[92] The issue, in the Board's opinion, is not NSPI's stated intention to improve its practices but the timeliness and effectiveness with which actual implementation of the new approach was achieved. NSPI, in the Board's view, failed to address its imported coal procurement problems quickly or efficiently enough to adequately protect itself or its ratepayers. Had it done so expeditiously following the 2002 rate hearing, the Board is satisfied that, based on the evidence at this hearing, it was possible for NSPI to create a balanced portfolio of short, mid-term and long-term imported coal at reasonable prices. Instead, NSPI appears to have slowly implemented the necessary changes to its procurement practices. It remains unclear to the Board whether the corporate philosophy actually changed, and whether the procedures and practices recommended by Ms. Medine are yet fully implemented, particularly with respect to the need for long-term coal supply contracts which exceed terms of twenty-four months.

[93] There is no question that, following the directives issued in the Board's 2002 decision, NSPI had a number of changes to be implemented concerning fuel procurement.

[13] Board Decision, Oct. 23/02, pp. 27-28

It is possible that, in its effort to comply with other Board directives, the necessary changes to its procurement strategy were not dealt with as urgently as should have been the case. However, the practical reality of the need for many of the changes ordered in the 2002 decision was that NSPI had inappropriately transferred core utility functions to Emera without the approval of the Board. To the extent that compliance with the Board's 2002 directives may have had an impact on the alacrity with which NSPI implemented fuel procurement process changes in late 2002 and early 2003, any delay in this regard is attributable to the decisions made by the Utility and Emera. Any financial impact as a result of delay in implementing these changes, specifically with respect to the higher cost of imported coal in 2005, should not be borne by ratepayers.

[94] NSPI now faces a spot market for coal supply that has spiked. Consequently, NSPI and its ratepayers are confronted with higher than necessary fuel costs. The Board finds that NSPI has been imprudent in its fuel procurement practice and, accordingly, it is not fair or reasonable to permit the total of these costs to be passed on to ratepayers. The Board wishes to make it clear that, in its view, this is not a reflection on the integrity or intentions of individuals, particularly those who were part of NSPI's fuel decision-making process. It does, however, reflect a corporate philosophy which did not change with the urgency and purpose required in the circumstances. NSPI, as a result of its management decisions, now faces changing and higher market prices. It will pay higher coal prices because it is almost completely subject to the vagaries of the short-term market for imported coal.

[95] While the Board finds that NSPI has been imprudent in its fuel procurement practice, it does not believe that the approximately $30 million reduction, which was suggested by a number of the parties, is an appropriate amount.

[96] The primary reason the Board does not agree with the suggested $30 million reduction is the relatively limited period of time during which coal prices declined. Even if NSPI had acted as quickly as it should have to change its procurement strategy and build a balanced portfolio of short, mid and long-term contracts, it had, at best, several months to do so. Considering that part of this time would be required to implement the necessary changes, NSPI had a relatively short period of time to take advantage of the decline in imported coal prices.

[97] The Board believes that an $18 million reduction in fuel costs, rather than $30 million, strikes a reasonable balance on this issue. Accordingly, the cost of fuel and purchased power approved by the Board for the 2005 test year is reduced from $377.1 million to $359.1 million. NSPI is directed to adjust its expenses in this regard in a Compliance Filing following the issuance of this decision.

4.2 Affiliate Activity

4.2.1 Submissions - NSPI

[98] As indicated earlier in NSPI's description of its fuel procurement decision-making process, it identified Todd Sattler as part of the group of individuals (fuel strategy table) who make decisions on fuel procurement. Mr. Sattler wears a number of hats. He

is Vice President of Energy Services for NSPI and he holds similar positions with Emera Energy Inc. and Emera Energy Services Inc.

[99] Mr. Huskilson and Mr. Tedesco confirmed Mr. Sattler's role with both Emera and NSPI in the following response to questioning by Avon Counsel:

Q. May I refer you to Exhibit N-29, Board IR-193? This is an organization chart for NSPI's in-house fuel expertise and procedures.

A. (Tedesco) Yes, it is.

Q. And it shows on the right hand side of the page under Todd Sattler the front office of NSPI responsible for fuel procurement, physical and financial gas trading, scheduling of NSPI generation assets and electricity imports and exports for NSPI.

A. (Tedesco) That's right.

Q. And Mr. Sattler, while he's Vice-President of Energy Services for NSPI, also holds the same title for Emera Energy.

A. (Tedesco) That is correct.

Q. And Mr. Sattler's reporting function is to Mr. Huskilson in his capacity at Emera rather than to you in your position at NSPI.

A. (Tedesco) That, too, is correct.

Q. Isn't that right, Mr. Tedesco?

A. (Tedesco) Yes. Yes, it is.

Q. Thank you.

A.. (Huskilson) And I think just to clarify the reporting structure, we've gone through a bit of a transition, as you know, over the last little while starting about in July of 2003 and ending November 1st when I assumed responsibilities for Emera and NSPI as CEO. Part of this structure is sort of in the middle of that transition. In fact, Mr. Sattler was reporting to me as COO of Nova Scotia Power initially and, as Mr. Tedesco came on board and I moved in to the office of the CEO -- so as COO of Emera I was actually within the office of the CEO, both of Nova Scotia Power and of Emera. And so it was really a movement of Mr. Sattler from the office of the COO of Nova Scotia Power to the office of the CEO of Nova Scotia Power that occurred at this time, so if you look today at the structure, Mr. Sattler still reports to me as President and CEO of Nova Scotia Power. And I think that may help in that transition to clarify just why we went through those organizational changes.

(Transcript, Nov 16/04, pp. 171-173)

[100] Mr. Sattler's activities at NSPI were further described by Mr. Tedesco in response to questions from Board Counsel:

Q. Mr. Tedesco, what are Mr. Sattler's duties as Vice- President of Energy Services for NSPI? I'm not asking for a day-to-day list but his major responsibilities

A. (Tedesco) Mr. Sattler is a very experienced participant in fuel markets across North America, and the expertise that he brings particularly with regard to gas and oil have been extraordinarily valuable to us.

Q. I'm sorry ---

A. (Huskilson) Specifically, though, he supervises the front office of Nova Scotia Power.

Q. Yes. Okay. And that's the front office we've seen in the org. charts and so on.

A. (Huskilson) Yes, that's correct. One thing I'd just like to point out is that this organization is an organization that has been vetted through a process from the orders of 2002 and the organization -- we've worked with Emily Medine on the subject. We've also filed this organization with the Board in 2003 and we've -- and I think we've answered IRs and so on on the subject, and I didn't know whether you were aware of that fact or not but I think it is something that has been in the works for some time.

Q. I'm well aware of that, Mr. Huskilson. Mr. Huskilson, can you tell me what Mr. Sattler's responsibilities are as Vice-President of Energy Services with Emera Energy Inc. and Emera Energy Services Inc.?

A. (Huskilson) Again, he supervises the front office of those operations. Each of the operations within the business have their own front office with their own Director responsible for the management of that office, and that's where the line is drawn between Nova Scotia Power and the other affiliated companies is at that Director level.

Q. Okay. So he supervises the front offices, so-called, of all three organizations.

A. (Huskilson) Yes, that's correct.

Q. And does he or any Emera employees who report to him engage in negotiations or commercial transactions with NSPI?

A. (Huskilson) Certainly the leader of the front office, Wayne O'Connor, would certainly negotiate with NSPI.

Q. Okay. And Mr. O'Connor would report to Mr. Sattler?

A. (Huskilson) Yes, and Mr. Sattler reports to me.

Q. Okay. And Mr. Tedesco, would Mr. Sattler or any employee of NSPI who reports to Mr. Sattler engage in negotiations, commercial transactions with Emera Energy Inc. or Emera Energy Services Inc.?

A. (Tedesco) I'm sorry, if you could repeat that, would Mr. Sattler ---

Q. Or any NSPI employee who reports to him engage in negotiations or commercial transactions with Emera Energy Services Inc. or Emera Energy Inc.?

A. (Tedesco) Yes.

Q. So he is on both sides of those transactions, so to speak.

A. (Tedesco) Yes, he is, and any of those transactions are conducted consistent with the company's code of conduct and, as Mr. Huskilson mentioned a moment ago, they are conducted consistent with the organization that was filed with the Board in 2003.

A. (Huskilson) And I think, Mr. Outhouse, as a practical matter, I mean, so am I obviously.

Q. Yes.

A. (Huskilson) And I think when the front office of NSPI is negotiating with the front office of Emera Energy clearly, at that point, the dotted line relationship between Mr. Tedesco and that front office Director is in force at that point.

Q. I understand that, I guess, Mr. Huskilson, but the fact remains that Mr. Sattler, at least, is in charge of all three of those front offices.

A. (Huskilson) Absolutely, as am I.

(Transcript, Nov 18/04, pp. 468-471)

[101] Board Counsel also questioned NSPI as to whether NSPI's fuel strategy table, and Mr. Sattler's presence there, was consistent with the Board's 2002 rate decision.

Q. And do you believe that it's consistent with the Board's directive that you just read for representatives of Emera, that's you, Mr. Huskilson, at least when you sat in that capacity, and for Mr. Sattler, to sit on the fuel strategy table, NSPI's fuel strategy table?

A. (Huskilson) Well, first of all, neither myself or Mr. Sattler sat in that capacity, Emera's capacity.

Q. Well no, you are the same individuals though, correct?

A. (Huskilson) Sure, absolutely.

Q. Yes. All right. So you had a duty, in some sense, to Emera. You had a duty, in some sense, to NSPI.

A. (Huskilson) Well, I think under the code of conduct we would have had a duty to NSPI in that particular circumstance. I mean, as you know, we're a small company and as a small company it is -- and I think the code of conduct quite rightly recognizes the fact that there will be overlaps in responsibility, that's part of the efficiency that can be bought by using a code of conduct as we have, and by having the relationship that exists with Emera. And so, you know, there are going to be these kinds of overlaps.

Q. I'm going to ask you to turn to what I have marked as paragraph 385 in the decision, and yours may be off by one.

A. (Huskilson) I'm sorry, could you repeat that please?

Q. Turn to paragraph 385 which should put you in the vicinity, I hope, and it's under the heading "Independence and Insulation." That's the heading you'll see. ...

Q. This paragraph reads: "The Board became increasingly concerned during the hearing with respect to the apparent lack of separation between NSPI and Emera and how this could negatively impact ratepayers. It is imperative in the Board's view that NSPI and Emera avoid becoming so integrated that senior management is conflicted between the interests of Emera shareholders and the interest of NSPI ratepayers. It is clear to the Board that these interests can diverge from time to time." Do you see that?

A. (Huskilson) I do, which is precisely why we have appointed a COO responsible for NSPI and solely responsible for NSPI. When I was COO of NSPI I had multiple other responsibilities, and Mr. Tedesco does not. So he is the person who is solely responsible for NSPI relative to its operation, relative to its decision making, and relative to all of these various pieces. And so any of the decisions that are made in conjunction with what you're talking about really fall to him in the end, and that's why he chairs the table. Some of what you might be concerned about is the transition that occurred but, you know, the practicality of needing to make a transition is something that has to be dealt with as those kinds of things happen.

Q. And perhaps, Mr. Huskilson, if I can say so, I understand from your perspective about the transition. Mr. Sattler's role, as I understand it, is not transitional. He holds the same responsibilities in all three companies, and I guess the question is what assurance does the Board have that decisions made by those front offices or the fuel strategy table, particularly I should have said the front office of NSPI and its fuel strategy table, will be made solely, bearing in mind the self-interest of NSPI, and without any regard whatever to the interests, perhaps competing interests, of the Emera companies?

A. (Tedesco) Well, Mr. Outhouse, that would be my responsibility. As Chair of the fuel strategy table I take input from these folks. My sole interests are NSPI and NSPI's customers when those decisions are rendered, and I believe that Mr. Sattler's responsibilities are as filed in 2003. I do not believe there have been any changes in that regard.

Q. You've referred to the 2003 filing. It's not my understanding that the Board has ever sanctioned the arrangement which exists, is that right?

A. (Tedesco)That is correct. And it's also the case that we have received no objection, either.

Q. You've received a number of IRs which you have answered.

A. (Tedesco) That is correct.

Q. And that's the status of the matter.

A. (Tedesco) At present that's correct.

Q. Okay. Now, the Board in its decision, and I've already read you the passage, alluded to the conflict of interest or certainly the potential conflict of interest which can occur. Do you agree with me that the potential for such conflict of interest still exists, nothing has changed?

A. (Tedesco) No, I think the controls that we have in place, the responsibilities I have, our code of conduct, and the transparency of our fuel transactions, I think all speak to that issue rather forcefully.

Q. But you would agree with me, Mr. Tedesco, that the potential for conflict is inherent in any commercial negotiation.

A. (Tedesco) I think negotiations often have conflict in them, if you're referring to conflict in the sense of disagreements.

Q. Sure.

A. (Tedesco) If you're referring to it in any other form with specific regard to the fuel strategy table I would not agree.

Q. Buyer/seller as between front offices there's clearly a potential conflict, there is a conflict of interest. One wants the best deal it can get, and the other wants the same.

A. (Tedesco) Yes, and as the buyer or seller for NSPI again my sole interest is that of the company and its customers.

Q. Okay. But you have already said, as I understood you a few moments ago, that Mr. Sattler has great expertise in fuel matters on which the company has relied.

A. (Tedesco) That is correct.

Q. And do you rely on him?

A. (Tedesco) On occasion I do.

Q. Is his expertise in fuel matters greater than yours?

A. (Tedesco) In many areas, yes.

Q. Okay. What role, if any, did the fuel strategy table play in the decision by NSPI to sell natural gas to Emera Energy?

A. (Tedesco) it was reviewed and approved by the fuel strategy table.

(Transcript, Nov 18/04, pp. 474-481)

[102] In NSPI's confidential closing submission, criticism of intervenors with respect to Mr. Sattler's participation in the fuel strategy table and the conflict of interest issue they raised were addressed. NSPI pointed out that it has taken a number of measures to comply with the Board's 2002 directives, including returning fuel procurement activity from Emera to NSPI. It indicated that Mr. Sattler's dual role, and his participation in the fuel strategy table do not conflict with the Board's findings and directives in its 2002 decision. It further states that it views the Code of Conduct as a very important document and has exerted considerable effort to ensure compliance with the Code. It also pointed out that it reported its organizational structure, including Mr. Sattler's role, to the Board and, while no approval was received, no criticism or alternate direction has been issued by the Board.

4.2.2 Submissions - Intervenors

[103] A number of intervenors have raised concerns surrounding Mr. Sattler's role with NSPI and Emera. In the cross-examination of Liberty witnesses during the *in camera* fuel sessions, Nancy Rubin, Counsel for Avon, raised the issue of Mr. Sattler's compensation. While this occurred during an *in camera* session, the Board does not believe the reference requires confidentiality. Referring to Exhibit N-7, Tab 2, the management information circular (a non-confidential document), she noted that:

> Q. For 2003, it lists annual salary of a hundred and eighty-one thousand, seven thirty-one. Other annual compensation of a hundred and ninety-eight thousand, four thirty-one. And there's a footnote No. 11. And that footnote states that Mr. Sattler's contract provides for an annual supplement to his salary -- "see employment contracts for further details." And then if you flip a few pages ahead to page 18, under the heading, "Other named executive officers," and in the second paragraph, it discusses Mr. Sattler's contract, and it states that:
>
> > "An annual incentive equal to two percent of earnings before interest and income tax from the business operations of energy services or 100 percent of annual salary, whichever is greater."
>
> I'm just wondering if you were aware of this incentive related to energy services and if you can comment on this.
>
> A. (Spangenberg) We were not aware of this specific provision of his compensation.
>
> A. (Adger) I was not aware of it either. I would just add to what you said that it looks like he has an important incentive to expand the earnings of the unregulated affiliate.
>
> (**Confidential** Transcript, Nov 30/04, pp.2564-2565)

[104] In its redacted evidence, Liberty also identified areas of concern relating to potential conflicts of interest and affiliate activities relating to both Mr. Huskilson and Mr. Sattler:

> Fifth, the VP of Energy Services has split responsibilities between the regulated entity of NSPI and the non-regulated activities of Emera Energy. He is the VP of Energy Services for NSPI, and he is also the VP of Energy Services for Emera Energy. This is unsatisfactory, and represents a material conflict of interest. The essence of this conflict is that NSPI's Front Office sells electricity and gas to Emera's Front Office, which, in turn, resells these products.

> The VP of Energy Services serves as manager of both of the offices that are the buyers as well as the sellers in these transactions.
>
> Sixth, there is an affiliate relations conflict on the membership of the Fuel Strategy Table. The membership of this group consists of five individuals, the COO of Emera Inc., the COO of NSPI, the VP Energy Services, the GM Power Production, and the Director of Energy, Fuels and Risk Management. Two of these individuals, also serve in the capacity as senior managers with Emera – the COO of Emera, and the VP Energy Services. This is unsatisfactory, and represents a material conflict of interest, considering this group has major decision-making responsibility for fuel procurement for NSPI.
>
> (Exhibit N-136, pp. 31-32)

[105] In their evidence during *in camera* portions of the hearing, both Mr. Spangenberg and Mr. Adger voiced concerns about Mr. Sattler's dual role with Emera and NSPI and about affiliate relations in connection with gas sales. John Antonuk, another witness from Liberty, expressed the view that incentive compensation should be paid to utility employees on the basis of the performance of the utility and should not be based, in large part, on the performance of unregulated affiliates. Dr. Stutz, in his evidence, expressed similar concerns relating to Mr. Sattler and Mr. Huskilson:

> **Q. PLEASE DESCRIBE NSPI'S NEW ARRANGEMENTS.**
>
> NSPI's new arrangements rely on a mix of "groups" and "offices", some of which are part of Emera. The Company's response to UARB IR-121 and 245 describes the offices and groups. The Fuels Strategy Table has overall responsibility for NSPI's fuel strategy. Members of this table are the Chief Operating Officer (COO) of NSPI (Mr. Tedesco), who chairs the table; the COO of Emera (Mr. Huskilson); the GM of Power Production (Mr. Taylor); the VP, Energy Services for NSPI (Mr. Sattler); and the Director of Energy, Fuels and Risk Management (Ms. Lambert). Beyond the Fuels Strategy Table there are two primary groups that deal with fuel. Energy, Fuels and Risk Management (EF&RM), reporting to Mr. Taylor, is responsible for fuel-related planning and forecasting, including development of overall strategy recommendations, progress monitoring, and reporting on strategy execution. NSPI's front office, reporting to Mr. Sattler, executes the strategy and plan developed by EF&RM and deals with asset optimization on a day-to-day basis.
>
> **Q. DO YOU HAVE ANY CONCERNS ABOUT THESE ARRANGEMENTS?**
>
> Yes, I do. My concerns center on two individuals, Mr. Huskilson and Mr. Sattler, who are at NSPI's Fuels Strategy Table. Mr. Sattler is VP, Energy Services for Emera Energy Inc., and Emera Energy Services Inc, as well as VP, Energy Services for NSPI. Inclusion of Mr. Huskilson and Mr. Sattler on NSPI's Fuel Strategy Table does not appear to meet the Board's directive that NSPI resume full responsibility for its

own fuel-related core functions. Mr. Sattler's dual roles at NSPI and Emera raises particular concern in light of the following point, made in the Board's order in the Last General Rate Proceeding:

> It is imperative, in the Board's view, that NSPI and Emera avoid becoming so integrated that senior management is conflicted between the interests of Emera's shareholders and the interests of NSPI ratepayers, it is clear to the Board that these interests can diverge from time to time.

In considering the point just raised, it is important to understand that it is not Mr. Sattler or Mr. Huskilson per se, but rather their positions within NSPI's fuel-related arrangements that is the concern.

Q. DO YOU SUPPORT CONTINUATION OF NSPI'S NEW ARRANGEMENTS?

No. I recommend NSPI reorganize its arrangements so that the core fuel-related functions are **fully** within NSPI and real or apparent conflicts of interest are avoided. In considering this recommendation I would ask the Board to take into account the evidence of the other Board Staff witnesses addressing fuel-related issues.

(Exhibit N-134, pp. 34-35, emphasis in original)

[106] At the hearing, Dr. Stutz elaborated on his concern when questioned by the Board:

Q. ... Do you have any comments concerning the affiliate relationship between NSPI and Emera as it has been raised from time to time during this hearing, for example the sale of gas from NSPI to an Emera affiliate which then resells it, the issue of the fuel table at which sits both Emera and NSPI personnel?

A. I do, and before I answer I just wanted to draw your attention to something but let me get the right reference for it. I can't put my hands on it but I think you'll recognize it when I mention it and maybe someone else can tell me where it is. What I'm thinking about is an organization chart for the fuel procurement process, and the organization chart that I'm looking at, I think it may have come from Ms. Medine's original evidence, I'm not sure, but anyway what it shows is the NSPI front office with various other functions reporting to it. So into the front office it shows gas, heavy fuel oil, power, coal, etcetera, and then it has the Emera Energy Services front office with gas and power reporting into that, and the two of them reporting to the same individual who, I understand, is Mr. Sattler. Now, that is a degree of interconnection that could conceivably give rise to concern. I was concerned about it primarily because of what you wrote in the last order on insulation. It didn't seem to me that a senior executive who was in that box to which both of these trains of command reported could have the degree of insulation that you wrote about in your last order. So if the standard is insulation as you described it in your last order, this organization chart, as I understand it, doesn't meet that standard. If the standard is that "We can have whatever organization chart we want as long as we abide by the code of conduct" then I would have to reserve judgment because maybe the code of conduct is adequate to handle the situation, but it certainly wasn't adequate to handle what I read in your order.

Q. So you're talking primarily about the fuel strategy table, is that correct?

A. Yes.

Q. What about the other aspect that I mentioned or asked you about, Dr. Stutz, the issue of the sale of gas from NSPI to an Emera affiliate? Do you include that in your comments or do you consider that somewhat different?

A. No, I include it in my comments for this reason. I understand that the portion of NSPI that undertakes the sale and the portion of Emera that would be purchasing all report to Mr. Sattler. Now, Mr. Sattler may have some form of what is often referred to as a Chinese wall, which makes that appropriate, but it didn't seem to satisfy your insulation concern.

(Transcript, Dec 3/04, pp. 3438-3440)

[107] Avon, in its closing submission, argued that NSPI has not adequately complied with the Board's 2002 decision regarding affiliate transactions. Avon points out that:

> The current organizational chart for NSPI's fuel procurement shows the front office for NSPI responsible for fuel procurement, physical and financial gas trading, scheduling of NSPI generation assets, and electricity imports and exports for NSPI, reporting to Todd Sattler, the VP Energy Services for NSPI. Mr. Sattler also holds the position of VP Energy Services for Emera Energy. Mr. Sattler reports directly to Chris Huskilson, COO of Emera. Mr. Sattler does not have a reporting relationship through Mr. Tedesco, COO of NSPI.
>
> Either Mr. Sattler or employees of NSPI reporting to him are engaged in negotiations or commercial transactions with Emera Energy Services Inc. or Emera Energy Inc. Mr. Sattler's expertise in fuel matters exceeds that of Mr. Tedesco and understandably Mr. Tedesco relies greatly upon Mr. Sattler in fuel matters.
>
> NSPI argues that the arrangement has sufficient insulation and independence for NSPI in that Mr. Tedesco chairs the Fuel Strategy Table and is solely responsible for NSPI. NSPI also refers to its Code of Conduct and "the transparency of our fuel transactions". It is difficult to understand what NSPI means by "the transparency of our fuel transactions" when the reports on affiliated party transactions are sheets of line entries with short descriptions of the transaction and a description of the pricing mechanism as either "fully allocated cost", "fair market value" or "fairly allocated cost" with no description of the units involved in the transaction or the basis upon which the value was ascertained.
>
> With respect to fuel transactions, the concept of "transparency" has to be modified to account for the fact that information pertaining to these transactions is not widely disclosed as they are subject to confidential agreements.
>
> The lack of insulation by NSPI in its fuel procurement raised concerns on the part of a number of witnesses. This concern was heightened by the consideration that Mr. Sattler is eligible for an annual incentive equal to two percent of the earnings before interest and income tax from the business operations of Emera Energy Services.
>
> Mr. Adger described this as an important incentive to expand the earnings of the unregulated affiliate. Mr. Antonuk stated that as a general principle, utility employees should have their incentive compensation based upon utility results and that no significant portion

of their bonus or incentive compensation should relate to non-utility activities. The reason for this is to take away as many incentives as possible from the employees to support the holding company or the non-regulated side at the expense of the utility.

Concerns respecting the lack of insulation are heightened by the criticism by the Board's expert, John Adger, of the solicitation process and resulting agreements for the sale of natural gas not used in NSPI generating facilities and whether they achieve the optimum benefit for NSPI ratepayers. Mr. Adger's recommendation that the Board inquire into the solicitation procedures in an effort to ensure that the annual agreement is not limiting the proceeds that NSPI derives from the sale of natural gas compared to what might be derived under more common seasonal and 30 day agreements also heightens this concern.

As Mr. Adger described the current arrangements for the sale of natural gas by NSPI to Emera, it appears only slightly different from the circumstances prior to the Board's Order in 2002. As Mr. Adger stated:

> *Even in the presence of the Board's instruction to get the affiliate out of the fuel supply business, here the affiliate turns up again buying all of the gas under the [Redacted] Contract and then reselling it into the New England market . . . now they're going to . . . – they've sort of inserted one step, so they're going to give the affiliate at least some piece of the market value of it.*

Mr. Adger's description of the underlying motivation still resonates:

> *Whosever idea it was to move the [Redacted] Contract from the regulated side to the unregulated side without compensation is still in the building, okay, and still looking for stuff to move.*

As Mr. Adger explained, as a general matter, the utility's off system sales activity is really engaged in the same markets as the unregulated affiliate's wholesale trading activities. They are fundamentally in the same business. The wholesale trading activity of the affiliate is buying and selling and the utility is just selling but the utility is selling in the same market.

Mr. Antonuk considered the situation to be one which transcends imprudence and relates to a matter of basic corporate integrity. He raises the question of whether the controls on the enterprise are sufficient to give adequate assurances that the interests of the affiliated company are not being given priority over that of the utility...

The fact that the Vice President of Energy Services for NSPI is eligible to receive an annual incentive equal to two percent of earnings before interest and income tax from the business operations of Emera Energy Services raises a reasonable and justifiable concern as to how he can balance conflicting interests in his dual position as VP Energy Services for NSPI and VP of Energy Services for Emera Energy. He has financial incentives for increasing the volume of transactions and therefore earnings of Emera Energy. His knowledge and experience makes him an influential member of the NSPI fuel strategy table. It is fair to question whether the progressively increasing volume of affiliate party contracts respecting fuel procurement have been influenced by the compensation scheme.

(Closing Submission, Avon, pp. 48-52)

[108] Avon further submits that:

> The lack of independence of NSPI and its lack of insulation from Emera are immediate and significant concerns which have intensified since the 2002 case. We would submit that the Board should make the following orders:
>
> 1. that an independent review be conducted of affiliated party transactions from 2002 to 2004 to ensure NSPI's ratepayers have benefited [sic] from these transactions;
> 2. that the Board order an independent review of the structure of the tendering process, the timing and terms of tenders to ensure they do not favour Emera over other tenderers;
> 3. that the Board order immediately that no employees of Emera (whether employed by Emera alone or in conjunction with NSPI) participate on the NSPI fuel table;
> 4. that no employee of NSPI who is also employed by Emera be engaged in the negotiation of contracts between NSPI and an affiliate; and
> 5. that NSPI be required to prepare and submit a plan which contains specific provisions identifying how it proposes to address the spirit and intent of the Board's direction with respect to NSPI's insulation and independence from Emera.
>
> (Closing Submission, Avon, p. 50)

[109] HRM, MEUNSC and the Province all commented on this issue in their written submissions. The Province states that:

> The Board's decision in the 2002 Rate Case contained a detailed discussion of NSPI's interactions with its affiliates. Among other things, NSPI was required to "resume full responsibility for its own fuel procurement, export electricity sales and gas sales". These were considered by the Board to be core functions of the utility. NSPI complied with this and other Board directives contained in the 2002 Rate Case Decision relating to the Code of Conduct and has demonstrated improvement in a number of areas.
>
> At present, the same individual (Mr. J.T. Sattler) holds the positions of Vice President Energy Services for NSPI, Emera Energy Service Inc. and Emera Energy Inc. Mr. Sattler supervises the "front offices" of each of these companies. Persons who report to Mr. Sattler in each of the above noted Emera companies may engage in negotiations or commercial transactions with NSPI. Further, Mr. Sattler is a member of the NSPI Fuel Strategies Table where major decisions related to fuel procurement and sales are made. This includes the decision to sell natural gas to Emera Energy.
>
> While there is probably much benefit to NSPI from employing someone with Mr. Sattler's background and experience, an exchange between Board Counsel and the NSPI Policy Panel, Chris Huskilson and Ralph Tedesco, highlights the appearance of and potential for a conflict of interest to arise because the same individual occupies the position of Vice President Energy Services for NSPI and two of its Emera affiliates. This potential conflict is heightened by the fact that a portion of Mr. Sattler's remuneration is in the form of "an annual incentive equal to two percent of earnings before interest and income tax from the business operations of [Emera] Energy Services, or 100% of annual salary, whichever is greater".
>
> This issue is brought to the Board's attention to demonstrate the need for ongoing monitoring for compliance with the Code of Conduct requirements. It is submitted that the Board should closely review the current organizational structure of NSPI to ensure that it is in full

> compliance with the Board's 2002 Rate Case Decision and the approved Code of Conduct. Notwithstanding the progress made by NSPI in relation to Code of Conduct compliance, the evidence demonstrates that further work is required to refine processes and increase stakeholder confidence.
>
> (Closing Submission, Province, pp. 30-31)

[110] SEB submitted the following:

> Various parties have noted the ongoing affiliate relationships between NSPI and Emera affiliates. [**redacted**] SEB does not intend to reiterate the record in this regard, but believes that the Board should continue to evaluate whether these relationships are providing value to NSPI. More particularly, in order to ensure transparency and to eliminate any potential for favored treatment of affiliates, the Board should require that NSPI fuel procurement decision-makers be employed only by NSPI, and have no direct employment relationship with Emera or its affiliates.
>
> (Final Argument, SEB, p. 22)

4.2.3 Findings

[111] The Board has reviewed this matter with particular interest in view of its findings in the 2002 rate decision. In that case, as has been noted earlier, the Board expressed considerable concern with NSPI's reliance on affiliated entities to provide fuel procurement services. NSPI's single largest annual expenditure is fuel required to generate electricity. In the Board's view, this made fuel procurement a core function of the Utility and one which should not have been transferred to unregulated affiliates.

[112] The Board acknowledges that NSPI is correct when it states that Mr. Sattler's role was disclosed in its filing of interim and final reports in 2003 concerning In-House Fuel Expertise and Policy and Procedure Development. The Board also acknowledges that it did not engage the services of fuel experts at that time to review these reports. However,

based on the opinions of the various fuel experts engaged in this hearing by the intervenors and Board Counsel, it is clear that valid concerns exist.

[113] The Board agrees with the views of the intervenors and Dr. Stutz with respect to the concerns surrounding Mr. Sattler's dual role with NSPI and Emera and his participation in NSPI's decision-making process on fuel procurement. Like the intervenors, the Board does not question Mr. Sattler's integrity, his expertise in the gas and oil industry or his value to Emera in terms of his work for affiliated companies. However, his integral role with respect to NSPI's decision-making on its largest single expense item is inappropriate, in the Board's view. His incentive compensation arrangements clearly reflect this. He is not compensated on the basis of NSPI's performance. He is compensated on the basis of Emera Energy Services performance. The Board stated in its 2002 decision that fuel procurement is the Utility's core function. Accordingly, it should not be overseen or influenced by individuals whose primary responsibilities relate to unregulated affiliates. The Board also has concern, expressed by Dr. Stutz and others, that Mr. Huskilson's participation as a member of the fuel strategy table does not conform to the degree of insulation required between NSPI and Emera as set out in the Board's 2002 decision.

[114] As referred to in the previous section on fuel procurement and prudency, the Board notes the criticism of intervenors with respect to NSPI's fuel procurement decision-making practices. Mr. Spangenberg pointed out that, in his view, NSPI lacks sufficient in-house expertise on fuel procurement, particularly coal; its fuel procurement solicitation process is not consistent; decision-making is not efficient or accountable enough; nor is there an appropriate delegation of authority to allow individuals to make these decisions.

NSPI's fuel strategy table, which consists of Chris Huskilson, former COO of Emera Inc.; Ralph Tedesco, COO of NSPI; Todd Sattler, Vice-President of Energy Services for NSPI, Emera Energy and Emera Energy Services; James Taylor, NSPI's General Manager of Power Production; and Mary Lambert, NSPI's Director of Energy, Fuels and Risk Management, review all imported coal supply contracts. Mr. Spangenberg believes that NSPI should hire sufficient in-house expertise and set out decision-making authority at various levels, based on contract costs, to improve efficiency and accountability. The Board agrees with this assessment.

[115] Accordingly, the Board directs that Mr. Sattler, so long as he continues to be an employee of Emera Energy or Emera Energy Services, or any other unregulated affiliated company, no longer participate in NSPI's fuel strategy table. NSPI is also directed to promptly engage high level in-house expertise to lead the imported coal supply aspect of its fuel procurement process and to establish a more efficient and accountable decision-making structure with respect to fuel procurement. NSPI is directed to file a report with the Board, within six months from the date of this decision, outlining the implementation of the changes noted above. The Board will engage the services of independent fuel experts to review the adequacy of NSPI's actions to address this issue. While the Board understands the similar concerns expressed regarding Mr. Huskilson's participation in the fuel strategy table, it is not prepared, in view of his positions with Emera and NSPI, to direct his removal from the fuel strategy table and decision-making process at this time.

[116] The Board also notes the concerns expressed with respect to other affiliate transactions involving energy and fuel. It is evident from the issues raised that reviewing

NSPI's annual filing on affiliate transactions solely by an accounting firm, however, well-qualified, is likely insufficient. Accordingly, in addition to the form of review on this information performed in the past, the Board, in future, will also retain fuel audit experts to examine and express their opinions on these types of affiliate transactions, including export sales and natural gas sales.

4.3 Fuel Adjustment Mechanism

4.3.1 Submissions - NSPI

[117] In its initial application, NSPI requested approval of a Fuel Adjustment Mechanism ("FAM"). NSPI explained the proposed FAM as follows:

> A relatively straightforward fuel adjustment mechanism would be a fuel adjustment clause. A fuel target is established (based on forecasts) for the purpose of initially setting rates. If actual fuel costs are above the target the additional costs are recovered from customers. If the actual costs fall in a band below the target the savings are returned to customers.
>
> NSPI appears to be in a minority of utilities in not having a fuel adjustment mechanism. In light of the volatility and uncertainty in fuel markets NSPI is proposing a fuel pass through. The Company wishes to consult with customers, other stakeholders and the Board about the appropriate structure of such a pass through mechanism for use in Nova Scotia.
>
> (Exhibit N-1, pp. 44-45)

[118] NSPI presented the views of Tim Simard, a principal with the firm Risk Advisory, with respect to FAMs. In his November 2, 2004 report, Mr. Simard explained that NSPI is one of only three investor-owned electric utilities in Canada and the only one which

does not have a FAM.[14] Mr. Simard noted that FAMs are also prevalent in natural gas utilities in Canada and common for gas and electric utilities in the U.S.

[119] Following a number of IRs from other parties concerning the FAM, and criticism of experts that the FAM proposed by NSPI was vague and lacked adequate details, a somewhat more refined FAM was described in the testimony of Mr. Tedesco and Mr. Huskilson at the hearing, and in NSPI's rebuttal evidence (Exhibit N-42). NSPI indicates that its initial proposal was deliberately general in order to provide an opportunity for stakeholders to influence the development of the FAM. Mr. Tedesco, under cross-examination by George Cooper, SEB's Counsel, acknowledged that, while NSPI had discussions with stakeholders concerning a FAM, the version proposed in Exhibit N-42 was not the subject of review or comment by other parties prior to filing.

[120] NSPI's comments on the revised FAM are as follows:

> NSPI is offering refinements to the proposed FAM that reflect:
>
> - Input from intervenors
> - A balance between the customer desire for rate stability and the benefits of market-responsive pricing
> - Underlying mechanics that are simple, easy to understand and apply
> - Continued incentive for the utility to optimize its fuel procurement activity
> - An extension of the period during which electricity prices remain unchanged
>
> The proposed FAM includes these elements:
>
> - The adjustment will be described in customer-friendly units of $/MWh or $/KWh.
> - Adjustments will be filed semi-annually, with the opportunity for UARB review.
> - The semi-annual adjustment will contain two components:
>   - o An adjustment to reflect the updated forecast fuel cost for the subsequent half year.

---

[14]Exhibit N-42, p. 26

- o An adjustment that allows for the clearing of any outstanding deferral account balance over a subsequent 12-month period acting to levelize rates.

- NSPI will establish a deferral account that will track the difference between the semi-annual forecast fuel cost on a dollar per MWh basis and the actual fuel cost.
- The deferral account balance (either a debit or credit) will bear interest at a rate equal to NSPI's weighted average cost of capital.
- Proximate to the filing of Annually Adjusted Rates, NSPI will also file an annual fuel forecast for the upcoming year for a 30-day period of review and commentary by stakeholders, the UARB and customers would have a 30-day period for review and commentary.
- The UARB or its designate will be invited to participate in matters of fuel procurement at any and all times at the Fuel Strategy Table.
- After each of the first two years of the initiation of the FAM, the UARB is invited to conduct an annual hearing or technical conference with customer participation to review the fuel procurement practices of NSPI over the previous year.

(Exhibit N-42, pp. 87-89)

[121] NSPI submits that, while a FAM shifts the risk of fuel price volatility to ratepayers, NSPI will continue to closely and prudently work to ensure fuel costs are kept as low as possible. As noted in the section of the decision on return on equity, the existence of a FAM is a factor used in determining what constitutes a reasonable rate of return for NSPI. NSPI points out that if the FAM is approved, the return on equity would be lower than would otherwise be the case, as the FAM reduces the fuel cost risk faced by the Company.

[122] Mr. Tedesco and Mr. Simard gave additional evidence regarding FAMs during the *in camera* portion of the rate hearing. Both indicated that FAMs are common in other North American jurisdictions and, to their knowledge, FAMs have only been withdrawn in the US where retail competition has been introduced. NSPI also filed the specific version of the FAM, to be included in its Tariff, in Undertaking U-24.

[123] In the SA filed by NSPI, the request for a FAM was deferred with the following plan for future consideration:

> 4. Board allows for the consideration of a Fuel Adjustment Mechanism (FAM) during 2005 for the calendar year 2006, subject to the following:
>   a. NSPI developing a specific FAM proposal for review by stakeholders at a Technical Conference
>   b. NSPI gaining further experience in international coal markets
>   c. NSPI agrees to a customer education campaign, should its request be favorably considered.
>   d. NSPI recognizes UARB approval of a FAM is required
>
> (Exhibit S-1, Terms of Recommended Settlement)

4.3.2 Submissions - Intervenors

[124] The proposed FAM was widely opposed by the intervenors. Fuel experts, including John Antonuk and Dennis Kalbarczyk of Liberty, essentially took a similar view with respect to why the FAM should not be approved. They all expressed concerns that NSPI's fuel procurement process is inadequate and, since a FAM could reduce or eliminate NSPI's incentive to make necessary improvements to its processes, a FAM at this time would be premature and ill-advised. They also took issue with the generality and vagueness of the initial FAM proposed. Their fundamental objection, even after reviewing NSPI's refined version of a FAM, was that the risk of fuel price volatility should not be transferred to ratepayers until NSPI's fuel procurement was much improved in a number of respects.

