers on the LIR.

[573] As previously indicated, the Board has directed NSPI to develop and file a replacement for ELIIR. Both NSPI and SEB have agreed that Dr. Stutz's approach to the development of such a replacement—beginning with a firm rate and then specifying credits for interruptibility—has merit. While the Board concurs, it would be prepared to consider other viable options which may be developed.

[574] NSPI proposed to add Special Condition 5 to the ELIIR tariff, the purpose of which is to require customers to file an hourly demand forecast on a day-ahead basis. Because the current version of ELIIR is about to be replaced, the Board will not approve any changes in the present tariff language. Upon filing, the Board will approve, effective January 1, 2006, the interim ELIIR rate calculated in accordance with this decision.

11.0 OTHER ISSUES

11.1 Load Forecast

[575] The details of NSPI's load forecast for the test year are provided in the 2006 Load Forecast Report appended to the Company's application as Exhibit N-2, Appendix F. Further information in support of the load forecast is contained in Exhibit N-1, pp. 162 to 179. In-province electric energy sales are forecast to grow by 1.2% in the 2006 test year despite an average annual growth rate of 2.6% over the past five years. NSPI states that the reduced growth rate for the test year is reflective of the impact of existing DSM initiatives. In comparison to the projected figures for 2005, residential sector sales in 2006 are expected to rise by 1.1%, commercial sector sales by 2.1% and industrial sector sales by 0.5%.[198]

[576] Peak demand for the winter of 2005/2006 is forecast to be 2,172 MW, a slight increase from the figure of 2,143 MW in the previous winter. The projected peak demand assumes a 60 MW reduction due to economic interruption at the time of system peak.[199]

[577] In its load forecast for the 2006 test year, NSPI has accounted for the impact of ongoing DSM initiatives which, NSPI states, will reduce in-province electric energy sales, as well as reduce peak demand by 13 MW.

[578] In its response to the Province IR-55, NSPI estimated that existing DSM initiatives will result in a reduction of 65 GWh for the 2006 test year. This reduction was

[198] NSPI Application, Exhibit N-1, p. 162

[199] NSPI Application, Exhibit N-1, p. 162

done manually by reducing its residential forecast by 1% (i.e., 42.7 GWh) and its commercial forecast by 0.5% (i.e., 16.7 GWh). NSPI's load forecast is typically calculated using an econometric model as defined in the Company's Load Forecast Report.[200] As it reiterated during the hearing, NSPI asserts that DSM's impact on the 2006 load forecast is the result of existing educational and awareness programs carried out by government and other agencies. NSPI states that the Company's own DSM efforts will only commence to impact its load forecast in the 2007 test year.[201]

[579] In Direct Evidence and oral testimony, Dr. Stutz expressed concern that NSPI's revenue forecast for 2006 may already be too low and that the Board should not approve NSPI's DSM-related adjustment to its load forecast. He stated:

> ... NSPI's statistically based residential and commercial forecasting models will reflect all ongoing DSM. An adjustment is only needed to account for the impact of new, incremental DSM activities. NSPI intends to develop new DSM initiatives. However, the specific programs are still unspecified. The 1.0 and 0.5 percent adjustments are based on assumptions, not estimates based on specific incremental DSM initiatives.
>
> Once specific programs are developed, time will be required to inform potential participants about the programs, for them to decide if they wish to participate, and for the participants to take the step promoted by the programs. There is almost no allowance for "start up" in NSPI's DSM adjustment.
>
> ...
>
> The impact of incremental DSM is more likely to follow and S-shaped "logistic curve," with very low impacts in the early years as knowledge of the program spreads, rapid increase in the middle years as the program takes hold, and decreasing growth in the later years as market saturation occurs.
>
> ...
>
> I recommend making no DSM adjustment at all. This recommendation reflects the fact that the 1.0 and 0.5 percent impacts are an assumption rather than an estimate of the impact of

[200] Exhibit N-2, Appendix F

[201] Province IR-55

> a specific incremental DSM program, the likelihood that any effect of incremental DSM will phase in slowly at first, and the concern that NSPI's underlying forecast of sales for 2006 may already be too low.
>
> (Stutz, Pre-filed Evidence, Exhibit N-81, pp. 16-17)

[580] In cross-examination by Mr. Connors, Dr. Stutz acknowledged that Exhibit N-229 may provide some evidence of incremental activity in support of NSPI's adjustment to its load forecast.[202] This exhibit outlined, according to Alan Richardson, NSPI's General Manager, Customer Service, better than anticipated results of the CFL program. In the end, however, Dr. Stutz believed there should be a detailed analysis to support the reduced load forecast and that the survey results (i.e., Exhibit N-229) are not normally the way utilities prove adjustments to their forecasts.[203]

[581] During the 2005 rate case, Dr. Stutz also expressed concerns that NSPI's sales forecast was too low. In its decision, the Board concurred with his view:

> [296] The Board shares Dr. Stutz's view with respect to the load forecasting issue. The Board accepts his recommendation and directs NSPI to initiate meetings with Dr. Stutz and Board staff to attempt to resolve these concerns.
>
> [297] The Board also directs that a report on the progress of improvements to NSPI's load forecasting methodology be filed by December 1, 2005.
>
> (Board Decision, March 31, 2005)

[582] By letter dated November 29, 2005, NSPI requested that the Board postpone the requirement for the filing of this report. In a letter dated December 14, 2005, the Board

---

[202]Transcript, December 2, 2005, p. 3576

[203]Transcript, December 2, 2005, pp. 3572 and 3576

agreed to postpone the filing of the report pending the review of this issue by NSPI and Dr. Stutz.

[583] Several intervenors also opposed NSPI's proposed DSM-related adjustment to the load forecast. Avon adopts Dr. Stutz's concerns with respect to the adjustment, particularly in light of his remarks that the load forecast may already be too low. SEB submitted that NSPI did not provide adequate support for the adjustment, including the Company's responses to NSDOE IR-55, SEB IR-131 and Exhibit N-229.

[584] Testifying on behalf of the Consumer Advocate, Ms. Brockway expressed reservations about NSPI's estimate of the impact of DSM on load projections. She stated that the Company had not incorporated the results of various studies and technical literature outlining the impacts that can be expected from different types of DSM activities.[204] Ms. Brockway was specifically asked by the Board about NSPI's estimated impact of DSM efforts with respect to the 2006 test year:

> Q. (Deveau) And I'd refer you quickly, if I could, to Exhibit N-229. And that was an exhibit presented yesterday by Mr. Richardson. I believe you were here when he probably spoke about that.
> A. Yes.
>
> Q. And that's -- that was an exhibit that he presented when -- based on his evidence that NSPI was actually experiencing penetration rates quicker than they had anticipated. And this is based on a survey and the extrapolations made based on the customers and the number of bulbs that had been installed. Do you have any comments to make with respect to this type of research that has been tendered?
> A. Well, actually, there was -- yes, I do. Thank you, Mr. Commissioner, because I would align myself with those comments that were either made or suggested by some that it's very common in survey research for respondents to give the questioner the answer that they think the question wants, particularly when you have raised cultural awareness of the importance of the right answer being, "Yes, I've got more CFLs." And ---

[204] Brockway Opening Statement, Exhibit N-242

Q. People are embarrassed to say they haven't.
A. Yes. Now, in some cases their memory has been adjusted to meet their expectations of themselves, and it's not a conscious lie. I'm not saying that. But the survey -- this kind of a survey research is well understood to be unreliable as -- certainly as the sole basis for estimating how much behaviour has changed. The other thing that I noted about this is that I would expect that the estimates of how many hours the bulbs are on is -- at least with respect to the five hours, that that's an over statement, that in very few households would an average of two and a half bulbs be on for five hours a day all year long. They might be in the depth of winter, but that's not all year long. So I think some of the wrong assumptions are being drawn from this, that the estimates are over stated.

(Transcript, December 2, 2005, pp. 3505-3506)

11.1.1 Findings

[585] Based on its review of the evidence, the Board is not persuaded that NSPI's manual adjustment to its load forecast should be approved. While the survey results shown in Exhibit N-229 are encouraging with respect to the positive impact of programs like the CFL initiative, the Board concurs with Dr. Stutz that this is not the appropriate way for a regulated utility to prove a reduction of its load forecast and, further, does not justify the manual adjustment made by NSPI.

[586] As noted above, NSPI's load forecast is typically calculated using an econometric model. While the Board is mindful that DSM is a relatively new initiative, it considers that the impact of some DSM programs is already embedded, at least in part, in the variables comprising the econometric model. Moreover, the Board notes Dr. Stutz's concern that NSPI's underlying load forecast may already be too low for the 2006 test year. In such circumstances, the Board is reluctant to allow a reduction which would result in an even lower load projection.

[587] Based on the evidence at the hearing, the Board concludes that denying the DSM-related load forecast reduction would increase variable costs for NSPI by about $5.1 million, while corresponding revenues from electricity sales would increase by approximately $6.3 million based on NSPI's proposed rate increase.[205] While these responses to the SEB IRs translate into a net reduction of $1.2 million in the revenue requirement, Avon asserts that the difference could be as high as $2.0 million.[206] It is the Board's understanding that because of the potential net savings of between $1.2 million - $2.0 million, the proposed rate increase sought by NSPI will go down. For the purpose of its decision, the Board's estimate of the impact is $1.6 million. The Company is directed to address the impact of the Board's denial of the DSM-related load adjustment in its Compliance Filing.

[588] As noted above, by letter dated December 14, 2005, the Board agreed to postpone the filing of a report by NSPI with respect to its load forecasting methodology, a report which was ordered by the Board in the 2005 rate decision. In its letter requesting the postponement, NSPI indicated that the delay would facilitate discussion of the load forecasting issues with Dr. Stutz in 2006. The Board directs that NSPI file its report on the progress of improvements to its load forecasting methodology by December 29, 2006. This extension of the filing deadline should allow NSPI to incorporate its response to the DSM-related load reduction issues noted by Dr. Stutz.

---

[206] Avon, Redacted Closing Submission, p. 46

11.2 Unmetered Rates

[589] HRM and the Union of Nova Scotia Municipalities ("UNSM") contend that an inordinate level of costs is being assigned to the Unmetered Class, which is primarily comprised of municipalities. As noted by Warden Richard Cotton, President of the UNSM, who spoke during the evening session, the unmetered rate is of great significance to municipalities because it represents almost 50% of the total of municipal electric bills.[207]

[590] In order to assign costs to its customer base in the Unmetered Class, NSPI uses a designated number of accounts as a surrogate for customers within the Class, referred to as the "weighting factor". For the C-3 Class, a weighting factor of 5.0 is applied to the number of accounts. HRM and the UNSM assert that this formula is not reflective of the costs actually being incurred for the provision of service to the Unmetered Class. In their view, the number of accounts do not bear the same relationship to costs as the number of customers do. They submit that municipalities use services such as billing or the call centre far less than other customers.

[591] HRM retained Robert Greneman, of Stone & Webster Management Consultants, Inc., to review this issue. In his pre-filed evidence, Mr. Greneman submits that the weighting factor of 5.0 for the Unmetered Class bears no relation to cost causation. He states that billing, customer service and call centre expenses for unmetered accounts are no greater than for residential accounts and, therefore, the weighting factor should not exceed 1.0. He concludes:

[207]UNSM Presentation, November 23, 2005

> NSPI should undertake a more detailed analysis of the activities that are included in factor C-3. I recommend that until such analysis is completed, this Board direct NSPI to set the weighting to the Unmetered class in factor C-3 from 5.0 to 1.0, beginning in this proceeding.
>
> (Greneman, Pre-filed Evidence, Exhibit N-85, p. 16)

[592] The UNSM estimates that reducing the weighting factor from 5.0 to 1.0 would reduce municipal electric bills by over $1 million across the province.[208]

[593] HRM states that a street lighting study was last conducted by NSPI in 1975, which forms the basis for the present allocation in the Cost of Service Study ("COSS"). HRM asks that a new streetlight study be undertaken to ascertain the number and type of fixtures, their age and actual maintenance data, broken out by municipality, and that the study include a review of current maintenance practices across Canada to establish a Best Practices Lighting Maintenance Standard. The UNSM adds that such a study should include data respecting the energy consumption of streetlights, to assist it in developing energy reducing strategies. Further, HRM asks that the study gather data to determine the number and origin of calls to NSPI billing staff respecting unmetered services.[209]

[594] Mr. Greneman also states in his pre-filed evidence that NSPI should identify the portion of rate base allocated for vehicles and plant associated with the meter reading function and that the Company should remove the related interest, return, taxes and depreciation from its allocation to the Unmetered Class.[210] While HRM acknowledges that

---

[208]UNSM Presentation, November 23, 2005

[209]HRM, Redacted Closing Submission, p. 1

[210]Greneman, Pre-filed Evidence, Exhibit N-85, pp. 16-17

any direct costs related to meter reading were removed from the Unmetered Rate as a result of the last rate hearing, it asks that the same adjustment be made with respect to indirect meter reading costs.[211]

[595] HRM also asserts that NSPI's COSS shows that almost $26 million of rate base associated with lighting fixtures was assigned to the Unmetered Class, attracting approximately $5.7 million of costs for depreciation expense, taxes, interest and return. In HRM's view, this allocation to rate base is a primary reason the Unmetered Class must pay $0.22/KWh, well above other classes.[212] Based on NSPI's response to Undertaking U-31, HRM submits that the Unmetered Class has not received any credit from NSPI for the new lighting installations contributed by developers and property owners over the past ten years. HRM believes that if such contributions were properly credited to the Unmetered Class, the rate base assigned to this class would decrease by more than 50%. It estimates that such costs comprise approximately $5.7 million or 22.5% of the proposed revenue requirement for the Unmetered Class.[213] HRM asks the Board to reduce the rate base directly assigned to the Unmetered Class to a level of 40% of that currently stated, until a proper assessment of contributions is made by NSPI.

[596] In its Closing Submission, NSPI indicated the following with respect to HRM's request for a review of the C-3 Unmetered Class allocator shown in the COSS:

---

[211]HRM, Redacted Closing Submission, p. 8

[212]HRM, Redacted Closing Submission, p. 8

[213]HRM, Redacted Closing Submission, p. 10

> NSPI agrees that the study used to develop the C-3 weighting factor for the unmetered class should be updated if the factor is to be changed. This would require the acquisition and analysis of customer-service-related activity relating to unmetered services over some representative period of time. NSPI plans to gather this information by April 1st.
>
> NSPI also agrees that the study of direct costs for street lights, including installation and maintenance costs, requires updating. NSPI plans to complete this work by July 1st.
>
> (NSPI, Redacted Closing Argument, p. 87)

11.2.1 Findings

[597] The Board is satisfied that a study should be conducted to determine whether the present weighting factor of 5.0 is still appropriate as the C-3 Unmetered Class allocator. Further, it determines that NSPI's suggested time line is appropriate in the circumstances.

[598] The Board directs that a cost of service study be conducted by NSPI with respect to the Unmetered Class. The study shall include a review of the appropriateness of the current weighting factor and a review of the rate base, including assets, assigned to the Unmetered Class. The study should indicate a breakdown of costs and rate base by municipality.

[599] The Board directs that the current weighting factor of 5.0 should remain in effect for the 2006 test year.

[600] The cost of service study results shall be filed with the Board by July 31, 2006.

11.3 Miscellaneous Charges

[601] NSPI has requested increases to its miscellaneous charges, as outlined in Exhibit N-2, Appendix I, along with proposed language changes to certain of its regulations

as outlined in Exhibit N-2, Appendix J. In keeping with the Board's direction in the 2005 rate decision, NSPI is limiting the proposed increase to the average rate increase for ATL customers.

[602] The Company submits that the proposed increase to miscellaneous charges brings them closer to recovering the actual costs of providing the service. In the four instances where incorporating the average ATL rate increase would have resulted in charges which exceeded the cost to deliver the service, the proposed rate increase was capped to reflect the actual cost.[214]

[603] As noted in the 2005 rate decision, it is not appropriate for the Company to charge a profit margin on miscellaneous charges. NSPI has removed any such mark-up in the present application.

[604] Ms. Brockway testified that the Board should deny most of the proposed increases to miscellaneous charges, particularly since those charges had already been increased considerably in 2005. In her view, these charges have a significant impact upon low income customers, expressing particular concern about the following charges:

- Regulation 7.1(a), Connection/Reconnection during normal working hours
- Regulation 7.1(b & c), Connection/Reconnection after normal working hours
- Regulation 7.1(e), Collection charge (Doorknob charge)
- Regulation 7.1(e), Collection charge (Registered Letter)
- Regulation 7.1(g), Returned Cheque Charge

[605] In her Direct Evidence, Ms. Brockway explained the basis for her concern:

> Customers with fixed incomes, seasonal incomes, poverty-level wages, and the like, are disproportionately likely to fall into arrears, and be subject to collection practices requiring

[214]NSPI Application, Exhibit N-1, p. 198

collection actions (doorknob notices, registered letters), and to disconnection, requiring reconnection. Indeed, for working poor families, reconnection will usually have to take place after hours, or someone will have to take off work at great cost in order to be present during the reconnection. Also, with respect to charges intended to prevent "leaning" on the system, they are not likely to have that salutary effect in the case of low-income customers with payment difficulties, as these customers will not become better able to pay their bills merely by making them higher.

...

I recommend that the charges for reconnections, collections and returned cheque charges not be increased at this time, but remain as set in the March 2005 order. I recommend that the difference in revenues be spread equally to all classes. The impact will be de minimis on customers not paying these charges, but will be most welcome for customers with limited incomes who are already struggling to keep up with rising energy costs.

(Brockway, Pre-filed Evidence, Exhibit N-87, pp. 15-16)

[606] The Consumer Advocate submits that more rigorous standards of "cost recovery" are being applied to low income customers than to other classes of ratepayers. In his view, the pursuit of "cost recovery" as against low income customers should be carried out with the same exactitude as that adopted with respect to the recovery of costs from other ratepayer classes. Describing this phenomenon as a type of discrimination, the Consumer Advocate argued:

68. No party would dispute the impact of such charges is particularly onerous for those on low incomes and who are the most susceptible of incurring the charges. The only argument in favour of the requested increases is that they are needed to recover the costs involved and to dissuade customers from defaulting on payments.