[125] Mr. Antonuk and Mr. Kalbarczyk outlined their reasons for recommending against a FAM in their direct evidence:

> NSPI's performance and its proposals in this proceeding do not lay a proper foundation for the introduction of a FAM, for four reasons:
>
> - The evidence of Donald Spangenberg shows the existence of substantial weaknesses in NSPI's management of its fuel and energy. Concerns about the effectiveness of NSPI fuel management substantially diminish the prospects for successfully introducing a new rate recovery method of this type.
> - The evidence of Donald Spangenberg and John Adger raises substantial questions about fuel and energy transactions with affiliates and about whether relationships with affiliates are conducted at arm's length. We believe it is appropriate for a more detailed examination to be made of affiliate relationships before considering the introduction of FAM.
> - Even if the two preceding concerns did not exist, NSPI's proposed FAM, insofar as we can identify its components is not sufficiently well identified, described, and laid out in proper form to provide for a clause with clearly established dimensions and procedures.
> - NSPI's proposal also fails to provide for certain, sufficient regular reviews of forecasted costs, structured, after-the-fact cost reconciliations, and examinations of the prudence and reasonableness of costs subject to FAM recovery.
>
> NSPI's proposed fuel cost pass-through mechanism is therefore premature to consider in the context of this proceeding.
>
> (Exhibit N-135, pp. 3-4)

They stated that:

> We recommend that the Board:
>
> - Not allow at this time the adoption of a FAM.
> - Monitor the effectiveness of fuel and energy management, in order to determine the point at which there is confidence that NSPI is performing at a level that is both stable and effective.
> - Defer to a later proceeding the question of whether it is appropriate to adopt a FAM for NSPI, considering as well in that proceeding the administrative questions not adequately addressed in this one, including structure, components, and protections.
>
> (Exhibit N-135, pp. 4-5)

[126] Dr. Stutz also recommended in his direct evidence that the Board should reject the proposed FAM, stating that:

> **Q. DO YOU SUPPORT THE ESTABLISHMENT OF A FAM FOR NSPI AT THIS TIME?**
>
> A. No, taking all of the above considerations into account, I do not recommend establishment of a FAM for NSPI at this time. In considering this recommendation I would ask the Board to take into account the evidence of other Board Staff

witnesses concerning the adequacy and effectiveness of NSPI's efforts to date to control its fuel-related costs.

Q. DOES YOUR RECOMMENDATION REST ON THE EVIDENCE PROVIDED BY OTHER WITNESSES APPEARING ON BEHALF OF BOARD STAFF?

A. No. In the absence of that evidence I would still oppose the establishment of a FAM at this time. Establishment of a FAM would remove or diminish the incentive for NSPI to manage its fuel costs efficiently and, as shown in the response to NSDOE IR-33, it would adversely affect rate stability. Actions that remove or diminish incentives for utility efficiency and create rate instability should only be taken if they are clearly needed. NSPI's need for a FAM is not yet established.

(Exhibit N-134, pp. 32-33)

[127] Mark Drazen, of Drazen Consulting Group, Inc., an expert witness for Avon, made the following comment concerning NSPI's proposed FAM:

> An automatic fuel adjustment mechanism (FAM), such as requested by NSPI, is not the only way–nor necessarily the best way–of dealing with anticipated variations in fuel cost. The ability to pass through fuel costs reduces the incentive to minimize those costs. This transfers the risk of fuel cost variation to customers and increases that risk. Further, as the recent past shows, NSPI's forecast of fuel costs for the test year is not necessarily representative of the costs that will be incurred in that or subsequent years.
>
> (Exhibit N-91, p. 3)

[128] Mr. Drazen also noted that, while FAMs exist in a number of U.S. jurisdictions, Newfoundland Power is the only Canadian electric utility that has a FAM.[15]

[129] Avon, in its closing submissions, states:

> Thereafter, NSPI revised its proposed FAM and included a new proposal as part of its rebuttal evidence. The "refinements" were stated to reflect, among other things, input from intervenors and continued incentive for the utility to optimize its fuel procurement activity.
>
> It should be noted however that the revised FAM failed to include any mechanism by which cost-sharing between ratepayers and shareholders would drive the incentives for efficient management. Apart from LRCA which recommended a sharing mechanism intervenors' consultants did as well, including Mark Drazen and Alan Rosenberg...

[15] Exhibit N-91, p. 27

> On fairness principles, the intervenors, the Board and their consultants have been denied the opportunity for a thorough analysis of this new revised FAM and the opportunity to pose information requests as to its implications.
>
> (Avon, Closing Submission, pp. 31-32)

[130] In closing submissions, CBRM, ECANS, HRM, MEUNSC, the NDP, the Province and SEB all objected to the approval of a FAM at this time. In its final argument, SEB states that:

> As noted above, SEB and other parties to this proceeding clearly believe that NSPI's fuel procurement strategy is simply not sufficiently well developed or managed to give ratepayers any comfort that a FAM could work to the benefit of the ratepayers at this time. The record is exceedingly clear in this regard, with statements from numerous experts – those of SEB and other parties – and SEB does not intend to reiterate those views here. Suffice it to say that, although not fundamentally opposed to the concept of a FAM, SEB does not believe the timing is right to impose such a mechanism upon NSPI's ratepayers. SEB does not believe that NSPI is yet fully sophisticated enough in fuel procurement, particularly Atlantic seaborne coal procurement, and it does not believe that NSPI has a proper complement of fuel expertise in-house. Furthermore, it has continuing concerns with the significant number and value of fuel transactions which occur with Emera affiliates. Until ratepayers have a much higher comfort level on these issues, SEB does not believe the Board should approve the adoption of a FAM.
>
> (SEB, Redacted Final Argument, p. 19)

4.3.3 Findings

[131] The Board shares the views of the intervenors with respect to the FAM proposed by NSPI. The Board recognizes that FAMs exist in many other jurisdictions and can, potentially, be a positive and useful regulatory tool. However, in view of the Board's findings with respect to imprudence and inadequacies in NSPI's fuel procurement practices, it would be quite inappropriate to approve a FAM at this time. The Board does not believe it is in the public interest to transfer the risk of fuel price volatility to ratepayers when NSPI's ability to achieve the best possible fuel price is in question.

[132] Further, the Board is of the view that transferring such risk from shareholders to ratepayers could diminish the incentive for NSPI to quickly and thoroughly improve its fuel procurement process. This is particularly the case since the FAM proposed by NSPI would transfer 100% of the risk to ratepayers. Accordingly, the Board rejects the proposed FAM. Further, in view of the Board's concerns in this area, should NSPI apply for approval of a FAM in future, the Board will order an independent audit of NSPI's overall progress and performance with respect to the necessary fuel procurement improvements. This audit would include, as recommended by Liberty, "... a more detailed examination..." of fuel and energy transactions and relationships with affiliates and would form part of the evidence the Board would consider in any future FAM application.[16]

[16]Exhibit N-135, p. 3

5.0 FINANCE

5.1 Return on Equity

5.1.1 Submissions - NSPI

[133] NSPI's expert witness concerning the issue of rate of return on common equity was Dr. Roger Morin, Professor of Finance at Georgia State University.

[134] In determining his recommended return on equity ("ROE"), Dr. Morin reviewed current market conditions and performed several risk premium studies. He indicated that he relied principally on the Capital Asset Pricing Model (CAPM), as well as the Risk Premium and the Discounted Cash Flow (DCF) methodologies in order to estimate a fair and reasonable ROE for NSPI. He examined the risk premiums allowed by regulators in North America and applied the DCF model to U.S. electric utilities. He also stated that he applied the DCF model to U.S. vertically integrated utilities and to natural gas distribution utilities to supplement the risk premium estimates. He indicated that he used the Comparable Earnings test as a supplementary check on his recommendations.[17]

[135] Based on the results of his risk premium studies, Dr. Morin determined that the risk premium range is 4.5% to 5.5%, with a midpoint of 5.0%. He then determined that the forecast risk-free rate of return is 5.7%. Adding the forecast risk-free rate of return to the risk premium range of 4.5% to 5.5%, Dr. Morin arrived at a ROE range of 10.2% to

---

[17]Exhibit N-3, p. 14

11.2%, with a midpoint of 10.7%. He pointed out that his recommended ROE range of 10.2% to 11.2% is predicated on a common equity capital ratio of 37.5%.[18]

[136] In his direct evidence, Dr. Morin stated that:

> Based on the results of various methodologies, I recommend the adoption of a rate of return on common equity ("ROE") in the range of 10.2% - 11.2% with a midpoint of 10.7% for ratemaking purposes in 2005. A rate of return in this range is required in order to (i) attract capital on reasonable terms, (ii) maintain financial integrity, (iii) be commensurate with returns on comparable risk investments, and (iv) act as an incentive device for cost effectiveness and productivity gains. My ROE recommendation is derived from cost of capital studies that I performed using the financial models available to me and from the application of my professional judgment to the results obtained in light of NSPI's long-term investment risks and economic environment....My recommendation is predicated on the adoption of the Company's capital structure consisting of 37.5% common equity capital and the adoption of the Company's proposed fuel adjustment clause.
>
> (Exhibit N-3, Appendix G, p. 5)

[137] While NSPI recognizes and supports Dr. Morin's recommendation as appropriate, it nevertheless adopted an ROE of 10.2% for ratemaking purposes instead of the 10.7% recommended by Dr. Morin. NSPI stated its reason for doing so as follows:

> The Company supports his recommendations as being appropriate but in consideration of minimizing the impact on customer rates, the Company has based this Rate Application on an ROE of 10.2 percent for ratemaking purposes, which is the lower end of Dr. Morin's recommended range.
>
> (Exhibit N-1, p. 70)

[138] Dr. Morin clarified, in response to IR-55 from the Province (Exhibit N-27), that if a FAM is not approved and the common equity ratio remains at 37.5%, his recommended range would change to 10.70% to 11.70%, with the midpoint of 11.20% being used for ratemaking purposes. On cross-examination by Counsel for SEB, he stated:

---

[18] Exhibit N-3, p. 71

Q. So, your testimony is that without a FAM your recommendation is 11.2 in a range of 10.7 to 11.7?

A. Yes, and I suspect a company would utilize 10.7, or the low end for rate-setting purposes

(Transcript, Nov. 18/04, pp. 587-588)

Mr. Tedesco indicated, during his cross-examination by Board Counsel, that without a FAM NSPI believes an appropriate return on equity would be 11.2%.

[139] The Board, in its rate decision of October 23, 2002, established an earning range of 9.90% to 10.40%, with the return on equity set at 10.15% for ratemaking purposes. NSPI responded to the suggestion of a number of intervenors that there has been no material change in NSPI's risk since the last hearing:

> Several intervenors have suggested through cross examination that NSPI's risk profile is no greater than it was in 2002, and some have even suggested that it has a lower risk profile, in support of their claims that NSPI does not require a higher ROE than that granted in 2002. The arguments for a lower risk profile stem from the fact that NSPI's financial risk has decreased since 2002 as a result of improvements the Company has made in its capital structure....
>
> Those intervenors who have suggested the ROE should be reduced because of the stronger financial profile have overlooked the fact that **this improvement was needed to maintain the Company's existing rating, not improve it....**
>
> ... Throughout this hearing, NSPI has provided evidence of the increased business risk since 2002:
>
> 1. Taxes have tripled and increased by $79 million since 2002.
> 2. Fuel prices are higher and more volatile now than in 2002.
> 3. The electricity sector throughout North America is viewed as more risky. Downgrades, escalating emphasis on environmental concerns, and deregulation have all changed the risk perception of the industry. NSPI is not immune to the overall perception of the industry.
> 4. Since 2002, Standard and Poor's have downgraded 14 Canadian electric utilities. In all cases, the reasons cited for the downgrades were increased business risk.
>
> In order to manage the risk profile of NSPI to reduce upward pressure on customer rates while balancing the requirements of the investment community, NSPI is proposing that a Fuel Adjustment Mechanism be introduced. The implementation of such a mechanism would reduce investors' overall risk perception of NSPI, enabling the Company's rates to incorporate a lower return on equity and therefore a lower cost to consumers.
>
> (NSPI, Closing Argument, pp. 10-12, emphasis in original)

5.1.2 Submissions - Intervenors

[140] Michael P. Gorman, a principal at Brubaker & Associates, Inc., appeared as an expert witness on behalf of SEB. Mr. Gorman indicated in his direct evidence that he used several financial models in order to estimate NSPI's cost of common equity.[19] They were: the constant growth discounted cash flow model (DCF); the risk premium model; and a capital asset pricing model (CAPM). He applied these models to a group of publicly traded utilities which he determined to proxy the investment risk of NSPI.

[141] Mr. Gorman stated that:

> Based on my analyses, I estimate an appropriate return on common equity for NSPI to be in the range of 9.1% to 10.1%, with a mid-point estimate of 9.6%. The high end of my estimated range is based on my CAPM analyses, and the bottom of my range is based on my DCF analysis.
>
> (Exhibit N–69, p. 17)

He indicated that:

> My recommended 9.6% common equity return does not include a possible management performance penalty as discussed by Dr. Alan Rosenberg. My proposed return on common equity for NSPI presents fair compensation based on today's market costs, and reflects the reduction in financial risk created by NSPI's increase of its common equity ratio in the capital structure NSPI proposes for setting rates. If the Nova Scotia Utility and Review Board (Board) adopts a fuel adjustment mechanism (FAM), it should reduce NSPI's authorized equity return by 0.50% to 0.25% below my recommended 9.6% common equity return to capture the reduced investment risk, created by implementation of a FAM.
>
> (Exhibit N-69, p. 2)

---

[19]Exhibit N-69, p. 5

[142] Mr. Gorman also stated that his recommended return on common equity is reasonable because it produces adequate pre-tax earnings coverage of debt interest expense to support NSPI's current bond rating.

[143] Billie S. LaConte gave expert evidence on behalf of Avon. She is a consultant in the field of public utility economics and regulation, and is a member of Drazen Consulting Group, Inc.

[144] Her recommended ROE was determined by using the Equity Risk Premium (ERP) Method. The Equity Risk Premium is the extra return (premium) that the stock market requires over the risk free rate of return in order to compensate for market risk. The Equity Risk Premium was determined by using the Capital Asset Pricing Model (CAPM). The range which she recommends for a return on common equity is 8.70% to 9.30%.[20]

[145] Ms. LaConte testified that:

> I recommend the Board set a rate of return on equity for NSPI in the range of 8.7 to 9.3 percent. I base my recommendation on an analysis using the capital asset pricing model. With the fuel adjustment mechanism, I believe the return on equity should be set at the low end of my recommended range, 8.7 percent. Without a fuel adjustment mechanism, the Board should set the return on equity at 9.3 percent. If the Board wishes to allow a band width, then the authorized return should represent the mid-point of that band width with an equal probability [profitability] of NSPI earning above or below the authorized return.
>
> (Transcript, Nov. 19/04, pp. 889-890)

[146] In its reply submission, Avon states:

> Avon Valley et al, in its closing submissions urged that an appropriate ROE for NSPI was in the range of 9.3% - 9.6%, without a FAM. To clarify, it is recommended that the midpoint of NSPI's allowed ROE be set at some point between 9.3% and 9.6% in accordance with the

[20]Exhibit N-92, p. 3

> recommendations of Mr. Rothschild, Mr. Gorman and Ms. LaConte. Thereafter, the Board should permit a range of 25 basis points on either side of its allowed ROE.
>
> (Avon, Reply Submission, pp. 7-8)

[147] James A. Rothschild, President of Rothschild Financial Consulting, appeared as an expert witness for Board Counsel. In his direct evidence, Mr. Rothschild states that he determined the appropriate cost of equity by applying the Discounted Cash Flow (DCF) and Risk Premium/CAPM methods to the two groups of companies selected by Dr. Morin, NSPI's financial witness. Mr. Rothschild indicated that he applied two different versions of the DCF method and two different versions of the Risk Premium/CAPM method. He stated:

> ... Based upon the analyses I conducted, I find that the cost of equity to NSPI is 9.50% which is the midpoint of a 9.25% to 9.75% range and is applicable to a capital structure containing 37.50% common equity.
>
> (Exhibit N-133, p. 15)

[148] Mr. Rothschild also commented:

> ... The capital structure I have recommended is equal to the capital structure requested by the Company. This 37.50% common equity ratio is higher than the 35% allowed to NSPI in its last case, but is within the 40% ceiling that the UARB found acceptable in the last case and is reflective of the actual capital structure being used both by NSPI and its parent, Emera
>
> (Exhibit N-133, p. 6)

[149] According to Mr. Rothschild, he is recommending a reduction in the 10.15% cost of equity allowed in the 2002 rate case to 9.50% as a result of a decline in interest rates, and a reduced financial risk associated with NSPI's higher common equity ratio. He added that both of these changes have occurred since NSPI's last rate case.

[150] With respect to the proposed FAM, Mr. Rothschild stated that if a FAM were approved by the Board, his overall cost of capital recommendation would be reduced. This

is because the reduced risk of volatility in expenses resulting from a FAM would allow NSPI to use a smaller common equity ratio in its capital structure.

[151] Mr. Rothschild contrasted his recommended cost of equity of 9.50%, being the midpoint of a 9.25% to 9.75% range, with the cost of equity requested by NSPI of 10.20% and a range recommended by Dr. Morin of 10.2% to 11.2%.[21]

[152] The recommended ranges and the recommended ROE's of the various financial witnesses are set out in HRM's final submissions as follows:

Witness	**ROE Range**	**ROE with FAM**	**ROE w/o FAM**
Current NSPI ROE	*9.9%[9.75%] - 10.4%*	*N/A*	*9.9%[9.75%] - 10.4%*
Proposed -Mr. Rothschild	9.25%-9.75%	Not Provided	9.50%
Proposed -Mr. Gorman	9.10%- 10.10%	9.10%-9.35%	9.60%
Proposed - Ms. LaConte	8.70%-9.30%	8.70%	9.30%
NSPI (Dr. Morin)	10.20-11.20%	10.20%-11.20%	10.70%-11.70%

(HRM, Final Submission, p. 5)

5.1.3 Findings

[153] The Board has carefully considered the evidence of the experts on this issue. As noted earlier in this decision, the Board has not approved a FAM at the present time. Accordingly, the appropriate ROE has been determined on this basis.

[21] Exhibit N-33, p. 15

[154] The Board believes that an ROE of 9.50% to 9.60%, as recommended by Mr. Rothschild and Mr. Gorman respectively, fairly represents an appropriate ROE. The ROE of 11.2%, as recommended by Dr. Morin, is, in the opinion the Board, too high given the current economic climate. At the same time, the Board believes that the ROE of 9.30% which was recommended by Ms. LaConte is somewhat on the low side. Accordingly, the Board approves a ROE at 9.55% for the purpose of setting rates. The earnings range is set at 9.30% to 9.80%.

[155] It was pointed out during the hearing that, generally, other utilities calculate the rate of return using the rate base method, and there was a consensus among the intervenors that NSPI should change its method of calculating the rate of return.

[156] In its reply to closing arguments, NSPI states that:

> Some intervenors have recommended that the UARB set rates based on a return on rate base versus a return on the equity portion of total capitalization. NSPI determined its 2005 revenue requirement in its Rate Application based on the methodology that the UARB has used in previous decisions. NSPI has no particular objection to moving to a return on rate base provided the definition of rate base includes all capital invested for the benefit of rate payers.
>
> In theory the two approaches should arrive at the same revenue requirement. This was confirmed by Dr. Morin and Mr. Selecky. NSPI's Rebuttal Evidence shows that by employing the return on rate base approach that Mr. Selecky has proposed, the total capitalization and rate base are identical and the revenue requirement would be unchanged. The Rebuttal Evidence also illustrates that suggestions that NSPI is earning on non-regulated assets or equity are unfounded.
>
> (NSPI, Reply to Closing Arguments, p. 26)

[157] In its 2002 rate decision, the Board stated:

> ... This Board, in prior rate decisions, has based the revenue requirement for the test year on an allowed return on equity. The Board's focus has been a return on equity, and not return on rate base. Once the rate of return on common equity is determined, it is possible to calculate the return on average rate base.
>
> (Board Decision, Oct. 23/02, P-875, p. 79)

[158] In view of the comments expressed at the hearing, the Board believes it is appropriate to approve a change to NSPI's long-standing practice in this regard and directs that NSPI use a return on rate base methodology for the next rate application. Further, NSPI should file at that time all necessary information and explanations necessary to enable the Board and intervenors to clearly understand the basis of NSPI's calculations. NSPI should also reconcile its calculations of return on rate base to calculations using the return on equity methodology. It is not necessary, nor is there sufficient evidence on this point, in the Board's view, to determine in this proceeding if NSPI is correct in its suggestion that the revenue requirement should not be impacted by this change.

[159] The Board further directs NSPI, as part of the required Compliance Filing, to recalculate the return on average rate base in Table 5 of Exhibit N-2, taking into account the adjustments made to test year revenues and expenses as a result of this decision. Following a review, the Board will issue a final Order which, among other things, will approve the rate of return on average rate base.

5.2 Capital Structure

5.2.1 Submissions - NSPI

[160] In its direct evidence, NSPI indicates that the application is based on a common equity ratio of 37.5%. It refers to the Board's 2002 decision which states that:

> The Board directs the common equity level of NSPI remain at 35 percent for rate-making purposes. The Board would indicate that it has no objection to NSPI increasing its actual equity ratio in the future to 40%. However at any future rate hearing, the Board will determine what equity ratio is appropriate for rate-making

> purposes at that time, among other things the Board will consider the level of equity in Emera.
>
> Emera has a target capital structure common equity component of 40 – 45 percent. Emera Inc. expects to be at the low end of that range in 2005.
>
> (Exhibit N-1, p. 68)

In its closing argument, NSPI confirms that Emera's target capital structure for common equity is 40% to 45%, and that it expects to be at the low end of that range in 2005. It also states:

> There are several issues on which the ROE witnesses in this hearing agreed:
>
> - NSPI's requested common equity of 37.5% is reasonable considering the actions taken by bond rating agencies after the last decision.
>
> (NSPI, Closing Argument, p. 8)

5.2.2 Submissions - Intervenors

[161] SEB does not object to NSPI's contention that it should have a common equity component of 37.5%. In its closing submission, SEB states:

> SEB does not take issue with NSPI's position that it should have a deemed regulatory capital structure including 37.5% common equity, as long as this is actually supported by the common equity in the regulated business. However, as described in more detail below, SEB believes this increase in NSPI's common equity weighting must be considered in reviewing NSPI's risk profile for the purpose of determining an appropriate return on equity.
>
> (SEB, Closing Submission, p. 23)

[162] Avon, in its closing submission, states:

> Increasing the allowed equity component from 35% to 37.5% without changing the return on equity ("ROE") rate results in an increase in the required revenue of approximately $7.2 million for the test year 2005. If NSPI is also permitted to increase its allowed ROE to 10.20% as sought, the increased revenue requirement is $8.1 million.
>
> It is observed that none of the intervenors or experts presented direct evidence opposing NSPI's request to increase its common equity component to 37.5%. Indeed, the consensus seems to be that it is merited to support NSPI's bond rating.
>
> The import of this increase in common equity thickness, which comes at a higher cost to ratepayers, is that it reduces the financial risk of NSPI and, all other things being equal, should reduce NSPI's appropriate return on equity.

> In its 2002 decision, the Board stated that it had no objection to NSPI increasing its equity ratio in future (above the allowed 35% for rate making purposes) however, the Board wished to consider the level of equity in Emera. As is evident from the documents on file, Emera has a target capital structure common equity component of 40-45% and Emera expects to be at the low end of that range in 2005. This would suggest that the time is appropriate to allow NSPI's common equity to increase to 37.5%, with an appropriate recognition of the correlative reduction in risk and return on equity.
>
> (Avon, Closing Submission, p. 7)

[163] The Province also supports an increase in NSPI's common equity ratio to 37.5% for ratemaking purposes. It comments:

> No evidence has been filed opposing NSPI's request for a common equity component of 37.5%. NSPI stated that steps taken to increase its actual common equity in December 2002 to approximately 37.5% assisted in maintaining its current bond ratings. Those ratings have remained constant since December 2001. The Province supports NSPI's application to have common equity increased to 37.5% for ratemaking purposes.
>
> The Province also supports continued growth toward 40% common equity in NSPI taking into account that any further increase in common equity must result in a lower return on equity. Any further increase in the common equity for ratemaking purposes would require the approval of the Board as stated in the 2002 Rate Case Decision, and any further increase in common equity should not add any increase to NSPI's revenue requirement.
>
> (Province, Closing Submission, p. 36)

[164] With respect to future increases in the common equity ratio, the Province indicated that, while it supported continued growth towards 40% common equity, any further increase in the common equity ratio must result in a lower ROE.

[165] ECANS indicates that, while it has no issues in principle with a 37.5% common equity ratio, it cannot support the proposal in view of the significant impact the increase would have on ratepayers.[22]

---

[22]ECANS, Final Brief, p. 17

5.2.3 Findings

[166] The Board has considered the evidence concerning this matter and approves the proposed increase in the common equity ratio for ratemaking purposes from 35% to 37.5%. The Board is satisfied that the strengthening of the balance sheet in this way is desirable in the current economic climate. The Board notes that the majority of intervenors appear to be in favour of the proposed increase in the common equity thickness.

[167] In its October 23, 2002 rate decision, the Board stated:

> ... The Board understands the benefits which could flow from an increase in the common equity ratio. However, the Board also accepts Mr. Rothschild's view that without a corresponding increase in the common equity ratio of NSPI's parent company, Emera, there will likely be no overall benefit accruing from an increase in the common equity level of NSPI. ...
>
> (Board Decision, Oct. 23/02, P-875, pp. 72-73)

[168] The Board continues to be of the view that this is the case. With respect to the common equity component of NSPI's parent company, Emera, the Board notes that as at December 31, 2003 Emera had a common equity ratio of 38.0%, and in NSPI's response to the Province's IR-34 (Exhibit N-27), Emera was projected to have a common equity ratio of 39.1% as at December 31, 2004, which is not expected to change significantly in 2005.

[169] On this basis, the Board approves the increase in NSPI's common equity ratio to 37.5% for ratemaking purposes.

6.0 TAXES

6.1 Section 21 Costs and Amortization

6.1.1 Submissions - NSPI

[170] As noted earlier, on June 11, 2004, the Supreme Court of Canada ("SCC") heard and dismissed an appeal by NSPI relating to deductions claimed under **s. 21** of the **Income Tax Act** between 1998 and 2002. On June 23, 2004, NSPI substantially revised its application to recover the costs it now faces as a result of the SCC decision. NSPI has requested Board approval to recover approximately $150 million in additional tax and interest expenses that have not, to date, been included in NSPI's costs which are used to calculate rates charged to customers.

[171] NSPI sets out its position as follows:

> This evidence revises the May 28, 2004 Rate Application to account for the Supreme Court of Canada decision of June 11, 2004. The Court dismissed NSPI's arguments in favour of deductions under Section 21 of the Income Tax Act. Under law, these taxes are a cost of service recoverable by the Company in rates.
>
> The Section 21 elections postponed a substantial increase in revenue required to be collected through rates between 1998 and 2002. A successful court case would have secured this original benefit to customers, as well as substantial additional benefits in subsequent years for a total benefit to customers estimated at more than a quarter of a billion dollars.
>
> The actions taken by NSPI at each step in the process were wholly reasonable and supported by expert opinion, the favourable ruling of the Tax Court of Canada, and the sheer size of the potential benefit to customers. At all times, the Company took steps to minimize costs to customers.
>
> The Supreme Court of Canada decision has the unfortunate effect of further increasing tax costs.
>
> The Court's ruling cannot be appealed. Therefore, the principal and interest that the Company deposited with the CRA must now be recovered in rates.
>
> In light of the decision of the SCC and the foregoing evidence, NSPI seeks an order from the Board:
>
> a. Amortizing the Section 21 deferral over a seven-year period beginning in 2005, and

> b. Providing for the recovery of these amortized costs through the customer rates described in this revision to the original Rate Application.
>
> (Exhibit N-3, Appendix O, p. 32)

[172] NSPI proposes to expense the $150 million by amortizing $21.4 million per year for the years 2005 through 2011.[23] The revised 2005 revenue requirement is $1,072.9 million, $32.7 million more than in the original application. The $32.7 million is as a result of the **s. 21** decision and related tax impacts. Since below-the-line ("BTL") rates are based principally on fuel costs rather than tax costs, these customers are impacted by an additional $1.8 million. Above-the-line ("ATL") customers, whose rates are based on a broader range of expenses, face a revenue requirement increase of $30.9 million which moves the average increase in rates for ATL customers from 8.6% in the May, 2004 filing to 12.4% in the June, 2004 revised filing.[24]

[173] NSPI takes the position that tax costs and related expenses are legitimately recoverable utility costs which are, for the most part, beyond its control. It suggests that there is no question that its increased costs as a result of the SCC decision should be included in the Company's revenue requirement and be passed on to customers through rates. The only issue NSPI believes is left to be determined is the appropriate length of time over which these costs will be recovered.

[174] The principal issues raised by intervenors relate to NSPI's decision to pay 50% rather than 100% of the tax costs during the initial stage of the appeal process and

[23] Appendix O, p. 10

[24] Appendix O, p. 12

the appropriate amortization period and methodology to be used. With respect to the timing issue, the balance of the outstanding tax cost was paid by NSPI following the unfavourable ruling by the Federal Court of Appeal on January 24, 2003.[25]

[175] Along with Gordon Lawlor, Director of Finance at Emera (who also oversees taxation at NSPI) and Ron Smith, former Senior Vice President and Chief Financial Officer for Emera, Richard Daw, a partner with Deloitte Touche in St. John's, Newfoundland, appeared on NSPI's tax panel at the rate hearing. Mr. Daw described his work for NSPI as follows:

> We were engaged to do three things. One, to look at the provision which was in the December 31st, 2005 financial projections for the purposes of this hearing. Second, we were to review the aspects and their behaviour towards the Section 21 case, and particular to look at whether it was reasonable that they paid the taxes and interest when they paid it. And third, we were to look at the management of their tax function in general to comment on it. And then we were asked to attend and prepare for the Tax Technical Conference, and finally to appear here.
>
> (Transcript, Nov 25/04, p. 1860)

[176] In Mr. Daw's direct evidence, filed prior to the SCC's decision, he outlined the procedures followed in assessing the **s. 21** tax issue:

> As part of a review of its tax position in 1998, Nova Scotia Power amended its 1992 income tax return by increasing, by over $900 million, the capital cost on assets acquired from Nova Scotia Power Corporation. This represented interest incurred by the crown corporation on assets it constructed. Capitalizing the interest is pursuant to Section 21 of the Income Tax Act.
>
> This permitted Nova Scotia Power Inc. to claim additional tax depreciation (capital cost allowance) on this interest which ultimately resulted in taxable income being lower than accounting income. Since the Company pays tax on a cash basis, these claims for additional tax depreciation reduced the income tax provision substantially below the statutory rate.
>
> This position was challenged by CRA which reassessed the Company's tax returns to disallow the claims for additional tax depreciation. The Company successfully appealed these reassessments to the Tax Court of Canada, but that decision was overturned by the Federal Court of Appeal. The Supreme Court of Canada has granted leave to appeal, with submissions expected in June 2004.

---

[25] Exhibit N-6, Appendix O, p. 5

> Nova Scotia Power has adjusted its 2003 income tax return and projected its 2004 and 2005 income tax provisions as though the Federal Court of Appeal decision was upheld by the Supreme Court of Canada. In other words, the carry-forward balances at December 2002 have been reduced by the interest that had been capitalized.
>
> It is our considered opinion that this is a reasonable approach to forecasting the Company's 2005 income tax provision.
>
> As a large corporation, Nova Scotia Power is required to pay one-half of income tax assessments that are being disputed. Given the unfavourable ruling of the Federal Court of Appeal, the Company decided to pay all the income taxes reassessed in this matter to date - $49 million. As well, the Company calculated the balance of related reassessments, in advance of such reassessments being issued, up to the December 2002 year. This estimate has also been paid - $108 million. This total of $157 million, minus various tax credits and adjustments of $13 million, is now recorded as deferred expense on the balance sheet.
>
> These payments were made to limit the amount of high rate non-deductible interest charged by the CRA on unpaid amounts in the event of an unfavourable ruling by the Supreme Court of Canada.
>
> If the Supreme Court of Canada overturns the Federal Court of Appeal decision, Nova Scotia Power will recover all of its funds.
>
> We have reviewed the Company's working papers and rationale and believe that Nova Scotia Power Inc. made a reasonable decision to pay these amounts.
>
> (Exhibit N-2, Appendix B, pp. 5-6)

[177] In the addition to Mr. Daw's evidence, which is dated June 18, 2004, he stated:

> On June 11, 2004, the Supreme Court of Canada dismissed Nova Scotia Power's appeal from the Federal Court of Appeal decision to disallow the Company's claims for extra capital cost allowance pursuant to Section 21 of the Income Tax Act (Canada).
>
> Since the Company's 2005 forecasted income tax provision was already prepared as though the Federal Court of Appeal decision was upheld by the Supreme Court of Canada, it is still our opinion that the tax provision has been properly calculated and that it was reasonable to calculate the provision on that basis.
>
> We continue to believe that Nova Scotia Power made a reasonable decision to pay all the income taxes reassessed in the Section 21 Income Tax Case to date, in addition to all the estimated taxes in advance of reassessments being issued. We understand that the Company has amended its application to request rate adjustments to recover these paid amounts over a period of seven years. These amounts would be in addition to the tax provisions originally calculated.
>
> We continue to believe that the management of Nova Scotia Power has been prudent in managing its income tax expense.
>
> (Exhibit N-2, Appendix B, Addition, p. 1)

[178] In his opening statement at the hearing, Mr. Lawlor said:

> ... Our Section 21 strategy has been accepted -- either explicitly or implicitly -- as being in the overall best interest of customers. We feel there are just a few key issues raised in the intervenor evidence that will require the Board's consideration. The length of the amortization of the Section 21 costs is an issue. The Board must strike a balance between minimizing the effect of the recovery through rates, while ensuring the customers who benefitted from the deductions are largely the same customers to share the cost. One intervenor argues that NSPI should not recover all of the twenty million in interest expense associated with the Section 21 deductions. This position requires a special type of hindsight about the case and ignores the fact that preemptively remitting funds to the Canada Revenue Agency would cause the company to incur significant costs that could not be recovered. For the reasons we have put forth in our evidence, we believe we have clearly demonstrated that we acted responsibly, promptly and in the best interests of customers in scheduling our payments to avoid unnecessary expense. Another question was raised about whether the Section 21 case should somehow be used as a reason to reduce our rate of return -- retroactively. In our view, this would be wrong. The actions the company undertook with regard to Section 21 were conducted 'in the light of day' with the support from the Province. These are the main material questions raised. Otherwise, the dramatic increase in tax expense and need to reflect these costs in rates remains very much the elephant in the room in this rate hearing. As detailed in our direct evidence, since 2002, when electricity rates were last reviewed by the UARB, Nova Scotia Power's overall tax bill has more than tripled to a hundred and thirteen million annually, an increase of seventy-nine million dollars ($79,000,000). This is primarily a result of higher corporate income taxes and the doubling of the grants in lieu of property taxes. To date, the company has been able to shield customers from the full impact of these taxes, but in 2005, the picture is different. In addition to these increased tax costs, the Supreme Court of Canada decision in the Section 21 case disallowed deductions used to keep rates lower between 1998 and 2002. That decision ended a seven-year effort by Nova Scotia Power in three different courts to save customers ultimately more than a quarter billion dollars in taxes. It cannot be appealed. As a result, NSPI now seeks to recover these costs through customer rates...
>
> (Transcript, Nov 25/04, pp. 1863-1865)

[179] Under questioning by the Board, Mr. Daw explained his disagreement with the suggestion that NSPI was imprudent in its manner of paying the taxes:

> Q. Thank you. Mr. Daw, in - - what do you make of the conclusions by Mr. Ewens that - - as appearing on page 11 of his report which Mr. Outhouse referred to a little earlier - - its N-61, page 11, where at the top he basically says:
>
> > "Accordingly, in my opinion, NSPI failed to act prudently by not paying the 100 percent and also not paying the total additional business when NSPI found out that the disallowances were going to be made."
>
> Do you agree with that comment?
>
> A. (Daw) No, I do not.
>
> Q. Would you explain why?

A. (Daw) When asked to determine whether they were reasonable to make the payments when they did, which was before the Supreme Court decision, which was actually just after the time the Federal Court of Appeal turned down the Tax Court decision, I had to put myself in their position at the time they made the decision using the information they had available at the time. And at the time, they had received one reassessment, had paid it, had received another, had paid 50 percent, and that was within a few months of them expecting the Tax Court of Canada decision. And up till that time they had not received any other reassessments for any other years. In January, 2002 when they received the Tax Court of Canada decision, which was favourable to them, they felt it was unnecessary to pay any more at the time, and I agree with that. Secondly, not every company pays more than the required amount of the taxes and reassessments at the time, as noticed in Newfoundland Power's case. And finally, again, you must recall that they still did not receive any other reassessments for any other years for either losses carried forward from the Section 21 depreciation claims or for the actual capital cost allowance claims in the current years as well. When the Federal Court of Appeal actually went against them, then they determined that they would pay all the taxes, not only the balance of those that had actually been reassessed, but to determine the amounts that had yet to be reassessed right up to 2002. I thought that -- if I was in those circumstances that would have been a reasonable approach to make. And from a business decision standpoint, which I checked, it appeared that it probably wouldn't have cost that much more to do it that way anyway. So I did not agree then with Mr. Ewens' assumption or assertion that they were not being prudent by not paying all the taxes in advance.

Q. So when the Federal Court went against them, that's when they paid the ---

A. (Daw) Within a very short period of that date, yes.

Q. And it's your view, then, that once they received a favourable ruling from the Tax Court that they had every expectation to -- that they were going to continue or that they had a favourable -- a reasonable expectation of getting a favourable verdict out of the next -- out of the Federal Court. And on that basis, it wasn't necessary or it ---

A. (Daw) In my ---

Q. --- was a reasonable decision, in your view, not to pay the balance.

A. (Daw) In my view it was.

Q. What about Mr. Ewens' comment that generally utilities pay the total amount owing as opposed to the 50 percent because of the unique nature of the entity?

A. (Daw) Not all entities pay more than the 50 percent. Again, look at Newfoundland Power's example. My view is that if they felt confident in the decision, if they felt confident in the case as given the advice that they'd had and given the Tax Court of Canada ruling, then it was reasonable to not pay any more than the required amount.

... and ...

Q. You used Newfoundland Hydro as an example of a situation where a regulated utility did not pay the full amount. Are there any other examples that you're aware of?

A. (Daw) The only example here that I used was actually Newfoundland Power.

Q. Newfoundland Power. Sorry. Because in Mr. Ewens' evidence it's -- he indicates that generally utilities do it a different way.

A. (Daw) It's my understanding that it was also on the basis, Madam Chair, if they felt confident in the result it wasn't always necessary to pay more than 50 percent.

(Transcript, Nov 25/04, pp. 1968-1972)

[180] In its Closing Argument, NSPI responded to allegations of imprudence in its actions with the Canadian Revenue Agency:

> ... The record shows that at every step NSPI proceeded carefully and only after considerable reflection. The cautious approach taken throughout the entire proceeding underscores NSPI's determination to act prudently.
>
> (NSPI, Closing Argument, p. 28)

[181] NSPI also responded to the suggestion of intervenors to exclude part of **s. 21** costs due to "excess earning" from 1998 to 2002:

> During cross-examination Mr. Selecky testified that he had no regulatory or accounting support for his position. NSPI asserts that his position is unprecedented and unsupportable.
>
> NSPI strongly disagrees with the recommendation of Mr. Selecky. Not only is there no precedent, but also such a recommendation would effectively cap NSPI's earnings at the low end of the ROE range. There would be no incentive to manage costs or undertake any initiatives for the benefit of ratepayers if there was any associated risk.
>
> (NSPI, Closing Argument, pp. 36-37)

[182] NSPI points out, in its Closing Argument, that extending the amortization period from seven to 10 years, using a levelized methodology as proposed by one of SEB's experts, does increase the total revenue requirement over the life of the amortization by approximately $35 million.[26]

[183] NSPI, in the SA, agreed to increase the proposed amortization period for the **s. 21** taxes from 7 years to 17 years, with a complete deferral of this expense in 2005. Under the SA, the recovery of the **s. 21** taxes would be accomplished by applying money currently in rates for amortization of defeasance and the Glace Bay generating station costs to **s. 21** taxes when those funds are no longer required. This method of amortization

[26] NSPI Closing Argument (Redacted), Dec. 13/04, p. 36

recovers the full $150 million over a period of seventeen years. The commencement year is 2005, with an amortization amount of zero, and the end year is 2021, with an amortization amount of $14.2 million.[27]

[184] In his opening statement on the SA, Mr. Tedesco remarked:

> ... Also regarding Section 21, this proposal is better for customers next year, is nearly equivalent to the original proposal on a net present value basis, and from a customer perspective, assuming the Company's rate of return, is actually better on a net present value basis. ...
>
> (Transcript, Jan 13, 2005, p. 3517)

6.1.2 Submissions - Intervenors

[185] Witnesses for SEB recommend reductions in the amount of the **s. 21** taxes that should be recovered from ratepayers. James T. Selecky of Brubaker & Associates, Inc., in his direct evidence, recommends that the **s. 21** taxes should be reduced by $20.2 million to reflect the difference between NSPI's earned ROE and the low end of its allowed return on equity from 1999 to 2002.[28] Both ECANS and Avon support Mr. Selecky's position in their closing submissions.[29]

[186] Douglas Ewens, Q.C., of McCarthy Tétrault, was also retained by SEB to provide an opinion on issues arising out of tax planning undertaken by NSPI and the resulting **s. 21** income tax litigation. In his direct evidence, Mr. Ewens states:

---

[27]Exhibit S-1, Table - **S.21** Treatment

[28]Exhibit N-68, pp. 22-25

[29]ECANS, Final Brief, p. 14
Avon, Closing Submission, pp. 42-44

Accordingly, in my opinion NSPI failed to act prudently by:

(a) having decided to pay on August 31, 2001 only 50%, rather than 100% of the tax reassessed by the Minister at the time of NSPI receiving the 2000 Reassessment and to defer payment of the remaining 50% of such tax until the time of the adverse decision of the Federal Court of Appeal; and

(b) not having also paid at the time of receiving the reassessment for its 1999 taxation year (i.e. April 26, 2001) the Additional 1999 and 2000 $40 million Tax Liability that NSPI knew it would be liable for (as described in paragraph 21 hereof) if the Attempted $995,260,716 NSPC Interest Capitalization issue were resolved against NSPI plus the portion of the Post-2000 $79 million Tax Liability that had accrued to April 26, 2001.

(Exhibit N-73, pp. 10-11)

[187] SEB, in its final argument, states that the Board should:

Disallow $20.8 million from NSPI's revenue requirement, on the basis of NSPI's imprudent decision to not pay the full amount of the Section 21 tax liability at the earliest time when it would have been entitled to pay such tax, and thus minimize or eliminate its risk of incurring non-deductible interest charges, compounding daily;

(SEB, Final Argument, p. 3)

[188] Avon made similar arguments for a disallowance based on an imprudent tax strategy:

It is respectfully submitted that this Board should disallow $21 million relating to the s. 21 strategy for reasons relating to imprudence. In the alternative, where NSPI's shareholders shared in the benefit of the tax strategy, the burden should also be shared on the used and useful principles. Furthermore, and in any event, the time period over which the tax payments should be depreciated should be set at 10 years, and levelized to lessen the rate impact.

(Avon, Closing Submission, p. 39)

[189] In his direct evidence, Mr. Selecky also recommends that the **s. 21** amortization period be extended to ten years and the annual amounts to be amortized be adjusted to produce a levelized revenue requirement over the amortization period.[30]

[190] A comparison of the NSPI seven year amortization period and Mr. Selecky's ten year levelized amortization period is shown below:

[30]Exhibit N-68, pp. 20-22

S. 21 AMORTIZATION PERIODS

Year	NSPI		J.T. SELECKY	
	Amortization	Revenue Requirement	Amortization	Revenue Requirement
1	$21.43	$48.81	$10.60	$32.54
2	$21.43	$46.43	$11.40	$32.56
3	$21.43	$44.06	$12.25	$32.59
4	$21.43	$41.69	$13.17	$32.61
5	$21.43	$39.31	$14.16	$32.63
6	$21.43	$36.94	$15.22	$32.66
7	$21.43	$34.56	$16.36	$32.69
8			$17.59	$32.72
9			$18.91	$32.75
10			$20.33	$32.79
TOTALS	$150.00	$291.80	$150.00	$326.54

(Summary of data from Exhibit N-68, Ex. JTS-2, page 1 of 2 and Ex. JTS-3)

[191] Avon supports the ten year levelized amortization period in its closing submission, as does ECANS.

[192] Board Counsel's witnesses on this issue were J. Patrick O'Neil, FCA, CMC, and Elaine Sibson, FCA, senior partners with PricewaterhouseCoopers ("PwC"). Ms. Sibson's direct evidence as to whether these tax costs should be included in the test year revenue states:

> The only amounts in question in this area relate to the non-deductible interest and the question of whether or not NSPI acted prudently with respect to the reassessment and the payment of the assessed taxes.
>
> This is clearly a matter of judgment. Assuming advice was given by other professional firms that the matter had a likelihood of succeeding, we are not in a position, at this time, to question their professional opinions.
>
> (Exhibit N-131, p. 14)

[193] Ms. Sibson elaborated on this question in her evidence at the hearing. In response to questions from the Board she states:

> Q. And do you have any opinion as to whether or not they acted prudently or imprudently? I know you did refer to this in your opening statement this morning, but I'd just like to discuss it with you.
>
> A. (Sibson) If you can bear with me for just one minute, I'll try to explain how I saw the sequence of events yesterday in terms of Mr. Daw and Mr. Ewens. For the last four years, I've served on the Executive of the Canadian Tax Foundation and in last year as Chair. And in that capacity -- the Canadian Tax Foundation is the body that represents all tax lawyers and all tax accountants in Canada. So in that capacity, I've had the ability to deal with both sides of the profession, and basically they look at things differently. A tax accountant will come at it from the point of view of a business decision first and foremost, where a tax lawyer will come at it from the point of view of matters of law and what is right and what is wrong. So in Mr. Daw's situation, he was looking at the sequence of events and the timing, and he was saying, you know, "Should you prepay tax when it's not assessed yet, considering the fact you don't get any interest on that money if it's prepaid and the decision is turned around." So from a business point of view, you probably would not necessarily pay it. On the other side, Mr. Ewens would look at it from the point of view were they right or wrong in the first instance in trying to claim the Section 21 almost billion dollars worth of write-offs. And he would look at the opinions of the other tax lawyers, and in my experience as well, they quite often differ in their opinions of whether they're going to be successful or not in the Tax Court. Me, as an accountant looking at the situation, and were they prudent, you'd also have to take into account the fact that it's a utility and you have to be much more prudent in a utility than you would be in a normal business decision. So I don't have the experience that Mr. Daw and Mr. Ewens have in dealing with utilities, although speaking with our Winnipeg partner who does have considerable experience, his position was that they should have at least paid the assessed taxes. But I think this is why you're getting conflicts of interest a little bit in what's prudent and what's not prudent.
>
> Q. So you don't have any view, in other words, as to whether or not they were prudent or imprudent.
>
> A. (Sibson) I guess my personal view would have been to pay the assessed taxes. From a business point of view, whether you pay the additional taxes or not, that's really a business decision based on all the factors that take place in the organization, the cost of capital, the borrowing cost and ---
>
> Q. So that's a judgement call, in your view.
>
> A. (Sibson) A judgement call. And the reason I didn't get into it significantly was because looking at it again as an accountant, the amount is not material relative to some of the other more significant items that I saw and put in my report.
>
> (Transcript, Nov. 26/04, pp. 2077-2080)

[194] In its Final Argument, SEB characterized the evidence of Ms. Sibson and Mr. Daw as follows:

> With the greatest respect to both Mr. Daw and Ms. Sibson, who commented on this issue under cross examination by Commissioner Morash, neither appeared to have addressed the actual issue at hand. The decision whether or not to prepay the tax is a

> business decision, but it is a business decision based on the perceived chances of success as determined by an assessment of the strength of one's legal case. In a utility setting, particularly where the utility intends to seek recovery of its interest costs in the event it is unsuccessful, the burden is greater than in a non-utility situation. It is not simply a question of whether a reasonable person in an unregulated business might or might not make a different business decision regarding the payment of taxes. It is a question of whether the utility fully considered the impact on its ratepayers, and acted appropriately. ...
>
> (SEB, Final Argument, p. 35)

6.1.3 Findings

[195] After a review of the evidence in this matter, the Board is not convinced that NSPI acted imprudently in its method of payment of the **s. 21** taxes. There is no question that, generally, taxes are a reasonable cost which utilities are expected to recover. **Section 21** taxes also fall into this category. The Board has also noted the calculations set out in Undertaking U-31 which reflects the cost differences between Mr. Ewen's suggested approach and the one chosen by NSPI. The amount differs depending on a number of factors, including the interest rate used, but the range is between $800,000 and $3.7 million.

[196] While Mr. Ewen's testimony is persuasive, the Board finds that there is not sufficient evidence to convince it that NSPI's handling of this matter was imprudent. There is some suggestion that a higher standard prevails in the case of a utility and Ms. Sibson made a comment along these lines, based on a discussion with her colleague in Winnipeg who has expertise in utility regulation. However, that individual was not at the hearing nor is there specific information on this subject. Accordingly, the Board is unable to conclude that the amount of **s. 21** taxes to be recovered should be reduced as recommended either by Mr. Ewens or Mr. Selecky.

[197] There was much discussion during the hearing on the amortization period which should be used for the **s. 21** tax costs and whether or not the amortization should be adjusted to produce a levelized revenue requirement. One of the principal factors to consider when determining how long a period of time is appropriate is that of intergenerational equity. This is a regulatory term which refers to the need to ensure fairness to customers over periods of time. Recovery of costs should be timed, to the extent reasonable, to ensure that customers who derive a benefit from an action by the utility are the same customers who eventually pay the costs associated with that activity.

[198] During his testimony at the SA hearing, Dr. Stutz answered questions from the Board on both these issues:

> Q. ... Mr. Selecky with respect to the Section 21 tax costs has suggested that they be amortized for 10 years rather than the company's suggested 7, and that the cost each of those years would be flat not increasing or decreasing. And the company has suggested 7 and talked about concerns about intergenerational inequity or the fact, I guess, that you ought to time the recovery of these things so that the people who got the benefit of them not being paid are also the people who end up having to pay for it. Do you have any concerns with respect to the 10-year suggestion as opposed to seven?
>
> A. I think it's within the realm of judgment. If Mr. Selecky had proposed 20 years I might have had a different answer, but intergenerational equity is a very important but vague concern, and I think a couple of years on either side of what the company has proposed would be well within the kind of judgment that the Board might exercise. To me personally the most interesting part of what Mr. Selecky had to say was the idea of amortizing things in a flat fashion. I must admit I must have been asleep at the switch but I didn't quite think about the return, I just thought about the amortization, and so the company's dividing it and recovering it in what looks like a flat fashion. I must have just been asleep as I say because I didn't think about the return, when you put the return in, you do get a declining recovery. Mr. Selecky's proposal operates more like a mortgage. So whether you choose 7 or 10, a matter for your judgment, I would make it flat in the way Mr. Selecky did.
>
> (Transcript, Dec. 3/04, pp. 3449-3450)

[199] The Board is mindful that an appropriate balance needs to be achieved in easing the impact of this increase in costs on ratepayers without extending the recovery period for such a long period of time that intergenerational equity is overly compromised.

The issue of determining appropriate amortization periods is not a precedent for the Board. The retirement of the Glace Bay generating station raised similar issues. The Board must balance what is a reasonable and fair amortization period with the interests of ratepayers and the avoidance of rate shock. In this case, the Board notes that Dr. Stutz has suggested that a 10 year amortization period, under these circumstances, would comply with the principle of intergenerational equity. In order to avoid a higher than acceptable rate increase the Board also believes that deferral of the recovery period is warranted.

[200] After considerable reflection, the Board finds that amortization of the **s. 21** taxes should be deferred for two years (2005 and 2006) and, commencing in 2007, amortization over an 8 year period should occur. The Board is satisfied that this approach is reasonable for ratepayers and NSPI, and complies with the regulatory principle of intergenerational equity. In addition, the Board agrees with Mr. Selecky's method of amortization in that a levelized revenue requirement over the 8 year period is appropriate. This approach will eliminate the $21.4 million amortization in the 2005 test year which, according to NSPI's evidence, will result in an actual reduction in NSPI's 2005 revenue requirement of approximately $32.7 million. The Board directs NSPI to include this reduction in its Compliance Filing.

7.0 OPERATING, MAINTENANCE AND GENERAL EXPENSES (OM&G)

7.1 Pension Expense

7.1.1 Submissions - NSPI

[201] In its pre-filed evidence, NSPI projected that its OM&G costs in the test year are essentially the same as they were in 2002, with the exception of pension costs. It stated:

> ... With the exception of pension expense increases, the Company's overall OM&G costs are essentially unchanged since 2002C. This has been achieved despite rising demands for power, more customers, and a projected rise in the consumer price index over this period of 6.8 percent
>
> (Exhibit N-1, p. 5)

[202] The projected pension expense for the test year of 2005 is $26 million, an increase of $19 million from the $7 million pension cost in 2002. NSPI explained the increase as follows:

> The increase reflects a general trend over the past few years that has been a major issue among many companies that sponsor defined benefit pension plans.
>
> NSPI's pension expense has increased since the last Rate Application as a result of the following:
>
> 1. Changes in actuarial assumptions as a result of ongoing review. In particular, the asset return assumption was recently changed to 7.5 percent in 2003 from 8.0 percent in 2002. The updated assumption better reflects the current economic environment, and is supported by the fact that it is the median assumption used by Canadian companies. Assumptions about retirement age have also been changed from 60.5 to 59, which better reflects our actual experience.
> 2. A decrease in the discount rate used to determine the present value of liabilities in the pension plan and the current service cost for each period. The discount rate is based on the yield on long-term corporate bonds. With the decline in bond yields the discount rate has fallen, increasing the current service cost portion of pension expense. ...
>
> (Exhibit N-1, pp. 53-54)

[203] NSPI reiterated the reason for the change in pension costs in its closing submission:

> **…** Almost all of the change (See SEB IR - 282) relates to changing actuarial assumptions for the discount rate and the asset return assumptions. These changes are the result of changes in the market and are outside the control of management.
>
> (NSPI, Closing Argument, p. 41)

[204] NSPI's projected pension expense is based on a discount rate of 5.75%, and a rate of return on assets of 7.50%. Greg Blunden, NSPI's General Manager of Finance, explained, in response to questions from David MacDougall, Counsel for SEB, that the actual discount rate would be not identified until early 2005:

> Q. I think -- Mr. Blunden, let's see if we can do it this way. And I don't know that I have the IR responses in front of me, so I apologize for that, because I didn't expect the answer the way you said it, but let me try and go through the questions and we'll see if we can deal with it this way. You will at the end of the year pick a discount rate. Correct
>
> A. (Blunden) That is correct, although it would most likely be early in January just for clarification purposes, yes.
>
> Q. Sure. Early in January. It's done after December 31?
>
> A. (Blunden) That would be correct.
>
> Q. But for the purposes of applying for rates you have to make an estimate of that, because you're putting a discount rate in your rates that will be different than the discount rate that will actually go into effect at the time you choose it because this rate hearing will have finished and you've made your forecast?
>
> A. (Blunden) Yes, that would be correct. We will not know the actual discount rate until early in January.
>
> (Transcript, Nov 26/04, pp. 2130-2131)

[205] During the hearing, NSPI's finance panel, including Zeda Redden, Treasurer for both NSPI and Emera, along with Mr. Blunden, outlined NSPI's position with regard to the increase in pension costs and indicated that NSPI uses the firm of Morneau Sobeco

as pension advisors. Paul Chang, a representative of that company, attended one of the technical conferences leading up to the rate hearing.[31]

[206] Mr. Blunden, responding to Counsel for SEB, made the following comments on the linkage between pension costs and discount rates and whether there is flexibility in discount rates:

> Q. And there is some flexibility around choosing discount rates?
>
> A. (Blunden) I would suggest there's very little sensitivity. We have a track record of picking bonds of a certain duration to tie into our pension liabilities. Our actuary will come at the end of the year or early in January and show us what those bond yields are. It is subject to an actuarial opinion, it is subject to review by our audit committee, it is subject to review by our auditors. Of all of the assumptions that we would make on a day-to-day basis from a management perspective, I would suggest that's one of the ones that we have the least amount of variability on.
>
> Q. Well, I guess I'll stick with that a bit, though, because at the technical conference I believe Mr. Chang said that there would be a range, he would look at numbers within a range, there wouldn't be a set number, and I believe again Mr. O'Neil stated a range and I believe in all the materials, even the IR response that we just referenced, there is a range. So, there's certainly flexibility of up to 50 basis points on which your actuary, I'm certain, said, you know, he was not driven by a specific number but would look within a reasonable range.
>
> A. (Blunden) I would expect the ranges that people -- that you're seeing are probably more related to -- when you compare it to comparable companies, are more related to the profile of their obligations as opposed to any discretion. Again, I would disagree that we have any discretion on that. Where we do have a little more discretion is around our expected return on plant assets.
>
> Q. So, you're saying there's no flexibility from the actuary's point of view on your discount rate?
>
> A. (Blunden) I would suggest that we have very minimal.
>
> Q. Were you at the finance technical conference?
>
> A. (Blunden) I was.
>
> Q. Was that your recollection of what Mr. Chang said at the finance technical conference?
>
> A. (Blunden) Yes, it was.
>
> (Transcript, Nov. 26/04, pp. 2128-2129)

[207] In the SA, NSPI agreed to reduce its pension expense by increasing the discount rate from 5.75% to 6.0%. While Exhibit S-1 does not explicitly state the reduction

---

[31] Transcript, Nov. 26/04, p. 2120

in pension expense which would occur due to the increase in the discount rate from 5.75% to 6.00%, NSPI, in an earlier response to SEB IR-233 (Exhibit N-28), stated that a change in the discount rate from 5.75% to 6.00% would reduce the pension expense by $2.7 million.

[208] Under questioning by Counsel for Avon during the SA portion of the hearing, Mr. Tedesco made the following comment:

> Q. Mr. Tedesco, in your opening statement, Exhibit S-9, you state at the bottom of the second page of the exhibit:
>
> > "Moreover, we now know that our actual pension expense will be higher than the amount in the Settlement Proposal."
>
> In the Settlement Proposal, you have indicated that there would be a five million dollar reduction in the pension expense. What is your estimate now as to what your actual reduction in expenses would be?
>
> A. I want to make clear we are not changing our Settlement proposal....However, it is, I think, important to recognize that based on the feedback we have very recently received from our actuaries, we had actually hoped that we would be able to reduce our pension costs by about $2.7 million dollars because of a change in interest rates of about a quarter percent. The actuary is essentially saying to us, "no." So in effect, under the terms of this settlement, our costs - - our costs, not our customer's costs - - Nova Scotia Power's costs have increased $2.7 million dollars.
>
> (Transcript, Jan 13/05, pp. 3545-3546)

7.1.2 Submissions - Intervenors

[209] Mr. Selecky, on behalf of SEB, also provided evidence concerning pension expense costs. He states in his direct evidence that NSPI's projected pension expense for 2005 is overstated. According to Mr. Selecky:

> ... NSPI's pension expense is overstated based on current market conditions. Specifically, the discount rates utilized to calculate the present value of the pension liability and the asset return assumption are understated. These rates do not reflect current market conditions. The use of a more current discount rate and asset return assumption reduces NSPI's pension liability.
>
> (Exhibit N-68, p. 4)

[210] Mr. Selecky's view is that the discount rate used by NSPI should be 6.25%, rather than the 5.75% which has been projected. As support for this contention, Mr. Selecky states:

> As previously indicated, the discount rate used to calculate the pension expense is 5.75%. In response to SEB IR-298(a), NSPI indicated that the appropriate discount rate to determine the present value of pension liabilities for accounting purposes is currently 6.25%. In response to that data response, NSPI stated the following:
>
> > If NSPI were to measure the accrued benefit obligation as at August 31, 2004, the discount rate would be 6.25%. The actual discount rate that will be used to determine the December 31, 2004 accrued benefit obligation and 2005 expense will be based on the December 31, 2004 AA bond yields – this rate will not be known until early January 2005. Recent history has seen discount rates move as much as 50 points within one to two month periods. As such, a best estimate today for December 31, 2004 would see a midpoint rate of 6.25% in a range of 5.75% to 6.75%.
>
> (Exhibit N-68, p. 5)

[211] Mr. Selecky states that, in view of this, a discount rate of 6.25% should be used to calculate the pension liabilities. He added:

> ...the discount rate to calculate the actual 2005 pension expense will be based on the AA bond yields as of December 31, 2004. The actual bond yields today provide a better estimate of the 2004 year-end bond yields than the yields that were estimated in February 2004.
>
> (Exhibit N-68, p. 6)

[212] Mr. Selecky also indicated that increasing the discount rate from 5.75% to 6.25% would reduce the projected pension expense by $5.4 million.

[213] With respect to the rate of return on assets, Mr. Selecky states that ..."the asset return assumption should also be increased to reflect the current and projected higher yield on long-term bonds." He recommends that ..."the asset return assumption be

increased from 7.5% to 8.0%. This increase reflects the increase in asset return of 50 basis points since the pension fund assumptions were developed."[32]

[214] The increase in the asset return assumption will reduce the pension expense by approximately $2.4 million, according to Mr. Selecky. As a result, the impact of increasing the discount rate, and increasing the asset return rate, will be to lower the pension expense by $7.8 million.

[215] Avon supported the position of Mr. Selecky in its closing submission, stating:

> We respectfully submit that the Board should rely on Mr. Selecky's approach to the calculation of discount rate, asset return assumption and, ultimately, NSPI's pension expense. NSPI's proposed pension expense for 2005 of $26 million is overstated. NSPI's proposed pension expense should be revised to reflect the appropriate discount rate and asset return assumption. The impact of increasing the discount rate and the asset return assumption by 50 basis points, as per Mr. Selecky's analysis, reduces the pension expense, and hence NSPI's revenue requirement, by $7.8M.
>
> (Avon, Closing Submission, p. 38)

[216] Ms. Sibson and Mr. O'Neil also gave evidence concerning the pension issue. In their direct evidence, they state that the proposed discount rate of 5.75 % put forward by NSPI is reasonable:

> The discount rate used to determine the present value of liabilities in the pension plan ...has decreased from 6.50% in 2002 (6.75% per the 2002 rate case) to 5.75% in the 2005 test year. This 2005 assumption was based on the interest rate on high quality bonds in the first quarter of 2004. The discount rate applicable to NSPI's 2005 pension expense will be determined at the measurement date used for 2004 (December 31),thus the appropriate discount rate will be in reference to market interest rates on high quality AA bonds (namely corporate bonds) as at December 31, 2004. As this date has yet to arrive, the best estimate assumption based on current interest rates on high quality bonds would be in the range of 5.5% to 6.0%...Thus, the discount rate used of 5.75% for the rate case would be considered reasonable.
>
> (Exhibit N-130, p. 3)

[217] With respect to the rate of return on assets, they state that:

---

[32]Exhibit N-68, pp. 6-7

> ... an asset return assumption of 7.5% is, in our opinion, likely at the high end of the current range of 6.5% - 7.5% for the 2005 rate case.
>
> (Exhibit N-130, p. 2)

In response to questions from the Board, Mr. O'Neil stated that:

> Q. Yes. So in your statement on page 9 -- or I'm sorry, line 9 on page 5: "The rate of return assumption is at the high end of the range, but reducing it would result in a higher expense and ultimately a higher rate increase." You're not necessarily -- or are you indicating that that's a reason why you agree that no adjustment is required?
>
> A. (O'Neil) No. We're in agreement with the rates because they're within an acceptable range. We're not directing that it should be higher or lower. It's within that range, and these are two important estimates in the whole calculation. But the whole calculation of pension expense has a number of other major factors that impact the total.
>
> (Transcript, Nov. 26/04, pp. 2085-2086)

[218] ECANS argues, in its final brief, that NSPI's pension expense be reduced by $5.4 million by increasing the discount rate to 6.25%.[33] MEUNSC, on the other hand, suggests using the actual rate once it becomes known. It states:

> The discount rate NSP used to determine the expense included in their $101.0 million additional revenue requirement request was 5.75%. Hearing estimates have placed this rate somewhat closer to 6.0%. Evidence indicated that the rate could move up to 50 basis points in a month.
>
> > "If NSPI were to measure the accrued benefit obligation at August 31, 2004, the discount rate would be 6.25 percent. <u>The actual discount rate that will be used to determine the December 24, 2004 accrued benefit obligation and 2005 expense will be based on December 31, 2004 Double 'A' Bond Yields</u>. This rate will not be known until early January 2005".
> > (Emphasis added).
> > (Blunden, transcript, pages 2120-2121).
>
> The "known" rate will no doubt be available to The Board prior to its final decision. We would urge that this is the rate which should be used to calculate the additional revenue approved for this case. Current estimates are that this rate could be 5.75-6.75%. If only the mid-point of this range is achieved a reduction of $5.4 million, in the revenue requirement is warranted.
>
> (MEUNSC, Final Brief, p. 9, emphasis in original)

---

[33] ECANS, Final Brief, p. 18

7.1.3 Findings

[219] The Board notes that NSPI, in its closing submission, addresses the issue of pension costs and takes issue with Mr. Selecky's qualifications on this subject. NSPI states that:

> Pension expense is a technical and complex issue. NSPI uses Morneau Sobeco (actuary) and Grant Thornton (external auditors) to assist with and review the Company's accounting treatment. Both firms are also required to express an annual opinion on NSPI's actuarial assumptions.
>
> Ms. Sibson, along with Mr. O'Neil of PWC have filed evidence on behalf of the Board staff. Both Board witnesses are Chartered Accountants with significant experience. They recommend a discount rate of 5.5%-6%. NSPI has used 5.75% in its rate application – the exact midpoint. Secondly they suggest asset return assumptions should be in the range 6.5%-7.5%. NSPI has used 7.5%, the high end of the range. A lower pension return assumption would increase pension expense and hence the revenue requirement, would increase.
>
> Mr. Selecky (SEB) has also offered recommendations related to discount rates (6.25% representing the August 31 rate) and asset return assumptions (8.0%). Mr. Selecky is neither an actuary nor an accountant and he acknowledges he has no experience with Canadian accounting rules. He is completely unqualified to express the opinions he has. Both of his assumptions fall outside the ranges deemed reasonable by Ms. Sibson and Mr. O'Neil.
>
> Accordingly, NSPI submits that the pension assumptions used by the Company in this application are reasonable for determining the 2005 revenue requirement and that there is no acceptable evidence that should lead the Board to any other conclusion.
>
> (NSPI, Closing Argument, pp. 41-42)

[220] After considering the evidence, the Board is not persuaded that there should be any adjustment to the projected pension expense originally set out in the 2005 test year expenses. The Board understands and shares the concerns of the intervenors with respect to this significant increase in costs. The range of discount rates and asset return assumptions which were discussed reflected a valid desire to address costs where parties believed NSPI had reasonable flexibility to do so.

[221] However, as MEUNSC points out, the Board is now making its decision at a time when the actual discount rate is known. During the SA portion of the hearing, it was

clear that NSPI's estimate of 5.75% for the discount rate turned out to be correct. In addition, the evidence of Mr. O'Neil clearly indicates that NSPI used reasonable assumptions to calculate its pension costs and that its asset return assumption is not unreasonable. Accordingly, the Board makes no adjustment to the $26 million in pension expenses in NSPI's OM&G for 2005.

7.2 Miscellaneous Charges and Regulatory Changes

7.2.1 Submissions - NSPI

[222] NSPI is proposing substantial (in some cases 100%) increases in the costs of many of its miscellaneous charges. It is also proposing language amendments to certain of its Regulations concerning such items as connection and disconnection charges, wiring inspections and load research, and the introduction of a new charge for registered letters notifying customers of disconnection. According to NSPI, increases are necessary to reflect the actual cost of providing these services. NSPI indicates that:

> NSPI provides a variety of services to customers as part of its obligation to provide low-cost reliable electricity to Nova Scotians. Charges for these services are set out in Section Seven (Schedule of Charges) of the Regulations. They encompass many charges that have been in effect since 1996. Periodically, the Company reviews these charges in light of changes in service delivery, cost structures and technological advances.
>
> The most recent review of these charges suggests that they need to be adjusted. The proposed rates for the various services are attached in table format in Appendix N. With each proposed change are the key assumptions, calculation details and benchmarking data (where available) showing comparable charges for services provided by other utilities.
>
> The methodology for calculating these charges is based on recovering the fully allocated cost of each service. Labour costs and fringe benefit rates are based on expected costs in 2005. The overhead applied for Administration (84 percent) and Vehicles (23 percent) are consistent with those used in the Company's 2004 Annual Capital Expenditure Plan filed with the UARB. Cost mark-ups are based on those currently included in the approved regulations (example 7.3 (b) = 25 percent) or 10 percent where no rate is specified. Labour efficiencies and technological changes have been factored into the cost analysis where Company foresees them.

> The aggregate impact of these proposed changes is to increase the Company's revenue by approximately $2.4 million. This additional revenue in turn reduces the overall revenue requirement from above-the-line customers.
>
> (Exhibit N-1, p.109)

[223] NSPI's rates panel at the hearing consisted of Nancy Tower, General Manager of Customer Service; Mel Whalen, Director of Regulatory Affairs and Rates; Bob Boutilier, Industrial Market Leader; and Eric Ferguson, Manager of Regulatory Affairs. Under cross-examination by DLAS, Ms. Tower confirmed the manner in which NSPI arrived at the costs involved in determining certain miscellaneous charges:

Q. Great. Thank you. So 109 states that: "The methodology for calculating these charges is based on recovering the fully- allocated costs of each service." Do you see that?

A. (Tower) I do see that.

Q. Thank you. Now looking at the right-hand column back in Appendix "N", it appears that the first step in calculating the costs caused by a customer requiring a door knob notice is to take the hours of time a Customer Service Field Representative spends in the activity and multiplying it by the labour rate. Do I see that correctly?

A. (Tower) That's right. It would include -- it would include direct charges and also some charges like training, etc., that would be included in their yearly activity.

Q. So here with the door knob notice, you multiplied .42 hours times the labour cost of twenty-one dollars, forty-six cents ($21.46). It gives you about nine dollars and eight cents ($9.08), I believe. Yes.

A. (Tower) Yes.

Q. Yeah, okay. Now, to this you add an administrative and vehicle overhead of 84 percent and 23 percent respectively. Is that correct?

A. (Tower) That is correct.

Q. And in looking through Appendix "N", I see the figure is 84 percent for administrative and 23 percent for vehicle overhead. They appear consistently. So I conclude that these are standard overhead rates. Is that correct?

A. (Tower) They are. They would be rates that we would use and would have filed with the Board.

Q. Okay. Now, from my understanding once again, the administrative overhead includes costs such as office space, heating, supervision and similar costs. Is that correct?

A. (Tower) Administrative overhead would be a non -- yes, labour, rent, software, those sorts of charges.

Q. Okay. So these are basic overhead charges that the company incurs irrespective of this specific activity, and you allocate a portion of these total overhead costs to each activity. Is that right?

A. (Whalen) That is correct.

Q. Now, then you add, I notice, a 10-percent mark-up. Do you see that as well? There's a 10-percent mark-up that seems to appear consistently with door knob notices and registered letters. Can you explain what that mark-up is and what regulation allows you to use this 10-percent mark-up?

A. (Tower) The 10 percent would actually be a profit margin consistent with our rate-of-return methodology.

Q. Okay. Was there a specific regulation that allows you to use that 10-percent mark-up?

A. (Tower) Again, it's consistent with the cost-of- service methodology that we would use, and including a rate of return -- including a portion of a rate of return in that is consistent with a fully-allocated cost methodology.

(Transcript, Dec. 1/04, pp. 2905-2907)

[224] In the SA, NSPI agreed with Dr. Stutz's recommendation that there be a 50% cap on increases to miscellaneous charges.

[225] NSPI has also proposed amending the availability clause in the time-of-day rate for domestic customers. In Exhibit N-40, NSPI filed a copy of an evaluation report on Domestic Service Time-of-Day availability which had previously been requested by the Board. NSPI advised that:

> As explained in the report, the market for ETS units and other load shifting technologies has now reached the point where it is no longer appropriate for NSPI to be the only supplier. In addition, we believe that the rate should be open to new systems that can effectively be used to shift load. Consistent with these conclusions, NSPI is proposing revisions to the Domestic Service Time-of-Day Availability Clause to:
>
> 1) Remove the restriction that NSPI supply the Electric Thermal Storage equipment; and
>
> 2) Remove the restriction that the in-floor systems must be hydronic.
>
> NSPI hereby requests Board approval of the proposed new rate, as presented in Appendix A of the report. As the Board will note, only the Availability of the rate is proposed to be changed.
>
> (Exhibit N-40, p. 1)

7.2.2 Submissions - Intervenors

[226] DLAS, in its written submission, suggests the increases to these charges should be rejected because:

> Given the unaffordable nature of NSPI electric bills even without the increased miscellaneous charges, to disproportionately pass costs on to low income customers when these customers have not caused the Company to incur the costs is unconscionable and should be rejected.
>
> (DLAS, Memorandum of Law, p. 16)

[227] Dr. Stutz, in his direct evidence, also recommended that the Board reduce the proposed increase in charges as follows:

> Q. NEXT PLEASE DISCUSS NSPI'S PROPOSED CHANGES IN THE CHARGES THAT RECOVER SPECIFIC COSTS
>
> A. NSPI's regulations include a number of charges designed to cover the cost of services, such as connection or reconnection, wiring inspections and load research. NSPI has proposed substantial changes in these charges, increasing those for connection and inspections and reducing those for load research. The full set of charges is shown in Schedules 7.1, 7.2 and 7.3 included in Appendix M of the Company's initial evidence. As the support provided for the charges shows, NSPI has moved the charges to levels at or near cost.
>
> Q. DO YOU HAVE ANY CONCERNS ABOUT THE CHARGES?
>
> A. Yes, I do. Many of the changes in the charges are quite large. For example, the charges for connection or reconnection of service increase from $18 to $36. Increases of this magnitude are contrary to the criterion of rate stability.
>
> Q. DO YOU RECOMMEND ANY CHANGES IN NSPI'S PROPOSED CHARGES?
>
> A. Yes, I do. I recommend that changes in the charges be capped at 50 percent increase. This balances equity, which favors cost-based rates against rate stability. Further movement toward cost could, of course, be made in future proceedings.
>
> Q. DO YOU HAVE ANY ADDITIONAL COMMENTS RELATED TO THE INCREASES IN CHARGES?
>
> A. Yes, I do. Some of the increases in charges affect those whose service is disconnected for non-payment. In 2003 there were 2,131 such disconnections. Under NSPI's proposed regulations, the standard collection charge accompanying a notice of disconnection would increase from $13 to $21 or $27, depending on the method of notification. The reconnection charge would increase from $18 to $36. Thus, for disconnection and reconnection, the cost could increase by $32. For now the 50 percent cap I have proposed would hold the increase to $16. To put these amounts in perspective, I note that the minimum wage in Nova Scotia is $6.50 per hour. Raising the cost associated with disconnection for non-payment may not be a productive step. I would simply ask the Board to consider this point in light of whatever regulatory and other considerations it might find appropriate.
>
> (Exhibit N-134, pp. 40-42)

[228] Ms. Brockway, in Exhibit S-4, outlined her views regarding the appropriateness of a 50% increase in Miscellaneous Charges which was part of the proposed SA. She states:

> The proposed settlement would allow the Company to increase Miscellaneous Charges by as much as 50%. My first concern is with the effort to directly assign all costs of such operations to the individual customers facing disconnection. It is unnecessary and in many cases pointless to send payment-troubled customers "price signals". If such customers do not have the money to pay the underlying bill, they will not acquire that money and more merely because a disconnection or reconnection fee is applied. At the least, such fees should be waived in the case of low-income customers.
>
> (Exhibit S-4, p. 15)

[229] Mr. Epstein, on behalf of the NDP, suggests:

> Other testimony from poverty activists and respected community leaders like Jeanne Fay and Paul O'Hara are convincing in their assessment of the urgency with which the Board, and NSPI, must take account of the budgetary restraints many families in Nova Scotia face, and the NDP requests that the Board take full account of these experts' testimony. Furthermore, the doubling of the re-connection fees is an unnecessary and unjustified measure, that will prove most punitive to those who can least afford it. The NDP urges the board to reject this proposal.
>
> (NDP, Written Submission, p. 4)

7.2.3 Findings

[230] The Board is concerned with the significant increases proposed for those charges identified by NSPI as requiring an increase to recover costs. As pointed out by the intervenors, increases of up to 100% for these services are simply too high.

[231] The Board also questions the appropriateness of approving the proposed new charge for sending registered letters on overdue accounts and the proposed increase in the currently-approved disconnection notice charge. The Board notes that Ms. Brockway raised an interesting point in her evidence at the SA portion of the hearing

concerning the appropriateness of NSPI imposing this type of charge on customers. When questioned by Claire McNeil, Counsel for DLAS, she responded as follows:

> Q Okay. And you mentioned that -- earlier on, that while there has been this trend towards more direct assignment, it's not necessary, and I guess what you're saying is that like all the other costs in providing service to the domestic customers that these costs could be averaged out and paid for by the class as a whole as opposed to this design that the company has proposed of trying to make individual customers responsible?
>
> A. Yes, and there are arguments on both sides of it. I would say that the company's proposal struck me as an extreme version of the allocate the costs as much as possible to each individual customer who can be identified as causing the company to incur those costs.
>
> Q. I think you describe the fees a[s] punitive in some cases?
>
> A. Yes, I think so.
>
> Q. And just to clarify, what you're saying is that your analysis did not take into account the fact ---
>
> A Let me explain. For example, on the doorknob notice, I presume the doorknob notice is required so that somebody doesn't end up getting cut off without a chance to remedy the non-payment, if that's the problem, or challenge the bill if there is a problem there, and end up with, even if they don't have electric space heat, a water heater that doesn't work perhaps, a pump that doesn't work perhaps, so no water, a furnace motor that doesn't work, so no heat. It's in the company's interest to make sure that any customer, before they're turned off, has a chance to remedy whatever the problem is and get back on track and to -- I've never seen a company charge for a doorknob notice. Let me just put it that way. This was a new one on me.
>
> (Transcript, Jan. 14/05, pp. 3837-3839)

[232] While the Board is not prepared to reduce or eliminate the charges currently applicable to this form of notice, it does believe that the proposed charges for registered letters and disconnection notices are unnecessarily high. The Board approves a charge for $7 per registered letter, as recommended by Ms. Brockway in Exhibit S-4, Ex. NB4.