69. Yet there can be no doubt that any similar analysis of cost recovery for other rate classifications, particularly the AAA rates, would raise questions as to the exact dollar cost recovery of the applicable rate. The reality is that precise and undisputed cost recovery is not possible and often is explicitly recognized or even intended. The justification is that there must be practicality to rate structures. That justification often finds its expression in the concept of due discrimination. Whatever it is called, the reality is that many, if not all, rate classifications have some degree of uncertainty whether there is perfect cost recovery. Often the inquiry is dropped because of the size of the ratepayer and their importance to the maintenance of the system.

70. Yet when it comes to recovering the full amount of doorknob notices or returned cheques, the pencils are sharpened to ensure the costs are recovered.

...

72. ... While it is not the function of the Board to use rates as an instrument of social policy, there is no need to be any more precise in recovering default costs from consumers than recovering the costs of service from the various rate classifications.

(CA, Redacted Closing Submission, pp. 17-18)

[607] In its Closing Submission, the Affordable Energy Coalition ("AEC") reiterated Ms. Brockway's view that there should be no increase to miscellaneous charges, stating that such charges have a "disproportionate impact" on low income customers.[215]

[608] The AEC urges the Board to adopt Ms. Brockway's suggestion to spread the shortfall in revenues from these charges equally across all classes, stating that this approach will satisfy the Board's obligation to ensure that charges are not unduly discriminatory, as required by **s. 67(1)** of the **Public Utilities Act**.[216] In her evidence, Ms. Brockway testified that spreading the charges in this fashion would have a *de minimis* impact on customers.

[609] The NDP Caucus submits that individual customers should not be charged for such services and that they be absorbed into general operating costs.[217]

11.3.1 Findings

[610] Having reviewed this matter, the Board considers it appropriate to proceed in a manner consistent with the approach it adopted in last year's rate case. Accordingly, the

[215]AEC, Redacted Closing Submission, pp. 18-19

[216]AEC, Redacted Closing Submission, p. 19

[217]NDP Caucus, Redacted Closing Submission, p. 12

Board approves the proposed increases to miscellaneous charges sought by NSPI. As noted above, in the event such increases result in a charge which exceeds the cost of delivering the service, the charge must be capped at the actual cost.

11.4 Low Income Consumers

[611] The AEC submits that the Board has a statutory obligation to protect the public interest by ensuring that the services provided by NSPI are affordable for its customers, including low income customers. Referring to the evidence of Mel Boutilier, Executive Director of the Parker Street Food and Furniture Bank, and of Joan Jessome, President of the NSGEU, the AEC noted that the impact of electricity rates upon low income customers manifests itself in various ways, including homelessness, evictions, unsafe heating practices, health problems related to inadequate heating and refrigeration, hunger, and other social and housing related problems.[218]

[612] The AEC noted that current programs, although helpful, are not adequate to address the needs of low income customers. It described a number of these programs, including a program providing financial assistance which is administered by the Department of Community Services, relief provided by charities and churches, the Keep the Heat Program offered by the provincial government which provides heating rebates, and the

---

[218] AEC Redacted Closing Submission, p. 5

Good Neighbour Program, which receives approximately $307,000 through donations from NSPI, its customers and employees.[219]

[613] While recognizing that DSM initiatives are important for low income residential customers, the AEC adds:

> ... Energy efficiency measures alone will not result in electrical services which are affordable to all: low income programs must include rate assistance, crisis intervention and improved arrears policy and management.
>
> (AEC, Redacted Closing Submission, p. 3)

[614] The AEC cites **ss. 44** and **67** of the **Public Utilities Act** in support of its view that the Board should develop programs which ensure electrical service is affordable and accessible to all consumers:

> 45. Here, in order for the Board to make a "just" order under s. 44, one that avoids a rate structure which created effective barriers to equal access for the poor, it is appropriate - and *Charter* compliant - for the Board to order programs to accommodate the disadvantage experienced by low-income people.
>
> 46. In resolving any ambiguities concerning the scope of the Board's power to decide on the implementation of a Rate Assistance Program, and the correct interpretation of section 67(1), the Board must avoid interpretations which would have the effect of excluding consumers from essential services based on protected grounds, including their socio-economic status.
>
> (AEC, Redacted Closing Submission, pp. 15-16)

[615] Thus, AEC asserts that the Board must apply the jurisdiction conferred upon it by its enabling legislation, in a manner consistent with the equality provisions of the

---

[219] Undertaking U-13

Canadian Charter of Rights and Freedoms, in order to ensure non-discriminatory access for low income customers to electricity services.

[616] In its Closing Submission, the Consumer Advocate stated:

> 73. NSPI made reference several times to giving consideration for low income consumers. They are to be commended for identifying that as an objective. Yet apart from the Good Neighbour program, for which their contribution is to be commended, there was a lack of any specific action, programs or steps relating specifically to low income consumers. All NSPI could say was that they would try to ensure that their existing services would be available to low income consumers.
>
> 74. We ask that the Board in its decision emphasize the importance of developing concrete and specific steps directed to the low income consumer.
>
> (CA, Redacted Closing Submission, para. 73-74)

[617] The NDP Caucus also asked the Board to revisit a proposal made by the AEC during the prior rate hearing to create a system of supports for low income customers.[220]

[618] In its 2005 rate decision, the Board determined that it does not have the statutory authority to approve a rate assistance program and that the issue is a "social and public policy question which falls within the purview of the Legislature rather than the Board."[221]

11.4.1 Findings

[619] Following the issuance of its 2005 rate decision, Dalhousie Legal Aid appealed the Board's decision. The appeal is set to be heard by the Nova Scotia Court of

[220] NDP Caucus, Redacted Closing Submission, p. 12

[221] Board 2005 Rate Decision, para. 256

Appeal. In the circumstances, the Board considers it prudent to await the disposition of the appeal before it undertakes any further review of the issues raised by the AEC.

11.5 Pole Attachment Fees

[620] In its pre-filed evidence, RuSh Communications Ltd. ("RuSh") expressed concern that some of the additional costs projected in OM&G for storm response, vegetation management and storm proofing are already being recovered in the rates charged to telecommunications clients such as RuSh. It asserts that costs for storm response, vegetation management and storm proofing are already included in NSPI's pole attachment rate of $14.15 and its incremental "make-ready" charges for vegetation management and general maintenance on structures accessed by tenants like RuSh to upgrade their equipment.[222]

[621] NSPI denies the assertions made by RuSh. It notes that the revenues received from pole attachment fees and "make-ready" charges are separately accounted for in the revenue requirement for the 2006 test year. It further notes that the $14.15 pole attachment fee only covers capital recovery, routine general maintenance and vegetation management, while additional construction or plant upgrade costs are recovered in "make-ready" charges.[223]

[222] RuSh Communications, Pre-filed Evidence, Exhibit N-86

[223] NSPI, Rebuttal Evidence, Exhibit N-153, pp. 108-109

11.5.1 Findings

[622] The Board concurs with NSPI's position on this issue. The setting of the pole attachment fee, as well as the scope of costs recovered under that rate and under "make-ready" charges, were canvassed by the Board in its Decision on such issues dated January 24, 2002. The Board is satisfied that NSPI's allocation of costs is in accord with that Decision and that the Company's proposed rate increase does not result in a duplication of the revenue earned from pole attachment fees and "make-ready" charges.

11.6 Renewable and Environmentally Sustainable Energy

[623] Some of the intervenors asked the Board to consider environmental issues in assessing NSPI's application for a rate increase.

[624] In its Closing Submission, the Ecology Action Centre submitted that energy issues are "inherently environmental issues". In its view, a rate increase is only justified if the resulting increase in revenues is directed towards making energy production, distribution, and consumption environmentally sustainable. According to the EAC:

> ... The EAC maintains that energy security for Nova Scotia residents would be best provided by including a combination of more aggressive and practical Demand Side Management (DSM) programs and greater encouragement of the development of clean and sustainable energy sources for Nova Scotia.
>
> The EAC believes that NSPI must focus on a sustainable, long term vision for electrical energy production and distribution in Nova Scotia. The EAC asserts that, as it is now designed, NSPI's current rate application simply prolongs Nova Scotia's reliance on coal and other fossil fuels to produce electricity.
>
> (EAC, Redacted Closing Submission, p. 1)

[625] In addition to submissions respecting DSM, the EAC made a number of recommendations related specifically to renewable and environmentally sustainable energy, including:

> 2) That NSPI develop a more ambitious strategy to reduce green house gases (GHGs) and pollution through renewable energy generation programs, internal NSPI DSM initiatives, and more extensive DSM services for customers in all rate classes.
>
> ...
>
> 3) That all coal and natural gas plants in Nova Scotia be retrofitted to reduce air pollution and waste energy. This includes the fitting of scrubbers at all thermal generating stations that remain in service, the deactivation of sites that cannot be fitted with pollution controls in a cost effective manner, and the installation of systems to recover waste heat.
>
> ...
>
> 4) That NSPI amend its Renewable Portfolio Standard (RPS) and increase its commitment to green energy production by increasing the minimum amount of total energy production to come from new renewable sources from five percent by the year 2010 to ten percent by 2010[sic] and twenty percent by 2015.
>
> ...
>
> 5) That the UARB support the use of standard offer contracts to encourage the development of local renewable energy production initiatives, and that the conditions and price paid be determined by the UARB.
>
> ...
>
> 6) That the UARB consider in its rate case ruling the introduction of a systems benefit charge to facilitate funding of DSM and renewable energy initiatives administered by an independent agency.
>
> ...
>
> 8) That an independent study be conducted to investigate alternative rate designs for the purpose of developing a rate structure for Nova Scotia which most appropriately furthers economic and environmental sustainability. The EAC is interested in the idea of implementing an inverted block rate in all classes, coupled with strong DSM initiatives.
>
> (EAC, Redacted Closing Submission, pp. 2-6)

[626] In its Closing Submission, the NDP Caucus echoed the EAC's concerns about NSPI's reliance on fossil fuels:

> The utility's vulnerability to the fluctuating prices of imported fuel has created a new urgency for increased energy security through the use of domestic, renewable energy generation. It is our view that the Board should note where legislative or policy changes by government would help to achieve this objective.
>
> (NDP, Redacted Closing Submission, p. 14)

11.6.1 Findings

[627] The Board notes from its review of the evidence that NSPI has undertaken steps to address many of the issues raised by the EAC, including significant stakeholder consultation with respect to DSM, targeting increased sources of renewable energy such as wind from independent producers, and retrofitting its generation facilities to reduce air pollution and waste energy.

[628] In the Board's opinion, NSPI has undertaken concrete steps to address many of the concerns raised by the EAC, the NDP Caucus, GPI Atlantic and ECANS. While much work remains to be done, the Board is satisfied that NSPI is addressing these issues. The Board will continue to monitor the Company's progress. It should be noted that DSM and air emission controls will be the subject of separate hearings held by the Board in 2006.

11.7 Incentive Compensation Plan Review

[629] In its March 31, 2005 rate decision, the Board determined that NSPI's incentive compensation plan should be reviewed to determine whether it delivers an equal benefit to both shareholders and ratepayers, who now share the cost of the plan on a 50/50

basis. The Board directed NSPI to file a report within six months of its decision, such plan to be then reviewed by independent experts engaged by the Board.[224]

[630] NSPI's Incentive Compensation Report was filed with the Board on September 30, 2005. In response to NSDOE IR-91, the report was filed in this hearing.

[631] Avon submits that NSPI's Report is unresponsive to concerns raised by intervenors during the last rate case, in that the Company, according to Avon, has provided little more than a generalization of the benefits accruing to customers. Avon's concern is that the executive incentive plan is not sufficiently aligned with ratepayers' interests (i.e., at least not to the extent of 50%). In support of this concern, Avon refers, as an example, to the "balanced scorecard" for NSPI's Director of Energy Fuels and Risk Management, which was the subject of cross-examination during the hearing.[225]

[632] In light of its concerns, and the Board's directives arising out of the last rate decision, Avon notes that NSPI is forecasting to double the bonuses paid out in 2006 over those paid in 2005, with 50% of the maximum possible bonus award for 2006 being included in costs for the 2006 test year.[226] Avon questions whether such bonuses should be awarded in the context of NSPI's request for a significant rate increase for customers. It adds that the burden is on NSPI to demonstrate that these expenses are reasonable and prudently incurred.

---

[224] Board Decision, March 31, 2005, para. 346

[225] Avon, Redacted Rebuttal Submission, pp. 17-18; Transcript, November 17, 2005, pp. 841-847

[226] Avon IR-9(d)-(f)

11.7.1 Findings

[633] The Board has engaged Lawrence N. Koppelman of Liberty to review NSPI's Incentive Compensation Report. His report was recently filed with the Board and has been forwarded to NSPI for their comment. Any issues arising from this review can be addressed in a future rate hearing. For the 2006 test year, the Board approves the amounts proposed by NSPI.

11.8 Non-Profit Intervenor Costs

[634] The Affordable Energy Coalition asks the Board for costs in this matter. In support of this request, it stated:

> 73. The Affordable Energy Coalition is a non-profit coalition of individuals and groups who work directly with low income Nova Scotians. These groups combined their efforts in a manner consistent with previous rulings of this Board, which had the effect of reducing hearing time and other costs.
>
> ...
>
> 75. Each of the members of the AEC is a non profit organization, and has no commercial interest in the outcome of these hearings. None of these groups receive funding to support public interest litigation or the costs of intervention in this rate application.
>
> ...
>
> 77. Low income Nova Scotians have a substantial interest in the application to increase rates by NSPI. The effect of a rate increase on low income residential consumers will be immediate and far ranging as it deepens already unsustainable energy burdens on this group of consumers.
>
> 78. It is submitted that the AEC acted responsibly and prudently in these hearings. The intervention on behalf of low income consumers combined the interests of several groups and it consciously avoided duplicating the evidence already presented or made available by other

> interveners in the matter. As such, it is submitted that the AEC has behaved in a responsible manner to incur only such costs as were necessary to complete the evidence before the Board concerning the issues in this application.
>
> 79. It is submitted that the arguments submitted by the AEC have contributed to the "better understanding" of the issues affecting low income residential customers in this application for a rate increase by NSPI.
>
> (AEC, Redacted Closing Submission, pp. 23-24)

11.8.1 Findings

[635] NSPI has not addressed the AEC's request for costs in its submissions. The Board directs NSPI to file its response to this request no later than April 20, 2006. AEC will have an opportunity to file additional written submissions on this issue no later than May 1, 2006. Following its review of the submissions, the Board will issue a ruling on this request.

11.9 General Demand Rate Class

[636] Robert Cook, President of the Nova Scotia Association of Health Organizations ("NSAHO"), made a presentation to the Board at the evening session on November 23, 2005. He outlined the mandate of his association and stated that it represents and provides services to the health organizations in the Province. The types of organizations NSAHO represents include hospitals, nursing homes, group homes, adult residential centres and home care support entities.

[637] Mr. Cook stated that NSAHO's reason for appearing at the hearing was the significant proposed rate increases, and the revenue/cost ratio ("R/C") for the General Demand class. He stated that the current R/C ratio for the General Demand customers is 108.75%, which is outside the Board's target range of 95% to 105% for all customers. He

outlined the impact this higher R/C ratio is having on NSAHO's members, based on the total current annual bill of approximately $20 million for these customers. He also pointed out that the R/C ratio for the General Demand class has been above 105% for some time and is causing hardship to NSAHO's members.

11.9.1 Findings

[638] In the Board's view, as set out in its 2002 and 2005 rate decisions, it is desirable to maintain, where reasonable, an R/C ratio between 95% and 105% for all classes. The Board continues to believe that it is fair and reasonable, in terms of the impact on other ATL customers, for the General Demand class to be gradually moved to an R/C ratio of 95% to 105%.

12.0 SUMMARY OF DISALLOWANCES AND ADJUSTMENTS

[639] NSPI, in its July 5, 2005 filing, projected a revenue requirement for 2006 of $1,003.7 million from above-the-line customers, which was $128.4 million higher than the 2005 Compliance Filing.

[640] NSPI illustrates the increases sought from customers, including the resulting revenue cost ("R/C") ratios and the total revenue requirement in the following table compiled by the Board:

		2006 Rate Application - July 5, 2005				
	Current Revenue	Costs	Proposed Revenues	Revenue Increase	Revenue % Increase	R/C Ratios
ABOVE-THE-LINE CLASSES						
Residential						
Total Residential	**$435.2**	**$512.6**	**$504.3**	**$69.1**	**15.9%**	**98.4%**
Commercial						
Small General	$25.9	$29.4	$30.1	$4.2	15.9%	102.3%
General Demand	$224.8	$237.2	$249.0	$24.2	10.8%	105.0%
Large General	$30.2	$36.0	$35.0	$4.8	15.9%	97.3%
Total Commercial	**$281.0**	**$302.6**	**$314.2**	**$33.2**	**11.8%**	**103.8%**
Industrial						
Small Industrial	$20.7	$23.5	$24.0	$3.3	15.9%	102.2%
Medium Industrial	$43.2	$49.7	$50.1	$6.9	15.9%	100.8%

Miscellaneous			**$10.4**			
Total Revenue Requirement			**$1,168.8**			

[641] As the Board has outlined in this decision, a number of disallowances and adjustments have been made which reduce NSPI’s 2006 revenue requirement. These are set out below:

Disallowances and Adjustments	
ITEM	**DISALLOWANCES/ ADJUSTMENTS**
Imprudence disallowance - fuel costs	$15,700,000
Additional natural gas resale benefit	$35,800,000***
PTMT - fuel disallowance	$2,300,000
OM&G	$12,300,000
Load Reduction	$1,600,000
Cash working capital (Rate Base)	$1,400,000*
Long-term receivable (Rate Base)	($1,186,000)**
Total Disallowances and Adjustments	**$67,914,000**

*($29,400,000 - 12,250,000) x 8.21% WACC = 1,408,000

**Average increase in rate base of 14,450,000 x 8.21% WACC = 1,186,000

***NSPI proposed an additional natural gas resale benefit of $22.6 million as the estimated impact of the settlement with its supplier

[642] The Board understands that the $67.914 million in disallowances and adjustments listed above are estimates based on the evidence filed during the hearing. The Board directs NSPI, through the Compliance Filing, to confirm the actual reduction in revenue requirement which flows from this decision.