[233] With respect to the cost of disconnection notices and the other charges which are identified by NSPI as requiring an increase, the Board is of the opinion that a reasonable increase, under the circumstances, is equal to the average rate of increase for above-the-line rates. Accordingly, the Board directs NSPI to calculate these charges based on the average rate of increase for ATL rates, with the charge rounded to the

nearest dollar. The Board approves the inclusion of the proposed new items on the basis noted above.

[234] The Board notes that, in evidence set out earlier, NSPI confirmed that a 10% mark-up or profit margin is included in these charges. While NSPI is permitted to earn a return on rate base it is not appropriate, in the Board's view, to also impose a profit margin on miscellaneous charges. The Board's decision to approve a modest increase to these charges is reflective of its concern regarding this matter. In future applications, this practice should be appropriately addressed by NSPI.

[235] The Board approves the language amendments proposed by NSPI as well as the amendments to expand the availability provisions of the Time-of-Day Rate, referred to earlier in this section.

8.0 DEPRECIATION

8.1 Submissions - NSPI

[236] NSPI's application includes a depreciation expense in the amount of $127.2 million, which is $24.4 million higher than the 2002 Compliance Filing amount. This increase is explained by the Company as follows:

> Depreciation expense has increased by $24.4 million between 2002C and 2005 when it will total approximately $127.2 million. The two principal factors are:
>
> ○ Revised depreciation rates previously approved by the Board. The 2005 test year revenue requirement is calculated based on the second year of the four year phase-in of new depreciation rates approved by the Board in its Decision dated November 21, 2003 in Proceeding NSUARB-NSPI-P-879.
>
> ○ Capital additions approved by the Board since December 31, 2001 including the two LM6000 combustion turbines and the two wind turbines.
>
> (Exhibit N-1, pp. 46-47)

[237] NSPI included depreciation for two LM6000 combustion turbines at Tufts Cove Units 4 and 5 in its depreciation costs. The first LM6000 unit has been in service since 2003 and the second LM6000 was not yet in service at the time of the hearing. The Board has not approved the depreciation rate for either of these units. NSPI states:

> When the Gannett Fleming Depreciation Study was undertaken the LM6000 Combustion Turbine, Tuft's Cove Unit 4, was not in service and was therefore not included in the study. Consequently, the Board has not yet approved a depreciation rate for the combustion turbine.
>
> In the economic analysis provided to the Board as part of the capital approval process for the LM6000s, a twenty-year life was assumed. Accordingly, this Application incorporates a five percent depreciation rate on both the LM6000 combustion turbine presently installed at the Tuft's Cove Generating Station and the second LM6000 approved by the Board for Tuft's Cove in April 2004.
>
> (Exhibit N-1, p. 48)

[238] Intervenors challenged NSPI's depreciation expense primarily in respect of one issue: the appropriate depreciation life for two new LM6000 combustion turbines. SEB also questioned the inclusion of costs relating to the project to convert the Burnside combustion turbines, which includes depreciation as part of the expenses noted. This latter issue is addressed later in this decision.

[239] NSPI disagrees with the evidence of Mr. Selecky that these units should be depreciated over 30 rather than 20 years. It submits that extending the depreciation period to 30 years will result in increased costs to customers and states that:

> Mr. Selecky's recommendation would reduce depreciation expense by $1.3M in 2005 but it would increase the cost to ratepayers over time. NSPI has used 20 years based on the estimated life recommended by the manufacturer.
>
> (NSPI, Closing Argument, p. 43)

[240] In the SA, in an effort to reduce depreciation costs for the 2005 test year, NSPI agreed to delay the second year of the four year phase-in of the new depreciation rates. The SA states:

> 2.c. For 2005, depreciation fixed at $122.2 M (Board will permit NSPI to delay phase-in of the depreciation study by one year.)
>
> (Exhibit S-1, p. 3)

8.2 Submissions - Intervenors

[241] Mr. Selecky gave evidence on behalf of SEB regarding the appropriate economic life of the LM6000 units. At the hearing, Mr. Selecky stated:

> ... The third issue I take exception with is a depreciation expense for the LM 6000. NSPI has utilized a 20-year life to depreciate the unit. I believe the unit should be depreciated with a life of at least 30 years. NSPI has indicated that there will be overhauls for this unit at

> approximately every 50,000 hours of running. During those overhauls the unit will basically be brought back to initial condition if not even better, and how it can be brought back better is if GE provides enhancements that can increase the efficiency or the useful life of the machine. GE has supported these types of machines or these types of peakers for a number of years. In fact, one of the early ones was the LM 2500 that was put in service or was introduced by GE in 1968 and they still continue to support the unit and still continue to install the units. Hence, I believe that the 20- year average service life is unrealistically short.
>
> (Transcript, Dec. 2/04, pp. 3221-3222)

[242] SEB, in its written submission argues that:

> ... the estimated economic life is not the sole criterion for establishing the depreciation rate; and although it may provide the financial justification for installing the unit, "economic life" is not necessarily an indication of its useful or total life (Direct evidence of Jim Selecky, Exhibit N-68, at page 8 to 13)
>
> Again, this matter is somewhat discretionary; and despite the significant rate increases being requested, NSPI has chosen a short life (20 years) over which to depreciate the LM6000's. SEB believes that Mr. Selecky's 30 year proposal is more appropriate.
>
> (SEB Final Argument, p. 31)

8.3 Findings

[243] The Board has considered the evidence with respect to the depreciation period for the two LM6000 combustion turbines at Tufts Cove Units 4 and 5. The Board notes that in response to Undertaking U-38, NSPI indicates that its current fleet of combustion turbines has been in operation for more than 20 years and that the average retirement age for these assets is beyond 30 years. The Board finds Mr. Selecky's opinion on the expected life of LM6000 units to be very persuasive as his views appear to concur with NSPI's actual experience with similar units. The Board directs NSPI to calculate depreciation expenses for these two LM6000 units on the basis of a 30 year life rather than 20 years. The Board estimates that this will reduce NSPI's annual depreciation for the two LM6000 units by $1.3 million and the Board directs NSPI to include this reduction in its Compliance Filing.

[244] Year 2 of the 4-year phase-in of new depreciation rates, is scheduled to occur in 2005. The new rates were approved by the Board on November 21, 2003, following a review of NSPI's depreciation rates and a public hearing on the subject. The new rates and phase-in schedule were the subject of consensus between NSPI and stakeholders who participated in the process. As noted earlier, the Board has, in the past, made decisions establishing appropriate amortization periods and deferring and extending recovery periods for depreciation expenses. Since the Utility is assured that the costs will be recovered, the issue to be determined is timing—that period of time which best conforms to the principle of intergenerational equity while protecting the ratepayers from rate shock and the Utility from higher than acceptable expenses.

[245] As noted in the section of the decision on **s. 21** tax costs, this rationale has been used by the Board in the past, specifically with respect to the cost of retirement of the Glace Bay generating station. The Board is of the opinion, based on the concerns noted above, that delaying year 2 of the phase-in represents a reasonable step to reduce test year expenses and, consequently, rate increases. As a result, the Board directs the deferral of year 2 of the 4-year depreciation phase-in until 2006. The Board expects this will reduce NSPI's 2005 depreciation requirement by approximately $5 million and the Board directs that this adjustment be included in NSPI's Compliance Filing.

9.0 OTHER

9.1 Rate Assistance Program (RAP)

[246] While DLAS has opposed the approval of a FAM and the SA, and has detailed concerns regarding aspects of customer service provided by NSPI, its main focus at the hearing was the implementation of a proposed Rate Assistance Program ("RAP") to help low-income customers meet their electricity costs.

[247] DLAS filed evidence from several individuals, including Dr. Richard Shillington, a principal of Tristat Resources and Roger Colton, a principal of Fisher, Sheehan & Colton, with respect to this issue. Dr. Shillington, in his direct evidence (Exhibit N-126), outlined the challenging costs of shelter and electricity for low-income Canadians. Mr. Colton's evidence focused on low-income energy assistance programs and his efforts, in a number of US states, in designing rate affordability programs. Mr. Colton's position is that NSPI should "... be directed toward allowing low-income consumers to obtain quality utility service at affordable prices within a reasonable budget constraint."[34] Mr. Colton also submits that the costs of such a program, to be shared by customers, are offset, although perhaps not fully, by savings realized by the Utility resulting from the adoption of a 'universal service program'.[35]

---

[34]Exhibit N-127, p. 12

[35]Exhibit N-127, p. 62

[248] Howard Epstein, on behalf of the NDP, also supports the universal service program as outlined by Mr. Colton.[36] Mr. Tedesco responded to questions from Counsel for DLAS on this subject as follows:

> Q. You've indicated that you'd be prepared to sit down with us voluntarily to discuss rate assistance. Why hasn't the company put forward to the Board proposals for the implementation of a rate assistance programme?
>
> A. (Tedesco) Again, we view it as a public policy issue not an electric rate issue.
>
> Q. And what does Nova Scotia -- what's the company's position with respect to the universal service programme recommended by Roger Co[u]lton?
>
> A. (Tedesco) Again, all of these things are matters of public policy.
>
> Q. So I take it from your response that you're not opposing the implementation of such a programme, you're simply saying that it's public policy.
>
> A. (Tedesco) No, I'm saying that if -- vetting the issue in a public forum, if, indeed, Nova Scotians think that that is sound public policy, we would certainly support it.
>
> Q. Okay. You would agree with me, though, that this is a public forum.
>
> A. (Tedesco) This is a rate case with an awful lot of important constituencies that probably should be present to address an issue such as folks who are below the poverty level. As I said earlier, electric rates are but one component, and there are fundamental skills that are often -- can be buttressed that can improve people's financial management skills that by themselves can make a huge difference. That is not a panacea, it's just an indication that the issue is broader than simply the price of electrons or the price of methane or the price of propane or oil for that matter.
>
> Q. Would you agree that there would be a benefit to the company, too, in the terms of the bottom line in instituting programmes such as rate assistance, including perhaps some of the programmes that you've described as well around budgeting in terms of reducing the bad debt?
>
> A. (Tedesco) Again, as I said earlier, no, I would not necessarily agree with that.
>
> Q. But what I hear you saying is that you would not oppose necessarily the implementation of such a programme here in Nova Scotia.
>
> A. (Tedesco) If it were supported broadly then of course we would -- and we were, as a matter of public policy, asked to institute such a programme, we would certainly undertake to do that.
>
> Q. You'd agree that public policy in the public interest though is a significant factor here in the deliberations of this Board.
>
> A. (Tedesco) I think the public interest is certainly part of setting electric rates.
>
> (Transcript, Nov. 17, pp. 280-283)

[36] NDP, Closing Submission, p. 4

[249] This issue was addressed by the Board in its 2002 rate decision. In that case, the Board stated:

> DLAS' principal recommendation to the Board is that it introduce a "rate subsidy program" under which low income residential customers would be subsidized by other customers of the utility. DLAS does not explain how such a program should be implemented.
>
> The Board has in the past rejected the principle of rate subsidies based on income disparity. For example, in its 1992 decision on a rate application by NSPI, the Board said this:
>
>> It was suggested that the Corporation be required to report on the affordability of domestic rates for seniors, people with disabilities and other individuals or families who are living on a fixed income. Changes to rate structures to provide subsidized rates to such persons would be discriminatory and thus contrary to the basic thrust of regulation, which is to ensure customers pay rates that are justified by the cost of serving them. The government might be interested in such a study from the social assistance viewpoint, but it is not within the regulatory mandate.
>
> **Section 67(1)** of the **Act** is pertinent to any discussion of rate subsidies:
>
>> 67(1) All tolls, rates and charges shall always, under substantially similar circumstances and conditions in respect of service of the same description, be charged equally to all persons and at the same rate, and the Board may by regulation declare what shall constitute substantially similar circumstances and conditions.
>
> The Board recognizes DLAS' argument that, in the context of human rights legislation, the courts might well hold that differences in treatment based on differences in income level might be justified as being differences in circumstances and would not constitute discrimination. The Board has given renewed consideration to the issue of rate subsidization based on income in light of the arguments put forward by DLAS. However, it continues to hold the view that the implementation of such rate subsidy programs is neither contemplated by **s. 67(1)** nor appropriate in the context of the regulation of public utilities.
>
> The Board would note that the reduction in the revenue requirement ordered in this decision and the Board's direction that the components of the domestic and other rates shall increase by the same percentage will alleviate the disproportionate effect of NSPI's proposed rate increase on residential customers who consume low amounts of electricity.
>
> (Board Decision, Oct. 23/02, P-875, pp. 143-144)

[250] In this case, while DLAS has filed considerably more evidence regarding how such a plan would work, the threshold issue remains the same—not whether a RAP is

acceptable or advisable, but whether the Board, under the existing legislation, has the authority to implement a RAP.

[251] In its Memorandum of Law, DLAS argues that the Board has broad authority under the **Act** to exercise its responsibility to protect consumers and uphold the public interest. DLAS takes the position that **s. 44** of the **Act** is sufficiently broad to permit the Board to order the implementation of a RAP. DLAS further points out that the Board must act in a manner consistent with the equality guarantee set out in **s. 15** of the **Canadian Charter of Rights and Freedoms**. DLAS states:

> Accordingly, it is incumbent on the Board, when exercising its discretion under s. 44 of the *PUA* to make an order that is "just", to do so in a manner which is consistent with the value of Equality.
>
> It is now well settled in law that when determining the interpretive scope of inherently open-ended terms in an *Act* (such as "just"), especially in a context where access to an essential "service" is being considered, a tribunal or court should construe the term in a way which best promotes *Charter* values.
>
> Similarly, the Board's discretion in s. 44 of the *PUA* to make remedial orders must be informed by and consistent with *Charter* values. The open-ended discretion in that section is to be exercised in a manner which is compliant with *Charter* values.
>
> The requirement to have regard for *Charter* values when interpreting and exercising the discretion to make a "just" order is located in the Supreme Court of Canada's judgment in *Slaight Communications*. In that judgment, former Chief Justice Lamer stated:
>
> > ...it is impossible to interpret legislation conferring discretion as conferring a power to infringe the *Charter*, unless, of course, that power is expressly conferred or necessarily implied...Legislation conferring an imprecise discretion must therefore be interpreted as not allowing the *Charter* rights to be infringed. Accordingly, and adjudicator exercising delegated powers does not have the power to make an order that would result in an infringement of the *Charter*, and he exceeds his jurisdiction if he does so.
>
> When applied to the present application, these principles mean that the Board must be cognizant of the effect of any rate decision on people living in a low income situation. To fail to do so raises the prospect that a barrier could effectively be erected to members of a historically disadvantaged group in their ability to meaningfully access a service provided to the public. Conversely, a "just" decision by this Board is one which, not surprisingly, incorporates considerations of equality of access into this analysis.
>
> (DLAS, Memorandum of Law, pp.28-29)

[252] In the alternative, DLAS recommends that, should the Board find that it lacks the statutory authority to approve a RAP, it should recommend to the Government that the **Act** be amended to provide the Board with this authority.

[253] Board Counsel filed a written submission on the issue of the Board's jurisdiction to approve a RAP and points out that, since no Nova Scotia or Canadian case law is available on this specific question, general statutory interpretation rules must be applied in reviewing the **Act**. Board Counsel also notes that in Mr. Colton's evidence there is no "guarantee" that the costs of a RAP would be wholly offset by savings realized from the program. Accordingly, this raises the question as to whether other customers would subsidize the RAP benefit received by a defined group of low-income customers.

[254] Board Counsel points to **s. 67(1)** of the **Act** which states that:

> **67(1)** All tolls, rates and charges shall always, under substantially similar circumstances and conditions in respect of service of the same description, be charged equally to all persons and at the same rate, and the Board may by regulation declare what shall constitute substantially similar circumstances and conditions

.

[255] As all customers, regardless of income, receive 'substantially similar' electric service from NSPI, Board Counsel concludes that:

> An interpretation of the PUA which would lead to a form of preferential treatment for low income households is not consistent with the legislative language, or with the objects and purposes set out by MacKeigan, C.J.N.S. that "rates for the various customers or classes of customers of a utility must not as between each other be unjustly discriminating or preferential".
>
> (Board Counsel, Written Submissions, p. 13)

[256] After reviewing the submissions of DLAS, Board Counsel and the relevant provisions of the **Act**, the Board finds that it does not have the statutory authority to approve a RAP. The Board has the authority given to it by the Legislature to perform its

duties in accordance with the provisions of the **Act**. The Board's role is to make decisions, based on fact and law, within the parameters of the statutory authority it has been given by the Legislature. The Board's duty is to follow public policy decisions made by the Legislature and expressed in statutes. The Board does not have jurisdiction to establish public policy. That is the role of elected officials who are accountable to the public for this function. It seems almost certain that the RAP, as described by Mr. Colton, would result in the electricity bills of certain customers, depending on their income, being subsidized by other customers. In the Board's view, this is a social and public policy question which falls within the purview of the Legislature rather than the Board. Should NSPI and DLAS wish to pursue this matter with Government, the Board would be pleased to offer assistance with respect to regulatory and ratemaking principles.

9.2 Costs - Preliminary Hearing

[257] SEB, Avon and DLAS have requested that the Board order NSPI to compensate them for costs incurred in preparation for a preliminary hearing requested by NSPI to deal with a disclosure issue immediately prior to the rate hearing. NSPI had issued IRs to certain expert witnesses, including those appearing for Board Counsel. Witnesses refused to respond to a number of these questions.

[258] On November 3, 2004, NSPI filed an application for a preliminary hearing to compel these witnesses to address these specific IRs. The Board subsequently advised that, in view of the schedule and the imminent commencement of the rate hearing, it would hear the application at the opening of the hearing. The Board, by letter dated November

5, 2004, declined a further request by NSPI to reconsider its decision to hear the preliminary matter prior to the rate case commencing, stating that:

> The Board understands and appreciates NSPI's desire to have this matter dealt with prior to the commencement of the rate case. However the Board views the disclosure issue, which NSPI has now raised, as an important matter which has the potential to significantly impact the manner in which regulatory proceedings before this Board are conducted. As such, the Board believes it is appropriate for the Board's Regulatory Panel, rather than a single Member, to deal with this issue. In terms of your concern with respect to the need for an early ruling on this question, the Board notes that even if this matter was heard next week, and the Board ruled in favour of NSPI, the type of information which is being sought by NSPI (and, potentially, by other parties in this proceeding) would not be available by the commencement of the hearing.
>
> In view of the importance of this issue, the Board also believes it is necessary to allow a reasonable period of time for intervenors, as well as NSPI, to prepare written submissions for the Board's review. As indicated in the Board's November 4, 2004 letter, the Board's schedule, and the very short period of time before the rate hearing commences, makes November 15, 2004, the most appropriate time for the Board to hear this matter.
>
> (Nov. 5, 2004 - Board Letter to NSPI)

NSPI subsequently withdrew its application for a preliminary hearing on November 10, 2004.

[259] While Avon, DLAS and SEB have all referred to this matter in their closing submission, NSPI has not responded to these claims, other than as follows:

> NSPI strongly objects to Avon characterizing as “frivolous” or “vexatious” its efforts to ensure that the hearing process is fair. The Company looks forward at the appropriate time to vigorously responding to Avon.
>
> We note that Dalhousie Legal Aid has also included a claim for costs both with respect to the withdrawn Application for a Preliminary Hearing, as well as a more general request for intervenor costs.
>
> In keeping with the Board’s practice in other cases NSPI assumes the Board will deal with all Applications for Costs after it has rendered its decision on the Rate Case. For that reason the Company reserves any discussion regarding costs until the Board has formally indicated its is prepared to hear all interested parties on that matter.
>
> (NSPI, Reply to Closing Arguments, p. 35)

[260] The Board directs NSPI to file, by May 20, 2005, its response to the application for costs which has been filed by the parties. Avon, SEB and DLAS will have

the opportunity to file additional written comments on this matter, if they wish, by May 31, 2005. The Board will then review the submissions and rule on costs at a later date.

9.3 Non-Profit Intervenor Costs

[261] Both EAC and DLAS have requested that the Board order costs be paid to compensate the organizations for their efforts in the hearing. DLAS notes that:

> The power to make an order for costs is contained in sections 12 and 28 of the *Utility and Review Board Act*. Section 6(2) of the Board's Rules of Practice and Procedure Respecting Costs states that:
>
> > 6(2) The Board may consider awarding costs against a utility to non-profit, public interest interveners with limited financial resources who:
> >
> > a) have a substantial interest in the proceeding
> >
> > b) will be affected by the proceeding
> >
> > c) participate in the hearing in a responsible way; and
> >
> > d) contribute to a better understanding of the issues by the Board
>
> This authority has been rarely used in the context of rate increase applications, in part due to the absence of non-profit interveners in Nova Scotia. The involvement of DLAS on behalf of a coalition of groups supporting the interests of low income residential customers thus can be seen as a new development, offering the Board the opportunity to address some of the systemic barriers to involvement in these matters by non profit and low income customer groups...
>
> Dalhousie Legal Aid Service receives funding from the Nova Scotia Legal Aid Commission which allows it to provide legal services and representation to clients who quality financially. Such funding does not include public interest litigation or the costs of intervention in this rate application...
>
> It is submitted that DLAS acted responsibly and prudently in these hearings. The intervention on behalf of low income consumers combined the interests of several groups and it consciously avoided duplicating the evidence already presented or made available by other interveners in the matter. It sought to identify issues and present evidence which would otherwise not be made available to the Board. Such evidence is admissible and directly relevant to the issues to be determined. As such, it is submitted that DLAS has behaved in a responsible manner to incur only such costs as were necessary to complete the evidence before the Board concerning the issues in this application...
>
> Based on the foregoing submission, it is respectfully submitted that the Board should allow the application by DLAS for costs in this application. These costs would include a reasonable sum for legal costs, as well as for reasonable disbursements incurred in retaining DLAS' experts in this matter. DLAS attaches a summary of Mr. Colton's account in this matter by way of correspondence dated December 10, 2004. Should further information be required, DLAS is prepared to offer any further particulars as directed by the Board.
>
> (DLAS, Memorandum of Law, pp. 43-46)

EAC requests that:

> Pursuant to section 12 of the Utility and Review Board Act, the Costs Rules apply to these proceedings.
>
> Section 6(2) of these Rules provide as follows:
>
> 6(2) The Board may consider awarding costs against a utility to non-profit, public interest interveners with limited financial resources who
>
> a) have a substantial interest in the proceeding;
>
> b) will be affected by the proceeding
>
> c) participate in the hearing in a responsible way; and
>
> d) contribute to a better understanding of the issues by the Board
>
> The Ecology Action Centre suggests that this submission meets the criteria of Rule 6(2) and requests an opportunity to make submissions with respect to the issue of costs in this application.
>
> (EAC, Written Submissions, final page)

[262] NSPI has not addressed the request for costs by either of these parties in its submissions. The Board directs that NSPI file its response to these requests with the Board by May 20, 2005. DLAS and EAC will have an opportunity to file additional written submissions on this issue by May 31, 2005. As with the costs applications relating to the preliminary hearing, the Board will then review the submissions and rule on the matter at a later time.

9.4 Demand Side Management (DSM)

[263] This issue was addressed by EAC and several other intervenors during the course of the hearing. In its written submission, EAC categorizes NSPI's action on DSM to be "... negligible"[37], and makes the following recommendations:

---

[37] EAC, Written Submission, p. 3

1. That the UARB request from NSPI a revised demand side management (DSM) strategy that encompasses measurable targets and timelines. The strategy should address GHG reduction initiatives, the renewable energy generation program, in-house DSM initiatives, and DSM services for customers in all rate classes.
2. That the UARB request that NSPI conduct a study investigating alternative rate designs, and engage stakeholders in the process of evaluating and selecting a rate design which most appropriately furthers economic and environmental sustainability.
3. That the UARB support in its ruling the Provincial use of systems benefit charge to facilitate funding of DSM initiatives.
4. That the UARB announce in the rate case ruling that it will conduct a demand side management hearing in 2005 to provide legitimacy to Provincial and NSPI commitments to GHG reductions and DSM.

(EAC, Written Submission, pp. 2-3)

[264] EAC also points out that DSM has been identified by the Electricity Marketplace Governance Committee ("EMGC") as a factor to be considered when determining future energy requirements. EAC also believes that NSPI, despite a 1993 DSM hearing before the Board, has not promoted DSM adequately.

[265] While Mr. Tedesco spoke of NSPI's progress on DSM issues, ECANS suggests NSPI's DSM efforts relate principally to the interruptible rider of the Large Industrial customer class. ECANS recommends that the Board direct NSPI to implement a DSM program. MEUNSC also points to the benefits of DSM efforts and the NDP suggests a continuation of the DSM hearing of the early 1990's. The Province, in its written submission, states that:

> Unfortunately, NSPI's efforts on energy efficiency and conservation measures appear to be generally limited to providing information through "bill stuffers", website information and participating in conferences designed to raise awareness with the expectation that its customers will then undertake measures that are in their own economic self-interest. This is not good enough.
>
> Since energy efficiency and conservation measures can result in savings to both NSPI and its customers, the Province submits that the utility has the obligation to assess such DSM measures in a lot more detail and to promote them with more vigour. Otherwise, the utility may be missing an opportunity to save money for both itself, and its customers. As well,

> NSPI needs to be able to benchmark the cost of DSM against the cost of adding a new capacity to address future supply/demand imbalances.
>
> (Province, Closing Submissions, pp. 34-35)

[266] NSPI had the following proposal regarding DSM:

> NSPI recognizes that spending on DSM must be shown to have clear and demonstrable benefits to customers. The Company's recent customer energy forum also underlines the strong interest that Nova Scotians have in energy conservation.
>
> The Company agrees with the concept that given the conflicting views and interests of various stakeholders, a technical conference process focused on DSM initiatives would be the most productive method of building consensus around long-term DSM targets that benefit all customers.
>
> (NSPI, Reply to Closing Arguments, p. 33)

[267] The Board has considered the helpful information provided on the matter of DSM during this proceeding. In the Board's view, further work and progress with respect to DSM is both important and necessary. The Board understands the suggestion that a DSM hearing should be held and, indeed, such a hearing may well be ordered in future. At present, however, the Board believes it is more appropriate to direct NSPI to initiate a technical conference process, with interested parties and stakeholders, to pursue an improved and effective DSM program for the Utility.

9.5 Municipal/Industrial Linkage

[268] There are six municipal utilities in Nova Scotia serving the communities of Antigonish, Berwick, Canso, Lunenburg, Mahone Bay and Riverport. These utilities are supplied with electricity by NSPI. In 2002, NSPI's rate application included a request to end the long-standing linkage in rates between municipal utilities and industrial customers. The Board indicated in its 2002 decision that it was unprepared to make such a change at

that time. As a result, NSPI's current application has continued this linkage. Other parties, however, have raised the issue of de-linkage. Both Dr. Stutz and Dr. Alan Rosenberg, a principal with Brubaker & Associates Inc., and one of SEB's expert witnesses, have advised that this linkage may no longer be justifiable. NSPI also confirmed that it has no objection to the separation of these two rates.[38]

[269] The original purpose of the linkage is set out in NSPI's response to CME IR 23 (Exhibit N-24) and was further explained at the hearing by Mel Whalen, NSPI's Director of Regulatory Affairs and Rates, when questioned by the Board:

A. (Whalen) My understanding, Commissioner Morash, is that there was a desire to set the municipal rate such that an industrial customer coming to Nova Scotia might choose to go to one of the municipal utilities or to NSPI and that the rates would not be prejudicing that decision one way or the other. It was an attempt to make the rate such that a customer would be equally comfortable going to a municipal utility -- an industrial customer would be equally comfortable going to a municipal utility.

Q. But the rate that NSPI charged the municipal was based on what? Was that based on the rate that NSPI would charge the large industrials?

A. (Whalen) Yes, I believe that was the case. The large industrial rate was calculated and then the municipal rate was set to be the same.

Q. Do you have any views as to the -- and that linkage has been maintained up to the present time, has it not?

A. (Whalen) Yes, it has.

Q. So, what are your views then, Mr. Whalen, in terms of the pros and cons of that linkage today?

A. (Whalen) I think my views would be similar to what we stated in 2002. I think there are a number of reasons now why it might be appropriate to break that linkage. Two reasons come to mind. One is that the way the municipalities set their rates -- of course, they're free to set those any way they want, and their rates have not always corresponded to ours on a class-by-class basis.

Q. And that's as we saw that evidence in the Exhibit N-200 from yesterday, is that correct, that there was an example there where they didn't necessarily correspond?

A. (Whalen) That's true, where they didn't, and I believe in 2002 we talked about that as well. A second reason is that we have not seen large industrial customers go to the municipalities even in spite of the policy. You may recall the only large industrial customer who was part of the municipality became -- applied to the Board to become an NSPI customer to be able to take advantage of the interruptible rate. And I think

[38] NSPI, Closing Argument, pp. 49-50

the third reason is that because of the energy policy that contemplates allowing the municipalities to be able to choose suppliers other than NSPI, perhaps there's no longer the same requirement to keep that linkage.

(Transcript, Dec. 2/04, pp. 3157-3159)

[270] Avon, in its closing submission, states that:

The rationale for linking the two rates as explained in Exhibit N-24 CME IR 23 has largely disappeared. The linking of the two rates has pushed the large industrial rate to 19.6% increase according to NSPI's application, an increase which would constitute rate shock in accordance with Dr. Stutz' definition.

Dr. Rosenberg also proposes to unlink the municipal rate from the large industrial rate in order to avoid shackling the large industrial rate class with the largest increase. In his direct evidence Exhibit N-67, he provides six cogent reasons for eliminating the linkage between the two rates.

We would note that the rates charged by the municipal utilities for comparable rate classes are significantly below those charged by NSPI to its rate classes. This is true either under NSPI's present rates or under the rates as proposed. There is, in our submission, no justification for further subsidization of the municipal utilities by maintenance of this unwarranted linkage.

(Avon, Closing Submsission, pp. 45-46)

[271] SEB supports ending the linkage between the two rates and recommends that Dr. Rosenberg's suggested "method 2" be used to implement this change.[39] CME also supports the separation of these two rates.

[272] MEUNSC, not surprisingly, objects to this change. It submits:

While we would agree that the opening up of the market, to the Municipal utilities in 2005, will no doubt introduce a new wrinkle to the linkage relationship it is unlikely that this issue will have any impact in the test year for this proceeding (NSP has not forecasted any changes in its revenues and / or expenses for this item). Any un-coupling based on this issue would surely only be applicable in future proceedings.

Dr. Stutz indicates, that the only reason to allow the rate components to diverge, even with the same increase, is to satisfy his requirement regarding rate shock. This is only created by the application of the Interruptible Credit to the Large Industrial customers and is, in our opinion, limited at best.

We would urge The Board to consider all of the issues associated with this item and not let the single, limited concern over-ride all of the other aspects associated with this 30 year marriage.

[39]SEB, Closing Submission, pp. 43-44

If, after all consideration, there is still a desire to separate than we would request that The Board take into account the following, when considering the rate design implications of the divorce.

1. NSP's rates are organized based on end use (Residential, Commercial, Industrial) and grouped within the end use based on size (Small, Medium, Large for Commercial and Industrial). This is a proxy for cost-based voltage level service separation (Distribution Secondary, Distribution Primary, and Transmission).

   Two of the Municipal Utilities are below 2 MVA and as such would qualify for a Medium styled application with no demand ratchet. (This load difference is presently recognized in the Cost of Service).

2. NSP only ratchets demands above 2MVA. This is based on the impact loads of this size and greater have on generation capital provisions. Given the above only four of the Municipals would warrant this concern.

3. If, as NSP states, the entire Municipal load, at only 1.6% of NSP's total requirement is of little concern (less impact then one year's growth), then we would urge The Board to consider removing the demand ratchet provision for any un-coupled rate design.

(MEUNSC, Final Brief, pp. 12-13)

[273] The Board is of the opinion that this is an appropriate time to de-link the Municipal and Industrial rate. There does not appear to be a reasonable or logical basis on which to continue the arrangement. The Board prefers Dr. Stutz's recommended proposal for distribution of revenue requirements and corresponding rate increases as a result of the separation of these two rates, and notes that NSPI concurs with this approach.[40] NSPI is directed to incorporate this change in its Compliance Filing. The Board further orders that the rate increase for municipal utilities will not take effect until May 1, 2005. The Board directs NSPI to confirm the estimated 6.1% rate increase to the six municipal utilities as soon as possible in order to provide an opportunity for these utilities to apply to the Board for a "pass-through" of this increase to their customers and mitigate the potential for lost revenue.

[40]Exhibit N-231, p. 11 and
NSPI, Closing Argument, p. 50

9.6 Annually Adjusted Rates/Below-the-Line

[274] It is clear from the evidence of SEB that the Extra Large Industrial Interruptible Rate ("ELIIR"), which was approved by the Board on January 28, 2003 as a new rate for very large customers, and the 2-part RTP rate are not offering the viable alternative option which was originally anticipated. ELIIR constitutes one of the Annually Adjusted Rates ("AARs") or below-the-line ("BTL") rates. These rates, which are not usually part of the general rate case, are set annually. They are based principally on projected fuel costs for the upcoming year which are usually put forward by NSPI in November of each year. In this case, while NSPI's estimated fuel costs in the May 28, 2004 rate case filing is $377.1 million, the fuel costs proposed to apply to AARs is significantly higher, at $393.7 million. In addition, the revenue requested to be derived from BTL rates increases from $126.3 million to $128.1 million, with NSPI's revised application on June 23, 2004.

[275] In the SA, NSPI agreed to increase the ELIIR and 2-part RTP rates by 10.4% for 2005. SEB also agreed to these increases and they are the only customers on these rates.

[276] Dr. Stutz, in his evidence regarding the SA, made the following statement:

> **Q. DO YOU HAVE ANY COMMENTS CONCERNING THE BELOW-THE-LINE RATES?**
>
> A. Yes, I do. For some time, there have been difficulties with the below-the-line rates, particularly ELIIR and the 2-part RTP. Discussions between NSPI and Stora/Bowater have led to implementation of "acceptable" below-the-line rates for winter 2005. This is an important development. Absent it the customers eligible for ELIIR might have chosen to take interruptible service on the Large Industrial rate (LIR). Because there

are no economic interruptions on the LIR, this would diminish the ELIIR customers' use of load management, likely causing others on the LIR to face more frequent interruptions during the coming winter season. However, the underlying difficulties remain.

Acceptance of the Settlement could provide a good starting point for an effort by NSPI, Staff and other interested parties to develop a long-term approach to below-the-line rates. If the Settlement is accepted the Board could require the Company to conduct discussions with Stora/Bowater, Staff and other interested parties, to determine whether, by rate design or other means, a more workable set of below-the-line rates might be developed. To ensure that any recommendations can be acted upon before the 2006 below-the-line rates need to be put in place, the parties to such a discussion could be required to report to the Board, through a consensus statement with appended individual comments, by August 1, 2005.

As was the case with fuel, the actions discussed above could be ordered whether or not the Settlement is accepted. However, as with fuel, the likelihood of productive effort may be greater if the Settlement—supported by both NSPI and Stora Bowater—is accepted.

(Exhibit S-3, pp. 6-7)

[277] This issue was addressed by NSPI, SEB (and others) in the closing submissions on the rate case portion of the hearing. SEB in its final argument, submits that:

Accordingly, SEB believes it is imperative, as set out in Dr. Rosenberg's Direct Evidence at page 41, that the ELIIR customers be entitled to continue on the current 2004 ELIIR rate until the Board renders its final decision in this rate case, with a new (2005) ELIIR rate only coming into effect concurrently with the new above-the-line rates becoming effective, and without being retroactive to January 1. Furthermore, customers should be entitled at the time both rates (LIR(IR) and ELIIR) are known to choose which rate they will use going forward. The Board will be aware that due to the significant "buy through" costs imposed in January and February, the ELIIR rate is most costly in those months, and ELIIR customers would remain subject to the "buy-through" in those months even if they chose to subsequently move to LIR(IR) once the rates are finally determined, if the Board's decision is not finalized prior to that time.

(SEB, Final Argument, p. 49)

[278] NSPI, in its reply to closing arguments, states:

In its Final Argument dated December 13, 2004, SEB argues the 2005 ELIIR should incorporate whatever fuel cost the Board approves in its decision in this case.

NSPI disagrees.

There is no reason why the fuel cost used to set ELIIR should be the same as the fuel cost in above-the-line rates. In most years this is not the case. In 2003 and 2004 for example, the fuel cost used to set annually adjusted rates was lower than the fuel cost being paid by all

> other customers. In those years, there were no objections from SEB on this issue. Annually adjustable rates can move down or up, based on the most current information used to set them. SEB are sophisticated customers and have to be taken as fully understanding all of the terms of the rates under which they agreed to take service.
>
> The effect of this would be to increase above the line rates in this rate case.
>
> (NSPI, Reply to Closing Arguments, p. 30)

[279] As noted earlier, the Board has found that the SA cannot be accepted. However, as Avon noted in its closing submission on the SA:

> Stora Enso has raised the concern that an uneconomic ELIIR rate could result in migration to the large industrial interruptible rate, leading to even more frequent interruptions. This risk of course, is of concern to our clients. However, if the Board rejects the settlement and proceeds to decision, the end result may well be rates which satisfy the below-the-line customers and the above-the-line customers and the risk of migration would dissolve.
>
> (Avon, Closing Submission, SA, p. 8)

[280] The Board is in a difficult position with respect to BTL rates in this case. Generally, these rates are set following a conventional process. Customers have the opportunity to appear before the Board to object to annual adjustments proposed by NSPI and NSPI has the same opportunity to make its case as to why an adjustment is justified. This process usually involves BTL customers only. BTL rates are expected to be based on the cost of service principles to these customers so that ATL customers do not subsidize BTL rates. The Board issues a separate decision fixing the BTL rates.

[281] Under the present circumstances, while a number of BTL customers objected to NSPI's proposed rates, a separate hearing on the BTL rates did not occur. However, the SA brought the BTL issue within this proceeding in that SEB and NSPI agreed to a 10.4% increase in the ELIIR and 2-part RTP rates. Generation Replacement Load Following ("GRLF") customers, who are also BTL customers, were not included in the SA.

[282] Reliance on the usual method for setting the BTL rates could delay a decision substantially, and introduce uncertainty in the revenues the BTL rates might produce. In the context of this decision, this would be an undesirable and inappropriate result. The Board believes that equity, fairness and the unique circumstances of this case justify a departure from the conventional process for setting these rates. The Board needs to ensure in this decision that the Utility is aware of the revenue it will receive in 2005 from all rates and that this revenue is derived from a fair and reasonable division of responsibility between ATL and BTL customers.

[283] As a result, the Board finds that it is appropriate at this time to approve a 10.4% rate increase for all BTL customers, including GRLF customers, effective January 1, 2005. The increases in the BTL rates set by the Board are equitable. The principal parties affected by this ruling are SEB and NSPI. Of the $116 million in revenue associated with BTL rates, the vast majority is paid by SEB. Had the SA, which NSPI and SEB both supported, been accepted, the BTL rates paid by SEB would have been the same as those now approved by the Board. The Board is of the view that the inclusion of GRLF customers in this group provides all BTL customers with the same treatment SEB and NSPI negotiated.

[284] Accordingly, in its Compliance Filing, the Board directs NSPI to calculate the BTL rates on the basis of a 10.4% increase.

9.7 Annually Adjusted/Below-the-Line Rates - Design Issues

[285] It has become apparent to the Board, after hearing a number of issues raised during this proceeding by both BTL customers and NSPI, that improvements in the rate design of BTL rates are necessary to ensure these rates actually work to the benefit of both ATL and BTL customers and NSPI. The Board notes Dr. Stutz's response to questions from the Board on this issue:

> Q. And in terms of -- it's clear, I think, from your evidence that you obviously have some concerns with respect to the current below-the-line rates, that work needs to be done no matter what the Board does with respect to the way those rates work.
>
> A. That's right. I feel as if I've been in an unending discussion of that set of rates going back so far that I can barely remember when it began, and I think we need to find some way of making those rates function in a way that those on them and those offering them are more comfortable with and doesn't lead to rancorous debate over and over again.
>
> (Transcript, Jan. 14/05, p. 3988)

[286] As noted earlier, the Board agrees with Dr. Stutz's comments that discussion of the BTL rates is needed and, for that discussion to be useful, it needs to occur quickly following this decision.

[287] Accordingly, NSPI is directed to convene a meeting of stakeholders, as well as Dr. Stutz and Board staff, to review this issue and attempt to resolve current outstanding problems. The Board further directs that a report reflecting progress on this issue be filed with the Board by August 1, 2005. Should adequate progress not be made, NSPI has the option of requesting that the Board hear and resolve this matter.

9.8 Light Emitting Diodes (LED)

[288] In its closing submissions, HRM outlined the issue of an LED rate:

> HRM has put forward a proposed rate for LED. In keeping with the general objective of reducing energy consumption, it is HRM's position that any steps which can be undertaken to encourage use of energy efficient lights should be supported. As Dr. Stutz in his testimony noted, it is difficult to modify behaviours to achieve conversion to more energy efficient lights and appliances. This represents an instance where the customer has come forward with a request for a rate that hopefully will support the conversion of additional intersections to LEDs but also pave the way for others to take advantage of this type of lamp.
>
> As was noted in exhibit N-203, these lamps reduce energy use by approximately 90%, reduce maintenance costs by virtue of their longer lifespan, and improve safety because lighting failure in one diode does not cause the entire indication to go dark. Traffic lights by their nature are in continual use and therefore energy use reductions provided by a traffic light have more immediate impact than lights used on a more sporadic basis...
>
> In addition, NSPI was asked in U-56 to comment on the rate proposed by HRM in Exhibit N-203 and that was not done. As a result, HRM asks that the Board to consider the adoption of the LED rate proposed by HRM.
>
> (HRM, Final Submission, pp. 43-44)

[289] Following the conclusion of the hearing, in a letter dated February 9, 2005, Mr. Whalen requested approval for a LED rate in NSPI approved Rates and Regulations, effective February 1, 2005, citing:

> The proposed rates will allow customers such as HRM to assess the business case for large scale replacement of existing incandescent traffic control lights with LED's. Such replacement will reduce energy consumption and produce savings for the customers.
>
> For 2005, NSPI expects that any conversion to LED's will have an insignificant effect on its revenue requirement or rates to other customers, so no other aspect of NSPI's rate application will need adjustment if these rates are approved.

NSPI also indicated that HRM supports this request.

[290] The Board has reviewed this issue and finds it to be a beneficial step, both from the perspective of energy conservation and customer savings. In view of HRM's agreement, and since there is no negative financial impact on customers as a result of this change, the Board approves the revised methodology in the calculation of this rate. In

addition, since rates are not affected by this change, retroactive ratemaking is not an issue and the Board has no objection to the proposed February 1, 2005 effective date. Accordingly, NSPI is directed to incorporate the revisions to its existing rate, effective February 1, 2005.

9.9 Load Forecasting

[291] Dr. Stutz raised concerns regarding NSPI's methodology to accurately predict future electricity loads. He states that:

> A. Each year NSPI develops a forecast of energy sales and peak demand. Sales are forecast for three sectors: residential, commercial and industrial. Sales to customers of the municipal utilities are included in these sectors. This year sectoral sales forecasts were developed using econometric models for residential, commercial and small and medium industrial sales. The large industrial forecast was not model based. Instead, it relied on information from customer surveys. Forecast sales by sector were allocated among the 14 rate classes for revenue forecasting purposes, and to develop peak demand.
>
> With the exception of the large customers, monthly and annual peaks were forecast based on forecast monthly energy and historical coincident load factors for each of the rate classes. For large customers, individual demand contributions to system peak were assessed based on recent history or new customer-specific information. These peak loads were adjusted for losses by rate class and are then summed to produce NSPI's forecast of Net System Peak. Non-firm Peak demand is forecast by customer. The forecast firm peak is just the residual (i.e., Net System Peak less Non-firm Peak).
>
> **Q. DO YOU HAVE ANY CONCERNS ABOUT NSPI'S FORECASTING PROCEDURES?**
>
> A. Yes, I have two concerns:
>
> - NSPI's treatment of uncertainty is very limited
> - NSPI's models are very limited in their ability to address the impacts of changes in the efficiency of energy use by customers.
>
> (Exhibit N-134, pp. 15-16)

[292] In his direct evidence, Dr. Stutz also refers to the possibility that, as a result of NSPI's load forecasting procedures, NSPI may have underestimated residential sales, at current rates, by up to $10.1 Million in 2005.[41]

[293] Dr. Stutz made the following suggestions for improvement:

> I recommend three changes in NSPI's procedures:
>
> - NSPI should produce High and Low Cases along with its Base Case using its econometrically-based forecasting equations, and include them in annual forecasting reports which should be filed with the Board.
> - NSPI should weather normalize its historic sales and demand data, use that data to forecast weather normalized future sales and demand, and then reconcile its forecast results to actual future weather normalized results as they become available. Such weather normalization efforts should be included in the annual forecasting reports.
> - NSPI should develop end-use models for the residential and commercial sectors. NSPI should use its EU models to perform the analyses discussed above. The EU models should be fully addressed in the annual forecasting reports.
>
> (Exhibit N-134, pp. 21-22)

[294] In his surrebuttal evidence, Dr. Stutz states:

> A. In my Initial Evidence I made the following recommendation.
>
> - NSPI should be directed to improve its forecasting procedures and to extend its capabilities for end-use analysis as recommended in Section 5 of my evidence.
>
> My hope in making that recommendation was that, after this proceeding, UARB Staff and Consultants could work with the Company to improve NSPI's forecasting efforts. Parts of NSPI's rebuttal suggests that a cooperative effort may prove useful.
>
> (Exhibit N-231, p. 10)

[295] NSPI referred to Dr. Stutz's evidence on this issue at the hearing in its closing submission, stating that:

> In discussing this further with Commissioner Morash, Dr. Stutz confirmed that issues related to load forecasting are perhaps best addressed subsequent to this hearing.

---

[41] Exhibit N-134, p. 25

> Q. Thank you. Now, you do spend a significant amount of your report talking about forecasting.
>
> A. I do.
>
> Q. And I believe you suggested this morning that you're not suggesting that any adjustments be made in this rate case. Is this something that you feel can be dealt with satisfactorily in the future, in the immediate future subsequent to the rate case? Is there – I guess where I'm going is there any underlying significant differences in your views as to where the forecasting should go and NSPI's approach to the forecast, or is it something you feel can be dealt with?
>
> A. The honest answer is I don't know. What I know is that the company is quite willing to discuss all of the types of forecasting issues that I've raised, and, in fact, I have had one rather extensive discussion with them. It didn't resolve all these issues. I think there may be some misunderstandings between myself and the company about what the real issues are and how serious they are and how they should be looked at, and I think what's clear to me is that in the immediate future I, and other members of the Board staff, could sit down with the company and explore all of the issues that I've raised and we may be able to resolve some of them. Some of them we may be able to resolve. So if we go through a process like that of consultation and attempt to resolve and we can't resolve them, it could be brought back to the Board certainly by the end of the coming year, if not before, but until I sit down with the company I don't know whether there's a fundamental disagreement.
>
> NSPI agrees that the approach proposed by Dr. Stutz is the best way to address any issues associated with the load forecast.
>
> (NSPI, Closing Argument, pp. 44-45)

[296] The Board shares Dr. Stutz's view with respect to the load forecasting issue. The Board accepts his recommendation and directs NSPI to initiate meetings with Dr. Stutz and Board staff to attempt to resolve these concerns.

[297] The Board also directs that a report on the progress of improvements to NSPI's load forecasting methodology be filed by December 1, 2005.

9.10 Incentive Compensation

[298] In the 2002 rate decision, the Board made the following finding with respect to incentive compensation:

The Board has heard no evidence which persuades it that ratepayers should bear 100% of the cost of incentive compensation. As Mr. Huskilson stated when questioned by Counsel for the Province as to how customers benefit from incentive compensation paid to NSPI employees:

A. Well, I think, first of all, it's important to look at the efforts of employees as not just being for shareholders, but as being for all of the stakeholders of the company. And it's very, very hard to distinguish between stakeholders of an organization, so you can't say that the success of the organization only goes to shareholders because a lot of the success of the organization goes to customers as well. As an example, in keeping rates the same between 1996 and today, that success of the organization which, in part, was driven by incentives to employees to work hard at that activity certainly was to the benefit of customers. And so from a conceptual perspective, we have a hard time understanding how you separate the benefit that the different stakeholders get from the company, so starting with that. The way that the bonus programs, as they exist today, benefit all stakeholders of the organization are that it causes employees to have a stake in the success of the organization, so employees don't get, automatically, their total compensation. They only get the compensation when they work hard, they meet goals and they meet objectives which work well for all stakeholders. At the end of the day, if you're talking about an employee being compensated, we're going to have to compensate that employee to the level that it takes to retain that employee. And we believe that it's very important that a part of that compensation be at risk for that employee and that that employee have to meet significant goals in order to be able to get those incentives. And so it's an important part of our strategy to get employees pulling in the direction of all stakeholders, which includes customers and shareholders and the general public.

Q. So you do not agree that shareholders are the primary beneficiary of these incentives.

A. It's absolutely impossible to separate one stakeholder in the operation of a company or an organization. If the company is successful, all stakeholders in that organization benefit from that.

(Transcript, April 24/02, pp. 484-486)

The Board agrees that both shareholders and ratepayers benefit from a well-run utility. The Board further agrees that it is difficult to quantify the benefit and, for that reason, reaffirms its earlier decision that an equal division of incentive compensation is the most appropriate method of allocating this cost. Accordingly, NSPI's 2002 test year expenses are reduced by approximately $1.58 million. This amount was determined by reducing the total incentive compensation costs of $3.5 million by the amount of Mr. Mann's incentive compensation and applying a factor of 50% to the remainder.

(Board Decision, P-875, pp. 56-57)

[299] In the present case, NSPI proposes no change to the 50% allocation of incentive costs to ratepayers. While no expert evidence has been filed on this issue, intervenors have raised concerns regarding the methodology used by NSPI to assess incentive compensation for employees. They ask whether ratepayers benefit as much as shareholders from the criteria used to determine incentive compensation and whether the incentives are reasonable.

[300] Avon states that:

> NSPI was requested in Av IR-4 and Av IR-5 to explain its employee incentive plans. Further information was provided in response to Undertaking U-2 and Undertaking U-20. We would submit that from a review of these materials, it is impossible to conclude that 50% of the NSPI executive goals relate to promoting the interests of ratepayers. To this extent, such bonus incentives should not be recoverable at all from the ratepayers.
>
> The more important issue, however is whether the bonus schemes in place at NSPI and the objectives sought to be achieved are aligned with the ratepayer's interests. Compensation and executive bonuses are powerful tools for motivating behavior on the part of employees. There is a reasonable basis to question the manner in which employees are being motivated when issues of obvious interest to the ratepayers are not addressed. The significant expansion in the number and dollar value of transactions with affiliated parties in circumstances where the Board's experts are unable to conclude that the transactions are for the benefit of the ratepayers is an obvious circumstance which calls for investigation of the underlying institutional motivations provided by NSPI to its employees.
>
> The fact that the Vice President of Energy Services for NSPI is eligible to receive an annual incentive equal to two percent of earnings before interest and income tax from the business operations of Emera Energy Services raises a reasonable and justifiable concern as to how he can balance conflicting interests in his dual position as VP Energy Services for NSPI and VP of Energy Services for Emera Energy. He has financial incentives for increasing the volume of transactions and therefore earnings of Emera Energy. His knowledge and experience makes him an influential member of the NSPI fuel strategy table. It is fair to question whether the progressively increasing volume of affiliate party contracts respecting fuel procurement have been influenced by the compensation scheme....
>
> We would submit that the concerns respecting the bonus and incentive plans in place for NSPI are sufficient that the Board require NSPI to prepare a comprehensive and detailed report of the bonus and incentive plans that it has in place and that the Board obtain outside expert advice to study its appropriateness to ensure that the plans not only provide value to the shareholders but also align with ratepayers' interests.
>
> (Avon, Closing Submission, pp. 51-53)

[301] HRM also addresses this issue in its submission, stating that:

> In looking at the design of the incentive program, $50,000 or 25% of the COO's annual "incentive payment" is tied to regulatory items.
>
> HRM recommends that regulatory items be considered of less importance than reliability issues, and that regulatory items become a lesser factor in scorecard success.
>
> Reliability is already a scorecard factor but is included with safety performance and environmental performance. It is suggested that reliability be made a larger factor in the incentive program and that an entire 25% be tied to improvements in the SAIFI and SAIDI indices and improvements in DSM. ...
>
> (HRM, Final Submission, pp. 26-27)

[302] MEUNSC submits that:

> As well as the concerns raised by Dr. Stutz with respect to real or apparent conflicts of interest relative to fuel issues we have NSP's failure to meet The Board's order requiring that the interests of rate payers and shareholders be non-conflicting. One needs to look no further than the issue raised regarding bonus provisions for NSP Executives being based on the success of the unregulated subsidiaries to see the problem here. An adjustment to the revenue requirement may very well be warranted to correct for the possible impacts of this continued conflict of interest.
>
> (MEUNSC, Final Brief, p. 21)

[303] The NDP states that:

> It is even more frustrating for consumers to see that while they are being asked to pay 18% + in additional rates, executives at NSPI are getting record-breaking bonuses. CEO Chris Huskilson is reported to have gotten a bonus of more than $210,600 - an amount 10 times greater than the low-income cut-off many Nova Scotians live beneath.
>
> The Board must ensure that compensation of this nature, it if is deemed to be a necessity, is an expense borne fully by the shareholders.
>
> (NDP, Written Submission, p. 5)

[304] The Board heard the opinions of intervenors with respect to the manner and amount of incentives paid by NSPI. In response to Undertaking U-2, NSPI advised that the incentives are based on the combination of the company's Economic Value Added (EVA), the company's performance and individual Scorecard performance. The total value of incentives for 2004 is $4.0 million. While the Board continues to be concerned at the level of compensation paid to senior management at NSPI, it notes that no specific evidence

has been filed which suggests that the salaries are not appropriate. Intervenors have taken issue with incentives paid and the Board continues to be of the view that ratepayers should not bear 100% of this expense.

[305] The Board has considered Avon's recommendation that NSPI should be directed to file a report on its incentive plans which could then be reviewed by outside experts in this field. In the Board's view, the purpose of such a review would be to evaluate NSPI's incentive compensation plan—its design and application—to determine whether it delivers an equal benefit to shareholders and ratepayers which would warrant the 50/50 costs-sharing currently in place. The Board finds this to be a worthwhile suggestion and, accordingly, orders NSPI to file such a report within six months of the date of this decision. The Board will engage independent experts to review this report and provide their opinion to the Board.

9.11 Burnside Combustion Turbine Units and Tufts Cove LM6000

[306] The Company currently has four combustion turbines at its Burnside location which are oil fired. In August of 2004, NSPI reactivated a request for approval of a capital expenditure to convert these units to gas fired turbines. The Board advised NSPI on November 25, 2004 that this request was not approved. The Board notes that costs related to this project are included in NSPI's 2005 OM&G expenses. Since following NSPI's application for a rate increase this project was not approved, the Board directs NSPI to eliminate any expenses related to the proposed conversion in the 2005 test year expenses in its Compliance Filing. While the project cost was $5,200,000, in its response

to Board IR 213, Exhibit N-29, NSPI estimated that eliminating expenses associated with this project from the 2005 test year would amount to approximately $554,000.

[307] In addition, as noted in the section of this decision on the SA, a new LM6000 unit, previously owned by Emera and transferred to NSPI, is now installed at Tufts Cove generating station. In its application, NSPI has included the cost of operating this additional LM6000 combustion turbine generator at Tufts Cove. It states:

> The Company's Tufts Cove generating station is comprised of three dual-fired generators, and one LM6000 natural gas-fired generator (with a second scheduled to be added by the end of 2004). ...
>
> (Exhibit N-1, p. 29)

The addition of this unit was not complete at the time of the hearing. As set out earlier, the Board approved the installation of this unit in March of 2004, on a conditional basis. The Board has received the report of PwC and Stone & Webster Canada L.P, the experts engaged by the Board to determine the appropriate transfer price for this unit. The expert's report sets the fair market value at $17,954,016, which is $841,004 less than the $18,795,020 originally proposed by NSPI. The Board, in a separate decision, approved the fair market value of the unit at $17,954,016, as recommended by the experts, and directed that NSPI's 2005 costs relating to the operation of this unit be reduced accordingly and reflected in NSPI's Compliance Filing. The Board estimates this reduction to be approximately $90,000.

10.0 SUMMARY OF DISALLOWANCES AND ADJUSTMENTS

[308] NSPI, in its June 23, 2004 filing, projected a revenue requirement for 2005 of $1,072.9 million. This represents an increase of $32.7 million over the May 28, 2004 filing which, in turn, had proposed a revenue requirement increase of $71 million.[42] Accordingly, in this application, NSPI seeks a revenue requirement increase of approximately $104 million.

[309] NSPI illustrates the increases sought from customers, including the resulting revenue cost ("R/C") ratios and total revenue requirement in the following table:

[42] Transcript, Nov. 16/04, pp. 27-28

	Current Revenue	May 28th Submission Costs	Proposed Revenues	Revenue Increase	Revenue % Increase	R/C Ratios	June 23rd Submission Costs	Proposed Revenues	Revenue Increase	Revenue % Increase	R/C Ratios

Exports			**$7.3**					**$7.3**			
Miscellaneous			**$11.9**					**$11.9**			
Total Revenue Requirement			**$1,040.2**					**$1,072.9**			

(Excerpt from Exhibit S-1, Rate Changes, p. 1)

[310] As the Board has outlined in this decision, a number of disallowances and adjustments have been made which reduce NSPI's 2005 revenue requirement. These are set out below:

Disallowances and Adjustments	
ITEM	**DISALLOWANCES AND ADJUSTMENTS**
Disallowance - fuel costs	$18,000,000
Reduced ROE of 9.55%	$6,900,000
Deferral of s. 21 costs for 2005	$21,400,000
Extend depreciation period for 2 LM6000s from 30 to 20 yrs.	$1,300,000
Deferral of Depreciation phase-in	$5,000,000
Eliminate Operating Cost of Burnside CT conversion	$554,000
Cost Reduction - Tufts Cove LM6000 Unit 5	$90,000
Total disallowances and adjustments	**$53,244,000**

[311] The Board understands that the $53,244,000 disallowances and adjustments listed above are estimates based on the evidence filed during the hearing. The Board also estimates that, because of tax impacts, the $53,244,000 in disallowances and adjustments will result in a reduction of approximately $70 million in NSPI's test year revenue requirement. The Board directs NSPI, through the Compliance Filing, to confirm the actual reduction in revenue requirement which flows from this decision.

[312] As noted earlier, NSPI requested an increase in its revenue requirement of approximately $104 million. This request resulted in a proposed average increase for above-the-line customers of 12.4%, with an increase of 14.1% for domestic customers. The disallowances and adjustments directed by the Board and noted above, are expected to result in an approximate average rate increase of 5.3% for above-the-line customers. Most above-the-line customers, including domestic customers, can expect a rate increase of approximately 6.1%. The increase in rates for ATL customers (other than municipal utilities)

is effective April 1, 2005. For the reasons set out in this decision, all below-the-line customers will see an increase of 10.4% in rates, effective January 1, 2005.

[313] The Board continues to be of the view expressed in the 2002 rate case decision that it is desirable to maintain, where reasonable, an R/C ratio of 95% to 105%. The Board recognizes that the General Demand rate category did not fall within the 95% to 105% R/C range in 2002. The Board believes it is fair and reasonable, in terms of the impact on other ATL customers, for this rate group to be gradually moved to the 95% to 105% R/C ratio. It directs NSPI to base its adjustments in the Compliance Filing on the principles noted above.

11.0 SUMMARY OF BOARD FINDINGS

11.1 Rate Increase Despite Pending Power Outage Review

[314] As part of the outage review, the Board has received a number of comments from members of the public questioning, among other things, why NSPI's request for a rate increase should be considered when the service provided by NSPI is, in the view of these customers, inadequate and unsatisfactory.

[315] While the Board recognizes the logic of this reaction, it is important to understand why this form of sanction cannot reasonably be applied to a regulated utility. Providing electricity to all communities in the Province was not (and likely still is not) financially feasible for private, competitive companies. For that reason, the Province's electric service supplier is a cost-of-service monopoly. In return for undertaking and continuing the costs of electrification of the Province, the Utility is permitted, under the **Act**, to recover the reasonable and prudent costs of providing this service.

[316] Rates charged to customers are based on costs incurred by the Utility in providing service. If the Board finds certain costs to be imprudent or unreasonable, it can (and has) disallowed such expenditures and reduced proposed rate increases accordingly. The Board cannot, however, make rate decisions based solely on reliability issues or current public opinion of the Utility. There are appropriate sanctions a regulator can impose should a Utility be found to have an inadequate or unreliable system. In many cases, it is likely such sanctions would involve higher expenditures, rather than reductions in costs. However, the practical reality in a regulated utility environment is that sanctions for service-related issues do not generally include a moratorium on rate increases.

11.2 Settlement Agreement

[317] The Board concludes that acceptance of the Settlement Agreement (“SA”) is not warranted in this case. The Board wishes to make it clear that its conclusion is based on certain unacceptable terms in the SA and is not as a result of a negative view on the Board’s part regarding SAs in general. The principal reason for rejection of the SA concerns fuel. If the SA were to be accepted by the Board, the significantly higher cost of fuel projected by NSPI would be passed on to ratepayers, either in 2005 or, in later years, by deferral. The evidence heard by the Board during the rate hearing simply does not warrant this result.

11.3 Fuel Procurement Strategy and Prudency

[318] NSPI, in the Board’s view, failed to address its imported coal procurement problems quickly or efficiently enough, following the 2002 rate hearing and decision, to adequately protect itself or its ratepayers. As a result, NSPI and its ratepayers face higher than necessary costs. The Board finds that NSPI has been imprudent in its fuel procurement practice and the cost of fuel and purchased power approved by the Board for the 2005 test year is reduced by $18 million. The Board wishes to make it clear that, in its view, this is not a reflection on the integrity or intentions of individuals, particularly those who were part of NSPI’s fuel decision-making process. It does, however, reflect a corporate philosophy which did not change with the urgency and purpose required in the circumstances.

11.4 Affiliate Activity

[319] Fuel procurement decisions should not be overseen or influenced by individuals whose work relates primarily to unregulated affiliates. As a result, the Board directs that Todd Sattler, so long as he continues to be an employee of Emera Energy or Emera Energy Services, or any other unregulated affiliated company, no longer participate in NSPI's fuel strategy table. While the Board understands the similar concerns expressed regarding Mr. Huskilson's participation in the fuel strategy table, it is not prepared, in view of his positions with Emera and NSPI, to direct his removal from the fuel strategy table and decision-making process at this time.

[320] NSPI is also directed to promptly engage high level in-house expertise to lead the imported coal supply aspect of its fuel procurement process and to establish a more efficient and accountable decision-making structure with respect to fuel procurement. NSPI is directed to file a report with the Board, within six months from the date of this decision, outlining the implementation of the changes noted above. The Board will engage the services of independent fuel experts to review the adequacy of NSPI's actions to address this issue. In addition, along with the current review on NSPI's annual filing on affiliate transactions performed by an accounting firm, the Board will also retain fuel audit experts to examine and express their opinions on affiliate transactions, including export sales and natural gas sales.

11.5 Fuel Adjustment Mechanism (FAM)

[321] The Board recognizes that FAMs exist in many other jurisdictions and can, potentially, be a positive and useful regulatory tool. However, in view of the Board's findings with respect to imprudence and inadequacies in NSPI's fuel procurement practices, it would be quite inappropriate to approve a FAM at this time as the Board does not believe it is in the public interest to transfer the risk of fuel price volatility to ratepayers when NSPI's ability to achieve the best possible fuel price is in question.

[322] Should NSPI apply for approval of a FAM in future, the Board will order an independent audit by Board-appointed fuel experts of NSPI's overall progress and performance with respect to necessary fuel procurement improvements. This audit would form part of the evidence the Board would consider in a future FAM application.

11.6 Return on Equity (ROE) and Capital Structure

[323] The Board believes that an ROE of 9.55% is fair and reasonable in the circumstances. The ROE requested by NSPI is, in the opinion the Board, too high given the current economic climate. The Board approves an ROE at 9.55% for the purpose of setting rates, with the earnings range set at 9.30% to 9.80%.

[324] The Board approves the proposed increase in the common equity ratio for ratemaking purposes from 35% to 37.5%. The Board is satisfied that the strengthening of the balance sheet in this way is desirable in the current economic climate and reflective of Emera's common equity ratio.

[325] The Board directs NSPI to use a return on rate base methodology for the next rate application. It is not necessary, nor is there sufficient evidence on this point, in the Board's view, to determine in this proceeding if NSPI is correct in its suggestion the revenue requirement should not be impacted by this change.

11.7 Section 21 Tax Costs and Amortization

[326] Generally, taxes are a reasonable cost which utilities are expected to recover. The **s. 21** taxes owed by NSPI fall into this category. The Board finds that there is not sufficient evidence to establish that NSPI acted imprudently in its decision not to pay the full amount of the **s. 21** at the earliest possible time.

[327] The Board is mindful that an appropriate balance needs to be achieved in easing the impact of this increase in costs on ratepayers without extending the recovery period for such a long period of time that intergenerational equity is compromised. The Board must balance what is a reasonable and fair amortization period with the interests of ratepayers and the avoidance of rate shock. The Board finds that amortization of the **s. 21** taxes should be deferred for 2005 and 2006 and, in 2007, amortization over an 8 year period should commence. The Board is satisfied that this approach is reasonable for ratepayers and NSPI and complies with the regulatory principle of intergenerational equity.

[328] The Board also finds that a levelized revenue requirement over the 8 year amortization period is appropriate. This approach will eliminate the \$21.4 million amortization in the 2005 test year and, according to NSPI's evidence, will result in an actual reduction in NSPI's 2005 revenue requirement of approximately \$32.7 million.

11.8 Operating, Maintenance & General Expenses (OM&G)

11.8.1 Pension Costs

[329] The Board is not persuaded that there should be any adjustment to the projected pension expense originally set out in the 2005 test year expenses. The evidence clearly indicates that NSPI used reasonable assumptions to calculate its pension costs. Accordingly, NSPI's estimated 2005 pension expenses of $26 million will not be reduced.

11.8.2 Miscellaneous Charges and Regulatory Amendments

[330] The Board is concerned with the significant increases (up to 100%) proposed for miscellaneous charges and finds the requested increases to be too high. The Board is of the opinion that a reasonable increase, under the circumstances, is equal to the average rate of increase for above-the-line rates rounded to the nearest dollar. This modest increase also reflects the Board's concern with NSPI's practice of including a 10% profit margin in its calculation of these charges which the Board finds to be inappropriate. NSPI is directed to address this practice in future applications.

[331] The Board approves the inclusion of the proposed new items, including a $7 charge per registered letter. The Board approves the language amendments proposed by NSPI as well as the amendments to expand the availability provisions of the Time-of-Day Rate.

11.9 Depreciation

[332] The Board directs NSPI to calculate depreciation expenses for the two LM6000 combustion turbine units at Tufts Cove Units 4 and 5, on the basis of a 30 year life rather than 20 years. The Board estimates that this will reduce NSPI's annual depreciation for these units by $1.3 million and directs NSPI to include this reduction in its Compliance Filing.

[333] In addition, the Board directs the deferral of year 2 of the 4-year phase-in of depreciation rates until 2006. This is similar to past decisions the Board has made to establish appropriate amortization periods and to defer and extend recovery periods for depreciation expenses. The Board expects this will reduce NSPI's 2005 depreciation requirement by approximately $5 million and the Board directs that this adjustment be included in NSPI's Compliance Filing.

11.10 Rate Assistance Program (RAP)

[334] The Board finds that it does not have the statutory authority to approve a RAP. It is almost certain that the RAP would result in the electricity bills of certain customers, depending on their income, being subsidized by other customers. In the Board's view, this is a social and public policy question which belongs to accountable elected officials in the Legislature rather than the Board.

11.11 Costs - Preliminary Hearing

[335] SEB, Avon and DLAS have requested that the Board order NSPI to compensate them for costs incurred in preparation for NSPI's requested preliminary hearing on a disclosure issue. The Board directs NSPI to file its response to the application for costs which has been filed by the parties by May 20, 2005. Avon, SEB and DLAS will have the opportunity to file additional written comments on this matter if they wish, by May 31, 2005. The Board will then review the submissions and rule on the matter at a later date.

11.12 Costs - Non-Profit Intervenors

[336] Both EAC and DLAS have requested costs to compensate them for their efforts in the hearing. NSPI has not addressed the request for costs by either of these parties in its submissions. The Board directs that NSPI file its response to these requests with the Board by May 20, 2005. DLAS and EAC will have an opportunity to file additional written submissions on this issue by May 31, 2005. The Board will then review the submissions and rule on the matter at a later time.

11.13 Demand Side Management (DSM)

[337] In the Board's view, further work and progress with respect to DSM is both important and necessary. A DSM hearing may be ordered in future. At present, however, the Board believes it is more appropriate to direct NSPI to initiate a technical conference

process, with interested parties and stakeholders, to pursue an improved and effective DSM program for the Utility.

11.14 Municipal/Industrial Linkage

[338] The Board is of the opinion that this is an appropriate time to de-link the Municipal and Industrial rate as there does not appear to be a reasonable or logical basis on which to continue the arrangement.

[339] The Board prefers Dr. Stutz's recommended proposal for distribution of revenue requirements and corresponding rate increases as a result of the separation of these two rates, and notes that NSPI concurs with this approach. NSPI is directed to incorporate this change in its Compliance Filing. The Board orders that the effective date of the rate increase for municipal utilities is May 1, 2005, and NSPI is directed to confirm the estimated 6.1% rate increase to the six municipal utilities as soon as possible. This provides an opportunity for these utilities to apply to the Board for a "pass-through" of this increase to their customers and mitigate the potential for lost revenue.

11.15 Annually Adjusted/Below-the-Line Rates

[340] The Board believes that equity, fairness and the unique circumstances of this case justify a departure from the conventional process for setting these rates. The Board needs to ensure that in this decision the Utility is aware of the revenue it will receive in 2005

from all rates and that this revenue is derived from a fair and reasonable division of responsibility between above-the-line and below-the-line customers.

[341] As a result, the Board finds that it is appropriate at this time to approve a 10.4% rate increase for all BTL customers, including GRLF customers, effective January 1, 2005. The increases in the BTL rates set by the Board are equitable. The principal parties affected by this ruling are SEB and NSPI. Of the $116 million in revenue produced by the BTL rates, the vast majority is paid by SEB. Had the SA, which NSPI and SEB both supported been accepted, the BTL rates paid by SEB would have been the same as those now approved by the Board.

11.16 Annually Adjusted/Below-the-Line Rates - Design Issues

[342] The Board agrees with Dr. Stutz's comments that discussion of the BTL rates is needed and, for that discussion to be useful, it needs to occur quickly following this decision. NSPI is directed to convene a meeting of stakeholders, as well as Dr. Stutz and Board staff, to review this issue and attempt to resolve current outstanding problems. The Board further directs that a report reflecting progress on this issue be filed with the Board by August 1, 2005. Should adequate progress not be made, NSPI has the option of requesting that the Board hear and resolve this matter.

11.17 Light Emitting Diodes (LED)

[343] The Board approves the post-hearing request of NSPI, consented to by HRM, for inclusion of a LED rate. The Board has reviewed this issue and finds it to be a beneficial step, both from the perspective of energy conservation and customer savings. In view of HRM's agreement, and since there is no negative financial impact on customers as a result of this change, the Board approves the revised methodology in the calculation of this rate. NSPI is directed to incorporate the revisions to its existing rate, effective February 1, 2005.

11.18 Load Forecasting

[344] The Board is concerned about NSPI's methodology of load forecasting and directs NSPI to initiate meetings with Dr. Stutz and Board staff to attempt to resolve these concerns. The Board also directs that a report on the progress of improvements to NSPI's load forecasting methodology be filed by December 1, 2005.

11.19 Incentive Compensation

[345] While the Board continues to be concerned at the level of compensation paid to senior management at NSPI, it notes that no specific evidence has been filed which suggests that the salaries are not appropriate. Intervenors have taken issue with incentives paid and the Board continues to be of the view that ratepayers should not bear 100% of this expense.

[346] The Board directs NSPI to file a report on its incentive plans which could then be reviewed by outside experts in this field. The purpose of such a review is to evaluate NSPI's incentive compensation plan—its design and application—to determine whether it delivers an equal benefit to shareholders and ratepayers which would warrant the 50/50 costs-sharing currently in place. The Board orders NSPI to file such a report within six months of the date of this decision. The Board will engage independent experts to review this report and provide their opinion to the Board.

11.20 Burnside Combustion Turbine Units

[347] The Company currently has four combustion turbines at its Burnside location which are oil fired. In August of 2004, NSPI reactivated a request for approval of a capital expenditure to convert these units to gas fired turbines. The Board advised NSPI on November 25, 2004 that this request was not approved. The Board notes that costs related to this project are included in NSPI's 2005 OM&G expenses. The Board directs NSPI to eliminate any expenses related to the proposed conversion in the 2005 test year expenses in its Compliance Filing. It is estimated that, based on NSPI's evidence, eliminating the expenses associated with this project from the 2005 test year will amount to approximately $554,000.

11.21 Tufts Cove LM6000 Unit

[348] A new LM6000 unit, previously owned by Emera and transferred to NSPI, is now installed at Tufts Cove generating station. The addition of this unit was not complete

at the time of the hearing. The Board approved the installation of this unit in March of 2004, on a conditional basis. The Board has received the report of PwC and Stone & Webster Canada L.P, the experts engaged by the Board to determine the appropriate transfer price for this unit. The expert's report sets the fair market value at $17,954,016, which is $841,004 less than the $18,795,020 originally proposed by NSPI. The Board, in a separate decision, has approved the fair market value of the unit at $17,954,016, as recommended by the experts, and directed that NSPI's 2005 costs relating to the operation of this unit be reduced accordingly and reflected in NSPI's Compliance Filing. The Board estimates this reduction to be approximately $90,000.

11.22 Disallowances and Adjustments/Rate Increase

[349] The Board has made disallowances and adjustments totalling $53,244,000. It estimates that, because of tax impacts, this will result in an approximate $70 million actual reduction of NSPI's test year revenue requirement. This, in turn, is expected to result in an average rate increase of approximately 5.3% for above-the-line customers, with an estimated rate increase of approximately 6.1% for most of these customers, including domestic customers. The increase in rates for most above-the-line customers is effective April 1, 2005. All below-the-line customers will see an increase of 10.4% in rates, effective January 1, 2005.

An Order will issue accordingly.

DATED at Halifax, Nova Scotia, this 31st day of March, 2005.

Margaret A. M. Shears, Vice-chair

APPENDIX - C

Code of Conduct and Order

Schedule “A” to Board Order dated November 9, 2004

NOVA SCOTIA POWER INC.
CODE OF CONDUCT
Effective January 1, 2005

1.0 PURPOSE

1. The primary purpose of this Code of Conduct is to ensure that transactions between Nova Scotia Power Inc. (NSPI) and its affiliates[1] demonstrate a benefit to the customers of NSPI.

2.0 STATEMENT OF PRINCIPLES

2.1 NSPI’s management will conduct the company’s transactions with affiliates in such a way that its utility customers benefit from such transactions.

2.2 NSPI’s customers will not otherwise bear the risks or share the rewards of an affiliate’s activities.

2.3 Competition in markets where NSPI’s affiliates are active will not be impaired by non-market behaviour by NSPI.

3.0 CORPORATE STRUCTURE

Objectives

To separate regulated electric and other utility services[2] from affiliate activities.

---

[1]For the purpose of this Code of Conduct, the term “affiliate” shall be interpreted in accordance with Sections 2(2), 2(3), and 2(4) of the Nova Scotia Companies Act.

[2]Regulated electric and other utility services are those covered by the Public Utilities Act.

Protocols

3.1 EMERA, the parent company of NSPI, will create and maintain a corporate organizational structure which ensures that regulated electric and other utility services are provided solely by NSPI and by no other affiliate.

3.2 NSPI will maintain a complete list of all of its affiliates. The list will include the name and address of each affiliate, a brief description of its activities and the names, addresses and telephone numbers of all of its officers. The list will be kept on open file with the Nova Scotia Utility and Review Board (Board).

4.0 UTILITY MANAGEMENT

Objectives

To dedicate to the provision of regulated services, in terms of quality and numbers, a management team capable of maintaining a superior level of performance, at the same time as NSPI affiliates are expanding into other business activities.

Protocols

4.1 NSPI will maintain a management team capable of delivering a superior level of performance.

4.2 NSPI will prepare and submit to the Board an annual report which summarizes utility performance. The report format, and contents thereof, shall be agreed upon in advance between NSPI and the Board.

5.0 UTILITY FINANCING

Objectives

To maintain a capital structure for NSPI which is in accordance with applicable Board decisions.

Protocols

5.1 NSPI's capital structure will reflect the Board approved capital structure.

5.2 NSPI's capital structure will not be used to subsidize affiliate activities. Affiliate risks or losses will not be borne by NSPI's customers.

5.3 NSPI shall not, without the prior approval of the Board, provide loans to, guarantee the indebtedness of, or invest in securities of an affiliate.

6.0 FAIR DEALING

Objectives

To avoid discrimination in the matter of pricing or in any other manner against non-affiliated buyers of regulated electric utility services.

To avoid NSPI subsidizing or being subsidized by the activities of affiliates.

Protocols

6.1 NSPI will provide access to regulated utility services on a non-discriminatory basis and will not in respect of those utility services directly or indirectly state, imply or offer any preference or favoured treatment to NSPI's affiliates or persons purchasing affiliate goods and services.

6.2 The financial records of NSPI, as well as NSPI's information systems, will be kept separate from those of its affiliates.

6.3 NSPI will not provide confidential customer information to affiliates or other persons without prior customer consent.

6.4 NSPI will provide customer information to NSPI affiliates and non-affiliates in a non-discriminatory manner.

6.5 NSPI will charge Board approved rates for all regulated electric and other utility services provided to affiliates.

6.6 NSPI will charge and be charged a market rate of return for any assistance it provides to or receives from affiliates by way of a guarantee or loan.