[643] As noted earlier, NSPI originally requested an increase in its revenue requirement of approximately $128.4 million from ATL customers. This request resulted in a proposed average increase for ATL customers of 14.7%, with an average increase of 15.9% for domestic customers. NSPI later indicated that the proposed increase would be reduced by about 2% due to the settlement with its natural gas supplier, announced November 21, 2005.

[644] The disallowances and adjustments directed by the Board and noted above, are expected to result in an approximate average rate increase of 8.6% for above-the-line customers. Domestic customers can expect a rate increase of approximately 8.9%. The increase in rates for ATL customers is effective March 10, 2006. The ELIIR and 2P-RTP rate shall be determined by NSPI in the Compliance Filing as set out in this decision. All other below-the-line rates are approved as set out in this decision. All BTL rates are effective January 1, 2006.

[645] As noted in prior rate decisions, the Board considers it desirable to maintain, where reasonable, an R/C ratio of 95% to 105%. The Board recognizes that the General Demand class category did not fall within the 95% to 105% R/C range in 2005, but it determined in its decision that it is fair and reasonable, in terms of the impact on other ATL customers, for this rate group to be gradually moved within the 95% to 105% R/C ratio. The Board continues to believe that the General Demand class should gradually be moved to an R/C ratio of 95% to 105%.

[646] The Board directs NSPI to base its adjustments in the Compliance Filing on the findings noted above.

13.0 FINANCIAL HEALTH OF NSPI

13.1 Submissions - NSPI

[647] In its evidence and submissions, NSPI repeatedly urged the Board to consider the financial health of the Company in assessing the rate application. In its Opening Statement, the Finance Panel cautioned that NSPI's customers would ultimately suffer from a possible credit rating downgrade faced by the Company:

> As the Board is aware from information provided directly and as part of this hearing, Nova Scotia Power is facing the very real prospect of a credit rating downgrade in the near future should the Company not be able to recover its fuel costs and improve its cash flow position. If these circumstances were not addressed, this would be a very significant event for the future of Nova Scotia Power with long-term implications for our customers. The Company is experiencing cash flow shortages today that are not sustainable if the Company is to continue as a financially viable utility.
>
> As a regulated investor-owned utility, we have a responsibility to both our customers and our shareholders. The continued financial strength of the utility is important to both parties. In the long run it is most important to our customers.
>
> Investors have choices about where to invest money. If NSPI is not viewed as providing a fair return compared to other utilities, NSPI will be limited in its access to capital. This would ultimately lead to higher costs, and in a worse case, inability to access fuel markets and provide appropriate customer service. It is our customers who would ultimately bear the brunt of a credit rating downgrade.
>
> (Exhibit N-170)

[648] This issue was further highlighted by Mr. Huskilson near the conclusion of the hearing:

> ... A year ago no one had anticipated such increases in world fuel prices or in that volatility. This creates a much greater risk for both us and for our customers, and uncertainty for all of us. Nova Scotia Power has paid a heavy penalty – perhaps heavier than anticipated -- for past actions, and I believe that a second fuel cost disallowance would create a very high risk that Nova Scotia Power would see its credit rating downgraded. That's certainly not in the best interests of customer because, you see, our customers are expecting us to invest in their energy future and that will require millions of dollars of future capital.
>
> (Transcript, December 1, 2005, p. 3052)

[649] NSPI indicates that its financial health has deteriorated, leading two of the three rating agencies that rate NSPI (Standard & Poor's and Moody's) to lower their outlook on NSPI from "stable" to "negative" .[227] The Company cautions that it risks a rating downgrade, observing that it would become the lowest-rated electric utility in Canada if it is downgraded one more notch by Standard & Poor's. According to Moody's, there are various factors which could lead to a downward rating, including the Company's inability to maintain sustainable credit metrics, its failure to receive timely and balanced regulatory decisions, its inability to manage its fuel price risk, and its increased reliance on short-term or floating rate debt.[228]

[650] In its evidence, NSPI referred the Board to various examples of comments provided by rating agencies about the financial health of the Company:

> The negative outlook reflects the weakening of the companies' financial profiles due to NSP's inability to fully recover its fuel costs through rate increases. The negative outlook also reflects Moody's concern that there may not be the regulatory willingness to address NSP's fuel price risk exposure through periodic rate applications or the adoption of a fuel price pass-through mechanism. Moody's also expects that increasing capital expenditure requirements over the medium term will cause NSP to have a negative trend for free cash flow over the next few years.
>
> (Moody's Investor Services, Global Credit Research Credit Opinion: Emera Inc., October 11, 2005; NSPI, Redacted Closing Argument, p. 52)

[651] Similar concerns were expressed even after NSPI reached a settlement with its supplier respecting its long-term natural gas agreement:

> Both Emera's and NSPI's financial profiles have been weakened by, among other things, under-recovery of increasing fuel costs at NSPI. Significant uncertainty remains regarding

[227] NSPI, Rebuttal Evidence, Exhibit N-153, pp. 54-55; Province IR-70 (Supplemental)

[228] Province IR-70 (Supplemental)

> the timeliness and fullness of future fuel cost recovery. Yesterday's announced gas pricing arrangement, therefore, will not serve to strengthen the utility's financial profits. Meaningful improvement in the company's business and financial profiles is reliant on favourable regulatory decisions in 2006.
>
> (Standard & Poor's, Bulletin, November 22, 2005, Exhibit N-221; NSPI, Redacted Closing Argument, p. 52)

[652] NSPI stresses the need for the Company to maintain an ability to secure capital investment for future projects. In its Closing Argument, it quoted Bonbright in support of this view:

> Professor Bonbright identifies the Capital-Attraction Standard as "one of the most prominent and most widely recognized functions of public utility rates":
>
>> By this standard, reasonable rates are rates adequate to yield revenues that will cover all legitimate operating expenses plus a return on investment sufficient to **maintain sound corporate credit and to attract required amounts of new capital. Rates below this level are deemed inefficient because, at least in the long run, they will not enable the company to live up to its obligation to service the community.** [Emphasis added in original]
>
> (NSPI, Redacted Closing Argument, p. 51)

[653] NSPI submits that a rating downgrade will have serious consequences for the Company, including higher borrowing and capital costs over the long-term as the Company refinances debt and attempts to raise new capital to support capital investment in facilities. Moreover, NSPI states that the most immediate impact of a credit downgrade will be its impact upon fuel procurement procedures and costs. It notes that a credit downgrade will impact credit limits with suppliers, impose less flexible payment terms, require deposits or

up-front payments, raise borrowing costs, increase fuel costs and, possibly, result in the inability to obtain fuel from certain suppliers.[229]

[654] Despite the assertion by intervenors that the risk of a downgrade must not deter the Board from denying costs which are not reasonably incurred, Mr. Huskilson underscored that the impact of any credit downgrade would ultimately be borne by NSPI's customers:

> A. (Huskilson) Well, if you're talking about bond ratings, it ultimately is an issue that the company has and also an issue for customers. And the reason that it's an issue for customers is because customers expect the company to make investments. And as the company makes investments, it has to raise money. And if it's unable to raise the money necessary to make those investments, then that will affect service. And that's the kind of thing that whether the -- it's very hard to separate the stakeholders of a company like a utility because, ultimately, all the stakeholders of the utility need the utility to be in a healthy situation and to be able to perform the functions and the service that it needs to provide.
>
> (Transcript, December 1, 2005, pp. 3198-3199)

13.2 Submissions - Intervenors

[655] A number of the intervenors questioned NSPI's assertion that the Company's financial health is in jeopardy. SEB refers to the evidence of Dr. Rosenberg, who disputes NSPI's claim that it is not financially healthy. After adjusting for the $18 million fuel disallowance incurred in the 2005 rate case, Dr. Rosenberg maintains that NSPI will still earn a return on equity of 9.36%, which is within the approved ROE band. This assertion was challenged by NSPI, which stated that the actual ROE for 2005 is expected to be 8.58%.

---

[229] NSPI, Redacted Closing Argument, pp. 54-55

[656] In addition to Dr. Rosenberg's relatively optimistic view with respect to NSPI's 2005 ROE performance, Avon refers to other items which could potentially add to NSPI's 2005 earnings, including the Company's settlement with its natural gas supplier, the Company's receipt of a favourable court order issuing an attachment order with respect to its litigation with AMCI Traders respecting a claim of $11.2 million, and a $5 million saving from the 2005 Compliance Filing for interest expense as a result of the Company's ability to secure lower interest rates in issuing long-term debt.[230]

13.3 Findings

[657] The Board recognizes the importance of ensuring that NSPI remain on a sound financial foundation as it heads into the future. The Company's ability to attract capital, access fuel markets and control costs must not be compromised.

[658] In the view of the Board, there are various reasons to be confident about NSPI's future financial health. First, with respect to fuel, which is the most significant component of costs, the Board has approved what it considers to be an appropriate estimate of total fuel costs. The Board recognizes, of course, that any estimate of future costs is subject to error. However, based on the most current information available at the time of the hearing, there is reason to be confident that NSPI can meet the approved fuel budget, and perhaps even better it.

[230] Avon, Redacted Closing Submission, pp. 23-24

[659] The only material exception to the Company recovering its fuel costs in 2006 is the imprudence disallowance of $15,700,000. Since NSPI essentially enjoys the benefit of being a monopoly supplier of electricity in this Province, it is imperative that it only be able to recover its prudently incurred costs. Ratemaking principles and utility regulation require that costs incurred imprudently should not be borne by ratepayers.

[660] Having said that, the Board wishes to emphasize that the imprudence finding for the failings discussed in this decision will no longer have an impact upon NSPI's fuel budget. The Board is satisfied that NSPI has taken significant steps to improve its fuel procurement policies, incorporating a portfolio approach which will help dampen the impact of price volatility. This will allow NSPI to better achieve results falling within the parameters of its fuel budget, which is reflected in rates.

[661] While certain OM&G expenses have not been approved by the Board, it notes that the costs which were denied will not generally impair NSPI's existing operations, but, instead, will merely curtail the spending with respect to programs requested by NSPI (e.g., DSM, vegetation management, communications). A further result of this rate case is the Board's direction that an operations review of NSPI must be carried out. This review will critically examine NSPI's operations and help ensure the efficient allocation of its resources. This should ultimately yield positive results for NSPI customers and investors alike.

[662] The Board recognizes that the interests of customers and shareholders of NSPI are not mutually exclusive. They both benefit from a financially sound utility. In this

decision, the Board has strived to strike an appropriate balance between the interests of NSPI and its customers.

14.0 SUMMARY OF BOARD FINDINGS

14.1 Financial Health of NSPI

[663] In its evidence and submissions, NSPI repeatedly urged the Board to consider the financial health of the Company in assessing the rate application. NSPI indicates that its financial health has deteriorated, leading two of the three rating agencies that rate NSPI (Standard & Poor's and Moody's) to lower their outlook on NSPI from "stable" to "negative". The Company cautions that it risks a rating downgrade.

[664] NSPI submits that a rating downgrade will have serious consequences for the Company, including higher borrowing and capital costs over the long-term as the Company refinances debt and attempts to raise new capital to support capital investment in facilities. Moreover, NSPI states that the most immediate impact of a credit downgrade will be its impact upon fuel procurement procedures and costs. It notes that a credit downgrade will impact credit limits with suppliers, impose less flexible payment terms, require deposits or up-front payments, raise borrowing costs, increase fuel costs and, possibly, result in the inability to obtain fuel from certain suppliers.

[665] The Board understands the importance of ensuring that NSPI remain on a sound financial foundation as it heads into the future. The Company's ability to attract capital, access fuel markets and control costs must not be compromised.

[666] The Board recognizes that the interests of customers and shareholders of NSPI are not mutually exclusive. They both benefit from a financially sound utility. In this

decision, the Board has strived to strike an appropriate balance between the interests of NSPI and its customers.

14.2 Fuel Procurement Strategy

[667] The Board recognizes the effort expended by NSPI in implementing many improvements in its fuel procurement procedures, and in the Fuel Procurement Policies and Procedures Manual, in the relatively short period of time which has elapsed since the Board's 2005 rate decision.

[668] However, a number of deficiencies still remain. The Board directs that NSPI implement, as soon as possible, all the recommendations by Liberty set out in this decision, and that NSPI file a report by August 31, 2006, outlining the status of the recommendations which were implemented, and those recommendations, if any, which were not implemented. The Board further directs that NSPI liaise with Liberty in the implementation of these recommendations.

[669] Notwithstanding that the Manual is not finalized and has not received approval, NSPI must proceed with the implementation of its proposed fuel strategy. The Board expects NSPI to use its judgment both with respect to the changes it proposes to the Manual, and with respect to the implementation of the fuel strategy.

[670] In its March 31, 2005 decision, the Board directed NSPI to engage a fuel procurement expert with respect to coal acquisition. While the Board understands that NSPI has been diligently working to identify and employ such an individual, the Board

wishes to convey to NSPI its concern over the lack of progress in this very significant area of NSPI's operations. Accordingly, the Board directs NSPI to continue expeditiously with its efforts to obtain a solid fuel expert. Failing that, NSPI is directed to consider and evaluate other options which would permit it to acquire the necessary skills to enable it to acquire coal on a competitive basis in the international market. NSPI is directed to file a quarterly status report with the Board concerning this matter, commencing April 30, 2006.

14.3 Carryover of Imprudency

[671] The Board concludes that there is a continuing harm in 2006 as a result of NSPI's failure to implement a portfolio strategy commencing in 2002. The Board is satisfied that, for the same reasons as the Board found in its decision of March 31, 2005, NSPI had an opportunity at that time to begin implementing an appropriate fuel procurement strategy. If NSPI had taken advantage of that opportunity, as it should have done, it would have been able to obtain coal for 2006 at costs significantly less than those which it now forecasts for the 2006 test year. The additional expense involved should not be borne by the ratepayers because it was imprudently incurred. The Board sets the imprudence disallowance for the 2006 test year at $15,700,000.

[672] To avoid any uncertainty going forward, the Board wishes to make it clear that the impact of NSPI's past imprudence for the failings discussed in this decision is now spent and will not extend beyond the 2006 test year. This is because, even if NSPI had entered into a multi-year contract in 2002 and 2003, as the Board considers it should have

done, the Board is satisfied that such contract would have likely run its course by the end of 2006.

14.4 Long-Term Contract

[673] In April of 2005, NSPI entered into its first multi-year contract to acquire low sulphur import coal. The Board finds that the April 2005 contract was not an imprudent transaction.

14.5 Affiliate Activity

[674] The Board is not prepared at this time to require NSPI to assume direct responsibility for selling its surplus natural gas. However, the Board will monitor the transactions and the relationship between NSPI and the company selected to handle NSPI's natural gas, particularly if the arrangement should be with an affiliated company.

[675] The Board directs that NSPI conduct a study to determine the feasibility of establishing an in-house capability to sell its own gas. The study shall be filed with the Board by August 31, 2006.

[676] The Board accepts the recommendation of Liberty to implement a process of detailed, periodic audits of affiliate transactions. Due to Liberty's extensive knowledge of NSPI, the Board will retain Liberty to carry out the first audit. During 2006, the Board will request Liberty to prepare a detailed work plan for the first audit, including the estimated time and budget, as well as an appropriate commencement date. The Board directs that

the work plan be filed with the Board by June 30, 2006 for Board approval. NSPI will be consulted during this process and its opinions solicited. The Board, in planning the commencement date for the first audit, will give consideration to other time commitments which may be facing NSPI.

[677] The detailed audit of affiliate transactions is not meant to replace the annual reporting required under the Code of Conduct.

14.6 Point Tupper Marine Terminal

[678] The Board has determined that NSPI is not entitled to include, in its fuel expense, a capital recovery charge of $2.3 million with respect to the Point Tupper Marine Terminal.

[679] At a future date, NSPI may apply to have the PTMT included in rate base. Should NSPI make such an application, the Board is prepared to consider at that time whether an allowance should be made for deferred capital charges.

14.7 Natural Gas Resale Benefit

[680] During the hearing, NSPI announced it had reached a settlement with its supplier on the future pricing and supply arrangements of natural gas. As a result of the settlement, the Company expects to achieve better results on the resale of its natural gas than originally forecast when it filed its application on July 5, 2005. The Board finds that it is reasonable to adopt a gas resale benefit of $35.8 million higher than that contained in

the original filing of July 5, 2005, thereby decreasing NSPI's original fuel budget by the same amount.

[681] The Board determines that no deferral mechanism or reserve fund should be implemented at this time. In a test year where customers are facing a significant rate increase, the Board is loath to defer any potential benefits from the gas resale benefit to a future test year.

[682] Some intervenors asked the Board to consider whether the benefits of the natural gas settlement between NSPI and its supplier were appropriately allocated between the Company's customers and shareholders.

[683] Having reviewed the terms of the negotiated settlement, the testimony related to it, and the submissions of the parties, the Board is persuaded that the settlement reached with the supplier benefits NSPI's customers and that there was a fair and reasonable allocation of the benefits accruing under the settlement between shareholders and customers.

14.8 Fuel Costs

[684] With the exception of the items noted above, the Board is of the view that there should be no further adjustment to NSPI's fuel budget. The Board sets NSPI's fuel budget for the test year at $425,100,000.

14.9 Return on Equity

[685] In the 2005 rate decision, the Board approved a return on equity at 9.55% for the purpose of setting rates, with an earnings range set at 9.30% to 9.80%. The Board has made no change to return on equity.

14.10 Capital Structure

[686] In the 2005 rate decision, the Board approved an increase in the common equity ratio for ratemaking purposes from 35% to 37.5%. The Board is satisfied that the common equity ratio should be maintained at 37.5%.

14.11 Rate Base

[687] In the 2005 rate decision, the Board directed that NSPI use a return on rate base methodology for its next rate application. The main issue which arose from the adoption of this approach was calculating the cash working capital ("CWC") allowance.

[688] While the Board determined that HST should be included in the calculation of the CWC allowance, it has excluded other items like the securitization of accounts receivable, interest expense and preferred dividends. The Board has also made adjustments to some of the lead/lag assumptions to be incorporated into the calculation.

[689] Based on the above findings, the Board has set the CWC allowance for the 2006 test year at $12.25 million, which has the effect of reducing the rate base by $17.15 million ($1.4 million reduction in the revenue requirement).

[690] The only other adjustment to rate base which appears to be justified on the evidence is to account for the increase in the long-term receivable resulting from the settlement between NSPI and its natural gas supplier. The Board approves an increase in the rate base of $14.45 million to reflect the difference between the long-term receivable estimated in the original rate filing and the amount estimated following the settlement.

[691] The amount of the 2005 Q1 tax deferral has not been finally determined as yet and, in the Board's view, it would be premature to include any amount in rate base at this time.

14.12 Operating, Maintenance and General Expenses (OM&G)

[692] The Board approves an increase in Operating, Maintenance and General expenses from $182.0 million (2005C) to $197.5 million for the 2006 test year, a $15.5 million increase. NSPI had requested an increase of $27.8 million.

(a) Power Production

[693] All the proposed Power Production increases are approved except a disallowance relating to succession planning. In the view of the Board, an additional amount of $1.0 million per year (rather than $1.8 million) should adequately address this group's succession planning issues for the 2006 test year.

(b) Customer Operations

[694] With respect to Customer Operations, the Board approves a proposed cost increase for enhanced storm response, which reflects an increase from $1.4 million

presently included in rates to $5.4 million allocated for the 2006 test year. The Board is mindful that NSPI has greatly enhanced its storm response activities since major storm events like Hurricane Juan and the November 2004 storm.

[695] The Board has reduced NSPI's proposed increase respecting succession planning for power line technicians from $500,000 to $300,000.

[696] In relation to vegetation management, NSPI requested an increase from $5.2 million to $10.4 million in spending. The Board approves a total of $6.8 million ($3.2 million for the transmission system and $3.6 million for the distribution system), an increase of $1.6 million over the amount currently reflected in rates.

[697] NSPI has also requested an additional $1.3 million to improve communication with its customers. The Board approves the requested amount of $500,000 with respect to enhancements to the HVCA and IVR telephone systems, as well as the testing of the systems. However, the Board is not satisfied that NSPI's request for the remaining $800,000 is warranted particularly in the context of the significant rate increase being requested by the Company. It reduces from $800,000 to $300,000, the amount requested with respect to increased customer research, additional proactive communications and increased quality assurance in the customer service area.

(c) Corporate Support Group

[698] With respect to the Corporate Support Group (with the exception of DSM which is discussed below), the Board denies the Company's request for a $492,000 increase for advertising activities carried out by the Investor and External Relations group.

It is the view of the Board that such expenses related to promoting the Company's corporate image and enhancing its goodwill in the community should not be included in the revenue requirement being sought from customers.

[699] The Board approves the $1.6 million expenditure increase under Regulatory Affairs respecting a 2007 rate case which NSPI expects to file in 2006, as well as the $400,000 increase for the 2006 Board assessment.

[700] New governance and audit regulations adopted by the OSC will result in higher regulatory compliance costs. The Board directs that half of the proposed net increase be deferred to 2007, resulting in a net increase approved for this activity of $235,000 ($470,000 less 50% recovered from Emera).

(d) Corporate Adjustments

[701] With respect to Corporate Adjustments, the Board denies NSPI's proposed deferral of $2.0 million associated with regulatory expenses incurred by the Company in 2005, including the cost of the rate hearing held in 2005 and the increased 2005 Board assessment. In the Board's opinion, it is not reasonable to burden ratepayers with the cost of two rate hearings and two increased Board assessments in the same test year, which would be the case were the Board to permit NSPI to roll the 2005 costs into 2006.

[702] The Board approves the remainder of the Corporate Adjustments sought by NSPI, including an increase relating to pension expense from $26.0 million to $31.7 million for the 2006 test year. This represents an increase of $5.7 million in pension expense, which was supported by an actuarial report outlining the basis for this increase.

14.13 Operations Review

[703] In past decisions, the Board has expressed concern about the control of OM&G expenses by NSPI. Following its review of the evidence in this hearing, the Board continues to be concerned about the magnitude of the increase sought by NSPI for OM&G expenses, particularly since it accompanies NSPI's request for a very significant rate increase.

[704] Accordingly, the Board directs that an operations review be carried out on NSPI's operations. The review shall encompass a detailed examination of NSPI's organizational structure, its level of OM&G expenditures, and any other pertinent areas which may come to light, with a view to determining whether cost savings and operational efficiencies can be achieved. NSPI is directed to prepare the terms of reference for the operations review and submit them to the Board for approval by May 31, 2006. The terms of reference shall also set out the procedures for identifying and selecting the firm or person who will perform the operations review.

[705] The Board directs NSPI to include detailed five year forecasts of OM&G costs in all future rate applications.

14.14 Demand Side Management

[706] The Board commends NSPI in its effort in preparing a DSM Plan. All intervenors and consultants generally agree that DSM is important and that it ought to be pursued. However, the Board considers that approval of the Plan, as submitted by NSPI,

is premature at this time. The Plan needs additional design work and resources. NSPI customers expect that any DSM program should be carefully designed to ensure its maximum impact, and effectively implemented.

[707] The Board approves $550,000 in additional funds (and not the $5 million requested by NSPI) to retain an outside consultant and to complete the Plan's design and development. NSPI is directed to prepare the terms of reference for the consultant and submit them to the Board for approval no later than April 15, 2006. The process of retaining and selecting the consultant will be monitored by the Board. The Board orders that NSPI complete the DSM Plan and file it with the Board no later than June 30, 2006, utilizing the assistance of the Board approved consultant.

[708] The Board orders that a separate hearing on DSM be held in the second half of 2006.

14.15 Depreciation

[709] The Board approves the resumption of the second year phase-in of the four year increase of depreciation rates in the 2006 test year.

14.16 Annually Adjusted Rates/Below-the-Line Rates

[710] The Board has not received any evidence in opposition to NSPI's proposed GRLF rates and they have been calculated as in previous years. Accordingly, the 2006 GRLF rates proposed by NSPI are approved by the Board effective January 1, 2006.

[711] There were no intervenor submissions on either the proposed increase in the 1P-RTP adders or the proposed amendment to the tariff. The Board approves the adders and the tariff addition proposed by NSPI.

[712] The Board has decided that ELIIR will be substantially redesigned for 2007. The redesign will affect the 2P-RTP rate used in conjunction with ELIIR.

[713] In light of the unanimous support for the language in the 2P-RTP rate at the time it was approved, and the likelihood of substantial change effective January 1, 2007, the Board has decided not to approve any changes in the tariff wording at this time. The Board approves the 2P-RTP rate in its current form effective January 1, 2006.

[714] The Board concludes that the FP-DSM/DR rate proposed by SEB is not cost based and would create an undue burden on ATL customers. Accordingly, the Board is not prepared to approve the FP-DSM/DR rate.

[715] It is clear to the Board that ELIIR is not working as it was originally intended to by both NSPI and SEB. Therefore, the Board will hold a separate hearing in 2006 to consider a replacement for ELIIR, which will become effective January 1, 2007. The Board directs NSPI to file an application for a new rate to replace ELIIR, after consultation with its customers, no later than June 30, 2006.

[716] For the current year, the Board has been presented with two approaches for setting the energy charge in ELIIR. NSPI supports the use of the formula in the existing tariff. The Board understands that Dr. Stutz recommends beginning with the LIR - that is the Large Industrial Rate at an 85% load factor, less the transformer ownership credit and

the value of the interruptible supply credit of $3.43 per month per kVa. Dr. Stutz then subtracts the value of economic interruptibility, which he calculated at $8.43 per MWh. Each of these approaches has strengths and limitations. Dr. Stutz's approach is conceptually correct, but does not provide a fully developed alternative for ELIIR. To give weight to each approach, the Board directs NSPI to set the ELIIR energy charge by averaging the results produced by the two approaches.

[717] In setting the ELIIR energy charge, the Board directs NSPI to use the fuel budget and all other items having an impact on ELIIR, as approved in this decision. The Board also directs NSPI to iterate its rate calculations, to ensure consistency between the LIR charges used to set ELIIR and those to be paid by customers on the LIR rate.

[718] The Board has directed NSPI to develop and file a replacement for ELIIR. Both NSPI and SEB have agreed that Dr. Stutz's approach to the development of such a replacement—beginning with a firm rate and then specifying credits for interruptibility—has merit. While the Board concurs, it would be prepared to consider other viable options which may be developed.

[719] NSPI proposed to add Special Condition 5 to the ELIIR tariff, the purpose of which is to require customers to file an hourly demand forecast on a day-ahead basis. Because the current version of ELIIR is about to be replaced, the Board will not approve any changes in the present tariff language. Upon filing, the Board will approve, effective January 1, 2006, the interim ELIIR rate calculated in accordance with this decision.

14.17 Load Forecast

[720] The Board is not persuaded that NSPI's manual adjustment to its load forecast should be approved. The Board concludes that denying the DSM-related load forecast reduction should increase variable costs, while corresponding revenues from electricity sales should increase. The impact of this finding is estimated to result in a net reduction of $1.6 million in the revenue requirement.

[721] The Board directs that NSPI file its report on the progress of improvements to its load forecasting methodology by December 29, 2006. This extension of the filing deadline should allow NSPI to incorporate its response to DSM-related load reduction issues.

14.18 Unmetered Rates

[722] The Board directs that a cost of service study be conducted as proposed by NSPI with respect to the Unmetered Class. The study shall include a review of the appropriateness of the current weighting factor and a review of the rate base, including assets, assigned to the Unmetered Class. The study should indicate a breakdown of costs and rate base by municipality. The cost of service study results shall be filed with the Board by July 31, 2006.

[723] The Board directs that the current weighting factor of 5.0 should remain in effect for the 2006 test year.

14.19 Miscellaneous Charges

[724] The Board approves the proposed increases to miscellaneous charges sought by NSPI, limiting the proposed increase to the average rate increase for ATL customers. In the event such increases result in a charge which exceeds the cost of delivering the service, the charge must be capped at the actual cost.

14.20 Low Income Consumers

[725] The AEC submits that the Board has a statutory obligation to protect the public interest by ensuring that the services provided by NSPI are affordable for its customers, including low income customers. Dalhousie Legal Aid appealed the Board's 2005 rate decision respecting such issues. The appeal is set to be heard by the Nova Scotia Court of Appeal. The Board considers it prudent to await the disposition of the appeal before it undertakes any further review of the issues raised by the AEC.

14.21 Pole Attachment Fees

[726] The setting of the pole attachment fee, as well as the scope of costs recovered under that rate and under "make-ready" charges, were canvassed by the Board in its decision on such issues dated January 24, 2002. The Board is satisfied that NSPI's allocation of costs is in accord with that decision and that the Company's proposed rate increase does not result in a duplication of the revenue earned from pole attachment fees and "make-ready" charges.

14.22 Renewable and Environmentally Sustainable Energy

[727] Some of the intervenors asked the Board to consider environmental issues in assessing NSPI's application for a rate increase. While much work remains to be done, the Board is satisfied that NSPI is addressing these issues. The Board will continue to monitor the Company's progress. It should be noted that DSM and air emission controls will be the subject of separate hearings held by the Board in 2006.

14.23 Incentive Compensation Plan Review

[728] In its March 31, 2005 rate decision, the Board determined that NSPI's incentive compensation plan should be reviewed to determine whether it delivers an equal benefit to both shareholders and ratepayers. NSPI's Incentive Compensation Report was filed with the Board on September 30, 2005.

[729] The Board has engaged Liberty to review NSPI's Incentive Compensation Report. Any issues arising from this review can be addressed in a future rate hearing.

14.24 Non-Profit Intervenor Costs

[730] The Affordable Energy Coalition asks the Board for costs in this matter. NSPI has not addressed the AEC's request for costs in its submissions. The Board directs NSPI to file its response to this request no later than April 20, 2006. AEC will have an opportunity to file additional written submissions on this issue no later than May 1, 2006. Following its review of the submissions, the Board will issue a ruling on this request.

14.25 General Demand Rate Class

[731] As set out in its 2002 and 2005 rate decisions, the Board considers it desirable to maintain, where reasonable, an R/C ratio between 95% and 105% for all classes. The Board continues to believe that it is fair and reasonable, in terms of the impact on other ATL customers, for the General Demand class to be gradually moved to an R/C ratio of 95% to 105%.

14.26 Disallowances and Adjustments/Rate Increase

[732] The Board has made disallowances and adjustments totalling $67,914,000, which will result in a reduction of a corresponding amount for NSPI's test year revenue requirement. This, in turn, is expected to result in an average rate increase of approximately 8.6% for above-the-line customers, with an estimated rate increase of approximately 8.9% for domestic customers. The increase in rates for above-the-line customers is effective March 10, 2006. All below-the-line rates will be effective January 1, 2006.

An Order will issue accordingly.

DATED at Halifax, Nova Scotia, this 10th day of March, 2006.

DECISION DATE:	**March 31, 2005**
DECISION:	**Settlement Agreement not accepted; Requested Revenue Requirement Increase of approximately $104 million reduced to approximately $34 million; Proposed average rate increase for above-the-line customers of 12.4% reduced to approximately 5.3% with a 6.1% increase for most above-the-line rates, including rates for domestic customers, effective April 1, 2005; Annually Adjusted Rates to increase by 10.4% effective January 1, 2005.**

TABLE OF CONTENTS

APPENDICES

1.0 INTRODUCTION

[1] This decision is further to a public hearing conducted by the Nova Scotia Utility and Review Board (the "Board") over 16 days between November 16, 2004 and January 14, 2005, in the matter of an application by Nova Scotia Power Incorporated ("NSPI", the "Company", the "Utility") for approval of revisions to its Rates, Charges and Regulations. Following the conclusion of the rate hearing on December 3, 2004, the Company filed a Settlement Agreement, between it and several of the intervenors, on December 15, 2004. The hearing was reconvened on January 13 and 14, 2005 to consider this proposal.

[2] NSPI is a regulated public utility and is the successor to Nova Scotia Power Corporation, a Crown Corporation which was privatized in 1992. As of January 1, 1999, NSPI became the principal subsidiary of Nova Scotia Power Holdings Incorporated, now known as Emera Incorporated ("Emera").

[3] NSPI is engaged in the production and supply of electrical energy. It distributes electricity through a province-wide system and, as at December 31, 2003, served approximately 460,000 customers, including six municipal electric utilities. Its revenues for the year 2003 were $896 million and its total assets, as at December 31, 2003, were $3 billion.[1]

---

[1]Exhibit N-7, Tab 1, pp. 18-23

[4] In its revised application, dated June 23, 2004, NSPI requested an increase in rates to meet its proposed revenue requirement. It has used its estimated expenses for 2005 as the test year for ratemaking purposes. The proposed rate increases result in an average overall increase of 12.4% across all classes. Certain customers would experience rate increases considerably in excess of this amount. NSPI also requests approval of a return on common equity in a range of 10.2% to 11.2%, with a common equity component of its capital structure of 37.5%. In addition, NSPI proposes a Fuel Adjustment Mechanism ("FAM") to provide for a means by which changes in fuel costs experienced by the Utility would be passed through to customers automatically without the need for a hearing.[2] NSPI's application also includes changes to a number of its regulations, including increases in miscellaneous charges.

[5] The public hearing was duly advertised in accordance with **Sections 64** and **86** of the **Public Utilities Act** ("the **Act**") R.S.N.S. 1989, c. 380, as amended, which read as follows:

> **Approval of schedule of rates and charges of utility**
>
> **64 (1)** No public utility shall charge, demand, collect or receive any compensation for any service performed by it until such public utility has first submitted for the approval of the Board a schedule of rates, tolls and charges and has obtained the approval of the Board thereof.
>
> **Filing with Board**
>
> **(2)** The schedule of rates, tolls and charges so approved shall be filed with the Board and shall be the only lawful rates, tolls and charges of such public utility until altered, reduced or modified as provided in this Act. R.S., c. 380, s. 64.

---

[2] Exhibit N-1, Tab 1, pp. 3-4

Notice of hearing of application for rate changes

86 Notice of the hearing of any application, for the approval of or providing for an increase or decrease in the rates, tolls and charges of any public utility, shall be given by advertisement in one or more newspapers published or circulating in the cities, towns or municipalities where such changes are sought, for three consecutive weekly insertions preceding the date of said hearing, unless otherwise ordered by the Board. R.S., c. 380, s. 86.

[6] Thirty-seven formal intervenors responded to NSPI's application, all but two in opposition. A number of these parties (identified in Appendix B, attached) were represented at the hearing by Counsel. The Provincial Department of Energy (the "Province"); Avon Valley Greenhouses Ltd. *et al.* ("Avon"), whose Counsel represented approximately 16 intervenors; Stora Enso Port Hawkesbury Limited and Bowater Mersey Paper Company Limited ("SEB"); Halifax Regional Municipality ("HRM"); Dalhousie Legal Aid Service ("DLAS"); Ecology Action Centre ("EAC"); Electricity Consumers Alliance of Nova Scotia ("ECANS"); Canadian Manufacturers & Exporters ("CME-NS"); GasWorks Energy Corp. ("GasWorks"); the Liberal and NDP Caucus offices; and the Municipal Electric Utilities of Nova Scotia Co-operative ("MEUNSC") all participated in the hearing. The Board also received numerous submissions from members of the public opposing NSPI's application.

[7] An initial application for a rate increase was filed by NSPI on May 28, 2004, and the Board made preliminary preparations for a public hearing in October of 2004. However, NSPI significantly altered its application following the June 11, 2004 decision of the Supreme Court of Canada to reject a long-standing tax appeal by NSPI under **s. 21** of the **Income Tax Act**. NSPI re-filed its application on June 23, 2004, requesting recovery of an additional $150 million in income tax and interest costs which it proposed to amortize

over seven years. This represented an increase over the initial 2005 test year revenue requirement of $32.7 million which, in turn, increased the proposed rates by an average of 3.8%, from the May 2004 request of 8.6% to 12.4%, with most classes subject to average increases higher than 12.4%.[3] For example, under the revised application, domestic customers would see an increase of 14.1%.

[8] Once the actual proposed increases in electricity rates were confirmed by NSPI in the June 23, 2004 revised application, the regulatory process commenced. The Board issued an Order on June 28, 2004 setting down a public hearing on NSPI's rate application commencing in mid-November, 2004. The Board established a timetable for evidence filings and information requests and responses ("IRs") that covered the period from July 15, 2004 to November 8, 2004. NSPI also conducted a number of technical conferences during this period.