6.7 NSPI will charge and be charged prices which reflect fair market value for all non-regulated utility goods and services provided to affiliates or purchased from affiliates, provided that in no case shall NSPI supply such goods and services at a loss.

6.8 Where prices based on market value cannot be established, NSPI will charge prices which reflect the utility's fully-allocated costs for the goods and services provided.

6.9 Where a capital asset is transferred from NSPI to an affiliate or from an affiliate to NSPI, that asset will be transferred at a price to be approved by the Board in advance.

6.10 The costs of corporate support services[3] will be fairly allocated between NSPI and its affiliates. The allocation factor employed will depend on the nature of the corporate support services.

6.11 Before an activity is transferred from NSPI to an affiliate or from an affiliate to NSPI, NSPI must ensure there is a demonstrated benefit to its customers.

7.0 ACCOUNTING COMPLIANCE

Objectives

To separately and fully account for the value of goods, services, financial and other support delivered to or from NSPI and its affiliates.

Protocols

7.1 NSPI shall report annually to the Board the following information:

(a) A detailed listing of all assets, services and products provided to and from NSPI and each of its affiliated companies.
(b) Each item on the listing should indicate the price received or paid and, as appropriate, the relevant fully allocated costs or market values.
(c) Where fair market value is used, an explanation should be provided as to how the value was determined, including the comparative source for the value.
(d) Where cost allocations are involved, a description of the cost allocators and methods used to make the allocations should be included.
(e) A summary of corporate services and the methodology for ensuring fair allocations of these costs.

[3]Corporate support services are those Management and Administrative services which are provided to affiliates by NSPI. Examples include Board of Directors' costs, Public and Regulatory Affairs, Finance and Administration, Corporate Services, Legal, Human Resources and Information Technology.

7.2 NSPI shall submit an annual report to the Board by its external auditors, in a form satisfactory to the Board, which indicates whether the company is in compliance with the provisions of this Code of Conduct.

7.3 NSPI shall submit to the Board annually, all internal Code of Conduct implementation guidance along with a summary of significant interpretations or judgements made by NSPI related to the Code during the year.

7.4 In order to monitor compliance, the Board at any time may review the records of NSPI and, so far as is required for this sole purpose, the records of NSPI affiliates.

8.0 EMPLOYEE COMPLIANCE

Objectives

To ensure understanding of and compliance with this Code of Conduct.

Protocols

8.1 NSPI will inform all its managers and employees directly involved in affiliate activities of their expected behaviour relative to the Code of Conduct and will undertake annual management reviews to ensure compliance.

9.0 GENERAL

9.1 All reports referred to in this document shall be provided by April 30 in respect of each preceding year.

9.2 This Code of Conduct replaces the Interim Code of Conduct and shall become effective on January 1, 2005.

ORDER **NSUARB - NSPI-P-167**

IN THE MATTER OF THE PUBLIC UTILITIES ACT

-and-

IN THE MATTER OF AN INTERIM CODE OF CONDUCT to govern the relations between **NOVA SCOTIA POWER INC.** and its **AFFILIATES**

BEFORE: **Margaret A.M. Shears, Vice-chair**
Kulvinder S. Dhillon, P. Eng., Member
John A. Morash, C.A., Member

ORDER

WHEREAS Nova Scotia Power Inc. (NSPI) is a body corporate incorporated pursuant to the *Companies Act* and is engaged in the production and supply of electrical energy in Nova Scotia;

AND WHEREAS NSPI is a public utility and its business activities are regulated by the Nova Scotia Utility and Review Board (Board) pursuant to the *Public Utilities Act*;

AND WHEREAS NSPI is the principal operating subsidiary of, and is wholly owned by Emera Inc. (Emera), formerly known as NS Power Holdings Incorporated, a body corporate incorporated pursuant to the *Companies Act* on July 23, 1998;

AND WHEREAS Emera, by itself and through subsidiaries other than NSPI, has a number of business interests and engages in a number of business activities which are not subject to regulation under the *Public Utilities Act;*

AND WHEREAS on March 16, 2001, the Board issued an Order approving an Interim Code of Conduct which states, as its purpose:

> The primary purpose of this Code of Conduct is to ensure that the customers of Nova Scotia Power Inc. (NSPI) are not harmed by transactions between NSPI and its affiliates[4].

[4]For the purposes of this Code of Conduct, the term "affiliate" shall be interpreted in accordance with Sections 2(2), 2(3), and 2(4) of the Nova Scotia Companies Act.

AND WHEREAS PwC, in a report to the Board dated April 22, 2002, concerning the Interim Code of Conduct, had recommended changes to Section 4.2, the combination of Sections 6.1 and 6.3, and the addition of Section 6.11;

AND WHEREAS in consideration of submissions on the Interim Code of Conduct by NSPI and Intervenors during NSPI's 2002 general rate hearing the Board, in its decision, stated that:

> The Board finds that it is not appropriate, at this time, to give final approval to the Interim Code of Conduct. There appears to be merit to the suggestion that Article 1.1 of the Code be amended to require that affiliate transactions must demonstrate a benefit to NSPI ratepayers as opposed to causing them no harm. The Board intends to retain independent consultants to review the implications of such a change, and also to review the desirability of making further changes in light of the recommendations contained in the PWC report, the evidence presented at the hearing, and the findings of the Board in this decision.

AND WHEREAS PricewaterhouseCoopers LLP (PwC) completed its review of the Interim Code of Conduct and issued a final report to the Board in August of 2004, noting a number of recommended changes;

AND WHEREAS the PwC report was provided to NSPI on August 16, 2004, for its comments prior to the Board's final determination in this matter, which were filed by NSPI on October 22, 2004;

AND WHEREAS NSPI, in its submission of October 22, 2004, agrees with PwC's recommended changes to Sections 4.2; the combination of Sections 6.1 and 6.3; and the addition of Section 6.11 as outlined in PwC's report of April 22, 2002;

AND WHEREAS in its 2004 report PwC recommended the following revisions to the Code in order to facilitate the change in the primary purpose of the Code from ensuring that NSPI's transactions with its affiliates does "no harm" to its customers to ensuring such transactions "demonstrate a benefit" to NSPI's customers:

> **Changes to the Interim Code recommended pursuant to item 1.b.**
>
> Section 1.1: replace the words from "the customers" to "affiliates" with the words "transactions between Nova Scotia Power Inc. (NSPI) and its affiliates demonstrate a benefit to the customers of NSPI." (retain footnote 1 against the word "affiliates")
>
> Section 2.1: replace this section with the words "NSPI management will conduct the company's transactions with affiliates in such a way that its utility customers benefit from such transactions."
>
> Section 2.2: renumber as Section 2.3

Section 2.2: read as follows “NSPI’s customers will not otherwise bear the risks or share the rewards of an affiliate’s activities.”

Section 6.11: Replace the clause recommended in our April 22, 2002 report with “Before an activity is transferred from NSPI to an affiliate or from an affiliate to NSPI, NSPI must ensure there is a demonstrated benefit to its customers.”

AND WHEREAS PwC also identified the following issues in its August, 2004 report:

It must be made clear that, while we do not advocate the approval or disapproval of implementation guidelines, this is still essential information for the Board to utilize when reviewing compliance with the Code. The principles approach gives NSPI the responsibility for developing implementation guidance and, at least initially, applying its own judgements to inter-corporate transactions. However, this approach is only effective if these interpretations and judgements are reported or made available to the Board. This point seems to be fairly clear in Section 7.1 of the Code. The actual information filed by NSPI on April 30, 2003 does not, for example, comply with Sections 7(b), 7(c), or 7(d). As well, only part of the information required by Section 7(c) has been filed.

We do not recommend that the Board change the Code of Conduct to make the Guidelines subject to approval.

However, for clarity, we recommend the following amendment to the Code:

Renumber 7.3 to 7.4.
Add:
7.3 NSPI shall submit to the Board annually, all internal Code of Conduct implementation guidance along with a summary of significant interpretations or judgments made by NSPI related to the Code during the year.

and

The Code of Conduct section 7.2 indicates that “NSPI shall submit an annual report to the Board by its external auditors in a form satisfactory to the Board”. We recommend clarifying with NSPI that the Board expects that all items where judgement has been applied be disclosed as significant interpretations in this report, and, that these interpretations, where applicable, should refer to specific line items in the Affiliate Transaction Report. No changes to the Code are suggested as the above noted provision provides the Board with the ability to improve the current reporting.

As noted above, the Affiliate transaction information filed by NSPI on April 30, 2003 does not appear to comply with the reporting protocols in Section 7(b), 7(c), 7(d) or 7(e). This is not addressed in the audit report, the management letter or the summary of unadjusted differences.

Recommendation
We recommend that the Board request that NSPI re-file the NSPI/Affiliate Transaction Report and amend it so that it includes the information required by the Code of Conduct.

AND WHEREAS NSPI, in its October 22, 2004 submission, agrees with all but two of PwC's recommendations for revisions to the Code, stating that;

> NSPI is strongly opposed to the consultant's recommendation to replace the Code's current "no-harm" framework with a mandated benefit approach. ...

and

> ... We are opposed to the Consultant's recommendation that the Code be revised to require annual filings of the Guidelines. ...

AND WHEREAS the Board has carefully considered the reasons provided by NSPI for its objection to these changes but agrees with PwC when it states that:

> We conclude that both in terms of expectable normal business behaviour and in terms of NSPI's management intentions and practices, the replacement of the "no harm" criterion by a requirement that transactions must "demonstrate a benefit" would represent a reasonable amendment to the Code, which would not work a hardship on NSPI.

AND WHEREAS the Board agrees with PwC's recommended changes to the Code as outlined by PwC and the Board also agrees that NSPI should re-file its most recent Affiliate Transaction Report to include the information required by the Code of Conduct;

IT IS HEREBY ORDERED THAT the Interim Code of Conduct be revised in accordance with the recommendations of the 2004 PwC report and that the revised Code, attached as Schedule "A" to this Order, shall become the final version of the Code of Conduct, effective January 1, 2005.

IT IS FURTHER ORDERED THAT NSPI's most recent Affiliate Transaction Report be revised and re-filed, in accordance with PwC's recommendation, by March 31, 2005.

DATED at Halifax, Nova Scotia, this 9th day of November, 2004.

____
Clerk of the Board

Northland Utilities (Yellowknife) Limited, 2005/06 General Rate Application, Board Decision 12/2005

Northwest Territories Public Utilities Board

August 18, 2005

Ms. Judith Goucher
Director & CFO, Dept. of Finance

TABLE OF CONTENTS

1. INTRODUCTION and APPLICATION

By letter dated December 31, 2004, Northland Utilities (Yellowknife) Limited ("**Northland**") submitted to the Northwest Territories Public Utilities Board ("**the Board**") a General Rate Application ("**GRA**", "**Application**") for the 2005/2006 test period ("**Test Years**") (Ex. 2).

In its Application, Northland requested that the Board:

a) Determine the Company's revenue requirement for each of the forecast test years 2005 and 2006;
b) Approve rate schedules;
c) Approve the revised Terms and Conditions of Service.

Pursuant to the provisions of section 13.(1) of the Rules of Practice and Procedure, the Board, by letter dated January 5, 2005 directed Northland to publish notice of the public hearing of the GRA in newspapers that circulate in the Northwest Territories. The notice provided details of the GRA and invited interested persons to file a request with the Board for intervenor status (Ex. 1).

The City of Yellowknife ("**the City**") and the Northwest Territories Power Corporation (**"NWTPC"**) registered their respective interventions with the Board. Ecology North of Yellowknife **("EN", "Ecology North")** indicated an interest in the proceeding, by letter dated January 26, 2005. The Yellowknife Chamber of Commerce also indicated an interest in the proceeding, by way of a fax dated January 27, 2005.

The Board and the City submitted information requests, to which Northland responded on or about March 4, 2005 (Ex 3).

Ecology North submitted a Proposal on March 9, 2005 seeking the Board's direction to Northland to institute an appliance rebate program **("ARP")** during the test period (Ex 5).

By letter dated March 10, 2005, Northland requested Board approval to proceed with a proposed meeting from March 16-18, 2005 to arrive at a Negotiated Settlement for Northland's 2005/2006 GRA. Northland identified the issues to be discussed at the negotiation meeting in the letter.

By letter dated March 14, 2005, the Board provided direction to Northland that the negotiated settlement should be confined to Phase I matters. Phase I matters involve the determination of the revenue requirements, forecast revenues and revenue deficiency/excess for the test years. Further the Board directed that should the negotiations result in a settlement on Phase I matters, Northland should refile affected portions of its Application reflecting the Settlement at a level of detail comparable to the Phase I filing.

A Comprehensive Phase I Negotiated Settlement ("**the Settlement**") dated March 24, 2005 was filed with the Board on March 31, 2005, together with letters of endorsement from all interested parties (Ex 6). By letter dated April 8, 2005, Northland refiled the affected portions of its application reflecting the Settlement. The revised rates also reflect corrections to the Franchise Tax allocation identified in information request YK-NUL-YK-25.

By letter dated April 11, 2005, the Board notified parties of a hearing to consider the Phase I Settlement and to consider Phase II matters involving rates, rate design and terms and conditions of service.

The Board submitted Information Request #2 to Northland respecting the Settlement, to which Northland responded on May 13, 2005.

The Board and Northland submitted information requests to Ecology North respecting its appliance rebate program proposal, to which Ecology North responded on May 13, 2005 (Ex 4).

2. PUBLIC HEARING

Public Notice of the hearing was published in the *Yellowknifer* on June 1, 2005 and in the *News/North* on June 6, 2005 (Ex 1). The hearing was held in the City of Yellowknife on June 22, 2005.

During the course of the hearing, members of the public who had not initially requested intervenor status were invited to participate in the proceeding.

Northland provided responses to the undertakings given at the hearing, at the conclusion of the hearing prior to the commencement of final submission by parties.

Final submissions were presented by Northland, the City and Ecology North. Northland presented reply submission to the submissions of other parties.

3. PHASE I NEGOTIATED SETTLEMENT

Northland filed for approval of the Settlement including approval of the revenue requirements of $27,827.000 for 2005 and $28,520,000 for 2006. Northland indicated that the Settlement was arrived at as a "package deal" between Northland and interested parties. The interested parties who are signatories to the Settlement are the City and NWTPC

The Settlement is attached hereto as Appendix A. The revised Phase I schedules, filed April 8, 2005, reflecting the changes agreed to in the settlement are attached hereto as Appendix B.

The following table provides a comparison of the rate base, revenue requirement, revenues at existing rates and revenue deficiency/excess as per the application and as per the Settlement:

Northland Utilities (Yellowknife) Limited
2005 - 2006 General Rate Application
Utility Revenue Requirement
($000s)

Line No.	Description	per Application Forecast 2005	per Application Forecast 2006	Negotiated Settlement Forecast 2005	Negotiated Settlement Forecast 2006	Variance	
1	**Revenues**						
2	Retail revenues at existing rates	27,539	28,073	27,564	27,947	25	(126)
3	Other revenue	292	298	292	298	-	-
4	**Total Revenues**	27,831	28,371	27,856	28,245	25	(126)
5							
6	**Costs**						
7	Purchase power	22,163	22,572	22,185	22,414	22	(158)
8	Operations and maintenance	2,106	2,168	2,077	2,113	(29)	(55)
9	Taxes other than income	736	756	725	740	(11)	(16)
10	Amortization of deferred costs/credits	(54)	(54)	(54)	(54)	-	-
11	Depreciation	1,356	1,509	1,104	1,259	(252)	(250)
12	Amortization of contributions	(69)	(79)	(69)	(79)	-	-
13	Return on rate base	1,599	1,783	1,532	1,723	(67)	(60)
14	Income taxes	536	678	327	404	(209)	(274)
15	**Total Costs**	28,373	29,333	27,827	28,520	(546)	(813)
16	Revenue Deficiency/(Excess)	(542)	(962)	29	(275)	571	687
17	Rate Base	20,200	22,397	20,284	22,774	84	377

The Board has a statutory duty to regulate in the broad public interest. The negotiated settlement process must not fetter the Board's ability and discretion to take into account any public interest considerations, which may extend beyond the immediate concerns of the parties to the negotiations. If the Board is not satisfied that a Settlement is in the public interest, it must reject the Settlement.

In Sections 3.1 and 3.2, the Board will examine and comment on the individual components of the settlement and determine whether the settlement taken as a whole is fair and whether approval is in the public interest.

3.1. INDIVIDUAL COMPONENTS OF THE SETTLEMENT

3.1.1 Revenues

The adjustments to sales revenues resulting from the Settlement reflect corrections of certain errors in the residential and commercial sales volume forecasts in the original filing. These errors were identified in the responses to BR NUL YK 4 and BR NUL YK 5.

The Board's examination of forecast sales and revenues as per the Settlement has not resulted in any exceptions requiring further Board comment.

3.1.2 Purchased Power/Losses

The changes in purchased power costs reflected in the Settlement primarily reflect the changes in sales volumes referred to above.

One of the components of the cost of purchased power is line loss. Parties have agreed to set the line loss factor for 2005 at 6% and the line loss factor for 2006 at 5.8%. In its Application, Northland used a 5-year average of actual line loss percentages from 1999 to 2003 for the purposes of forecasting the loss factors. Northland confirmed discussions on the impact that the 25 kV distribution plant conversion project would have on line losses did take place during the negotiation process.

Response BR NUL YK 54 indicates the actual line loss factor for 2004 to be 4.33%. During hearing examination, the Board staff questioned Northland on why the 2004 actual line loss percent is materially less than the forecast for 2004. Northland indicated the lower line loss percent in 2004 is due to the impact of unbilled revenues in 2004. Northland indicated its methodology for recognizing unbilled was unchanged from prior years. (Tr., p.29) Northland also indicated it would not be appropriate to look at one single year for line losses but rather an average line loss should be looked at. In this regard, Northland stated as follows:

> "...it's difficult to take a look at any specific year and -- and use the line loss percentage number from that year as reflective of the correct line losses. I think you need to look at it in several years, so you can take more of an average.
>
> I think we've had a previous year, I think it was 2003, but I could be incorrect on that, where we had lower than normal line losses, likely because we had a higher unbilled number booked that year.
>
> And then the next year it reverses around and you end up with a bigger line loss number. So I think you need to really look at the average line loss. (Tr., p.33, *ll.*11-22)

Board staff questioned Northland on whether it expects line loss percentages to change as the proposed 25 kV distribution plant conversion project progresses into the future. Northland's witness responded as follows:

> "MR. DOUG TENNEY: As we've indicated in some of our Information Requests during this Proceeding, line losses are -- they're difficult to quantify, there may -- they take into account a number of issues, including the load. It takes into consideration the configuration, the number of lines or the kilometers of lines that are in service, as well as the voltage of those lines.
>
> But all of that said, so all those come into play, but generally, I would agree with your statement, that as the 25 kV project progresses, we would expect to see line losses decrease, especially if that was the only change, if there was no change in load or any other kilometers of line in service, et cetera." (Tr., p.35, *ll*.6-19)

The Board staff also questioned Northland on the level of line losses and the merits of benchmarking Northland's line losses against the best practices of other distribution utilities. In response, Northland stated as follows:

> "MR. DOUG TENNEY: Again, I -- we can benchmark, but I can't be -- I don't think anyone could guarantee that we're doing an apples to apples comparison, and to say that -- that the Yellowknife system should be at a 3 percent, if -- if ENMAX is -- is at a 3 percent.
>
> But, it is -- there's no denying that it is a significant portion of our costs, and so we should be striving to have all other things being considered, because there's always -- there's always capital costs associated or O&M costs associated with reducing line losses.
>
> But it's certainly something that we should be striving for." (Tr., p.38, *ll*.16-25 & p.39, *ll*.1-4)

In its final submission, Northland submitted it is very cognizant of the impact that line losses have on its situation and would continue to monitor line losses. Further, Northland submitted that the 6% line loss supported by the negotiated settlement is reasonable and should be accepted by the Board. (Tr., p.135, *ll*.12-17)

The Board considers the accurate forecasting of line losses to be important since changes in line losses and line loss factors can have a significant impact on Northland's earnings. The Board notes Northland's view that any single year line loss percent should not be used for purposes of the forecast. The Board also notes, should the 2004 actual be included in the average used to calculate forecast line loss percentages, the line loss percentages would be 5.6% in 2005 and 5.5% in 2006 as shown in the table below:

	Loss Factor Calculation Per Northland Application	Loss Factor Calculation Using Most Recent 5 Years Including 2004
1999	6.2%	
2000	6.2%	6.2%
2001	5.6%	5.6%
2002	4.8%	4.8%
2003	7.1%	7.1%
		4.3%
Average 2005	6.0%	5.6%
Average 2006	5.9%	5.5%
Source: BR NUL YK 8 and BR NUL YK 54c)		

If the additional 0.1% reduction in line losses resulting from the Settlement were reflected for 2006 the line loss percent for 2006 would be 5.4%. The Board estimates using the 5.6% for 2005 and 5.4% for 2006, based on the most recent 5 year average line loss percentages including 2004, would result in a reduction of $73,000 in 2005 and $74,000 in 2006 in the purchased power costs agreed to by the parties.

Having examined the foregoing, the Board has certain concerns with the loss factors implicitly reflected in the Settlement. First, the loss factors of 6% for 2005 and 5.8% for 2006 do not reflect the most recent actual data including the actual losses for 2004. However, the parties did not have the 2004 actual information at the time of the negotiations. Since the method of recording unbilled revenues did not change in 2004, the Board has no reason to believe 2004 recorded loss factor is an outlier. The Board is concerned that the line loss percent based on the most recent data is not reflected in the Settlement.

Second, the Board is concerned that the method of determining the annual loss factor, the level of which is driven largely by the amount of unbilled revenues at year end, may be causing fluctuations in the loss percent from year to year. The Board understands unbilled revenues at year end to result from cycle billings which the Board expects ought to be a relatively stable number from year to year subject to growth in unbilled.

The Board notes the 25 kV distribution plant replacement program commences in 2005 and will continue into 2012. Given the expected improvement in line losses resulting from the ongoing 25kV distribution plant replacement project, the Board expects the use of 5 year average line loss percentages for forecasting purposes could result in delaying or staggering any annual reductions from the 25 kV conversion project being fully reflected in rates. The absence of a transparent method for determining line losses for a given year with reasonable accuracy is a concern for future line loss determination. However, the Board infers from the 0.1% reduction in the 2006 proposed loss factor that parties appear to have addressed this issue as part of the Settlement for this GRA.

The Board will address the foregoing concerns respecting line losses in Section 3.2 of this Decision.

3.1.3 Operations and Maintenance (O&M) Expense

The Parties agreed to a reduction in O&M expense of about $29,000 or 1.4% in 2005 and $55,000 or 2.5% in 2006.

The Board's examination of the O&M expense component of revenue requirement as per the Settlement has not resulted in any exceptions requiring further comment.

3.1.4 Taxes Other than Income

Taxes other than income were adjusted for the impact of the Settlement on franchise fees.

The Board's examination of the taxes other than income component of revenue requirement as per the Settlement has not resulted in any exceptions requiring further comment.

3.1.5 Depreciation

The parties agreed that the amortization of the investment in existing substation equipment (account 477.10) and existing line transformers (account 479.10) being replaced by the conversion to a 25 kV system would be extended over 15 years as opposed to the 8 years initially proposed by Northland. Northland acknowledged this extension of the amortization period essentially reduces the impact of the retirement of the existing assets on customers.

The parties also agreed to change the amount for amortization of reserve differences for computer hardware (Account 483.20) and transportation equipment (Account 484.10). Northland provided the rationale for this change as follows:

> "MR. DENNIS DE CHAMPLAIN: The amortization of the differences when it exceeds -- when it exceeds ten (10) years we typically invoke amortization -- the amortization of differences.
>
> In our Application it did have an amortization of differences, even though it was under that ten (10) year threshold. I think they were two (2) and two point seven (2.7) years respectively. So, we removed that adjustment for the amortization as part of the negotiated settlement." (Tr., p.59, *ll*.2-11)

Northland noted, after the above adjustments, the method of amortizing reserve differences for accounts 483.2 and 484.10 will be consistent with that for other asset accounts. (Tr., p.60)

The Board's examination of the depreciation component of revenue requirement as per the Settlement has not resulted in any exceptions requiring further comment.

3.1.6. Return on Rate Base

The parties agreed to a common equity ratio of 39.60% in 2005 and 39.57% in 2006. Further the parties agreed to include consumer deposits in the capital structure. The parties also agreed to a return on common equity of 10% for each of 2005 and 2006. The Parties agreed that the forecast cost of debt will be reduced in each of 2005 and 2006. As a result of these changes, the return on rate base was reduced by $67,000 in 2005 and $60,000 in 2006.

The parties also agreed to deferral account treatment of the 25 kV conversion plant additions, as a risk mitigation mechanism. Northland described the mechanics of the deferral account as follows in its application:

> "The deferral account will be calculated by applying the before tax return on rate base percentages approved by the Board in this application to the total variation in the additions to the 25kV conversion project. In addition the variance on the depreciation expense as well as income taxes resulting from changes in the CCA on these additions will be included in the deferral account.
>
> Carrying costs on the outstanding balance in this deferral account will be applied at Bank of Canada rate plus 1.5%. This carrying cost rate is consistent with the EUB policy IL 2000-1 on interest rates.
>
> The carrying costs will be calculated on the outstanding balance in this deferral account and will commence on January 1 of the year following the year on which the before tax return was calculated. The carrying costs will continue until all amounts have been refunded to or recovered from customers. An application will be made by the end of the second quarter of the year following the year in which the before tax return was calculated to dispose of the balance accumulated in the deferral account. This will result in the first deferral account application on the 2005 test year taking place by the end of the second quarter in 2006.
>
> This deferral account will remain in place until Northland Utilities (Yellowknife) Ltd.'s next GRA application." (Ex. 2; p.7-11 & 7-12)

In its final submission, Northland submitted as follows with respect to the negotiated return on rate base:

> "...The negotiated settlement provides for a rate of return of 10 percent on a capital structure containing 40 percent equity.
>
> This is part of the package deal agreed upon by all parties, and should be viewed as such. NUL is aware of the fact that items such as rate of return, or return on equity, generally attract considerable attention in the context of normal or typical GRA's or GTA's.

> Here the Board can rely on the fact that it was part of the package deal as prima facie evidence of its reasonableness, that would be, as indicated this morning, something that is unique to the current circumstances and is not intended to be of a broader application.
>
> We're dealing here with a negotiated settlement, and it is something that was arrived at in the confines of that specific circumstance." (Tr., p.136, *ll*.9-25 & p. 137, *l*.1)

With respect to the proposed deferral account for 25 kV plant additions, Northland submitted as follows:

> "...The main issue discussed here was the new deferral account that has been approved with respect to the conversion program, the 25 kV conversion program.
>
> We would note that seldom has a situation arisen where a single project would have such a significant impact on the utility's rate base. The circumstances we are facing are indeed exceptional, and NUL submits that in the circumstances this deferral account is indeed appropriate, and warranted.
>
> The details of how this deferral account would work have been illustrated in the Undertaking Response 1 that has just been filed. NUL submits that its approach to a deferral account in this situation is reasonable, and should be accepted by the Board." (Tr., p.135, *ll*.19-25 & p. 136, *ll*.1-7)

The City expressed the view that the return on rate base reflects a reasonable compromise by the parties:

> " But if the Board does get into examining this specific element of the agreement in isolation which the City doesn't believe is necessarily appropriate, then it will be important, in our submission, that the Board consider that the agreement does reflect a significant reduction in the return on equity from what was originally filed, some seventy-five (75) basis points from what was originally proposed in The Application.

> Also, the Board should, in our submission, take into consideration, as Mr. Keough said, that historically there has been a recognized difference in risk between NUL and southern utilities and that that has been reflected in the rate of return that has been approved over the years as compared to southern utilities.
>
> And further, as Mr. Keough said again, NUL did file evidence that the Board can have reference to in -- in considering those differences. Taken in the context of that, the City is satisfied that the rate of return and equity thickness, taken together with the whole of the agreement, and that part is key, represents a reasonable compromise and, again, a balancing of interests of the Company and the customers for this -- for this application." (Tr., p.156, *ll*.7-25 & p.157, *ll*.1-5)

The Board notes Northland's view that the capital structure and rate of return reflected in the Settlement is unique to the current circumstances and is not intended to be of broader application. The return component of revenue requirement may therefore be considered part of the revenue requirement package. The Board considers if in subsequent years, the other components of revenue requirement were to change in relation to the return component; the latter in isolation may not be reflective of a fair return. Considering the likely changes in the relative proportions of various components of revenue requirement that can occur over a period relative to the Settlement, the Board considers that the composite rate of return resulting from the Settlement, taken in isolation, may not be reflective of a fair return to be used in the calculation of the 25 kV conversion deferral amounts, once the two test years have been completed. Accordingly, the Board will be concerned if the 25 kV deferral account mechanism were to continue beyond the two test years.

The Board will address this concern in Section 3.2 of this Decision

3.1.7 Income Taxes

The parties agreed to reflect the CCA rates as proposed in the February 23, 2005 Federal Budget in the income tax calculations with the proviso that if the reduced rates are not officially enacted the negotiated settlement will be automatically amended to reflect the change in the approved revenue requirement. The parties also agreed that if Northland claims and the Canada Revenue Agency ("**CRA**") has accepted any income tax deductions for 2005 or 2006 arising from the expensing of costs that have been capitalized for regulatory purposes the benefits of such deductions will be flowed through to customers. Further, if there is a subsequent reversal of such deductions by the CRA the benefits previously flowed through will be reversed.

The Board's examination of the income tax component of revenue requirement as per the Settlement has not resulted in any exceptions requiring further comment.

3.1.8 Rate Base

The rate base reflects the adjustment for reduction in depreciation expense referred to previously. The Parties also agreed $140,000 pertaining to study costs related to the 25 kV conversion project will remain in construction work in progress in 2004 and will be capitalized in 2005.

The Board's examination of the rate base as per the Settlement has not resulted in any exceptions requiring further comment.

3.2 THE SETTLEMENT TAKEN AS A WHOLE

In this Section, the Board will evaluate the comments of the parties as well as the Board's comments in the preceding section dealing with individual components of revenue requirement, in light of the Settlement taken as a whole.

Northland submitted overall the Settlement is in the public interest:

> " The City of Yellowknife was represented in these proceedings, or in these discussions, by experienced counsel and regulatory consultants. NUL submits that the Board can, and indeed should take great comfort in the fact that the end results that were achieved via these negotiated settlement discussions were acceptable to all the participants.
>
> The Board is essentially being called upon to accept the negotiated settlement as a package deal, and not to focus on any one (1) specific component of the overall deal. This essentially requires the Board to conclude that, overall, the negotiated settlement is in the public interest." (Tr., p.133, *ll*.4-16)

Northland also submitted that the Board can, and should look to the knowledge, experience, and information that the parties had available to them, and conclude that the Phase 1 negotiated settlement is indeed persuasive evidence of its reasonableness, and the results contained therein. (Tr., p.133, *ll*.20-25)

Northland noted that the Board has other information available that can be used to test the reasonableness of the Settlement. (Tr., p.146, *ll*.14-20)

The City submitted significant reductions in the revenue requirement were achieved in the Settlement especially if one looks at the revenue requirement excluding purchased power. In this regard, the City stated:

> " The result, sir, was the agreement which has been filed with the Board and which delineates, in the City's submission, significant reductions in the revenue requirement as set out in the original application, especially when one removes the cost of power from the revenue requirement, and looks only to the portion of revenue requirement that the Company has control over.
>
> The agreement is the product of serious negotiating, gives and takes, and the City supports the position that it should be approved as a package including all aspects: depreciation, line losses, rate of return, the entire package." (Tr., p.152, *ll.*19-25 & p.153, *ll.*1-6)

The Board notes reductions of 9.1% in 2005 and 9.7% in 2006, in the non purchased power component of revenue requirement were achieved as a result of the Settlement. The Board notes the major portion of the reduction resulted from reductions to the depreciation expense and the consequent impact of the depreciation reduction on income tax. Nevertheless, the Board agrees with the City that significant reductions in the revenue requirement were achieved in the Settlement especially if one looks at the revenue requirement excluding purchased power.

The Board notes adequate notice was provided and no party opposed the Settlement. The Board considers therefore that the Settlement process was fair. The Board also notes from its examination of the individual components of revenue requirement that the substantive issues in the Application were addressed by the parties. The Board concludes therefore the Settlement taken as a whole can be considered to be in the public interest subject to the following.

In examining the individual components of revenue requirement certain concerns were identified by the Board with respect to loss factors resulting from information that came to light after the Settlement was concluded. In particular the 2004 actual loss factor, if reflected in the 5 year average, would result in a material reduction in purchased power costs which in turn can impact the balance arrived at by parties in regard to the non purchased power component of revenue requirements for 2005 and 2006. Since this information came to light after the Settlement was concluded, the parties to the Settlement could not have been aware of this information.

Accordingly, the Board directs Northland and the other parties to the Settlement to reassess the level of loss factors for 2005 and 2006 in light of the new information provided in response BR NUL YK 54 with respect to the 2004 actual loss factor and the impact of including this in the 5 year average for loss factors. Amendments to the Settlement, if any, resulting from these discussions should be included as part of the refiling of the Application. The Board will defer consideration of the Phase I Settlement and approval thereof until this reassessment has been completed. Likewise the Board will defer any directions respecting implementation of the Settlement until the reassessment is completed.

In addition to the foregoing, the Board expressed other concerns in Section 3.1 when examining the individual components of revenue requirement. The Board's directions or comments in this regard follow.

The Board expressed concern that the method of determining the annual loss factor, the level of which is driven largely by the amount of unbilled revenues at year end, may be causing fluctuations in the loss percent from year to year with consequent impact on earnings. The Board also expressed concern that the absence of a transparent method for determining line losses for a given year with reasonable accuracy is a concern for future line loss determination.

In order to address these concerns, Northland is directed to develop procedures for determining actual line loss factors for each year, which are reasonably reflective of the electrical line losses for that year. To the extent the unbilled consumption is a factor amongst others causing fluctuations in overall loss factors from year to year, the percent loss factor applicable to electrical losses should be identified separately from the loss factor applicable to other factors under the category of unaccounted for losses. Northland should institute the above procedures with immediate effect and explain how these procedures address the accurate determination of forecast loss factors, at the next GRA.

Northland is also directed to provide a comparison of forecast electrical loss factors with those that were anticipated at the time of the 25 kV conversion application, with explanations for differences, at the time of the next GRA.

The Board expressed the view that it will be concerned if the 25 kV deferral account mechanism were to continue beyond the two test years and the rate of return resulting from the Settlement were used to be used to make adjustments to the 25 kV capital deferral accounts beyond the test period. Accordingly, if Northland intends to continue the 25 kV deferral account mechanism beyond the 2005/2006 test period it should take steps to initiate a GRA on a timely basis.

3.3 ECOLOGY NORTH PROPOSAL

As a pilot project, Ecology North requested funding approval for an appliance rebate program for Northland customers who purchase certain Energy Star qualified appliances. EN proposed that this program be funded by Northland and be managed by Ecology North. Under EN's ARP proposal rebates of $100.00 for fridges and $50.00 for washing machines will be paid to appliance owners who exchange their existing appliances for energy star qualified appliances. EN estimated the uptake from the rebate program administered over a 12 month period during the 2005/2006 test period would be 400 customers under the fridge replacement program and 400 under the washing machine replacement program.

EN stated information on the program would be made available at each appliance store in Yellowknife. EN stated in order to access the rebate, consumers would have to prove:

- that they are Northland customers;
- that they have purchased an Energy Star qualified appliance; and,
- that they have sent their old appliance for recycling.

EN summarized the expected overall benefits of the program as follows:

> "In conclusion, we believe that the proposed Appliance Rebate Program would lead to significant short and long-term gains in energy conservation. The program should help reduce water consumption (and heating), and by reducing pressure on peak demand and energy growth, it should reduce the reliance on the Jackfish Lake generating plant and the attendant greenhouse gas emissions. An equally important impact will be an increased awareness of energy conservation amongst Northland customers, local property managers, and the City of Yellowknife. We believe that this increased awareness will be critical for gaining support for even more effective energy conservation measures such as time-of-use(smart) metering." (Ex. 5; p.8)

EN also proposed that Northland research the introduction of smart meters and time of use meters in the Yellowknife service area. EN stated starting the gradual introduction of smart meters could help to offset a much larger capital cost down the road. EN noted some brands of smart meters allow customers to pay in advance and monitor how much electricity they have consumed in dollar terms. EN stated, to be effective as possible and to justify the expense, smart meters need a time of use price structure. EN noted that with variable pricing there is an opportunity to reduce peak demand. Reduced rates during off peak hours can help economic development or replace fossil fuels. EN requested the Board to direct Northland by way of a directive similar to the one given in Decision 3-2003 for NWTPC with respect to the implications of time of use rates and time of use meters on the Northland system and report back to the Board preferably at the same time as NWTPC.

In response to BT EN 4 (a), EN acknowledged, based on NWTPC's estimates, the greenhouse gas emissions savings for the ARP would effectively be zero. However, EN argued ARP and other demand-side management measures, will help consumers reduce their electricity bills and will help to postpone the need to increase diesel generation at Jackfish as Yellowknife grows. EN noted that in diesel communities, an ARP and demand-side measure would most likely result in greenhouse gas emission savings.

With regard to the EN proposal, the Settlement states in part as follows:

> "..should the Board decide to approve an addition to the negotiated revenue requirement, as derived pursuant to this agreement to facilitate an appliance rebate program similar to that advanced by Ecology North in these proceedings, the negotiated revenue requirement shall be automatically adjusted to include such an amount for 2005 and 2006 as is approved by the Board." (Clause 3 of Settlement, p.4)

In its final Argument, Northland submitted it is sympathetic to the efforts of EN but questioned whether the Board is the appropriate forum to consider some of the EN proposals:

> " In the context of Ecology North's proposal, we would note that certain of the -- or we would -- would observe, I suppose, that certain of

> the discussions regarding various aspects of the proposal, appear to have gone far afield of what this Board probably can and should legitimately do, and get involved in. And that's another consideration that you may want to take into account when examining this matter.
>
> This Board's jurisdiction may well enable you to approve the inclusion of an amount in revenue requirement to be dispersed, as per the Ecology North proposal. But I think you must be cognizant of where your jurisdiction ends, and there are many aspects that have to be worked out in the details of such a program that may well be beyond your grasp. And some of those things came up this morning." (Tr., p.144, *ll*.3-18)

With regard to EN's proposal concerning smart meters, Northland stated:

> " Now, there was also discussion of the Smart meters, and again, we've tried to update the Board with regard to the pilot program that ATCO Electric has implemented.
>
> We're not sure that that is really the subject matter of these proceedings. We understand it's an issue that, albeit belatedly, was raised by Ecology North, but we really aren't sure that there's anything in this proceeding that you're being asked to do.
>
> There was some discussion about the NWTPC's program and I think Mr. Tenney indicated that NUL would be prepared to engage in these discussions as well, with a view to gaining some appreciation as to whether or not these type of programs can be legitimately conducted within Yellowknife.
>
> And I -- I think that commitment is probably all that's required here, if -- if even that's required. We do not think that the Board need make any specific decision or ruling with regard to what NUL should do." (Tr., p.145, *ll*.1-20)

Mr. Doug Ritchie for EN submitted, EN is not tied to any particular DSM program but considered the ARP program proposed by EN is a good one:

> " So I think there's a real rationale, we think, for the Board to intervene and say, hey, let's try to take advantage of some savings right now in terms of energy use. Let's take some steps towards moving towards a situation where five (5), ten (10) years down the road we say, oh, Yellowknife's grow -- growing and all of a sudden we have a large diesel generating plant, or a large hydro-electric facility that we have to deal with.
>
> We may not be able to avoid that, but at least by taking actions now to try to restrain demand, we can try to push back the date for those facilities. And with respect to the whole issue of demand side management, we -- we're not tied to any particular program, although we think the ARP, the Appliance Rebate Program, is a good one." (Tr., p.149, *ll*.20-25 & p.150, *ll*.1-9)

The City stated EN amended its ARP proposal in response to BR EN 5, where the rebate amount for both types of appliances was amended to $75.00 each.