[9] In its revised application, NSPI identifies its total 2005 test year revenue requirement to be $1,072.9 million,[4] and takes the view that its need for a rate increase is primarily driven by higher tax expenses. NSPI's policy panel witnesses were Mr. Chris Huskilson, President and Chief Executive Officer of Emera, and Mr. Ralph Tedesco, NSPI's Chief Operating Officer (COO). In his opening statement, Mr. Tedesco stated that:

> ... In this instance we have made an application necessitated by a tripling of our annual tax liability. This tripling of taxes represents an annual increase in our tax liability of $79 million dollars. On May 28th we filed a request to increase rates by $71 million dollars, or $8 million dollars less than the actual tax increase. Subsequently, and as a result of an unfavourable

[4] Exhibit N-6, App. O, p. 12

> tax ruling at the Supreme Court of Canada associated with **Section 21** of the **Income Tax Act**, we filed for an additional $33 million dollar increase in revenues.
>
> (Transcript, Nov. 16, 2004, pp. 27-28)

While Mr. Tedesco refers to taxes as the primary cause of the application, the increase appears to be also driven by higher fuel costs, primarily imported coal.

[10] A significant part of NSPI's evidence involves the cost of fuel, particularly imported coal. NSPI filed this data on the basis that it constitutes confidential information. The Board again imposed the precedent, established in the 2002 rate case, which provides access to this information only to those intervenors who agree to sign confidentiality undertakings.

[11] As a result, certain testimony, undertakings, exhibits and transcripts are considered confidential and are accessible only to the Board and those parties who agreed to sign confidentiality undertakings. For the most part, redacted versions of this evidence are on the public record. In addition, certain of the hearing days relating to evidence on fuel were conducted on an *in camera* basis.

[12] In its 2002 decision the Board stated that:

> While conducting *in camera* sessions is an unusual occurrence for the Board, it is not precluded by the Board's regulatory rules. Indeed the rules contemplate information being filed in confidence and also provide for other parties to request its disclosure. The Board believes that its role as a regulator responsible for protecting the public interest requires it to issue a decision that is, in all respects, accessible to the public. The Board considers that it is unacceptable to issue two versions of a decision - one public and one confidential. Therefore, although the Board has carefully considered all of the evidence filed during this proceeding, including those parts which involve confidential information, the Board has chosen, in this decision, to avoid direct reference to confidential information.
>
> (Board Decision, October 23 , 2002, p. 5)

[13] The Board continues to believe that this is the most appropriate manner in which to issue a decision in a case where a significant portion of the evidence is confidential. Accordingly, to the extent possible, this decision will not refer directly to confidential information.

[14] Just prior to November 15, 2004, the first scheduled day of the public hearing, NSPI requested that the hearing commencement be delayed until November 16, 2004. This request, which was agreed to by the Board, was as a result of significant power outages in various communities in the Province following a storm on November 13 and 14, 2004.

[15] The November outages are the subject of a separate review by this Board. On November 16, 2004, the Board received the following request from Premier John Hamm:

> The Government of Nova Scotia believes that the public interest would be served if the Utility & Review Board conducted an independent review. I therefore request that the Utility & Review Board, under the powers of the Public Utilities Act, begin a public review of the Company's state of preparedness for, and response to, last weekend's storm.
>
> This review should provide valuable insights into improvements which can be made to the overall restoration program in preparation for future outages.

[16] As part of the outage review, the Board has received a number of comments from members of the public questioning, among other things, why NSPI's request for a rate increase should be considered when the service provided by NSPI is, in the view of these customers, inadequate and unsatisfactory.

[17] While the Board recognizes the logic of this reaction, it is important to understand why this form of sanction cannot reasonably be applied to a regulated utility.

NSPI is not like an unregulated retailer. It is a virtual monopoly which operates its business on a cost-of-service basis. Providing electricity to all communities in the Province was not (and likely still is not) financially feasible for private, competitive companies. For that reason, the Province's electric service supplier is a cost-of-service monopoly. In return for undertaking and continuing the costs of electrification of the Province, the Utility is permitted, under the **Act**, to recover the reasonable and prudent costs of providing this service. Because it is a monopoly, regulation operates as a surrogate for competition. One of the regulator's tasks is to balance the need for the Utility to recover its reasonable and prudent costs with the need to ensure that ratepayers are charged fair and reasonable rates.

[18] It is in the interests of all Nova Scotians to ensure that NSPI continues to be a stable and financially sound company. This is a reality which the Board must consider when determining what, if any, rate increase is warranted.

[19] In short, rates charged to customers are based on costs incurred by the Utility in providing service. If the Board finds certain costs to be imprudent or unreasonable, it can (and has) disallowed such expenditures and reduced proposed rate increases accordingly. The Board cannot, however, make rate decisions based solely on reliability issues or current public opinion of the Utility. There are appropriate sanctions a regulator can impose should a Utility be found to have an inadequate or unreliable system. In many cases, it is likely such sanctions would involve higher expenditures, rather than reductions in costs. However, the practical reality in a regulated utility environment is that sanctions for service-related issues generally do not include a moratorium on rate increases.

[20] It should also be noted that on November 9, 2004, the Board approved a final version of the Code of Conduct. The Interim Code of Conduct was the subject of considerable discussion and input during the 2002 rate case. The Code of Conduct (set out in Appendix C) is a document which governs the manner in which NSPI conducts transactions with affiliated companies, including Emera. The principal change between the interim Code and final Code incorporates a suggestion from Counsel for Annapolis *et al.* in 2002. This revision changes the test for determining whether an affiliate transaction is acceptable. Instead of satisfying the Board that an affiliate transaction does no harm to ratepayers, NSPI is now required to show that affiliate transactions benefit ratepayers.

[21] The Board wishes to acknowledge, with appreciation, the contribution and participation of the intervenors, NSPI and the public in this proceeding. The Board has before it many thousands of pages of material to review, analyze and consider in its decision-making process. The significant work of the parties, as well as the expert witnesses appearing at the hearing, assisted the Board considerably in this process.

2.0 BACKGROUND

[22] NSPI is a vertically integrated, investor-owned, regulated public utility with a virtual monopoly on electricity service throughout the Province. In 2003, it supplied 97% of the generation, 99% of the transmission and 95% of the distribution in the Province.[5] As noted earlier, the Board regulates NSPI in the public interest on a cost-of-service basis. The **Act** gives the Board broad regulatory oversight over public utilities and provides it with the authority to discharge its regulatory responsibilities. Some of the relevant provisions are as follows:

> **Supervision of utility by Board**
>
> **18** The Board shall have the general supervision of all public utilities, and may make all necessary examinations and inquiries and keep itself informed as to the compliance by the said public utilities with the provisions of law and shall have the right to obtain from any public utility all information necessary to enable the Board to fulfil its duties. R.S., c. 380, s. 18.
>
> **Form of books and records of utility**
>
> **27** The Board may prescribe the forms of all books, accounts, papers and records required to be kept by any public utility and every public utility is required to keep and render its books, accounts, papers and records accurately and faithfully in the manner and form prescribed by the Board and to comply with all directions of the Board relating to such books, accounts, papers and records. R.S., c. 380, s. 27.
>
> **Examination and audit of accounts**
>
> **29 (1)** The Board may provide for the examination and audit of all accounts, and all items shall be allocated to the accounts in the manner prescribed by the Board.
>
> **Authority to inspect books or records of utility**
>
> **(2)** The agents, accountants or examiners employed by the Board shall have authority under the direction of the Board to inspect all and any books, accounts, papers or records and memoranda kept by any public utility. R.S., c. 380, s. 29.

---

[5] Exhibit N-7, Tab 1, p. 21

Power to determine value of property of utility

30 (1) The Board may at any time, with the assistance of such engineers, accountants, valuators, counsel and others as it deems wise or advisable to employ, inquire into and determine the extent, condition and value of the whole or any portion of the property and assets of any public utility used and useful in furnishing, rendering or supplying a particular service to or for the public, as of a date to be fixed by the Board.

Duty of utility to furnish information

33 (1) Every public utility shall furnish to the Board from time to time, and as the Board may require, maps, profiles, contracts, reports of engineers and other documents, records and papers, or copies of any and all of the same in aid of any investigation and to determine the value of the property of such public utility, and every public utility shall co-operate with the Board in the work of the valuation of its property in such further particulars and to such extent as the Board may direct.

Approval of improvement over $25,000

35 No public utility shall proceed with any new construction, improvements or betterments in or extensions or additions to its property used or useful in furnishing, rendering or supplying any service which requires the expenditure of more than twenty-five thousand dollars without first securing the approval thereof by the Board. R.S., c. 380, s. 35; 2001, c. 35, s. 30.

Separate rate base for each service supplied

42 (1) The Board shall fix and determine a separate rate base for each type or kind of service furnished, rendered or supplied to the public by a public utility.

Factors considered in establishing rate base

(2) In establishing a rate base the Board shall determine the value of the physical assets of the public utility in accordance with the provisions of this Act, including in such value the actual reasonable and necessary cost of labour and supervision up to and including gang foreman, and the Board may, in its discretion, make allowances for the following matters, and such other matters as the Board deems appropriate:

(a) necessary working capital;

(b) organization expenses to the extent of such sum as the public utility may establish to the satisfaction of the Board to have been reasonably and prudently expended out of capital account in respect of organization expenses as defined by the regulations of the Board;

(c) construction overheads to the extent of such sum as the public utility may establish to the satisfaction of the Board to have been reasonably and prudently expended out of capital account in respect of engineering, superintendence, legal services, taxes and interest during construction, and like matters not included in the valuation of the physical assets;

(d) expenses of valuations to the extent of such sums as may have been expended in respect of a valuation by the Board and, with the approval of the Board, charged to capital account;

(e) costs in whole or in part of land acquired in reasonable anticipation of future requirements.

Amortization of organization and valuation expenses

(3) The Board may direct that a public utility shall make such provision as to the Board seems proper for the amortization of the sums allowed in a rate base for organization expenses and expenses of valuations, and may direct that the sums required annually for such amortization shall be charged as an operating expense.

Revision of rate base

(4) The Board may from time to time revise any rate base making due allowance for extensions and additions to, improvements or alterations in and withdrawals or retirements from, the property and assets of the public utility.

Existing rate base

(5) Until a rate base is determined by the Board for any public utility pursuant to this Section, the present rate base for such public utility as from time to time revised or accepted by the Board shall continue in effect and shall be the rate base for such public utility, provided that the Board may direct that any such public utility shall make such provision as to the Board seems proper for the amortization of the sums allowed in such rate base for organization expenses, expenses of valuations or allowances not mentioned in subsection (2) and may direct that the sums required annually for such amortization shall be charged as an operating expense. R.S., c. 380, s. 42; 1992, c. 8. s. 35.

Amount utility entitled to earn annually

45 (1) Every public utility shall be entitled to earn annually such return as the Board deems just and reasonable on the rate base as fixed and determined by the Board for each type or kind of service furnished, rendered or supplied by such public utility, provided, however, that where the Board by order requires a public utility to set aside annually any sum for or towards an amortization fund or other special reserve in respect of any service furnished, rendered or supplied, and does not in such order or in a subsequent order authorize such sum or any part thereof to be charged as an operating expense in connection with such service, such sum or part thereof shall be deducted from the amount which otherwise under this Section such public utility would be entitled to earn in respect of such service, and the net earnings from such service shall be reduced accordingly.

Earnings are in addition to expenses and allowances

(2) Such return shall be in addition to such expenses as the Board may allow as reasonable and prudent and properly chargeable to operating account, and to all just allowances made by the Board according to this Act and the rules and regulations of the Board. R.S., c. 380, s. 45.

Power to compel compliance by utility

46 The Board shall have power, after hearing and notice by order in writing, to require and compel every public utility to comply with the provisions of this Act and any municipal ordinance or regulation relating to said public utility, and to conform to the duties imposed upon it thereby by the provisions of its own charter, if any charter has or shall be granted it, provided, that nothing herein contained shall be held to relieve any public utility or its officers, agents or servants, from any punishment, fine, forfeiture or penalty for violation of any such law, ordinance, regulation or duty imposed by its charter, nor to limit, take away or restrict the jurisdiction of any court or other authority which now has or which may hereafter have power to impose any such punishment, fine, forfeiture or penalty. R.S., c. 380, s. 46.

Duty to furnish information

51 (1) Every public utility shall furnish to the Board all information required by it to carry into effect the provisions of this Act, and shall make specific answers to all specific questions submitted by the Board.

Duty to furnish safe and adequate service

52 Every public utility is required to furnish service and facilities reasonably safe and adequate and in all respects just and reasonable. R.S., c. 380, s. 52.

Approval for transfer of undertaking

62 Notwithstanding the provisions of any Act of the Legislature, no public utility shall sell, assign or transfer the whole of its undertaking or any part thereof to any person or corporation except with the approval of the Board first had and obtained. R.S., c. 380, s. 62.

Approval of schedule of rates and charges of utility

64 (1) No public utility shall charge, demand, collect or receive any compensation for any service performed by it until such public utility has first submitted for the approval of the Board a schedule of rates, tolls and charges and has obtained the approval of the Board thereof.

Filing with Board

(2) The schedule of rates, tolls and charges so approved shall be filed with the Board and shall be the only lawful rates, tolls and charges of such public utility until altered, reduced or modified as provided in this Act. R.S., c. 380, s. 64.

Equal rates and charges for similar services

67 (1) All tolls, rates and charges shall always, under substantially similar circumstances and conditions in respect of service of the same description, be charged equally to all persons and at the same rate, and the Board may by regulation declare what shall constitute substantially similar circumstances and conditions.

Contravention prohibited

(2) The taking of tolls, rates and charges contrary to the provisions of this Section and the regulations made pursuant thereto is prohibited and declared unlawful. R.S., c. 380, s. 67.

[23] NSPI last filed an application for a general rate increase in December of 2001. The hearing was held between April and June of 2002, and the Board's decision was issued on October 23, 2002. Certain findings in the Board's 2002 decision, which are relevant to this case, can be summarized as follows:

- The Board reduced NSPI's revenue requirement by $42.4 million, which resulted in an average rate increase of 3.3%, rather than the 8.9% requested by NSPI;
- Common equity level for ratemaking purposes maintained at 35% - NSPI free to increase its actual equity ratio to 40%;
- Approved return on equity of 10.15% with earnings range of 9.90% to 10.40%;
- Reduction in estimated fuel costs - particularly imported coal - which were not sufficiently normalized for ratemaking purposes;
- Reductions in executive compensation for ratepayers' share of former President's annual salary and 50/50 share of incentive compensation for ratepayers and shareholders;
- NSPI to demonstrate that Operations, Maintenance and General (OM&G) is cost-efficient and that cost reductions affect higher levels, as well as lower levels, of the Company;
- Further review of the Interim Code of Conduct required prior to final approval;
- NSPI directed to undo the transfer of core utility functions of fuel procurement, export electricity sales and natural gas sales from Emera back to NSPI. NSPI also directed to develop in-house fuel procurement expertise, as well as develop fuel procurement policies and procedures. Fees paid by NSPI to Emera for these functions were disallowed;

- NSPI directed to "insulate" itself from Emera by using a different auditing firm than that used by Emera and by having different Chairs of the respective audit committees of each company.

[24] The Board stated in its 2002 decision that:

> In utility regulation, there are generally accepted principles which govern the rate-making exercise. The object of rate-making under a cost-of-service-based model is that, to the extent reasonably possible, rates should reflect the cost to the utility of providing electric service to each distinct customer class. In regulating NSPI, the Board is guided by these generally accepted principles as well as by case law.
>
> A widely-accepted publication written by Dr. James Bonbright entitled **Principles of Public Utility Rates,** sets out the following guidelines for determining appropriate rates:
>
> **CRITERIA OF A SOUND RATE STRUCTURE**
>
> 1. The related, "practical" attributes of simplicity, understandability, public acceptability, and feasibility of application.
> 2. Freedom from controversies as to proper interpretation.
> 3. Effectiveness in yielding total revenue requirements under the fair-return standard.
> 4. Revenue stability from year to year.
> 5. Stability of the rates themselves, with a minimum of unexpected changes seriously adverse to existing customers. (Compare "The best tax is an old tax.")
> 6. Fairness of the specific rates in the apportionment of total costs of service among the different consumers.
> 7. Avoidance of "undue discrimination" in rate relationships.
> 8. Efficiency of the rate classes and rate blocks in discouraging wasteful use of service while promoting all justified types and amounts of use:
>   (a) in the control of the total amounts of service supplied by the company;
>   (b) in the control of the relative uses of alternative types of service (on-peak versus off-peak electricity, Pullman travel versus coach travel, single-party telephone service versus service from a multi-party line, etc.).
>
> (Exhibit N-92) (James Bonbright, **Principles of Public Utility Rates**, Columbia University Press, 1961, p. 291)
>
> (Board Decision, Oct. 23, 2004, pp. 14-15)

[25] The Board continues to be of the view that its decision in this case should be based on these guiding principles.

3.0 SETTLEMENT AGREEMENT

3.1 Submissions - NSPI

[26] On December 15, 2004, NSPI filed a letter, together with other documents, advising that a Settlement Agreement ("SA") had been reached between it and certain intervenors in the rate case. The terms of the settlement are set out below:

1. The company's Revenue Requirement for the 2005 test year will be increased and be set at **$1,018,000,000**.
   a. This represents a $54.9 million dollar reduction from the rate filing
      b. Average rate increase for all classes is 8.7%, except:
         i Commercial General Demand increase is 3.2% (as a result of existing high revenue cost ratio)
      c. ELIIR rate increases by 10.4% for 2005, 2-part RTP is set at the same level
      d. Revised emission standards take effect on March 1, 2005.

2. The above Revenue Requirement includes these specific components to be approved by the Board in its Order approving this settlement:
   a. OM&G of $177.0M (reflects pension discount rate change from 5.75% to 6.0% and other savings, for a total of approximately $5 million)
   b. ROE set at 9.8% within a band of 9.3% - 10.3% setting rates on an equity thickness of 37.5% and continuing the ability to grow the equity to 40%.
   c. For 2005, depreciation fixed at $122.2M (Board will permit NSPI to delay phase-in of the depreciation study by one year.)
   d. Up to $13 million of fuel expense can be deferred for collection in 2006.