The City also submitted it is within the Board's jurisdiction, to consider the public interest and that it is in the public interest to conserve energy where possible and reasonable and it is in the public interest to potentially delay the need to add diesel generation or any other form of generation. Therefore, the City supported the ARP program with the above noted amendment. In this regard, the City stated:

> "...The City of Yellowknife supports the rebate program as set out in Exhibit 5. And as we understand it, as amended in Board/Ecology North-5. So amended to seventy-five dollar ($75) rebate for both types of appliances.
>
> As the City understands it, the reason for the differential as explained in the original proposal was that the energy savings for fridges wasn't as dramatic as it was for washing machines and thus it was felt that extra incentive was needed to incent consumers to make the switch to fridges.

But as the City understands the answer to Board/Ecology North-5 now, Ecology North has now considered that the difference in cost between an energy efficient washing machine and a non-energy efficient washing machine is considerably greater than the difference between fridges in those categories, which leads to the conclusion that the rebate perhaps should be seventy-five dollars ($75) for both appliances. The City can accept that reasoning.

The City does believe that it is within the Board's jurisdiction, certainly, to consider the public interest and that it is in the public interest to conserve energy where possible and reasonable and it is in the public interest to potentially delay the need to add diesel generation or generation at all for that matter. For those reasons the City does support that proposal.

For similar reasons, the City would support the Board issuing a directive to NUL to report on Time Of Use Meters and their feasibility in this jurisdiction in an effort coordinated with NTPC. I don't think the City would support going any further than that.

I think that's what Ecology North has asked for. They haven't asked for implementation. They've merely asked for that study and report." (Tr., p.162, *ll*.20-25 to p.164, *ll*.1-5)

The Board notes, EN requested a one time funding of $75,000 for the ARP program, to be administered and paid out over a period of 12 months during the test period. The Board notes Northland's position that customers would decide to what extent they conserve energy based on the price signals reflected in rates.

The Board notes the City's view that it is within the Board's jurisdiction, to consider the public interest and that it is in the public interest to conserve energy where possible and reasonable and it is in the public interest to potentially delay the need to add diesel generation or any other form of generation.

The Board considers that any demand side management project approved by the Board must make economic sense from a cost benefit point of view. Accordingly, the Board is prepared to consider the proposed ARP based on its merits as a viable demand side management project.

The Board notes the greenhouse gas emissions savings for the ARP in the Northland service area would effectively be zero. Irrespective of the level of greenhouse gas emission savings, the Board does not consider it within its jurisdiction to consider the merits of the project on the basis of greenhouse gas emissions savings.

The costs and estimated benefits, in terms of value of energy savings, of the ARP, as calculated from information provided by EN are as follows:

Program Component	**One Time Program Cost**	**Net Present Value of savings**	**Benefit/Cost**
	$	$	$
Fridge Rebate	50000	54013	1.08
Washing Machine Rebate	25000	281400	11.26
Total	75000	335413	4.47

Source: X 4 Updated Tables 2 & 3 BR EN 5(b)

The Board notes EN's view that by taking action now to try to restrain demand, the date for additional supply facilities and distribution facilities may be pushed back. In the Board's view given the estimated overall benefit cost ratio of more than 4 times noted above, the ARP proposal may be expected to provide benefits to all customers of Northland by delaying new facility additions at a lower cost than if the facilities were added absent the ARP.

The Board recognizes this is a pilot program and the estimated benefits may or may not materialize. However, the Board notes EN's view the proposed ARP could be considered a seed program potentially triggering higher levels of uptake for energy efficient appliances.

Considering the foregoing, the Board concludes the ARP is a viable demand side management program. Accordingly, the Board will approve the ARP with the amendment to the rebate levels as noted by the City.

The Board considers the ARP should be administered by Northland either directly or through contract with an organization such as EN. The Board directs Northland to file a proposal for initiating, administering and reporting on the delivery and success of the ARP including details of how the eligibility requirements for rebates noted by EN would be implemented, as part of the refiling of the Application.

With respect to rate treatment of the cost of the ARP, the Board notes Northland's submission that the costs should be recovered by way of a rate rider and adjusted to actual in 2007

> "It is difficult to forecast the actual number of participants in this program if it is approved. As such, there should be a mechanism in place to ensure equitable treatment for customers and the company. However, in light of the fact that the energy component of the retail rate and the purchase power rate are close to the same value, NUL-YK believes that for the sake of simplicity that only the administrative and rebate components of the program should be based on a reasonable forecast of participation and administered through a rate rider rather than base rates. The difference between the forecast administrative and rebate costs and the actual costs should be collected in a deferral account and refunded/charged to customers through an adjustment to the rider. The adjustment to the rider would occur in the following year allowing termination of the rider at the end of 2007." (BR NUL YK 65)

The Board considers the Northland proposal for rate treatment as outlined above to be reasonable and accordingly, directs the company to file a proposed rate rider with respect to the ARP as part of the refiling of the Application.

The Board considers the ARP as a demand side management program is expected to benefit all customers of Northland. Accordingly, the cost of the ARP should also be borne by all customers. The Board therefore directs Northland to design the ARP rider to be applicable to all customers of Northland, in its refiling of the Application.

With respect to EN's request that Northland investigate the implications of time of use rates and time of use meters on the Northland system, the Board agrees that it is appropriate to provide the right price signals to customers that would result in delaying new plant additions. Accordingly, the Board to directs Northland to investigate the benefits and market potential for time of use rates and address this matter at the time of the next GRA.

The Board also notes EN's view that some brands of smart meters allow customers to pay in advance and monitor how much electricity they have consumed in dollar terms. During the hearing, Northland indicated that its parent, ATCO Electric Limited had instituted a pilot program for smart meters in the communities of Grande Prairie and Drumheller, Alberta. The Board directs Northland to report on the lessons learned from this pilot program and address the applicability of these lessons in the Northland service area, at the time of the next GRA.

4. PHASE II MATTERS

4.1 COST Of SERVICE STUDY

4.1.1 Tracking of Customer Contributions

Northland indicated contributions in aid of construction (less amortization) were allocated to rate classes based on gross property plant and equipment. Northland indicated contributions are not tracked by rate class. In BR NUL YK 36(b), the company was questioned as follows:

> "Given the different maximum investment levels of different rate classes, please comment on the appropriateness of allocating contributions on the basis of gross plant as opposed to direct assignment or any other method that approximates direct assignment (example: sampling)."

In response Northland stated:

> "The allocation of contributions on the basis of gross plant is reasonable in these circumstances. Other methods, such as sampling, would not be reliable as contributions are not consistent from one year to the next or from one project to the next. The direct assignment method would be most accurate; this method, however, would entail a time consuming approach involving the study of all historical invoices." (BR NUL YK 36(b))

In its final submission, Northland indicated it is prepared to track contributions by rate class in the future and to assess the ability to look at historical contributions by rate class:

> " As indicated during Board questioning, NUL is -- is amenable to tracking contributions by rate class in the future, and will indeed assess the ability to look retroactively for a number of years, which obviously will

depend upon the availability and condition of records for those past periods." (Tr., p.139, *ll.*14-19)

Given the different maximum company investment levels applicable to different rate classes, the Board considers tracking of contributions by rate class would enhance the accuracy of the cost of service study. The Board notes Northland's willingness to track future contributions by rate class and to assess the ability to look at historical contributions by rate class. The Board considers tracking of historical contributions is a desirable objective to the extent it would have a material impact on the cost of service by rate class. However, the costs of such an exercise should be weighed against this benefit. Accordingly, the Board directs Northland to begin tracking future contributions by rate class, commencing with the beginning of the 2005 test year. Northland is also directed to assess the tracking of historical contributions having regard to the costs and the benefits and to reflect or report on the outcome at the time of the next GRA.

4.1.2 Classification of Demand Component of Purchased Power Costs

Northland classified the demand component of purchased power costs to energy in its cost of service study. Northland considered it would be suitable to classify the demand component of purchased power costs on the basis of demand. However, Northland argued against switching only one component without a complete analysis of all aspects of its cost of service and rate design. (Tr., p.140-141) Northland also noted there is more than one component to the rate design and one or the other would need to be changed if the classification of the demand component of purchased power costs were changed. (Tr., p.166)

The City disagreed with Northland and submitted the change should be made in these proceedings as it is an obviously fairer method of allocation:

> " And while the City can appreciate and understand that position, it believes that this obvious change should be made now as it simply appears to be obviously fairer than the method proposed.
>
> Certainly the City does not oppose a more thorough or comprehensive review at the next GRA, in fact, would welcome that." (Tr., p.161, *ll*.6-12)

The Board notes from response BR NUL YK 39 c) that a change in the classification of demand component of purchased power costs from the proposed energy classification to a demand classification would result in the following impacts by rate class:

Northland Utility (Yellowknife) Limited
Impact on Costs
Classifying Portion of Purchase Power to Demand

	Original Costs ($000)	Revised Costs ($000)	Incr/(Decr) Costs ($000)	Incr/(Decr) %age
Residential	11,193.4	11,492.4	299.0	2.7%
General Service	16,144.6	15,833.8	-310.8	-1.9%
Street Lights	727.3	738.6	11.3	1.6%
Space Lights	15.4	15.9	0.5	3.2%
Total	28,080.7	28,080.7	(0.0)	0.0%

The Board notes Northland's submission that this issue should not be viewed in isolation without a complete analysis of all aspects of the cost of service and rate design. The Board also notes Northland's view that changing the classification of purchased power costs could impact one or more components in the exercise of rate design.

The Board considers the classification of the demand component of purchased power costs on the basis of demand is reflective of cost causation. Although there may be other refinements to the filed cost of service study which may have an impact on costs by rate class the specific impacts of those refinements have not been identified or examined in these proceedings. The Board is not persuaded by the argument that it should not reflect an identified cost causation principle in the cost of service study for the reason there may be other potential changes. The Board recognizes a change in classification of the demand component of purchased power costs could impact the costs considered as fixed or demand related in the rate design exercise. However, the Board considers the impact of a change in the classification is one among many other factors to be considered in rate design. The Board will discuss this issue in the rate design section.

In view of the foregoing, the Board considers it appropriate to change the classification of the demand component of purchased power costs to a demand classification. The Board directs Northland to change the classification of the demand component of purchased power costs to a demand classification in its refiling of the Application.

4.1.3 Account Classification Factors

Northland proposed the following account classification factors for distribution assets:

Description	Customer Related	Demand Related
Land	0%	100%
Land Rights	0%	100%
Structures and Improvements	0%	100%
Poles Towers and Fixtures	75%	25%
Overhead Conductors	30%	70%
Services	100%	0%
Substation Equipment	0%	100%
Line Transformers	30%	70%
Meters and Meter Equipment	100%	0%
Street Loghts	100%	0%
Space Lights	100%	0%

Northland indicated it had not carried out a recent review of the above account classification factors. Northland indicated given the significant time lapse since these factors were last reviewed, it would be appropriate to review them having regard to the costs and benefits of conducting studies. In this regard, Northland stated:

> " The balance to be achieved here, particularly in the context of a small utility such as NUL, is one of a cost benefit assessment. NUL is willing to commence such a -- a review if the Board deems it to be necessary or appropriate, but we must always be cognizant of the associated costs.
>
> Clearly such studies should not be undertaking without a great deal of thought, and only when it -- it is expected that the benefits will exceed the costs, at least in the long run. As stated by NUL, any study should be complete, and at least we'll get all accounts and not be overly selective in nature." (Tr., p.140, *ll*.3-14)

The Board agrees it would be appropriate to carry out a study of account classification factors having regard to the costs and benefits involved in conducting such a study. Accordingly, the Board directs Northland to review all classification factors to determine if they remain appropriate and to reflect the results in the next Phase II application. The scope of the study should bear in mind the costs involved in conducting the study and the benefits in terms of enhancing the accuracy of cost classification and allocation by rate class.

The Board will accept the account classification factors proposed by Northland for purposes of these proceedings.

4.1.4 Classification of Administrative and General

Administrative & General ("**A&G**") expenses were classified by Northland on the basis of the sum of all service costs, including revenue offsets but excluding public liability and public damage insurance costs (PLPD) as shown in Schedule 11.15 of the cost of service study. The service costs for purposes of this classification included purchased power costs. As a result of including purchased power costs in service costs, a portion of A&G expense was classified as energy related and allocated to rate classes on the basis of energy.

The City questioned the proposed classification and allocation of A&G expense on the basis of service costs that included purchased power costs. In this regard, the City submitted:

> "...The City believes that there is no real logical link between purchased power and the administration and general costs and, on reflection, if fuel costs doubled, in our view, that should not change the quantum of NUL's administration and general costs.
>
> Accordingly, the City would propose that NUL recalculate the response to YK-NUL-YK-24(B)using the revenue requirement approved by the Board and that the allocation be made on the basis of all costs

excluding purchase power and administration and general PL and PD." (Tr., p.159, *ll*.13-23)

The Board estimates the change in classification of A&G expense proposed by the City would result in the following approximate increase or decrease by rate class:

	Original Costs	A&G classified on all costs including purchased power costs per Northland	A&G classified on all costs excluding purchased power costs per City	Approximate Increase/(decrease)	Approximate Increase/decrease Percent
	$000	$000	$000	$000	
Residential	11193.4	179.1	281.5	102.40	0.9%
General Service	16144.6	317.4	174.2	(143.20)	-0.9%
Street Light	727.3	4.7	45.4	40.70	5.6%
Space Light	15.4	0.2	0.4	0.20	1.3%
	28080.7	501.4	501.5		

The Board notes, from the above table, the order of magnitude change in costs by rate class is significant. The Board considers the classification of A&G expense should reflect cost causation. The Board agrees with the City that there is no logical link between A&G expense and purchased power. Accordingly, the Board is prepared to accept the City's proposed classification of A&G expense on the basis of all service costs excluding purchased power costs, A&G expense and PLPD, as this would be consistent with cost causation. The Board directs Northland to classify A&G expense on the basis of all service costs excluding purchased power costs, A&G expense and PLPD, in its refiling of the Application.

4.1.5 Energy Weighting of Metering Assets

Northland classified metering asset costs to the customer category and the customer costs associated with meters were further weighted to reflect the meter costs for customers in different rate classes. As well, 2% of the metering assets were weighted by relative energy supplied. Northland indicated these weightings are in accordance with previously approved methodologies.

In response BR NUL YK 38 (c), Northland acknowledged the weighting of 2% of metering assets by energy is in error and will be corrected. (Tr., p.90, *ll.*10-22)

The Board considers a 2% energy weighing for meter assets is not appropriate given the initial weighting to reflect differences in meter costs by customer class. Accordingly, the Board directs Northland to remove the 2% energy weighting of meter assets in its refiling of the Application.

4.2 RATE DESIGN/REVENUE TO COST RATIOS

Northland stated the following rate design criteria were relied upon to design the proposed rates:

- Recover the total forecast revenue requirement.
- Utilize the cost of service allocations of the revenue requirement.
- Avoid undue discrimination between customer classes.
- Consider the rate levels, structures and policies of other utilities, particularly those of similar load and service conditions.
- Promote ease of understanding and acceptance by customers, as well as ease of administration and economy of billing.
- Recognize the level and structure of existing rates.
- Promote efficient and cost effective use of power through price signals built into the rate structure. (Application, p.12-1,12-2)

Northland stated it is attempting to move the revenue to cost ratios for each class into the range of 95% to 105% subject to the constraint the increase decrease for any one rate class is less than 10%.

Northland proposed the following revenue to cost ratios under proposed rates:

	2005	**2006**
Residential	95%	95%
General Service	103%	103%
Street Light	101%	100%
Space Light	100%	99%

Northland suggested there should be flexibility in establishing revenue to cost ratios for different classes given the lack of precisions inherent in any cost of service study. In this regard, Northland stated:

> " There are many assumptions built into both cost of service and rate design, that render the achievement of a specific target, like 100 percent, to be something that is really not as precise as it may seen.
>
> In reality, a range, such as 95 to 105 percent, is far more reflective of the circumstances that do, in fact, exist. And in addition, provide flexibility to the utility that it needs to address various situations that confront it on an ongoing basis.
>
> We would urge the Board to recognize the desirability of retaining this type of flexibility, and not to get caught up in trying to achieve a single 100 percent revenue to cost ratio for all classes." (Tr., p.141, *ll.*11-23)

Northland noted the rate increases to the residential class were kept to a minimum to minimize rate impact as a result of this GRA and having regard to any potential future increases.

The City submitted the proposed 95% revenue to cost ratio for the residential class is reasonable having regard to the fact that there has been an improvement since the last GRA and having regard to the cost of service changes proposed by the City in these proceedings:

> " If we look back in the decision on the 1996/97 GRA the Board, at that time, approved a revenue to cost ratio for domestic at 92.5 percent in 1997. So in this next application we have already moved to 95 percent and the City would consider that that is a reasonable step rather than going to the full 100 percent which we believe would be a significant impact on residential customers.
>
> And further, as I've mentioned and as you will hear more about, the City will propose two (2) changes in the allocation of costs both of which have the general effect of shifting cost from the general class to the domestic class.
>
> The City is advocating that these changes be made and that the revenue to cost ratio for the domestic class be maintained at 95 percent. Thus, the domestic rate would go up from what is presently proposed and the general rate would go down correspondingly." (Tr., p.157, *ll*.24-25 & p.158, *ll*.1-16)

Northland appears to defend its proposal to target a residential class revenue to cost ratio of 95% on the basis that the cost of service study is not precise. The Board recognizes the cost of service study is not an exact science as it includes many assumptions but does not agree this reason alone justifies a target revenue to cost ratio less than 100% for any one rate class. The Board considers, notwithstanding its limitations, the cost of service study provides the best estimate as to costs by rate class. Accordingly 100% should remain the target revenue to cost ratio for all rate classes subject to other rate design considerations.

In Section 4.1 dealing with the cost of service study, the Board determined there should be certain changes to the cost of service study and directed Northland to reflect these changes in the refiling of the Application. As noted by the City, the principal changes involving the classification of the demand component of purchased power costs and the classification of A&G expense have the general effect of shifting costs from the general service class to the residential and other classes. Accordingly, in the interest of mitigating rate impacts, the Board will accept a revenue to cost ratio of 95% for the residential class, for the purposes of these proceedings. The Board directs Northland to design rates in accordance with these findings, subject to the constraint the increase/decrease for any one rate class is less than 10%, in its refiling of the Application.

4.3 INDIVIDUAL RATES

4.3.1 Domestic (Residential) Rate

Northland proposed to increase the existing residential Customer Charge to $18.00 from $15.00 to bring it in line with neighbouring utilities, and proposed to increase the energy charge to 14.28 cents/kW.h.

Northland indicated, based on the cost of service study the average customer related cost is approximately $27 per customer per month. The movement of the customer charge to $18 brings the customer charge closer to the customer related costs taking into consideration other rate design criteria. (BR NUL 43 (a))

The City supported the proposed upward movement in the residential fixed charge and considered any further upward movement in the fixed charge towards full cost recovery would not be conducive to conservation:

In this regard, the City stated:

> " For that reason, the City would submit that the eighteen dollar ($18) -- the movement to eighteen dollars ($18) is reasonable. It's a movement

> towards cost causation but we would submit that the conservation angle also has to be considered." (Tr., p.155, *ll*.20-24)

The Board notes the proposed residential fixed charge would recover approximately 67% of the customer costs associated with residential service. The Board recognizes this percentage cost recovery may be somewhat lower with the changes to the cost of service accepted in this Decision, though not materially so for the purposes of rate design. The Board notes, the submissions of Northland and the City, that this level of recovery strikes a reasonable balance between cost recovery and other rate design criteria. The Board agrees with the views of Northland and the City in this regard. Accordingly, the Board will accept the increase in the residential fixed charge from the existing $15 per month to $18 per month as proposed by Northland. The Board directs Northland to reflect a residential fixed charge of $18 per month in the refiling of the Application.

4.3.2 General Service (Commercial) Rate

Northland proposed to increase the minimum billing demand for commercial customers to 5 kV.a from 2.4 kV.a (equivalent to the $20 minimum monthly charge at $8.20 per kV.a) to reflect a similar bill minimum of neighbouring utilities. Northland also proposed to reduce the general service demand charge to $7.36 per kV.a from the current $8.20 per kV.a and proposed an energy charge of 12.80 cents/kWh.

With regard to the rationale for the proposed changes, Northland stated as follows:

> "NUL YK has attempted to move the rate components of the General Service rate class towards 100% revenue-to-cost ratios. As a result, the proposed demand charge of $7.36/kV.a is close to the COS calculated

> cost of \$7.70/kV.a taking into consideration other rate design criteria. NUL YK's customer related cost to provide service to General Service customers, is \$43.34/customer/month. NUL YK proposes a minimum demand level of 5 kV.a, which is equivalent to a minimum charge of \$36.80/customer, to recover 85% of the cost." (BR NUL YK 44 (b))

The Board notes Northland's attempt to more closely match the demand and energy rate components for the commercial class with the corresponding cost components. The Board considers the move towards cost recovery would result in appropriate demand and energy price signals for commercial customers. The Board also notes the minimum demand level of 5 kV.a provides for recovery of about 85% of customer costs and would be consistent with minimum demand levels of neighbouring utilities. The Board considers while cost recovery at the minimum demand level is an important consideration other considerations such as gradualism and comparability with neighbouring utilities would support the 5 kV.a minimum demand level proposed by Northland. Accordingly, the Board will approve the proposed increase in minimum billing demand for commercial customers to 5 kV.a from 2.4 kV.a and the reduction in demand charge to \$7.36 per kV.a from the current \$8.20 per kV.a. The Board directs Northland to reflect a minimum demand of 5 kV.a and a demand charge of \$7.36 per kV.a for the general service class, in the refiling of the Application.

4.3.3 Street Lights

Northland stated the street lighting rate schedule is being revised to cover nine different light types from the existing six. Northland proposed to transfer the rates for 50 W, 70 W and 100 W HPS lights from the space light rate class to the street light rate class because these lights are more indicative of a streetlight than a space light.

Northland stated the rationale for moving the lights to the street lights class is that they are not considered private lighting or space lights as they are paid for by the City of Yellowknife. (BR NUL YK 45 (b))

The Board accepts Northland's explanation for moving the space lights referred to above to the street lights class. Accordingly, the Board will approve the proposed transfer of the rates for 50 W, 70 W and 100 W HPS lights from the space light rate class to the street light rate class. The Board directs Northland to reflect this in the refiling of the Application.

4.3.4 Space Lights

Northland stated the space lighting rate schedule has been revised to cover six different light types from the existing nine. The rates for 50 W, 70 W and 100 W HPS lights have been transferred to the street light rate class.

The Board accepts the above change for the reasons stated under the street lights discussion.

4.3.5 Rider A

Northland proposed to use this Rider to recover the revenue shortfall between the proposed rates effective date, of January 1, 2005, to the rate implementation date decided by the Board. Northland also proposed to use Rider A to collect a Rider S outstanding balance of $11,577 and to refund the remaining Income Tax Rebate balance of $10,378. Rider S was established initially to flow through a purchased power cost adjustment from NWTPC and was set to zero by Northland, effective May 1, 1998 when the NWTPC adjustment was substantially collected leaving a small amount of $11,577 to be collected as part of these proceedings.

Northland set out details of the Rider A calculations in Schedule 12.3, as amended as of April 8, 2005. Rider A is a percent surcharge/refund applicable to customer bills.

The Board considers the proposed mechanism for refund/recovery of excess/shortfall amounts calculated by rate class, by way of a percent rider, and applicable to the base bill amounts, provides for equitable refund/recovery of excess/shortfall amounts by rate class. The Board also considers, including relatively small residual amounts of under or over collections applicable to Rider S and income tax rebates as part of Rider A is an administratively simple and practical way of disposing of these amounts. The Board will therefore approve the use of the Rider A mechanism for the refund/recovery of items referred to in this section and directs Northland to design Rider A in accordance with the foregoing comments, in its refiling of the Application.

4.3.6 Rider B Snare Cascades Hydro

The Snare Cascades Hydro Rider has been in effect since May 1, 2001 (Decision 3-2001) and was set at 0.5313 cents/kW.h to offset NWTPC's rider, of 0.5 cents/kW.h, that recovered the closing balance in the Snare Cascades Hydro Deferral Account amortized over 10 years, plus a cash return.

Northland forecast an over-collection of $14,672 by December 31, 2004 with respect to this Rider. Northland proposed to adjust Rider B to 0.5210 cents/kW.h to reflect the revised loss factor of 6.0% and to refund the over-collection.

The Board understands the Rider B mechanism provides for recovery of the amounts invoiced to Northland by NWTPC with respect to the Snare Cascades Hydro Rider and the amounts so invoiced are reconciled by comparing to amounts recovered from customers of Northland via Rider B. The amounts invoiced to Northland by NWTPC are on a per Kwh basis and the recovery via Rider B is also on a per Kwh basis, subject to adjustment for line loss. The Board considers the per Kwh mechanism for recovery of this portion of purchased power costs is consistent with the manner in which costs are incurred by Northland. The Board will therefore approve the use of the Rider B mechanism for recovery of amounts invoiced to Northland by NWTPC with respect to the Snare Cascades Hydro Rider and directs Northland to file a proposed Rider B adjusted for any change in the loss factors arising from this Decision, as part of its refiling of the Application.

4.3.7 Rider C

The NWTPC GRA Shortfall Adjustment Rider, Rider C, was intended to be a straight flow-through of Riders applied by NWTPC to purchased power costs.

The Board notes from Northland's GRA that Rider C will be rolled into base rates and Rider C set at zero percent. The Board also notes subsequent to filing of this GRA, the Board approved for Northland by way of Decision 9-2005, the recovery of NWTPC Riders S and P and refund of excess amounts collected to December 31, 2004 under Rider C, by way of Rider C.

The Board considers it appropriate to incorporate into Northland's base rates the current components of base rates charged to Northland by NWTPC for purchased power. The Board considers further that Riders such as NWTPC's Riders S and P should continue as part of Northland's Rider C since those Riders are not part of NWTPC's base rates. Further, any Rider C over collection amounts should continue to be refunded through Rider C. The Board directs Northland to design Rider C in accordance with these findings, and adjusted for any changes in loss factors arising from this Decision, in its refiling of the Application.

The Board notes the Rider C over collection as of December 31, 2004 was about $200,000. (Decision 9-2005; p.2) This is about 6.5% of the total amounts collected under Rider C in 2004. The Board is concerned that Northland's forecasting of Rider C revenues and corresponding costs has caused such a significant over collection of funds. In the future, the Board expects Northland to adjust Rider C on a timely basis as forecast loss factors change or if a consistent pattern of over/under collection is observed, so as to ensure there is no significant over or under collection in the Rider C account.

4.3.8 Rider P

Rider P, Power Purchase Adjustment Rider came into effect April 1, 1997 (Decision 8-97) as a result of NWTPC changing the demand and energy components of the purchased power rates. Rider P is part of the existing rates of Northland.

Northland proposed to roll Rider P into the base rates and set the rate to zero percent effective January 1, 2005.

The Board accepts Northland's proposal to roll Northland Rider P into base rates consistent with the Board's reasons set out above under the Rider C discussion.

4.4 TERMS AND CONDITIONS OF SERVICE

Northland submitted it has included for approval, as part of the Application, the revised Terms and Conditions of Service ("**T&Cs**"). The T&Cs apply directly to all customers within the service area of the Company. Northland stated the basic structure of the revised T&Cs has not changed significantly from the previous version, but enhancements to formatting and amendments to the text to reflect current business practices and procedures have been included to improve clarity.

The Board's Counsel examined the company on the proposed wording change to Article 3.1 concerning the process for amending the T&Cs. He noted that the proposed change shifts the onus to the Board to actually respond to any proposed amendments. (Tr., p.101)

Article 3.1 of the proposed T&Cs states in part as follows:

> "These terms and conditions have been approved by the Board. The Company may amend these terms and conditions by filing a notice of amendment with the Board. Included in the notice to the Board shall be notification of which Customer groups are affected by the amendment and an explanation of how affected Customers will be notified of the amendments. The amendment will take effect 60 days after such notice is filed, unless the Board otherwise directs." (Article 3.1 in part)

Northland submitted the wording of Article 3.1 is reasonable. Northland stated it would adopt a process under which it would circulate proposed changes to all interested parties, as well as the Board. (Tr., p.142)

The City opposed Northland's proposal where changes to the T&Cs could potentially take effect by default if the Board does not respond within the 60-day period. In this regard, the City stated:

> " However, the City does believe that the change ought to be approved by the Board. The City is somewhat uncomfortable with what Board counsel called the reverse onus or the onus on the Board which would be reflected in the amendment in Section 3.1." (Tr., p.162, *ll.*14-18)

The Board notes from Section 63(3) of the Public Utilities Act, that Board approval is required for amendments to T&Cs:

> "No terms and conditions of service or amendments to terms and conditions of service are of any effect until approved by the Board." (Section 63(3))

The Board interprets the above section to mean approval is required for amendments to the T&Cs. However, the Board considers the approval process could be simplified. The Board will accordingly direct Northland to amend Article 3.1 of the T&Cs to include the following words respecting approval process for amendments to T&Cs:

Article 3.1

These terms and conditions have been approved by the Board. The Company may amend these terms and conditions by filing a notice of amendment with the Board and interested parties from the preceding General Rate Application. Included in the notice shall be notification of which Customer groups are affected by the amendment and an explanation of how affected Customers will be notified of the amendments. The Board will either acknowledge the notice of the amendment to the Terms and Conditions or direct a further process to deal with the requested change as the Board deems appropriate. If the Board *acknowledges notice of the amendment, the amendment will take effect upon the date of such acknowledgement.*

No other issues were raised during the proceedings with respect to the proposed T&Cs. Accordingly, the Board directs Northland to refile the proposed T&Cs for approval, subject to incorporation of the change noted above with respect to Article 3.1, as part of its refiling of the Application.

5. REFILING OF THE APPLICATION

In the foregoing sections of this Decision, the Board made reference to a refiling of the application. The directions that are to be reflected in the refiling of the Application are listed below:

1. The Board directs Northland and the other parties to the Settlement to reassess the level of loss factors for 2005 and 2006 in light of the new information provided in response BR NUL YK 54 with respect to the 2004 actual loss factor and the impact of including this in the 5 year average for loss factors. Amendments to the Settlement, if any, resulting from these discussions should be included as part of the refiling of the Application. The Board will defer consideration of the Phase I Settlement and approval thereof until this reassessment has been completed. Likewise the Board will defer any directions respecting implementation of the Settlement until the reassessment is completed.

2. The Board directs Northland to file a proposal for initiating, administering and reporting on the delivery and success of the ARP including details of how the eligibility requirements for rebates noted by EN would be implemented, as part of the refiling of the Application.

3. The Board considers the Northland proposal for rate treatment of the cost of the ARP to be reasonable and accordingly, directs the company to file a proposed rate rider with respect to the ARP as part of the refiling of the Application.

4. The Board directs Northland to design the ARP rider to be applicable to all customers of Northland, in its refiling of the Application.

5. The Board directs Northland to change the classification of the demand component of purchased power costs to a demand classification in its refiling of the Application.

6. The Board directs Northland to classify A&G expense on the basis of all service costs excluding purchased power costs, A&G expense and PLPD, in its refiling of the Application.

7. The Board directs Northland to remove the 2% energy weighting of meter assets in its refiling of the Application.

8. In the interest of mitigating rate impacts, the Board will accept a revenue to cost ratio of 95% for the residential class. The Board directs Northland to design rates in accordance with these findings, subject to the constraint the increase/decrease for any one rate class is less than 10%, in its refiling of the Application.

9. The Board accepts the increase in the residential fixed charge from the existing $15 per month to $18 per month as proposed by Northland. The Board directs Northland to reflect a residential fixed charge of $18 per month in the refiling of the Application.

10. The Board directs Northland to reflect a minimum demand of 5 kV.a and a demand charge of $7.36 per kV.a for the general service class, in the refiling of the application.

11. The Board will approve the proposed transfer of the rates for 50 W, 70 W and 100 W HPS lights from the space light rate class to the street light rate class. The Board directs Northland to reflect this in the refiling of the Application.

12. The Board approves the use of the Rider A mechanism for the refund/recovery of items referred to in section 4.3.5 and directs Northland to design Rider A in accordance with the comments in section 4.3.5, in its refiling of the Application.

13. The Board approves the use of the Rider B mechanism for recovery of amounts invoiced to Northland by NWTPC with respect to the Snare Cascades Hydro Rider and directs Northland to file a proposed Rider B adjusted for any change in the loss factors arising from this Decision, as part of its refiling of the Application.

14. The Board considers that Riders such as NWTPC's Riders S and P should continue as part of Northland's Rider C since those Riders are not part of NWTPC's base rates. Further, any Rider C over collection amounts should continue to be refunded through Rider C. The Board directs Northland to design Rider C in accordance with these findings, adjusted for any changes in loss factors arising from this Decision, in its refiling of the Application.

15. The Board directs Northland to refile the proposed T&Cs for approval, subject to incorporation of the change noted above with respect to Article 3.1, as part of its refiling of the Application.

16. The Board directs Northland to refile the 2005/2006 GRA Application with the Board and interested parties within 30 days of the Decision. Interested parties will have an opportunity to comment on the refiling of the Application within 14 days of the refiling and the Board will render its final Decision thereafter.

6. SUMMARY OF DIRECTIONS FOR THE NEXT GRA

The following is a listing of directions to Northland for the next GRA:

1. The Board expressed concern that the method of determining the annual loss factor, the level of which is driven largely by the amount of unbilled revenues at year end, may be causing fluctuations in the loss percent from year to year with consequent impact on earnings. The Board also expressed concern that the absence of a transparent method for determining line losses for a given year with reasonable accuracy is a concern for future line loss determination. In order to address these concerns, Northland is directed to develop procedures for determining actual line loss factors for each year, which are reasonably reflective of the electrical line losses for that year. To the extent the unbilled consumption is a factor amongst others causing fluctuations in overall loss factors from year to year, the percent loss factor applicable to electrical losses should be identified separately from the loss factor applicable to other factors under the category of unaccounted for losses. Northland should institute the above procedures with immediate effect and explain how these procedures address the accurate determination of forecast loss factors, at the next GRA.

2. Northland is also directed to provide a comparison of forecast electrical loss factors with those that were anticipated at the time of the 25 kV conversion application, with explanations for differences, at the time of the next GRA.

3. The Board directs Northland to investigate the benefits and market potential for time of use rates and address this matter at the time of the next GRA.

4. During the hearing, Northland indicated that its parent, ATCO Electric Limited had instituted a pilot program for smart meters in the communities of Grande Prairie and Drumheller, Alberta. The Board directs Northland to report on the lessons learned from this pilot program and address the applicability of these lessons in the Northland service area, at the time of the next GRA.

5. Northland indicated it is prepared to track customer contributions by rate class in the future and to assess the ability to look at historical contributions by rate class. Accordingly, the Board directs Northland to begin tracking future contributions by rate class, commencing with the beginning of the 2005 test year. Northland is also directed to assess the tracking of historical contributions having regard to the costs and the benefits and to reflect or report on the outcome at the time of the next GRA.

6. The Board directs Northland to review all classification factors to determine if they remain appropriate and to reflect the results in the next Phase II application. The scope of the study should bear in mind the costs involved in conducting the study and the benefits in terms of enhancing the accuracy of cost classification and allocation by rate class.

7. BOARD ORDER

NOW THEREFORE, IT IS ORDERED THAT:

1. Northland Utilities (Yellowknife) Limited shall refile its 2005/2006 GRA within 30 days of this Decision in accordance with the determinations and directions contained in this Decision.

2. Nothing in this Decision and order shall bind, affect or prejudice the Board in its Consideration of any other matter or question relating to Northland Utilities (Yellowknife) Limited.

ON BEHALF OF THE
PUBLIC UTILITIES BOARD
OF THE NORTHWEST TERRITORIES

DATED August 18, 2005
John E. Hill
Chairman

FOLLOWING IS

APPENDIX A

ATTACHED TO AND FORMING PART OF

THE PUBLIC UTILITIES BOARD

OF THE NORTHWEST TERRITORIES

DECISION 12-2005

DATED August 18, 2005

IN THE MATTER of the General Rate Application filed by Northland Utilities (Yellowknife) Limited with respect to the years 2005 and 2006;

AND IN THE MATTER of a Negotiated Settlement reached between Northland Utilities (Yellowknife) Limited and Interveners to the referenced proceedings;

AND IN THE MATTER of an Application by Northland Utilities (Yellowknife) Limited seeking NWTPUB approval of the Negotiated Settlement.

NORTHLAND UTILITIES (YELLOWKNIFE) LIMITED
2005/2006 GENERAL RATE APPLICATION
NEGOTIATED SETTLEMENT

1. Northland Utilities (Yellowknife) Limited ("NUL") has been successful in reaching a Negotiated Settlement with the Intervenors, who are signatories to the attached agreement, regarding all Phase I issues raised by NUL's General Rate Application ("GRA") filing.

2. The participants to the NUL Negotiated Settlement were as follows:

   - City of Yellowknife
   - Northwest Territories Power Corporation

3. This Negotiated Settlement is presented to the Northwest Territories Public Utilities Board as a "package deal" as more fully described in the attached Negotiated Settlement Agreement, paragraph 3.

4. NUL requests that the Board approve the 2005 Revenue Requirement, and the 2006 Revenue Requirement, as summarized in Appendix 1, attached to the Negotiated Settlement Agreement.

5. It is expressly agreed that the execution of the attached Negotiated Settlement Agreement by Intervenors signifies their support for the granting of this Application and further confirms that such parties consider this Negotiated Settlement, as filed, to yield just and reasonable rates and to be in the public interest.

ALL OF WHICH IS RESPECTFULLY SUBMITTED this 24th day of March, 2005.

D.A. De Champlain

Northland Utilities (Yellowknife) Limited

NORTHLAND UTILITIES (YELLOWKNIFE) LIMITED
2005/2006 GENERAL RATE APPLICATION
NEGOTIATED SETTLEMENT

A. INTRODUCTION

In consideration of the mutual covenants set out in this settlement agreement (the "Negotiated Settlement"), the parties hereto agree as follows:

1. Northland Utilities (Yellowknife) Limited ("NUL") has concluded this Negotiated Settlement with the parties hereto for the years 2005 and 2006 covering the functions performed by NUL. All of the Phase I issues raised by NUL's General Rate Application ("GRA") are disposed of in accordance with the terms hereof.

2. It is understood and agreed that:

   (a) all settlement offers were exchanged and discussed among the parties on a confidential and without prejudice basis; and

   (b) additional information provided by NUL in respect of and relating to NUL's 2005 and 2006 General Rate Application as filed with the Board (the "Application"), was not provided on a confidential or without prejudice basis.