3. By Order the Board will approve:
   a. Recovery of Section 21 monies (approx. $150M) by applying money currently in rates for amortization of defeasance and Glace Bay to Section 21 when those funds are no longer required for defeasance and Glace Bay. There is no change in rates with this approach. (NSPI's cash flow is reduced approximately $30 million)

b. The increase in Miscellaneous Charges (part of Other Revenue and not Electric Revenue) subject to no charge increasing by more than 50%.

c. The valuation and accounting treatment of the second LM6000 approved as submitted to the UARB.

4. Board allows for the consideration of a Fuel Adjustment Mechanism (FAM) during 2005 for the calendar year 2006, subject to the following:

   a. NSPI developing a specific FAM proposal for review by stakeholders at a Technical Conference

   b. NSPI gaining further experience in international coal markets

   c. NSPI agrees to a customer education campaign, should its request be favorably considered.

   d. NSPI recognizes UARB approval of a FAM is required

5. NSPI proposes Dalhousie Legal Aid's request for a low-income program be undertaken in a separate process including a technical conference

   a. NSPI will suggest no change in the present residential rate for the first 150 kwhrs of use. The difference to be recovered via a slightly increased 'tail block' residential rate. There is no change to the proposed overall residential rate increase.

6. New rates giving effect to this settlement will be effective January 1, 2005.

(Exhibit S-1, Terms of Recommended Settlement)

[27] NSPI also provided letters of support from a number of intervenors who agreed with the terms noted above. These include several large industrial customers such as Michelin and SEB. The Province indicated its support in a letter from the Honourable Cecil Clarke, Minister of Energy. CME-NS and EAC also advised of qualified support for the SA.

[28] The SA, if accepted, would reduce the proposed average rate increase for above-the-line customers ("ATL") (domestic, commercial, municipal and certain industrial categories) from 12.4% to 7.3%, with an increase of 8.7% for residential customers.

Below-the-line ("BTL") customers (with the exception of Generation Replacement Load Following ("GRLF") customers), whose rates are subject to annual adjustments based primarily on the fluctuating cost of fuel, would have their rate increase under the SA reduced to 10.4%. While NSPI's general rate application did not include specific projected rate increases for these customers, the SA does provide for a defined and lower rate increase for certain BTL customers and all ATL customers. As a result, the majority of NSPI's Annually Adjusted Rate ("AAR") customers are signatories to the SA.

[29] Since the domestic class of customers did not have a specific representative focused exclusively on this customer class during the rate hearing, they were not represented during the SA negotiations. As a result, following receipt of the SA filing, the Board ordered that an independent consumer advocate review the SA, solely from the perspective of domestic customers, and provide opinion evidence concerning the SA at the public hearing. On December 17, 2004, the Board engaged Nancy Brockway, of NBrockway & Assoc., a former US utility regulator and consumer advocate, to fulfill this role.

[30] In his evidence during the SA portion of the hearing, Mr. Tedesco explained how the SA was developed:

> As Mr. Huskilson and I indicated in our discussion with Commissioner Morash during cross-examination in this proceeding, we remain very much open to the opportunity to continue discussions with others to try and find a solution to the issues raised by our Rate Application. Discussions resumed with stakeholders during the hearing. Intervenors were canvassed for their input and their interest in moving forward with a settlement agreement. Some chose to participate in the settlement, others did not. Based on these conversations and meetings, in December, Nova Scotia Power filed a proposed settlement of its 2005 Rate Application with the Utility and Review Board. As with any settlement, the proposal involves substantial give and take on all -- by all participants aimed at balancing the interests of all stakeholders. Where possible, the settlement seeks to address issues that were raised by

> other intervenors, whether or not those intervenors are part of the settlement. From Nova Scotia Power's perspective, the proposed settlement represents significant concessions and will mean substantial pressures on the Company in 2005. I ask you to note that in the 12 years since privatization, the Company has had just three general rate increases totalling six percent for a pace far below the rate of inflation. As well, the Company's original application involved a commitment to keep non-pension OM&G expenses at levels less than 2002. The Company will also absorb over three million dollars in expected fuel costs. Moreover, we know that our actual pension expense will be higher than the amount in the Settlement Proposal. We have also reduced miscellaneous revenue by almost a million dollars. In addition, the settlement lowers the Company's rate of return from 10.2 percent to a mid point of 9.8. We also expect, as we have filed in modified Table 1 of Appendix A of the application, that our actual return will be 9.6 percent. The Company will also forego approximately thirty million dollars ($30,000,000) in cash flow compared to its filed application. This is mainly to accommodate the extended amortization of Section 21 tax expenses and the delayed implementation of new depreciation rates. Also regarding Section 21, this proposal is better for customers next year, is nearly equivalent to the original proposal on a net present value basis, and from a customer perspective, assuming the Company's rate of return, is actually better on a net present value basis. Finally, the settlement does not incorporate a fuel adjustment mechanism. These concessions were made in the interest of compromise and to enable a variety of concerns raised during the rate application to be addressed.
>
> (Transcript, Jan 13, 2005, pp. 3515-3518)

[31] NSPI also stressed the significance of the support of the Province for the SA and pointed out that, while Ms. Brockway recommended that the SA not be accepted, her suggested revisions would result in an average increase for customers in the domestic class of 8.2%, which is very close to the 8.7% rate proposed in the SA. NSPI also pointed out that Board Counsel's witness, Dr. John Stutz, a regulatory expert and Vice President of the Tellus Institute, who made comments on the SA in his evidence without recommending whether the Board should accept it or not, stated that:

> **Q. HOW DOES THE SETTLEMENT AFFECT THE PROPOSED INCREASE?**
>
> A. The settlement reduces the rate-related increase in NSPI's required revenues from $104.4 million to $49.5 million. This is a reduction of $54.9 million, or roughly 53 percent. As shown in the spreadsheet accompanying the Settlement, this reduces the average increase in revenues for the above-the-line rates from 12.4 to 7.3 percent. Increases for two of the below-the-line rates—ELIIR and 2-Part RTP—are also reduced. To achieve these reductions the Settlement relies heavily on deferrals, including a 16-year amortization of Section 21 tax costs beginning in 2006.
>
> **Q. ARE THERE BENEFITS ASSOCIATED WITH THE USE OF DEFERRALS TO LESSEN THE INCREASE?**

A. Yes. Absent the Settlement, the Board might, for example, decide to set the Company's return on common equity (ROE) below 9.8 percent or disallow $30 million or more of NSPI's test year fuel costs of $377.1 million. Such actions could have substantial, adverse impacts on the Company's financial health. The Settlement will not make things easy for NSPI in 2005. However, compared to the alternatives mentioned above, its acceptance will likely allow the Company to devote more of its energy to longer-term issues such as its fuel procurement strategy and the below-the-line rates.

(Exhibit S-3, pp. 2-3)

[32] In response to considerable criticism from intervenors who oppose the SA, NSPI, in its rebuttal submission, defended both the SA and the process by which it was reached. It stated that:

... as the Company has indicated, other parties were again approached to try and involve them in the consensus. It was not take-it-or-leave it. The Company made a determined effort to include others, including those who now still oppose the settlement.

A reasonable view of the process that unfolded is that the intervenors wanted any and every opportunity to challenge and lower the Company's revenue requirement, and the rate increases that flow from that revenue requirement. The settlement proposal attempts to meet the interests of the broader range of customers by using a combination of revenue reductions, deferrals and extended amortization to lower the revenue requirement by $54.9 million.

The settlement attempts to balance the interests of each class of customers by arriving at an average increase of 7.3 percent to above the line customers, and a 10.4 percent increase to the below the line customers on the ELIIR rate. This is a classic interest-based approach to a resolving issues that affect many stakeholders. The opposite approach involves holding fast to positions that other parties in the process, for whatever reasons, are unable to support. ...

Contrary to the arguments put forward by some, if the Board rejects the settlement proposal on the narrow issue of the process involved, it would just as easily rewarding behaviour of those who choose not to participate. This could effectively create a veto over constructive attempts to build consensus.

Certain intervenors, one could conclude, are more interested in a punitive disallowance of certain utility costs than in the broader objective of working together to accomplish a reduction in the revenue requirement in the interests of all customers without causing undue harm to the utility.

(NSPI, Reply to Closing Arguments - SA, pp. 4-5)

3.2 Submissions - Intervenors

[33] Those intervenors who do not support the SA oppose it on several grounds. These can be fairly summarized, in part, as follows:

- The SA is disproportionately beneficial to BTL customers;
- The SA negotiating process was not adequately inclusive or timely and, as such, was unfair;
- NSPI's expenses are primarily deferred, not reduced;
- NSPI escapes potential sanctions relating to issues such as fuel procurement prudence, while the fuel deferral it seeks would actually increase the fuel costs to be recovered.

[34] Avon, MEUNSC, ECANS, DLAS, HRM and Howard Epstein, MLA, on behalf of the NDP, all cross-examined witnesses and filed written submissions opposing the SA. Since certain of the parties named in Avon's original list of intervenors did agree to the SA, Counsel for Avon, Robert Grant, Q.C., and Nancy Rubin, represented fewer intervenors during the SA portion of the hearing. Avon, in its filing, submits that the Board's legal obligation in assessing the SA is:

> Acceptance of a settlement can only be undertaken judicially in our submission by careful consideration of what the evidence and submissions before the Board warrant and consideration of whether it is in the public interest to make an order reflecting the proposed settlement.
>
> (Avon, Closing Submission - SA, p. 10)

[35] Ms. Brockway, in her evidence, recommends that the Board reject the SA. In Ms. Brockway's view, revisions to the SA to address her concerns would result in an average increase in rates for domestic customers of 8.2%. She summarized her recommendation as follows:

> The settlement has three major flaws from the perspective of domestic customers:
>
> > First, it overstates the revenue requirements of the Company, based on the evidence in this docket, particularly by overstating the Company's required return, the Company's fuel costs, and certain OM&G costs.
> >
> > Second, it masks the total cost of the settlement to consumers by deferring cost recovery of the fuel costs not sought in the filing, and by deferring and stretching out cost recovery of Section 21 expenses for an unreasonable period.
> >
> > Third, to the extent it is determined accurately to represent the Company's revenue requirements, it does not give the domestic customers a fair allocation of the increase in revenues allowed to the Company.
>
> Also, the proposed settlement would allow Miscellaneous Charges to increase by as much as 50%, which will put an unreasonable burden on domestic customers, particularly low-income domestic customers. In addition, the proposed settlement would leave issues of affiliate transactions and conflict of interest unaddressed.
>
> (Exhibit S-4, p. 3)

[36] As noted earlier, Dr. Stutz, in his evidence, commented on aspects of the SA without recommending acceptance or rejection of the SA by the Board. He noted that under the SA, deferrals, rather than actual reductions of costs, are used to reduce the rates originally sought. He acknowledged that acceptance of the SA will not "make things easy" for the Company in 2005 and pointed out that ongoing effort is required to develop "... a more workable set of below-the-line rates ..."[6]

3.3 Findings

[37] The Board has concluded that acceptance of the SA is not warranted in this case. The Board wishes to make it clear that its conclusion is based on certain

---

[6] Exhibit S-3, p. 7

unacceptable terms in the SA (the reasons for which are detailed below) and is not as the result of a negative view on the Board's part regarding SA's in general.

[38] The Board does not object, in principle, to SAs. Obviously, unanimous SAs are more persuasive than contested SAs but, potentially, either could be acceptable to the regulator. The Board understands and appreciates the considerable efforts expended by NSPI and the intervenors involved in the negotiations, including the Province.

[39] The parties arguing against the SA appeared to be opposed, not only to certain of its terms, but also to the process by which it was negotiated—particularly the timing and extent of their respective inclusion in the process. For example, ECANS and DLAS, in their written submissions on the SA, outlined their views as to the inadequate opportunity NSPI provided for stakeholder input. The Board believes that, in future, should a similar effort be undertaken by NSPI, the factors which clearly offended a number of parties in this case ought to be carefully assessed and avoided.

[40] In the Board's view, Avon, in its closing submission on this issue, has succinctly described what the Board is obliged to do when considering the SA. Essentially, the Board must be satisfied that the evidence heard during the rate hearing supports approving the SA. On a number of occasions during the SA hearing, questions were posed to NSPI regarding whether flexibility existed for the Board to change or amend certain elements of the SA without voiding or defeating the purpose of the SA. With minimal exception, Mr. Tedesco indicated that the terms set out in the SA are integral and

that "... the settlement should be treated as a whole."[7] Accordingly, the Board concludes that changes, which it believes are necessary, cannot be made without essentially voiding the SA 'as a whole'.

[41] Since the Board is duty bound to accept the SA only if it is satisfied that the SA is warranted by the evidence and, since it does not have the flexibility to adequately address issues of concern in the SA, the Board is unable to accept it. From the Board's perspective, there is one principal reason why it cannot accept the SA and one other factor which also weighs against acceptance.

[42] The principal reason for rejection of the SA concerns fuel. During the course of the rate hearing, most of the fuel experts were of the view that NSPI's fuel procurement practices are inadequate and imprudent and, as a result, NSPI and its ratepayers are faced with higher than necessary fuel costs. Ms. Emily Medine, a principal in the firm of Energy Ventures Analysis, and NSPI's able and credible fuel expert could not, in the Board's opinion, provide adequate evidence to the contrary. The Board will detail its findings on this subject in the fuel section of this decision. However, if the SA were to be accepted by the Board, the significantly higher cost of fuel projected by NSPI would be passed on to ratepayers, either in 2005 or, in later years, by deferral. The evidence heard by the Board during the rate hearing simply does not warrant this result.

[43] NSPI correctly notes that the result of the SA—an 8.7% increase for most ATL customers (including domestic), is very similar to the 8.2% which Ms. Brockway

[7] Transcript, January 13, 2005, pp. 3685-3686

indicated would reflect a more acceptable SA for domestic customers. However, a similar mathematical end result does not address the important principles of prudency and fairness. If the Board does not believe that fuel procurement was adequately managed and finds that certain coal costs should be disallowed as imprudent, how can it accept an SA which passes these costs on to ratepayers? This would not be fair or reasonable or in the public interest and, as a result, the Board cannot accept the SA.

[44] The second factor which weighs against approval of the SA is the inclusion of term 3(c) in the agreement. This refers to the most recent LM6000 combustion turbine unit installed at NSPI's Tufts Cove generating station. The installation of this additional LM6000 unit at Tufts Cove was approved by the Board on an "emergency" basis following a request from NSPI in March of 2004. The LM6000 had previously been purchased by Emera and it was placed in storage in Port Hawkesbury in October of 2001.[8] The LM6000 remained unused in storage until it was installed at Tufts Cove in late 2004. NSPI's March, 2004 request to immediately install the LM6000 warned of potential outages which could result in early 2005 from inadequate generation in high demand situations, combined with severe weather conditions, if the Board did not approve the request. The Board, noting that Emera was transferring the LM6000 to NSPI, and that NSPI had been working on generating capacity addition issues with a number of stakeholders in a process which could be undermined by the LM6000 request, gave only conditional approval for the unit's installation.

[8]NSPI Response to Board IR-1, LM6000 request process

[45] The conditions imposed by the Board were that the transfer cost between Emera and NSPI for the LM6000 be reviewed by an independent consultant and that capacity addition stakeholders would have an opportunity to review and comment on the independent expert's report. At the time of the SA, this process was underway. Stone and Webster Inc. and PricewaterhouseCoopers (PwC) were engaged by the Board to review the LM6000 transfer cost. Their report was received and circulated to stakeholders. It recommends a somewhat lower transfer price for the LM6000 than that proposed by NSPI.

[46] The SA, if approved, would void this process and would permit NSPI to pay its proposed higher cost to Emera for the LM6000. The higher cost for this unit would ultimately be passed on to ratepayers. It is unlikely, in the Board's view, that any party in this proceeding, other than NSPI, benefits from this term in the SA. The Board is not prepared to accept it and, as a result, the inclusion of this term in the SA weighs against its approval. The Board comments further on this matter later in this decision.

4.0 FUEL ISSUES

4.1 Procurement Strategy and Prudency

4.1.1 Submissions - NSPI

[47] The cost of fuel and purchased power is the single largest cost borne by NSPI. In its June 23, 2004 revised application filing, NSPI confirmed this cost to be $377.1 million for the 2005 test year. This is an increase of $33.2 million over the 2002 cost which was used as a basis for the last rate adjustment, and is approximately $94 million more than NSPI's forecasted 2004 cost for fuel and purchased power.[9]

[48] According to NSPI, these cost increases are based on five factors which are summarized below:

- a 57% increase in the cost of low sulphur coal
- reduction in profits from gas resales due to contract changes
- 2005 SO_2 emissions reduction requires the purchase of a higher amount of more expensive low sulphur import coal
- increase in cost of heavy fuel oil
- increase in fuel transportation costs

(Redacted Summary of Exhibits N-1 and N-4, p. 23)

[49] NSPI generates electricity using several varieties of fuel. These include heavy and light fuel oil, natural gas, domestic coal, petroleum coke and imported coal. For the purposes of this decision, the focus is primarily based on NSPI's structure and practices used in contracting for the supply of imported coal.

---

[9]Exhibit N-1, pp. 22-23

[50] It is the information and evidence relating to fuel procurement and costs which constitutes the confidential data referred to earlier in this decision. The witnesses who testified on this matter at the hearing did so during *in camera* sessions. While the Board has considered this confidential data in making its decision, the description of the evidence heard and the explanations for Board findings which are set out in this section of the decision generally are from redacted versions of evidence filed and summaries of confidential material.

[51] NSPI described its fuel strategy as follows:

> In general, NSPI's fuel strategy is to stay close to the market and leverage fuel diversity. Staying close to the market means that the Company's contracts provide for the delivered cost of fuels over terms that extend up to 24 months. During this 24-month window, NSPI locks in contracts for varying amounts of the Company's fuel requirement based on market opportunities. The Company reacts to short-term market changes to contract the lowest cost fuel over time, and pays no premiums (to compensate the seller for the extended term) for short-term contracts. NSPI's strategy provides a high degree of flexibility in optimizing the mix of fuels at any particular facility and in any given year...
>
> On the advice of Emily Medine, the Company's expert fuel witness (see Section 3.6), NSPI believes that it should increase the amount of coal that it purchases under contract if such coal can be obtained on attractive terms.
>
> Given the level of volatility in the coal market over the last few years, NSPI believes it could benefit from additional term commitments subject to market conditions. NSPI will enter into term contracts as part of its supply portfolio where the premium for the term is reasonable.
>
> (Exhibit N-1, pp. 31-32)

[52] NSPI also described its attempts, between late 2002 and 2004, to obtain multi-year imported coal supply contracts. These attempts were unsuccessful as, in NSPI's view, the limited number of the responses which it did receive to its solicitations had prices which were too high to warrant entering into multi-year contracts. The Company also described its practice of 'hedging', a form of insuring against swings in costs, and the

risks it faces in terms of fuel costs and foreign exchange rates, principally in US dollars.[10] NSPI advises that its world coal market expertise has increased since the Board's 2002 decision and points out that much of its purchases of petroleum coke is on the basis of multi-year contracts.

[53] In February of 2003, NSPI engaged the services of Emily Medine, a fuel procurement expert who gave evidence for a group of intervenors (Annapolis *et al.*) in the 2002 rate hearing. Ms. Medine's engagement with NSPI was in response to the direction of the Board in its 2002 rate decision that NSPI improve its fuel procurement expertise and processes. Ms. Medine's September, 2003 report to NSPI outlined suggested improvements to NSPI's fuel procurement policies and procedures, including the goal of developing a mixed portfolio of short, mid-term and long-term supply contracts.

[54] Along with recommending approval of a FAM (which will be discussed later in this decision), Ms. Medine's evidence in the current hearing outlined progress made by NSPI since 2002 in improving its fuel procurement strategy; its compliance with the Board's 2002 directives for changes in this area; and the reasonableness of its fuel cost estimates for 2005.

[55] In Exhibit N-42, NSPI states that:

> Contrary to the evidence from certain witnesses, NSPI has been active in soliciting tenders for multi-year term contracts for all the components that make up the fuel expense. NSPI has successfully awarded multi-year contracts, ranging from 30 months to ten years, for local coal; pet coke; natural gas; ocean freight; coal handling and local transport storage at Sydney port; coal handling/storage at Aulds Cove, natural gas transport; and a limestone supply contract for Point Aconi.

---

[10] Exhibit N-1, pp. 32-36

> NSPI has gone to tender for multi-year supply of coal five times since the spring of 2002, and on each occasion (when quotes were submitted) the prices tendered exceeded market prediction to the degree that NSPI did not place an order. Based on the information available to NSPI at the time of evaluation there was no justification to award those multi-year volumes. The award would have resulted in higher costs in 2003 and 2004. (See Table 3.1 for summary of multi-year coal bids.)
>
> NSPI did not receive any offer for multi-year contracts with three-to-five year terms with a 20 percent volume flexibility. Mr. Spangenberg recommends these contracts should make up 60 percent of NSPI's portfolio. The multi-year offers received by NSPI from the spring of 2002 to present carried significant premium to market, which viewed in the context of information available at the time, NSPI chose not to accept. Moreover, long-term contracts typically include pricing that is linked to a specific market index, and therefore cannot be hedged.
>
> (Exhibit N-42, p. 64)

[56] Essentially, the Company submits that its fuel procurement strategy is reasonable and appropriate and it refutes the suggestions of other fuel experts who suggest that NSPI's fuel procurement is imprudent. NSPI noted that similar allegations were made in the 2002 rate hearing and points out that, in its 2002 rate decision, the Board did not make any finding of imprudence. The relevant excerpt of the Board's decision states:

> After evaluating all the evidence concerning NSPI's coal procurement strategy, the Board finds that NSPI's actions do not go so far as to constitute imprudence.
>
> Although NSPI had contracted on the international market for some part of its coal requirement in the late 1990's, the bulk of its coal was supplied by CBDC pursuant to a long-term supply agreement dating back to 1978. NSPI's coal supply situation changed drastically between 1999 and 2001 with the decline in production at CBDC's mines followed by the announced closure of all of CBDC's coal mines in the spring of 2001. Accordingly, NSPI has not had a lengthy history of involvement in the international coal markets. The Board surmises that its learning curve has been a steep one. While not imprudent, the Board considers that NSPI's coal procurement strategy has been lacking in sophistication. However, the Board is not prepared to find that NSPI's strategy of buying coal pursuant to short-term contracts on the international markets was fundamentally flawed. The Board agrees with Ms. Medine, however, that stringent procedures should be in place to govern coal procurement (i.e., practices and procedures setting out approved methods for issuing bids for coal supply) as coal acquisition accounts for a huge portion of NSPI's total expenses. The records show considerable sloppiness on NSPI's part in terms of its purchasing practices, including the interchangeable and confusing use of Emera and NSPI as the contracting party for coal. ...

> Notwithstanding that the Board does not consider that the evidence supports a finding of imprudence on the part of NSPI, the Board does believe that NSPI's practices in this area are sufficiently lax so as to undermine NSPI's ability to ensure, and demonstrate to the Board, that coal was obtained at the lowest possible price. NSPI's argument that it had an "evolving" relationship with Emera Energy does not justify the confusing document trail in terms of who was actually contracting for coal. In the Board's view, there is too much at stake and, consequently, too significant a potential impact on ratepayers, to accept anything less than the best possible business practice.
>
> (Board Decision, P-875, October 23, 2002, pp. 27-28)

[57] NSPI has cited decisions of regulatory bodies in Canada and the U.S. regarding prudency standards. It suggests, in its rebuttal evidence and in its closing submission, that the experts who allege imprudency on NSPI's part have not followed the appropriate legal standards for determining what constitutes imprudency in a regulatory environment. NSPI also points to the evidence of Dr. Stutz who, while recommending a reduction of $30 million in fuel costs (which NSPI also argues against), based his justification for the reduction on the principle of fuel cost "normalization" rather than imprudence.

[58] NSPI also emphasizes that its "evolving" fuel procurement strategy was the subject of reports and information filed with the Board in 2003 and 2004 and notes that, until evidence was filed by expert witnesses with Liberty Consulting Group ("Liberty"), Board Counsel's witnesses, in October of 2004, no objection had been raised by the Board regarding NSPI's actions during this period. NSPI vigorously disputes the opinions of Liberty and the intervenors' experts which indicate that, if NSPI had properly developed a mixed fuel procurement strategy, providing for a variety of coal supply contracts, including long-term contracts, and used these tools in late 2002 and part of 2003, it would not face as significant an impact as it now does due to the high cost of coal in 2005. NSPI suggests

that it has made valid efforts to acquire longer term coal supply prices, but limited availability of such contracts and high prices associated with the few offers received, has, since late 2002, effectively hindered NSPI's ability to enter into longer term imported coal contracts.

[59] Ms. Medine gave evidence during the *in camera* portion of the hearing regarding her views of NSPI's fuel procurement. She confirmed to Robert Grant, Avon's Counsel, that she advised NSPI to alter its tendering process to ensure coal suppliers would perceive NSPI's long-term coal contract solicitation as serious. She also confirmed that her firm was first asked to advise NSPI regarding specific procurement tenders in May of 2004.

[60] Ms. Medine acknowledged under cross-examination by Stephen McGrath, Counsel for the Province, that in her 2002 rate case evidence she was of the view that NSPI's coal bidders list used for solicitation was inadequate and that this advice was repeated to NSPI in her report to the Company in the latter part of 2003.

[61] James Taylor, NSPI's General Manager of Power Production, confirmed to Mr. McGrath that NSPI plans to solicit supply quarterly began in 2004 and that solicitation in 2003 occurred on two occasions – once in January and again in September.

[62] Ms. Medine defended NSPI for not having long-term contracts by indicating that for much of the period in question, coal prices were moving up and, when prices are rising, it is not advisable to lock in to long-term, high-volume contracts. She acknowledged, under questioning from Board Counsel, that this increase in price began in late 2003.

[63] Ms. Medine also acknowledged, in response to questions from Board Counsel, that NSPI's revised fuel procurement and policies manual, which is dated July, 2004, appears to continue NSPI's trend to 'stay close' to the fuel market and to prefer, in many cases, contracts no longer than 24 months. While both she and Mr. Taylor described NSPI's evolving practice in this regard, they acknowledged that, currently, NSPI does not have any long-term contracts for imported coal.

4.1.2 Submissions - Intervenors

[64] SEB and Avon presented evidence from fuel experts regarding NSPI's fuel procurement practices. Liberty also gave expert evidence on this matter.

[65] Colin V. Gubbins of the McCloskey Group, Richard Marston of Marston & Marston Inc. and Sharon Hennings of Brubaker and Associates Inc. all gave evidence on behalf of SEB with respect to fuel. Both Mr. Gubbins and Mr. Marston provided their views with respect to world coal markets and NSPI's fuel procurement practices in pre-filed direct evidence and in their testimony at the hearing. Both experts take a similar view of NSPI's procurement strategy. They do not believe it is appropriate. In their opinion, NSPI has not, since 2002, adequately pursued a balanced portfolio of short, mid-term and long-term coal supply contracts and, consequently, customers are not adequately protected against price volatility. They were critical of NSPI's solicitation of the market between 2002 and 2004 for long-term contracts. They noted that coal prices had reached low levels in late 2002 and that Ms. Medine's evidence in the 2002 hearing, which indicated that NSPI should

pursue a balanced portfolio of short, mid and long-term contracts, was correct. In their view, NSPI did not act quickly or effectively enough to follow this advice.

[66] Mr. Gubbins and Mr. Marston generally agree that NSPI had a window of opportunity in late 2002 and early 2003 to lock in reasonably priced, long-term coal supply contracts. They indicated that NSPI overlooked this opportunity and, instead, focused on shorter term contracts. As a result, NSPI and its ratepayers are exposed to a sharp increase in coal prices and, had NSPI acted prudently, this price increase could have been reduced. Mr. Marston, in Exhibit N-71, indicated that NSPI relies primarily on market timing in solid fuel purchases, rather than clear guidelines or price objectives. His opinion is that the solid imported fuel costs projected by NSPI for 2005 are "... based on an unreasonable and imprudent fuel procurement strategy and are unreasonably high because of NSPI's over-exposure to short-term and spot contracts."[11] Mr. Gubbins advises that, despite the reference to 24 months as the preferred maximum length of fuel supply contracts noted in NSPI's new manual, long-term contracts are generally understood in the industry to be between three and five years in length.

[67] Dr. Manfred Raschke, of International Strategic Information Services, gave fuel evidence on behalf of Avon. He is also of the view that a balanced portfolio of short, mid-term and long-term coal supply contracts is necessary to avoid high risk exposure to coal price volatility and is essential for a prudent fuel procurement strategy. He indicated that, in his opinion, NSPI does not have a balanced portfolio for coal supply and, as a

[11]Exhibit N-71, pp. 2-4

result, NSPI and its customers are vulnerable to spot markets and price volatility. Dr. Raschke also pointed out that had NSPI moved quickly to adopt a balanced portfolio in late 2002 and early 2003 (which was Ms. Medine's advice during the 2002 rate case) it could have reduced the impact of the high 2005 coal costs it now faces.

[68] Liberty expert witnesses were John Antonuk, Donald T. Spangenberg, Jr., Dennis Kalbarczyk and John B. Adger, Jr. They took a similar view with respect to NSPI's fuel procurement strategy. Mr. Spangenberg indicated that his review of NSPI centred on fuel management, particularly coal. He testified that, in his opinion, NSPI did not use a balanced portfolio approach to secure coal supplies and that NSPI's fuel procurement procedures, as well as the structure of its organization and internal expertise relating to this issue, are inadequate.

[69] Mr. Spangenberg explained his concerns regarding NSPI's fuel procurement relating to the organization and structure of the decision-making process. He said that, since most of NSPI's decisions on fuel supply are made by a committee rather than by specialized individuals, effectiveness and accountability on fuel supply decisions is not adequate. He pointed out that NSPI's process involves decision-making by a 'fuel strategy table', which includes Mr. Huskilson, Mr. Tedesco, Todd Sattler, Vice-President of Emera Energy Services, and several other individuals. Mr. Spangenberg described a preferred, and in his experience more common, fuel decision-making process in a utility as one which sets out decision-making autonomy which graduates up the chain of command. Each level is authorized to enter into contracts within a certain cost range, although decisions with

major cost implications may be overseen by senior executives. According to Mr. Spangenberg, this improves efficiency and accountability in the utility.

[70] In the view of Mr. Spangenberg, as a result of NSPI's inadequate coal purchasing practices, it now cannot demonstrate that the coal it is purchasing will produce electricity at the lowest possible cost. According to Mr. Spangenberg, NSPI has been imprudent and its projected fuel costs should be reduced by $28.9 million. Other fuel experts suggested a similar reduction.

[71] Mr. Spangenberg's observations concerning NSPI's fuel procurement practices are set out in the redacted version of his evidence as follows:

- Because fuel planning has been weak at NSPI, the overall fuel strategy is weak and not well defined.
- NSPI has not adopted an appropriate portfolio approach to coal procurement, and continues essentially to rely upon the spot market for a vast share of its coal supplies.
- NSPI has not included a sufficient number and variety of long-term coal contracts in its coal supply portfolio.
- NSPI's coal solicitations have not conveyed an image of professionalism to the coal supply market.
- NSPI has not prepared, or included sufficient production quality model runs in its long-term coal supply analyses in order to properly evaluate issues such as fuel switching costs to comply with the lower SO_2 cap.
- NSPI does not track transportation costs separately as necessary to consider future transportation costs in making and executing fuel management plans.
- NSPI's Fuel Procurement Policies and Procedures are weak and need significant improvement.
- NSPI's policies and procedures for fuel hedging are weak and need significant improvement.
- NSPI is not able to demonstrate that it procures fuels that will produce the lowest possible cost of electrical energy delivered to the bus-bar.
- NSPI's organization is not structured nor staffed appropriately to provide for effective fuel management.
- NSPI's organizational structure raises several areas of concern in the area of conflicts of interest related to affiliate relations.

- NSPI has not established the proper performance baseline in the area of fuel management necessary to justify introduction of a Fuel Adjustment Mechanism.
- NSPI demonstrated imprudence by missing the opportunity to save $28,935,500 on coal supplies for the year 2005.

(Exhibit N-136, pp. 5-6)

Mr. Spangenberg's recommendations are:

1. NSPI should immediately conduct an overall re-evaluation of its generating system to determine the optimum way of meeting new requirements for control of SO_2 emissions, as well as emissions of other pollutants of concern, from its generating plants. Such re-evaluation should incorporate a long-term view, not just the next several years. The recommended study should consider not only all fuel supply options, but also integration of fuel supply options with capital expenditures for alteration, modification or expansion of its generating units in order to achieve the lowest possible costs for generation of power, consistent with other issues of reliability, environmental concerns and legal issues.
2. Consistent with item #1 above, NSPI should immediately revise its fuel portfolio strategy to incorporate a balance of both short-term (or spot) and long-term fuel contracts with terms ranging from one up to seven years, with expiration dates not all occurring at the same time.
3. NSPI should adopt a consistent policy of annual solicitations for long-term coal supply that are accompanied by production quality model runs for at least seven years into the future in order to determine actual fuel requirements. Such model runs should also provide the base for evaluation of proposals received from coal suppliers in order to conduct analysis of variances, such as fuel switching costs to comply with the lower SO_2 emission requirements.
4. NSPI should revise its coal solicitation process to make it an aggressive one that conveys the image of a utility operating from a position of professionalism and strength. RFP language must be clear and correct, and RFP's must be very clear about the specific fuel supply needs of the future, in terms of tonnes of coal required for each year in the future up to a maximum of seven years. Do not leave tonnages and years of supply at the discretion of fuel suppliers. NSPI must demonstrate it is a professional and serious fuel buyer that knows what it wants, and when it wants it.
5. NSPI should revise the Fuel Procurement Policies and Procedures Manual to incorporate the suggested improvements as listed in Exhibit DTS-3.
6. NSPI should develop a more comprehensive set of fuel hedging policies and procedures, along the lines as suggested in this testimony.
7. NSPI should commit to either procurement, or internal development of a comprehensive fuel procurement model that permits evaluation of fuel supply options, and procurement decision-making on the basis of procuring that mix of fuels that will result in producing the lowest possible cost of electrical energy delivered to the bus-bar.
8. NSPI should resolve the seven organizational weaknesses described in this testimony in a manner that is satisfactory to the Nova Scotia Utility and Review Board.

> 9. NSPI should resolve all of the above eight recommendations of this testimony in a manner that is satisfactory to the Nova Scotia Utility and Review Board before reconsidering resubmission of any application to institute a Fuel Adjustment Mechanism.
>
> (Exhibit N-136, pp. 6-8)

[72] Dr. Stutz recommends a reduction in NSPI's fuel costs on the basis of what he refers to as "normalization" as opposed to imprudency. In Dr. Stutz's opinion, it is inappropriate to use abnormally high fuel costs for ratemaking purposes as NSPI has done. Dr. Stutz, in his direct evidence, recommended a reduction in NSPI's 2005 proposed fuel costs of $58.9 million. In his surrebuttal evidence he revised this amount to $29.4 million, noting that:

> Q. RETURNING TO AN EARLIER POINT, HOW MUCH SHOULD NSPI'S TEST YEAR FUEL COSTS BE NORMALIZED?
>
> A. How much to normalize, that is how close to the historic mean to set Total Fuel Cost per MWH, is a matter of judgment. In a period of increased volatility in fuel prices, without a FAM the Company does face increased risk. To address this issue, I am raising my recommendation from $24.94, the historic mean, to $27.25, half-way to the Company's figure of $29.56. This will increase NSPI's required revenues by about $29.5 million.
>
> Q. PLEASE EXPLAIN HOW YOUR RECOMMENDATION ADDRESSES RISK.
>
> A. In the 2002 General Rate Proceeding, NSPI initially requested a Total Fuel Cost of $30.98 per MWH. On compliance with the Board's decision, the figure was $28.64, a reduction of $2.34. Here, the difference between the Company's proposed $29.56 and my recommended $27.25 is $2.31. Normalization by roughly the amount proposed here allowed NSPI to earn a return on equity of 10.15 percent in 2003, 10.47 percent in 2003, and an expected 10.40 percent in 2004. Thus, based on NSPI's experience since 2001, my revised recommendation addresses risk without establishing a FAM.
>
> The purpose of my revised recommendation is to set the total Fuel Cost per MWH included in required revenues at a representative level. After considering the issues addressed by the fuel experts - prudence in coal purchasing, likely revenues from gas sales, etc - the Board may find it appropriate to select a higher or lower figure than the $27.25 I have proposed. My key point is that, for now, in spite of NSPI's increased volatility in fuel costs, the appropriate course of action is to set fuel costs at a representative level and not establish a FAM.
>
> (Exhibit N-231, pp. 7-8)

[73] In his evidence at the SA portion of the hearing, Dr. Stutz stated that:

> ... My recommendations -- I think the only ones I really want to touch on is the fuel-related costs. I said initially that they should be set at the historic average of total fuel cost, that is twenty-four ninety-four per megawatt hour. In my surrebuttal I raise that to twenty-seven twenty-five per megawatt hour. This reflects my concern that the company does bear substantial risk and my desire on average to balance setting representative costs with ensuring that in the test year the company faces a reasonable situation. This is where I think the balance sits, but I would again acknowledge that that's a matter of judgment.
>
> (Transcript, Dec. 3, 2004, p. 3394)

[74] In its closing submission, Avon points out the similarities in the fuel experts' views on NSPI's procurement practices:

> If there is any consensus among the experts it is that NSPI must adopt a fuel procurement strategy with a portfolio of different coal contracts for imported coal. ...
>
> NSPI can no longer claim that it is inexperienced in the international coal market as it did in 2002. The consensus of the experts with respect to what constitutes prudent fuel management and an appropriate coal procurement strategy is striking. ...
>
> NSPI has defended its failure to enter into longer term contracts essentially on the basis that it was not prepared to do so until the market had turned up again in late 2003. At that time, it would not have been appropriate to lock in long-term. NSPI has pleaded that it took time to address the recommendations of the Board arising from the 2002 rate case.
>
> The surrebuttal of the Liberty consultants address this argument succinctly noting that:
>
>> It would defy simple logic to contend that the fact that it takes time to correct a failing that should not have existed in the first place (in a prudently managed operation) excuses the imprudence of allowing the failure to have come about. The most one could say is that the timely correction of imprudent behaviour avoids a compounding of a management failing; it certainly does not excuse it.
>
> With respect, while NSPI's efforts may be steps in the right direction, surely, given the clear direction imparted to NSPI in the last rate case and all the information respecting the cyclicality in the market, it was incumbent upon NSPI to take immediate and focused steps to accomplish a balanced portfolio. The opportunities were available in 2002. The opportunities were available in 2003. As Ms. Medine noted on questioning by Mr. Outhouse, "It was a bit of a buyer's market probably beginning in 2002 – mid 2002 through mid 2003....
>
> Consistent with the views of Dr. Raschke, Mr. Spangenberg, Mr. Marston and Mr. Gubbins, these intervenors submit that a case for imprudence has been made out such that this Board ought to disallow approximately $30 million of fuel costs from the 2005 revenue requirement.
>
> (Avon, Closing Submission, pp. 20-26)

[75] The similar findings of fuel experts were also noted by ECANS which stated that:

> NSPI's initial filing included a total cost of fuel at $377.1 million and subsequent information showed a revised fuel cost at $393.7 million – a commanding 38% of NSPI's total revenue requirement. According to NSPI and its experts, much of this increase is due to the resurgence or development of the Chinese economy. China's demand for energy-related products is placing stress on the entire global energy industry, particularly low sulphur coal and associated ocean transportation. It is clear to all parties that **fuel and fuel procurement are THE fundamental issues in this rate case**. The simple magnitude of the number dictates the degree of examination and evaluation that must be contributed by the utility, the regulator, the shareholders and most importantly the ratepayers.
>
> In view of the enormity of the issue, it is understandable why so much of the hearing was dedicated to examining NSPI's fuel-related issues. In fact, this rate case contained more witnesses than the 2002 hearing. In this case they included:
>
> - Tim Simard and Emily Medine (for NSPI)
> - Colin Gubbins, Sharon Hennings and Richard Marston (for StoraEnso and Bowater)
> - Donald Spangenberg, John Antonuk, John Adger, and Dennis Kalbarczyk (for Board staff)
> - Manfred Raschke (for Avon valley et al)
>
> All would agree this was a formidable array of coal-market talent who very much expanded our understanding of what is happening on the international coal scene. Of course, witnesses for the intervenors and for Board staff held a common and not-so-complimentary view of how well NSPI performed in handling its fuel procurement. In fact, their independent evaluations arrived at the same conclusion in terms of fuel costs that should be denied by the Board. Since this part of the hearing was conducted via in-camera sessions, we are unsure how much of those proceedings can be referred to in this submission. However, in summary form, the intervenor witnesses agreed to the following:

Average Amount of Denied Costs	$30 million

> Although individual assessments differed slightly on how much of NSPI claimed fuel costs should be denied, they were unanimous in their overall assessment of NSPI's inability to competently procure fuel for the company; stressing that ratepayers should not be held responsible for mistakes made by the utility.
>
> (ECANS, Final Brief, pp. 5-6, emphasis in original)

[76] ECANS recommends that:

> NSPI's approved fuel budget be reduced by $20 million
>
> NSPI be directed to establish, support and develop a strong fuel procurement department
>
> (ECANS, Final Brief, p. 11)

[77] MEUNSC endorses Dr. Stutz's opinion on fuel costs:

> The primary concern has been placed in the proper context by Dr. Stutz;
>
> > "as in 2001, NSPI asks The Board to approve rates which embody a Total Fuel Cost per MWH which is higher than any historic value, and far above the historic average" (emphasis added)
> >
> > Evidence filed by John Stutz, October 15, 2004 page 28 lines 9-13
>
> He points out that if the 2001 estimates had been approved NSP would have over recovered by upwards of **$249 million**.
>
> In answering the question of whether or not the high costs proposed for this hearing are appropriate his response is a resounding **"NO".**
>
> Based on his method of using historic averages as a basis for setting the Total Fuel Costs per MWH to be included in required revenues he concludes that the appropriate level is $27.25 per MWH as opposed to NSP's proposed $29.56 per MWH.
>
> This 7.8% reduction would amount to a decrease in fuel and purchased power costs of $29.4 million ($377.1 x .078). Of this, approximately $23.5 million would be applicable to the above-the-line revenue requirement.
>
> We would agree with the estimates placed in evidence by Dr. Stutz.
>
> (MEUNSC, Final Brief, p. 8, emphasis in original)

[78] The Province, in its confidential closing submissions, avoided making recommendations regarding the issue of imprudency. Like Dr. Stutz, it suggested that test year fuel costs should be normalized. The Province also urged the Board to require NSPI to improve its fuel purchasing guidelines.

4.1.3 Findings

[79] The Board has carefully considered the evidence heard with respect to NSPI's fuel procurement strategy and actual practices. There is no question that, in the 2002 rate decision, the Board stopped short of finding NSPI's fuel procurement to be imprudent. The Board understood that with the closure of Devco, and the end of the majority of NSPI's coal supply coming from domestic sources, NSPI had to begin purchasing much of its fuel supply in the international market. The Board believed that NSPI, at that time, was relatively inexperienced in international coal markets and that the Company should be provided with a fair opportunity to make the changes necessary, in both its organizational structure and in fuel procurement practices, to address this important change in its coal supply procurement.

[80] The need for change was clear in the evidence during the 2002 rate case, especially in the evidence offered by Ms. Medine. The prudency and effectiveness of a balanced portfolio of short, mid-term and long-term coal contracts was unquestionable. In the present case, Avon reminds the Board of her 2002 evidence, stating:

> Emily Medine who testified on behalf of NSPI in this rate case confirmed that in the 2002 rate application she had identified NSPI's approach to coal procurement as imprudent because of NSPI's failure to have a balanced portfolio in place. She described a portfolio for NSPI whereby 50% of its coal procurement should be acquired on long term three to ten year contracts, 25% on medium term contracts of one to three years and the remaining 25% on a spot market basis. Her opinion was that a portfolio approach should result in the lowest long-term costs for the utility.
>
> As early as 2002, Ms. Medine was warning:
>
>> The higher 2002 NSPI prices cannot all be attributed to market. NSPI had not developed a balanced procurement portfolio for its import supplies, making it totally exposed to annual market swings.

> Ms. Medine confirmed that her views on the benefits of the portfolio strategy generally, and also particularly with respect to NSPI have not changed since 2002. Furthermore, she continued to express concerns about the lack of long term coal contracts when she reviewed NSPI'S fuel procurement and reported September 15, 2003 ...
>
> Ms. Medine also noted on that same report that NSPI had not to that point approached procurement of longer term contracts in any meaningful way. On cross-examination by Mr. Grant, Ms. Medine also expressed concern that from a sellers perspective they would not perceive NSPI as being serious about its desire to enter into long-term contracts.
>
> (Avon, Closing Submission, pp. 20-21)

[81] The Board has carefully reviewed NSPI's defense of its coal procurement strategy since 2002. As NSPI points out, it hired Ms. Medine as an expert in this area; it developed a Fuel Procurement and Procedures Manual which was completed in July of 2004; and it has complied with the Board's 2002 directives to return the coal procurement function to NSPI from Emera. NSPI asserts that it has taken reasonable and necessary steps to improve fuel procurement. According to NSPI, the fact that it currently has no long-term imported coal supply contracts does not fairly represent its revised procurement strategy. As NSPI explains it, during the period of time in question, mid or long-term coal supply contracts were inadvisable, either because of limited interest on the part of suppliers or unduly high prices.

[82] The Board acknowledges that certain of NSPI's fuel procurement processes in 2002 have changed considerably since that time. In 2002, NSPI was relatively inexperienced in terms of importing coal. The Board's findings as to whether NSPI's coal procurement practices in 2002 were imprudent were based on whether the strategy and practices used by NSPI were reasonable and prudent under the circumstances. As noted earlier, at that time, the Board did not find NSPI's coal procurement to be imprudent as it believed NSPI should be given a reasonable opportunity to react to the fairly abrupt end

to its reliance on domestic coal supply. This "opportunity" should have involved NSPI quickly acquiring the necessary in-house expertise for imported coal purchasing and expediently revising its purchasing practices to reflect the new reality of the international coal market supply.

[83] It is clear that NSPI took several important steps toward this goal. In early 2003, NSPI engaged Ms. Medine as an external coal consultant and began to develop a Fuel Procurement and Procedures Manual. Ms. Medine's advice regarding the need to have a mixed balance of short, mid and long-term coal supply did not change since her 2002 analysis. Her evidence at this hearing is consistent with her earlier advice. What she could not confirm was whether NSPI had acted quickly and effectively enough to actually implement recommended and necessary improvements in its fuel procurement activity.

[84] The Board has reviewed the submissions of NSPI, and certain of the other intervenors, with respect to the issue of imprudency. NSPI, in its rebuttal evidence addresses the standard for prudency and cites the following as an established definition of this issue:

> As noted in the testimony of John Stutz, certain ratemaking principles must guide the Board in its review of NSPI's proposed 2005 Rates. The presumption in rate making, of course, is that a utility will recover in its rates its prudently incurred expenses. With respect to fuel costs, there are also standard principles which Dr. Stutz and the other consultants fail to recognize.
>
> The standard for determining prudency of a utility's fuel procurement practices is well established. As stated by the Illinois Commerce Commission, "prudence is that standard of care which a reasonable person would be expected to exercise under the same circumstances encountered by utility management at the time decisions had to be made….Hindsight is not applied in assessing prudence….A utility's decision is prudent if it was within the range of decisions reasonable persons might have made. … The prudence standard recognizes that reasonable persons can have honest differences of opinion without one or the other necessarily being imprudent.
>
> (Exhibit N-42, pp. 28-29)

[85] NSPI also argues that the standards applicable to management audits should apply to the review of NSPI's fuel procurement practices, including those performed by Liberty experts.[12]

[86] Avon, in its closing submission, sets out a number of factors to be considered by the Board in determining whether NSPI was imprudent:

> NSPI's inexperiences in the international coal market as of 2002 and the steep pitch of the learning curve in this field were circumstances which the Board found as mitigating considerations in addressing the prudence of NSPI's coal procurement strategy. These can no longer be considered mitigating circumstances. After being battered in the 2002 hearing concerning its approach to coal procurement and receiving the decision of the Board which could only be interpreted as requiring urgent, focused and timely correction, NSPI deserves to be judged in its 2005 application against a higher standard in this most important area of its business.
>
> It is inexplicable that NSPI's 2005 Rate Application reflects procurement of the entirety of it[s] seaborne coal requirements in 2005 by spot contracts having a term of one year or less. NSPI's failure to hedge its exposure to a spike in coal prices in 2005 has caused a large portion of its increased revenue requirement.
>
> Not having a portfolio of coal contracts in 2002 was imprudent and it remains imprudent in 2005. If anything, it is even more imprudent and unreasonable in 2005 that NSPI knew that to meet lower sulphur dioxide emissions requirements it would have to purchase low sulphur coal. Given its reliance upon self-unloading vessels, NSPI was essentially restricted to suppliers from the eastern seaboard of North America, Columbia and Venezuela.
>
> (Avon, Closing Submission, p. 3)

[87] SEB also provided helpful material on the question of imprudency:

> In its Rebuttal Evidence (Exhibit N-42 [N-44 confidential]) NSPI, through Ms. Emily Medine, raises the issue of the prudence standard as defined by the Illinois Commerce Commission. During various portions of its cross-examination NSPI referred to this Illinois Commerce Commission definition. SEB submits that this (and any other) definition of prudence must be viewed in the wider context of the actions of the utility that led up to the decisions in question, as this Board and various other courts and commissions have found in the past. The following discussion sets out this wider context, particularly as it applies to NSPI's obligations as the incumbent monopoly electric supplier.
>
> Subsection 45(2) of the Nova Scotia *Public Utilities Act* provides as follows:
>
>> "Such return shall be in addition to such expenses as the Board may allow as <u>reasonable and prudent and properly</u>

---

[12]Exhibit N-44, p. 29

> chargeable to operating account, and to all just allowances made by the Board according to this Act and the rules and regulations of the Board" [Emphasis added.]

In general, the starting point is the presumption that the expenses of a utility are prudent. However, once a doubt is raised about a given investment or expense, the burden shifts firmly to the utility to demonstrate that the investment or expense was both reasonable and prudent (see for example: *Gulf States Utilities Company v. Louisiana Public Service Commission* (578 So. 2d 71, Util. L. Rep. P 26,061 (West) p. 16); and *Entergy Gulf States, Inc. v. Public Utility Commission of Texas* (112 S.W. 3d-208, Util. L. Rep. P26,862 (West) p. 8).

To meet this burden, the jurisprudence imposes a clear requirement that the utility produce evidence of what the decision was based upon. The decision-making process includes:

> ". . . decision inputs, assumptions, forecasts and studies which might have affected the decisions made by management." (*Gulf States Utilities Company, ex parte Louisiana Public Service Commission* (1988 WL427505 (La. P.S.C.) (West) p. 8)

Furthermore, in *Gulf States Utilities Company v. Public Utility Commission of Texas* (841 S.W. 2d 459, Util. L. Rep. P26,337 (West) p. 19) it was noted that:

> "[a] utility without contemporaneous evidence to support is decision-making process faces a heavy burden . . ."

Accordingly, not only does NSPI bear the burden of proving that its decisions were prudent, but they are also required to put forward evidence of what activities it undertook to underpin those decisions. If there is little or no evidence of facts, actions, analyses, etc. upon which the utility could reasonably have based a carefully thought-out decision, then it has not discharged its burden of demonstrating that the decision itself is prudent. ...

SEB agrees that a utility's decision should not be found imprudent merely because, with the benefit of 20/20 hindsight, a different decision would have been made. However, as the Board will note from the jurisprudence, there is a heavy burden on the utility to show evidence that supports its decision making, and such decisions must be shown to be the result of a logical process guided by a reasonable set of considerations and based on information that is both relevant and sufficiently comprehensive. As will be noted in various sections of this Argument, SEB is of the view that NSPI has clearly failed to meet this burden in relation to a number of matters.

(SEB, Final Argument, pp. 9-12)

[88] The Board has reviewed the case law cited by the intervenors and NSPI on the question of the acceptable legal standard for a finding of imprudency. As SEB notes, **s. 45(2)** of the **Act** identifies that expenses which the Board may allow a utility to charge must be "... reasonable and prudent and properly chargeable ...". The Board agrees with Avon and SEB that, while expenses are generally presumed to be prudent, when questions

are raised with respect to prudency, the burden falls to the utility to satisfy the regulator that its actions were prudent and reasonable.

[89] While the Board recognizes that the definition of imprudence varies somewhat among the jurisdictions cited, there are several fundamental principles which are common. These include:

- Were the utility's decisions reasonable in the context of information which was known (or should have been known) at the time?
- Did the utility act in a reasonable manner and use a reasonable standard of care in its decision-making process?
- The imprudency test should relate to the circumstances at the time in question and not to hindsight.

[90] While several cases were cited on this issue by the parties, NSPI referred in particular to a decision of the Illinois Commerce Commission noted earlier. Following a review of the cases, the Board finds that the definition of imprudence as set out by the Illinois Commerce Commision is a reasonable test to be applied in Nova Scotia.

[91] Accordingly, the Board has focused on NSPI's performance with respect to fuel procurement on the basis of the circumstances confronting NSPI in late 2002 and 2003. In the context of that test, the Board believes the circumstances at the time are reflected in the 2002 hearing and decision. NSPI faced a significant change in its coal supply. It lacked high-level in-house expertise in the international coal market. It defended allegations of imprudence in coal procurement in 2002 and, while the Board did not make a finding of imprudence, it categorized NSPI's coal procurement as "... lacking in sophistication ..." and "... sufficiently lax so as to undermine NSPI's ability to ensure ... that

coal was obtained at the lowest possible price...".[13] In terms of the process for decision-making used since 2002, it has been criticized by Liberty witnesses as lacking in efficiency and accountability. NSPI does not appear to have quickly retained high-level in-house expertise in the international coal market. It is compelling that all of the fuel experts, including Ms. Medine, confirmed that coal prices declined in late 2002 through to mid-to-late 2003. NSPI did not obtain a single long-term coal supply contract during this time.