3. The terms of the Negotiated Settlement reflect a "package deal" and, therefore, it is not possible for the Northwest Territories Public Utilities Board ("NWTPUB" or "Board") to accept any part(s) of the Negotiated Settlement and still reflect the overall agreement reached as between the parties.

The parties specifically agree that it is not possible for the Board to impose any terms and conditions on any approval of this Negotiated Settlement and still preserve the agreed upon "package deal" agreement, as this Negotiated Settlement addresses all Phase I GRA matters. Thus, if the Board does not accept the complete Negotiated Settlement, as filed, there shall be no settlement among the parties of the issues raised by the NUL Application and the parties hereto will be free to litigate all or any such issues before the Board. Notwithstanding the above, should the Board decide to approve an addition to the negotiated revenue requirement, as derived pursuant to this agreement to facilitate an appliance rebate program similar to that advanced by Ecology North in these proceedings, the negotiated revenue requirement shall be automatically adjusted to include such an amount for 2005 and 2006 as is approved by the Board.

4. Appended hereto are executed signature pages from interested parties (acceptable in counterparts) which indicate their concurrence with the Negotiated Settlement as reflected in this agreement. It is agreed that NUL will request that the Board approve the Negotiated Settlement and that parties to this Negotiated Settlement will support NUL's request.

5. Immediately after the Negotiated Settlement is executed by all of the signatories hereto, NUL will request that the Board approve the Negotiated Settlement, including the 2005 Revenue Requirement, effective January 1, 2005; and the 2006 Revenue Requirement, effective January 1, 2006, both as summarized in Appendix 1 attached hereto.

6. NUL's 2005 Revenue Requirement shall be $27,827,000.

7. NUL's 2006 Revenue Requirement shall be $28,520,000.

8. The parties hereto agree that the following specific changes including, associated impacts, shall be made to NUL's 2005/2006 Phase I Application, as same was filed with the Board, as updated during the negotiated settlement discussions, as well as, to reflect errors and corrections to the original filing.

		($000's)	
		2005	**2006**

	- Revised CCA Rates ***	(44)	(109)
	Reductions to filed revenue requirement	(545.8)	(812.8)
vii.	Revenue Forecast	(25)	126
	Reductions to filed rate increase	(570.8)	(686.8)

* Taxes other than income have been adjusted for the impact of the negotiated settlement on franchise fees.

** The study costs of $140,000 relating to 25kV conversion project will remain in work in progress attracting AFUDC through 2004 and 2005 and will be capitalized as part of the 25 kV conversion addition in 2005.

*** It is expressly agreed and understood that, at this time, the reduced CCA rates, as proposed in the February 23, 2005 Federal Budget, have not been enacted. This reduction is subject to such reduced rates being officially enacted. Should this not occur, the negotiated settlement will be automatically amended to increase the approved revenue requirement by the amount of the reduction to CCA rates identified herein.

9. NUL undertakes to file updates to all GRA schedules related to Phase I and Phase II of these proceedings to reflect the impacts of this negotiated settlement.

10. All costs relating to NUL's revenue requirement for 2005 and 2006, which result from amendments to the *Public Utilities Act* or other legislative changes, including changes to relevant regulations and changes in general policies as published by the relevant authorities, which occur from the date hereof that have not otherwise been expressly contemplated in this Negotiated Settlement shall be flowed through (dollar for dollar) to NUL's Revenue Requirement.

11. The Application shall be deemed to be amended to the extent necessary to reflect the provisions of this Negotiated Settlement. The mechanisms described in the Application with respect to deferral accounts shall be implemented as described therein.

12. NUL will maintain quality of service and ensure that cost savings are not obtained at the expense of system reliability, safety and/or customer satisfaction. NUL will continue to use good utility operating practices.

13. NUL agrees to pay Intervenor costs associated with the GRA proceedings and this Negotiated Settlement upon receipt of an invoice from each Intervenor. Each Intervenor agrees to provide an invoice of such costs, not later than 30 days after the Board issues an Order approving NUL Revenue Requirements on a final basis for 2005 and 2006, and to provide in writing that its costs have been reasonably incurred and that its cost claim has been prepared in accordance with the Board's guidelines for intervenor cost claims.

    NUL will advance a summary of costs paid by NUL to all Interveners to the Board within 60 days of receiving the Board's Order. The summary will also include out of pocket costs reasonably incurred by NUL in respect of its participation in the GRA proceeding and this Negotiated Settlement. NUL will ask the Board to approve the recovery of these costs from NUL's Hearing Cost Reserve Account. Each Intervenor will be responsible for providing any additional information the Board may request in respect to its cost claim. In the event that the Board finds that any portion of costs paid by NUL in respect of any Intervenor may not be recovered by NUL from NUL's Hearing Cost Reserve Account, that Intervenor shall pay the disallowed amount to NUL within 30 days of the Board advising NUL of its decision to not approve the recovery of such costs.

14. The final Revenue Requirement established for NUL for 2005, in accordance with this Negotiated Settlement, will be implemented effective on January 1, 2005. The final Revenue Requirement established for NUL for 2006 in accordance with the Negotiated Settlement will be implemented on January 1, 2006.

15. All parties to this Negotiated Settlement agree that the 2005 and 2006 Revenue Requirements, as proposed herein, are fair, reasonable and in the public interest.

16. The parties hereto agree that all matters relating to NUL's Terms and Conditions of Service will be addressed in Phase II of these proceedings. Any changes to such Term and Conditions resulting from the Phase II proceeding will not impact this negotiated settlement.

17. This Negotiated Settlement does not preclude or prejudice the rights of parties to pursue any issues of concern to them in any proceedings in respect of 2007 or subsequent years.

18. If NUL claims and the CRA has accepted any income tax deductions for 2005 or 2006 arising from the expensing of costs that have been capitalized for regulatory purposes, NUL agrees to flow through to customers the benefits of any such deductions. If these deductions are reversed as a result of any subsequent action or audit by the CRA, the benefits previously flowed through to customers will be reversed and the full amount thereof, plus any associated interest and penalties charged by CRA, will be collected from customers.

SUBMITTED THIS 24th DAY OF March, 2005 by Northland Utilities (Yellowknife) Limited.

Attention: Mr. John Hill, Chairman

Dear Sir:

Re: Northland Utilities (Yellowknife) Limited
2005/2006 General Rate Application

Further to the Board's letter of March 14, 2005, NUL is refiling the affected portions of its application reflecting the Negotiated Settlement filed with the Board March 31, 2005. The revised rates also reflect the correction to the Franchise Tax allocation identified in information request YK-NUL-YK-25.

Enclosed are the following:

- Revised Phase I Schedules
- Revised Section 11 Phase II Cost of Service Schedules and Models
- Revised Section 12 Phase II Rate Design Schedules
- Revised Section 13 Phase II Rate Schedules

If you have any questions please call me at (780) 420-5420.

Yours truly,

NORTHLAND UTILITIES (YELLOWKNIFE) LIMITED

37													
38		Depreciation Expense	S.1 L.11								1,104,087	1,356,101	(252,014)
39													

Note: Depreciation expense for an account for a month is calculated by multipling 1/12 of the annual account depreciation rate by the previous month end account plant in service. Multiplying the annual depreciation rate by the opening plant in service provides an approximation of the annual depreciation expense. The actual depreciation expense includes the impact of the amount and timing of additions and retirements.

Forecast depreciation for Transportation Equipment and Heavy Work Equipment (Accounts 484 10 and 484 50) is developed using a composite rate applied to the forecast balance of the two accounts in total.

Energy, Demand, and Loss Analysis

An Energy, Demand, and Loss Analysis was required for the development of annual energy and NCP demand cost allocators. In this analysis:

- Forecast annual energy losses were allocated to each rate class;
- Coincident peak (CP) demand at the customer level and CP demand losses were determined for each rate class as a basis for the calculation of NCP demand losses for each rate class;
- Non-coincident peak (NCP) demand at the customer level and NCP demand losses were calculated for each rate class.

Section 13 – Rate Schedules

A. Overview

This section contains Northland's proposed 2005 Rate Schedules, and the retained Rider Schedules.

RATE SCHEDULE INDEX

DOMESTIC RATE SCHEDULE

Application

- For single-phase service at secondary voltage through a single meter.
- For normal use by a single and separate household.
- Not applicable to any commercial or industrial use.
- As requested by the City of Yellowknife, churches assessed as exempt will be entitled to this rate.

Rates

- The charge for service in any one billing month is the sum of the Customer Charge and Energy Charge, determined for each individual Point of Service.

Component	Charge
Customer Charge	\$18.00 / month
Energy Charge	14.28 ¢ / kW.h

- The minimum monthly charge is the Customer Charge.

Options and Riders

Price Adjustments – the following price adjustments (riders) may apply:
Temporary Refund/Surcharge Rider (Rider A)
Snare Cascades Hydro Rider (Rider B)
NTPC GRA Shortfall Adjustment Rider (Rider C)
Purchase Power Adjustment Rider (Rider P)
Franchise Tax

GENERAL SERVICE (COMMERCIAL) RATE SCHEDULE

Application

- To any use of electric energy consistent with safe and adequate service to all customers of the Company.
- For single-or three-phase service at secondary voltage through a single meter.

Rates

- The charge for service in any one billing month is the sum of the Demand Charge and Energy Charge, determined for each individual Point of Service.

Component	**Charge**
Demand Charge	$ 7.36 / kV.a / month
Energy Charge	12.80 ¢ / kW.h

- The billing demand may be estimated or measured and will be the greater of the following:
  (a) The highest metered demand during the billing period;
  (b) 75% of the highest demand set in the twelve (12) month period including and ending with the billing period;
  (c) the estimated demand;
  (d) 5 kV.a

Options and Riders

Price Adjustments – the following price adjustments (riders) may apply:
Temporary Refund/Surcharge Rider (Rider A)
Snare Cascades Hydro Rider (Rider B)
NTPC GRA Shortfall Adjustment Rider (Rider C)
Purchase Power Adjustment Rider (Rider P)
Franchise Tax

STREET LIGHT RATE SCHEDULE

Application

- For all Points of Service throughout the City of Yellowknife that are served by the Company, for street lighting.
- Applies to all standard mercury vapour and high pressure sodium street lights.

Rates

- The charge for service in any one billing month is the light charge for each individual Point of Service.

Type	Component	Monthly Charge per Light
Mercury Vapour	175 Watt	$ 24.50
	250 Watt	$ 35.60
	400 Watt	$ 42.03
High Pressure Sodium	50 Watt	$ 5.93
	70 Watt	$ 8.31
	100 Watt	$ 11.85
	150 Watt	$ 32.16
	250 Watt	$ 36.45
	400 Watt	$ 42.64

Options and Riders

Price Adjustments – the following price adjustments (riders) may apply:

Temporary Refund/Surcharge Rider (Rider A)
Snare Cascades Hydro Rider (Rider B)
NTPC GRA Shortfall Adjustment Rider (Rider C)
Purchase Power Adjustment Rider (Rider P)
Franchise Tax

SPACE LIGHT RATE SCHEDULE

Application

- For all Points of Service throughout the City of Yellowknife that are served by the Company, for space lighting.
- Applies to all standard mercury vapour and high pressure sodium street lights.

Rates

- The charge for service in any one billing month is the light charge for each individual Point of Service.

Type	Component	Monthly Charge per Light
Mercury Vapour	175 Watt	$ 12.96
	250 Watt	$ 18.80
	400 Watt	$ 22.53
High Pressure Sodium	150 Watt	$ 16.76
	250 Watt	$ 19.28
	400 Watt	$ 22.85

Options and Riders

Price Adjustments – the following price adjustments (riders) may apply:

Temporary Refund/Surcharge Rider (Rider A)
Snare Cascades Hydro Rider (Rider B)
NTPC GRA Shortfall Adjustment Rider (Rider C)
Purchase Power Adjustment Rider (Rider P)
Franchise Tax

TEMPORARY REFUND / SURCHARGE RIDER (Rider A)

SAMPLE

Applicable

- Rider A is applicable to all rate classes defined by the Company for services provided in the City of Yellowknife

Rates

- The charges listed below are in effect over 6 months commencing July 1, 2005 and ending December 31, 2005

- A positive value indicates a surcharge and a negative value indicates a refund.

Rate Schedule	Effective Date	Expiry Date	Rate
Domestic	July 1, 2005	January 1, 2006	-0.065%
General Service	July 1, 2005	January 1, 2006	0.303%
Street Lights	July 1, 2005	January 1, 2006	-11.070%
Space Lights	July 1, 2005	January 1, 2006	-7.170%

Snare Cascades Hydro Rider (Rider B)

Applicable

- Rider B is applicable to all rate classes defined by the Company for services provided in the City of Yellowknife

Rates

- A surcharge of $0.005210 / kW.h will be applied to all energy consumption.
- Rider B is in place for a period of ten (10) years commencing May 1, 2001.

NTPC GRA Shortfall Rider (Rider C)

Applicable

- Rider C is applicable to all rate classes defined by the Company for services provided in the City of Yellowknife when a charge or refund is approved by the Board.

Rates

- A refund of $0.0 / kW.h will be applied to all energy consumption to reimburse a net over-collection.

Franchise Tax

Applicable

- The Franchise Tax is applicable to all rate classes defined by the Company for services provided in the City of Yellowknife

Rates

- Revenues billed under any of the Company's Rate Schedules are subject to a charge of 2.4656% for franchise taxes.

Purchase Power Adjustment Rider (Rider P)

Applicable

- Rider P is applicable to all rate classes defined by the Company for services provided in the City of Yellowknife when a charge or refund is approved by the Board.

Rates

- All of the company's base rate revenue will be adjusted by 0.0%.

Northland Utilities (NWT) Decision 9-2006

THE PUBLIC UTILITIES BOARD

OF THE

NORTHWEST TERRITORIES

DECISION 9-2006 **March 31, 2006**

IN THE MATTER OF the Public Utilities Act, being Chapter 110 of the Revised Statutes of the Northwest Territories, 1988(Supp.), as amended.

AND IN THE MATTER OF an application by Northland Utilities (NWT) Limited for changes in the existing rates, tolls and charges for electrical energy and related services provided by Northland Utilities (NWT) Limited to their customers within the Northwest Territories.

THE PUBLIC UTILITIES BOARD

BOARD MEMBERS	John E. Hill	Chairman
	Joe Acorn	Vice-Chairman
	Gene Nikiforuk	Member
BOARD STAFF	Louise Larocque	Board Secretary
	Raj Retnanandan	Board Consultant
	John Donihee	Board Counsel

APPEARANCES

Loyola Keough	Counsel for Northland Utilities (NWT) Limited
Thomas Marriott	Counsel for The Town of Hay River
Rangi Jeerakathil	Counsel for The Hamlet of Fort Providence

WITNESSES

Northland Utilities (NWT) Limited

Dennis DeChamplain	Vice President, Controller
Doug Tenney	General Manager
Duane Morgan	Operations Manager
Bob Clarke	Senior Engineer
Ken Koenig	Senior Regulatory Analyst

Hamlet of Fort Providence

Azad Merani	Consultant to the Hamlet
Albert Lafferty	Senior Administrative Officer

Town of Hay River

Robert Bruggeman	Consultant to the Town

TABLE OF CONTENTS

1. INTRODUCTION and APPLICATION

By letter dated July 4, 2005, Northland Utilities (NWT) Limited ("**Northland**", "**Company**") submitted to the Northwest Territories Public Utilities Board ("**the Board**") a Phase I General Rate Application ("**GRA**", "**Application**") for the 2005/2006 test period ("**Test Years**") (Exhibit. 2).

In its Application, Northland requested that the Board determine Northland's revenue requirement for each of the forecast Test Years.

By letter dated August 2, 2005, Northland submitted to the Board an additional filing respecting Northland's GRA including a Phase II filing, an amended Phase I filing and a request for 2005 interim rates (Ex. 3).

In the additional filing of the Application, Northland requested that the Board:

a) Approve rate schedules;
b) Approve the revised Terms and Conditions of Service; and
c) Approve the proposed 2005 rates on an interim refundable basis

Pursuant to the provisions of section 13.(1) of the Rules of Practice and Procedure, the Board, by letters dated July 6, 2005 and August 8, 2005 directed Northland to publish notice of the public hearing of the GRA in newspapers that circulate in the Northwest Territories. The notice provided details of the GRA and invited interested persons to file a request with the Board for intervenor status (Ex. 1).

The Town of Hay River ("**Town**"), the Hamlet of Fort Providence ("**Hamlet**") the Northwest Territories Power Corporation (**"NWTPC"**) and the Community Government of Wekweeti registered their respective interventions with the Board.

The Board issued Decision 13-2005, dated September 9, 2005 with respect to Northland's proposed 2005 rates on an interim refundable basis. The Board directed Northland to file proposed interim rates for each of the communities designed to recover 50% of the proposed 2005 revenue increases, if applied on an annualized basis, for each community and to file a Rider E for each of the communities for recovery of the deficiency resulting from implementation for the interim rates effective October 1, 2005 as opposed to the beginning of the Test Year.

By letter dated September 19, 2005, Northland submitted responses to Decision 13-2005, by filing the interim rate schedule (Rider K) and Rider E. The Board issued Decision 14-2005, dated September 26, 2005 approving Rider K and Rider E, for each community, effective October 1, 2005.

The Board, the Town and the Hamlet submitted information requests, to which Northland responded on October 14, 2005 (Ex. 5).

By letter dated October 20, 2005, Northland advised the Board that based on discussions with interested parties, Northland does not consider it likely that a comprehensive Negotiated Settlement could be reached regarding the GRA.

The Hamlet filed intervenor evidence on October 31, 2005 (Ex. 6). The Board, Northland and the Town submitted information requests to the Hamlet respecting its intervenor evidence, to which the Hamlet responded on November 14, 2005 (Ex. 7).

By letter dated November 21, 2005, the Town filed rebuttal evidence (Ex. 9).

2. PUBLIC HEARING

Public Notices of the hearing was advertised and scheduled for November 29 and 30, 2005 (Ex. 1). The hearing was held in the Town of Hay River.

During the course of a public hearing, members of the public who had not initially requested intervenor status are allowed to participate in the proceeding. At this public hearing, Ms. Lesli Fisher, President of the Hay River Chamber of Commerce made a presentation to the Board.

At the beginning of the 2nd day of the hearing, Northland provided responses to the undertakings given at the 1st day of the hearing.

The Board and interested parties agreed on dates to file written argument and written reply argument. Northland, the Town and the Hamlet provided their written argument and reply argument, as per the Board's schedule.

PHASE I MATTERS

3. REVENUE AND SALES

The residential energy sales forecast was determined by multiplying the forecast number of customers by the forecast consumption per customer. The commercial sales forecast consists of a two part process involving the determination of energy sales to existing customers and then a detailed review of all known or expected commercial customer additions or losses. The forecast for existing customers was determined based on the most recent number of customers and a three-year average historic monthly consumption per customer.

The Town submitted that it is not clear whether the lower than normal sales in the first 5 months of 2005 was due to above average weather, unbilled sales or other reasons. By including the first 5 months of actual sales from 2005, Northland has eliminated that risk over that period but has not adjusted its rate of return on equity accordingly.

The Town also submitted that Northland provided the monthly number of customers in Schedule 1 to BR-NUL-NWT-1(b) and confirmed that that spreadsheet was used to drive the revenue forecast. However, there were no additions shown in the spreadsheet for December of both years and thus only 16 new customers instead of 20 were added. Therefore, the 2006 residential sales are understated by 27,200 kWh (4 x 6,800) and 2006 revenues on existing rates are understated by about $5,400.

In Reply to the Town’s concern about the decrease in average consumption for residential, Northland submitted it is entirely appropriate for it to take into account the best information available to it and therefore the use of the 5 months of actuals in forecasting the 2005 average residential consumption is appropriate.

With respect to the number of residential customers not reflected in the revenue forecast, Northland stated that it is prepared to adjust its forecast for the number of customers to reflect the four customers inadvertently omitted in certain schedules, as well as the associated purchase power costs. This will be done as part of Northland's refiling.

The Hamlet noted that Northland presently does not temperature normalize sales. By using heating degree day data for each of Fort Providence and Hay River, Northland would be able to calculate the average usage per customer per degree day for each class and better predict usage patterns in any given month. The Hamlet indicated that the ability to predict usage pattern accurately would assist in the procurement of fuel in the spot market. The Hamlet submitted that Northland should conduct a study in this regard to be able to better predict usage patterns in any given month.

The Hamlet also submitted that it is unlikely that commercial consumption per customer will decrease or be flat from 2005 to 2006. Assuming 2005 forecast amounts are reasonable, most communities show a clear increasing trend in consumption per commercial customer, with the exception of Trout Lake, which shows increases in 2003 and 2004, with a decline in 2005 and 2006. The Hamlet submitted that the 2006 average commercial customer usage forecast for each community, with the exception of Trout Lake, should be increased over forecast 2005 levels by the percentage increase in annual commercial customer usage between 2004 and 2005.

With respect to the Hamlet's concern over weather normalization, Northland stated that it is a small utility, with a small workforce, that should not be burdened with the cost of doing unnecessary studies that are unlikely to provide any material benefits. Further, Northland submitted that its forecasting methodology, which makes use of prior historical averages, already implicitly factors in the impact of weather changes from year to year.

With respect to the Hamlet's concern over commercial sales, Northland stated that its forecast for commercial customer usage is contained in Information Response FP-NUL-NWT-4(a) Schedule 1 and shows total commercial usage increasing 3.7% in 2006 versus 2005. This forecast is based on the process outlined on pages 2-3 of the Application and provides Northland's best forecast for 2006.

The Board notes that Northland expects to correct the residential sales forecast and revenues to reflect corrected customer growth numbers in 2005 and 2006. Northland is directed to reflect this change in its refiling of the Application.

The Board notes intervenor concerns respecting temperature normalization of sales. The Board agrees temperature normalization of sales would provide the Company and interested parties greater assurance that the sales forecast is accurate particularly where partial year data is reflected in forecast sales. It may also assist in more accurately determining the impact on sales and losses of unbilled consumption at year-end.

The Board notes Northland’s view that temperature normalization is an added burden for a small utility. However, in the Board’s view, given that purchased power and fuel costs constitute significant elements of Northland’s revenue requirement, normalization of sales could provide a means for meaningful comparison of sales and sales per customer from year to year and help explain changes in line losses or unbilled consumption from year to year. Accordingly, the Board directs Northland to temperature normalize historical sales for the purposes of forecasting test year sales and use normalized sales for the purposes of determining the energy balance, including line losses, at the time of the next GRA.

The Board notes the Hamlet’s concern respecting the difference in the growth rates for commercial consumption per customer from 2005 to 2006. The Board also notes that the commercial forecasts were prepared based on a detailed review of all known or expected commercial customer additions or losses. Accordingly, the Board considers that there may be customer specific reasons for the differential growth rates for commercial consumption per customer from year to year. Therefore the reason for change in commercial forecasts for 2006 offered by the Hamlet may not necessarily apply in this instance. The Board considers other changes to the sales forecasts recommended by intervenors to be not material in the overall context of revenue forecasts. Accordingly, the Board will accept Northland's sales and revenue forecasts, subject to the change with respect to customer additions noted above.

4. PURCHASED POWER

4.1 Line Losses

Northland forecast line losses based on an average of the previous five-year loss percentage (2000-2004) for each community. Northland indicated that the following variables can impact the forecasted line loss:

- System Configuration;
- Conductor Size on Feeders;
- Voltage of the System;
- Load on the System;
- Kilometers of line within the Community; and
- Types of Transformers and Electrical Equipment used.

With respect to the Hay River System forecast line losses, the Town submitted as follows:

> "… there was a significant increase in total and distribution losses on the Hay River System in 2004, system losses increasing by 1.8% over the

> 1999-2003 average of 10.8% and distribution losses increasing by 1.4% over the 1999-2003 average of 4.2%. NUL was asked to explain why distribution losses in 2004 were so much higher than in all other years shown in Schedule 1 to HR-NUL-NWT-9-1. In Undertaking No. 1, NUL indicated that part of the increased losses was due to growth in billed sales (which should not affect the percentage of losses) and growth in unbilled sales estimated to be 104 MWh from 2003 to 2004. However, there still remained 584 MWh of unaccounted growth in losses that NUL attributed to possible energy diversion and the accounting for unbilled sales. There is simply no evidence in support of the energy diversion theory." (Town's Argument, p.3)

The Town considered that the distribution losses for 2004 cannot be relied upon, not even as part of the five-year average as suggested by Northland. The Town submitted that the 1999-2003 average of distribution losses should be utilized as the best proxy for distribution losses in Hay River for the 2005 and 2006 test years rather than the 5-year average including 2004. The Town submitted Northland should be directed to refile its Purchased Power Expense using the 1999-2003 average of 4.2% for distribution losses.

The Hamlet submitted that by using the average line loss experience of the last 5 years (2000-2004), any improvements that may manifest in reduction in losses in the test years are effectively rendered mute. The evidence is clear, for example, that in both Fort Providence and Trout Lake, initiatives were undertaken in early to mid-2005 to reduce line losses. In the face of these initiatives to curtail losses, it is somewhat surprising to see Fort Providence, for example, experience an increased line loss of 11.90% in 2005 relative to the 2004 loss factor of 10.90%. The Hamlet recommended that there should be at least a 10% reduction in line losses for Fort Providence.

The Hamlet submitted Northland agreed to undertake further study to look at the costs and benefits of improvements to the system that would mitigate these losses. The Hamlet recommended Northland should be directed to provide the outcome of this study and provide specific steps planned and undertaken with a view to reducing line losses in the diesel communities.

Northland submitted that it has initiated measures that will be implemented, primarily on a go forward basis, to assist in mitigating line losses in the future. Northland stated that it has adopted a practice of using a larger conductor to assist in this regard, but has not quantified the impact its efforts will have on actual line losses. Northland also observed that line losses increased with load growth and, therefore, there are two competing, offsetting factors that must be taken into account. Northland acknowledged that unaccounted for energy is comprised of two components, being line losses and unbilled revenues, but observed that the latter was not causing significant fluctuations as was the case in Northland Utilities (Yellowknife) Limited's (“**Northland YK**”) recent GRA.

The Board notes the material fluctuations in distribution line loss percentages from year to year as shown in HR-NUL-NWT-9-1(c) line 3 for Hay River and in Exhibit 25 line 4 for each of the diesel communities. Northland alludes to unbilled consumption, among others, as a contributory factor to yearly fluctuations in line losses. However, the Board shares intervenors’ concern that Northland has not adequately explained the reasons for the fluctuations in line loss percentages from year to year. The level of line loss percentages particularly in the communities Fort Providence, Trout Lake and Dory Point/Kakisa also concerns the Board.

In order to address the concerns over fluctuations in line loss percentages from year to year, Northland is directed to develop procedures for determining actual line loss factors for each year, which are reasonably reflective of the electrical line losses for that year. To the extent the unbilled consumption is a factor amongst others causing fluctuations in overall loss factors from year to year, the percent loss factor applicable to electrical losses should be identified separately from the loss factor applicable to other factors under the category of unaccounted for losses. Northland should institute the above procedures with immediate effect and explain how these procedures address the accurate determination of forecast loss factors, at the next GRA.

Northland is also directed to provide an engineering assessment of the level of line losses in each community given the community's particular system configuration and report on and reflect the outcome of the study in the next GRA.

5. DIESEL FUEL COSTS

5.1 Fuel Procurement

The Hamlet submitted that by using heating degree day data for each of Fort Providence and Hay River, Northland will be able to calculate the average usage per customer per degree day for each class and better predict usage patterns in any given month. The Hamlet indicated the ability to predict usage pattern accurately would assist in the procurement of fuel in the spot market. The Hamlet submitted Northland should conduct a study in this regard to be able to better predict usage pattern in any given month.

The Hamlet also submitted that simply because some communities receive fuel supply once a year and prices are paid on delivery, it does not mean Northland is engaging in any form of hedging. In fact, in this case, the entire year's fuel supply is based on spot prices, i.e. the price that prevailed on the delivery date. The Hamlet conceded there is no doubt that the supplier will be looking for a premium over spot prices in any form of a hedged transaction. However, the Hamlet believed that, from the customers' perspective, some extent of hedging provides for protection that payment on spot for 100% of fuel supplies maybe too high.

Northland submitted that there is absolutely no evidence to support a conclusion that the implementation of a partial hedging program would be practical or cost effective in the circumstances encountered by Northland. The additional costs associated with hedging small volumes of fuel in remote communities are likely to outweigh any speculative benefits that might possibly occur.

The Board notes the Hamlet's view that temperature normalization of average usage per customer per degree day for each rate class would enable Northland to better predict usage patterns in any given month, from the point of view of fuel procurement. The Board considers any systems that would assist in the balancing of supply and demand as well as provide fuel price forecast accuracy, without the need for frequent price reforecasts, would contribute to rate stability particularly in the context of Rider A for diesel communities. The Board notes the Hamlet's concern respecting rate stability resulting from quarterly adjustments to Rider A consequent upon fuel price changes. In light of these concerns, the Board expects Northland to consider the suggestions offered by the Hamlet as well as other options towards the goal of improving fuel price forecasts prepared in the context of Rider A applications so as to reduce the need for frequent price reforecasts. Further comments respecting Rider A are provided under Section 14.2.

5.2 Heat Rates

Northland stated forecast fuel efficiencies or heat rates are based on historical trends adjusted for the non-recurring use of less efficient units or for the forecast fuel efficiencies of any new engines forecast to be in service. During hearing examination, Northland acknowledged the impact on fuel efficiency resulting from the addition of a new generating unit in Fort Providence in 2006 is not reflected in the Application. In response to Undertaking 10, Northland indicated:

> "The heat rate calculation based on using a three (3) year average for the months of January to May of 2006 using the three (3) year average of 2002, '03, and '04, together with the forecast heat rate for June through December of including the new unit together with the remaining existing units would have resulted in a heat rate of 3.55 kilowatt hours per litre." (Tr., Vol. II; p.13)

The Board considers that, in accordance with Northland's stated method of forecasting heat rates, the forecast fuel efficiencies of any new engines forecast to be in service should be reflected in the forecast heat rate calculations. Accordingly, the Board directs Northland to adjust the 2006 heat rate calculation for Fort Providence to reflect the addition of the new generator in 2006.

5.3 Steps to Reduce Reliance on Diesel

The Hamlet submitted that it continues to be concerned about the total reliance on diesel as the only source of generation in the so-called "diesel communities". The Hamlet submitted that as long as Northland can recover its costs and earn a fair return on its investment in these communities, it has little incentive to find alternatives to diesel generation. The Hamlet noted that it is not only concerned about the fact that diesel costs a lot of money, but also about the negative environmental aspects of using diesel.

The Hamlet submitted that the Board should direct Northland to actively pursue any federal and territorial funding available to undertake a feasibility study to connect Fort Providence (and other diesel communities) to the hydro system. As well, alternate technologies should be investigated.

In response to the Hamlet's Argument, Northland submitted that there is simply no evidence on the record to justify the costs associated with conducting any such study now. Northland noted that it is a small utility with only 15 employees and less than 2,600 customers. The costs associated with such studies are likely to far outweigh any potential benefits, particularly in circumstances where there is no factual basis to support a view that any such benefits will be derived.

The Board considers the procurement of energy supplies at prudent costs to be a matter within its jurisdiction. The Board considers that Northland has a mandate and responsibility to take all necessary steps that would help minimize the cost of electricity supplied to its customers. Accordingly, Northland is directed to provide a preliminary assessment of feasible energy supply alternatives for diesel communities, including those referred to by the Hamlet, that may help alleviate the high cost of providing electricity supply to these communities, as part of its next resource planning cycle and provide Northland's recommendations thereon to the Board and interested parties by year end 2006. Following this filing, the Board may direct that further detailed studies or a further process be undertaken or may conclude that the matter needs no further action.

6. OPERATIONS AND MAINTENANCE EXPENSES

6.1 Labour Expense

The Hamlet submitted, despite a constant complement of 15 employees since 2003, Northland is forecasting significant increases in labour expenses over the test years. The explanations provided by Northland for the increases in labour expense, "that there is now a full compliment of employees, as opposed to prior years", do not reconcile with this constant number of employees of 15. (Hamlet Argument, p.16)

The Hamlet submitted that the increases are not justified and the labour forecast should be reduced 20% in each test year.

Northland responded that there is no evidence to support this suggestion.

Given the adjustments determined as appropriate in regards to the vacancy rate applicable in each test year, the Board is satisfied that the net labour forecast is reasonable for the test period.

6.2 Vacancies

Northland submitted that it is a small company in terms of the total number of employees and is forecasting a minor vacancy rate (.1 position) for 2005 and zero for 2006. If an employee were to leave during the test period, Northland indicated that it would have to backfill with a contractor or affiliate secondment, as well as hire a replacement to complete required work. Northland also noted that the arguments of that intervenors ignore the impact of recruiting and relocation costs related to vacancies during the test period and which have not been included in the forecast.

The Town noted actual vacancies averaged 7.2% over the years 2001-2004. While Northland's intent may be to fill all positions, the Town submitted that history shows this does not happen and recommended the vacancy rate of 7.2% be applied to the 15 positions in BR.-NUL-NWT-4(f), resulting in an average of 1.1 vacancies for each of 2005 and 2006. The Town also noted, in reply, that

Northland had the same opportunities to backfill in non-test years but did not do so.

The Board recognizes small fluctuations in the staffing levels of a smaller complement of employees may result in larger vacancy rates. The Board notes from BR-NUL-NWT-4 (f) that the vacancy levels ranged from a low of .5 FTE in 2002 to a high of 1.9 FTE in 2003 during the four-year period from 2001 to 2004. The average vacancy level during this period was 1.05. Given Northland's evidence that vacancies experienced in the past resulted in the Company not being able to complete certain critical maintenance work, the Board considers it would not be appropriate to use the experienced average to assess vacancy rates. Rather the Board considers the low end of vacancy rates experienced in 2002 may be more reflective of normalized vacancy levels. The Board agrees the opportunity to backfill positions would have been available to Northland during the historical period but does not appear to have been the chosen course of action. The Board directs Northland to use a vacancy level of .5 FTE in each of 2005 and 2006 and to reflect the appropriate reduction in labour, benefits and other expenses in its refiling.

6.3 Affiliate Charges in Operation & Maintenance (including Administration and Head Office Fees)

Northland indicated the Information Technology charges now reflect an I-TEK direct billing rather than billing through ATCO Electric ("**AE**"). This reclassification has an offsetting reduction in costs from AE and must be viewed together. Northland also noted it has been allocated a portion of the costs associated with implementation of the new Oracle financial systems. Northland also indicated regulatory and financial reporting charges are forecast to increase in the test year due to the additional workload.

Northland submitted that the Code of Conduct requirements mandated a change in the presentation and charging of certain head office fees, as well as the imposition of a 70% loading charge on labour costs incurred for services provided by AE. These costs do not contain any element of profit or return.

The Town submitted that there have been significant increases in total administrative costs since 2003. The Town indicated that it has concerns with several of Northland's explanations regarding year over year increases. The Town also submitted that the $54,000 estimated amount for preparation of the Phase II in this proceeding should be amortized over 4 years. Further, while Northland asserts that the $15,000 of clerical support plus $5,000 for fringe benefits from customer accounting would result in reductions, there is only a $6,000 reduction. The Town recommended that the net $14,000 increase related to clerical support from customer accounting should be disallowed.

The Hamlet noted that, as AE does not have an approved revenue requirement for 2005 and 2006, amounts included in Northland's affiliate costs might include untested amounts. To the extent the costs of AE are reduced by the Alberta Energy and Utilities Board ("**AEUB**"), the Hamlet submitted that the reductions should be flowed through to customers.

In response, Northland noted work performed by AE for Northland is required whether there is an active proceeding taking place at the time or not. Ongoing work for items such as the administration of various riders and deferral accounts is ongoing in nature.

The Board considers regulation and Phase II related expenditures are not likely to occur annually at the same level each year. Accordingly, the Board is not convinced the $27,000 cost in 2004 for regulation and Phase II activities is likely to be incurred at this level in each of 2005 and 2006. The Board considers it more reasonable to spread the costs identified as related to regulation and Phase II over the two-year test period. Therefore, the Board directs Northland to reflect a net reduction of $13,500 for this expenditure item in each of 2005 and 2006.

In terms of flowing through reductions in AE's affiliate charges following resolution of those costs by the AEUB, the Board has no basis to determine whether such an adjustment is likely to result in material changes and is satisfied the current forecast is based on the best information available at the time the forecast was prepared and available as at the time of the hearing.

The Board notes Northland's explanations for increases in administration costs from 2003 to 2004, which includes the addition of a casual employee at $14,000 and additional fringe benefits of $5000. The explanations for increases in 2005 over 2004 includes the addition of $12,000 for an employee returning from maternity leave, additional clerical support from customer service at $15,000 and fringe benefits increase of $5,000. The Board is concerned by the level of increases year over year and the explanations, which appear to be somewhat duplicative.

The Board notes the Town's view that the $15,000 of clerical support plus $5,000 for fringe benefits from customer accounting should result in corresponding reductions in customer service whereas there is only a $6,000 reduction. The Board agrees Northland has not explained why the increase in administration due to transfer of an employee does not result in a comparable reduction in customer service expense. In the absence of adequate explanation from Northland and in light of the addition of a casual employee in 2004 and a further addition of an employee returning from maternity leave in 2005, the Board is not convinced the proposed level of increases are justified. Therefore, the Board will accept the Town's proposal to reduce administration by $14,000. The Board directs Northland to reflect a net reduction of $14,000 for this item in 2005 and 2006.

6.4 Distribution Maintenance

Northland submitted that it provided a complete explanation for the requested increase in Distribution Account 87300 – Maintenance. The overall increase is due to a new hire, a new heat scan program and a new ground rod inspection program. Northland submitted that there is no double counting of the proposed expenditures and the full requested increase is required. Northland noted that certain activities, which did not impact upon the safety or reliability of the system, were simply not done or not done to the level that may have been desirable in prior years (due primarily to manpower shortages). Northland is now planning to return to the level of maintenance that is desirable and appropriate given that it will have a full complement. (Northland Argument, p.6)

The Town noted Distribution Maintenance is forecast to increase $101,000 in 2005 and $86,000 in 2006. The Town noted Northland's acknowledgement that it had counted $17,000 for heat scanning equipment twice in the explanation of increases. As a result, the Town submitted the $29,000 increase attributed to catch up on deferred maintenance should really be $46,000. The Town noted that Northland had also indicated in BR-NUL-NWT-5(b) that "Based on 2004 actual there is $37,000 of deferred maintenance which is being made up in 2005 and 2006." The Town noted Northland's explanation that this latter amount was the difference between a vacancy of 1.0 in 2004 and 0.1 in 2005 times the pay rate. The Town submitted that given that power linemen vacancies are noted in both Account 85300 Transmission Overhead Lines and Account 87300 Distribution Maintenance, in 2004, the difference must reflect only a portion of a lineman in each account.

The Town noted that it is not convinced that had the resources been available, either by way of contractor or employees seconded from an affiliate, that the $46,000 of distribution maintenance could and should have been performed in 2004. That maintenance would include both labour and materials and supplies. The Town submitted that the 2005 and 2006 distribution maintenance should be reduced by $23,000 in each test year to ensure that customers do not pay twice for those services. (Town Argument, p.8)

The Town stated that it can only conclude activities not done, or not done to a desirable level, should have been done in prior years and the costs to perform those activities were previously paid by consumers. “NUL has effectively deferred those activities to the test year and customers will pay for them a second time.” (Town Reply, p.3)

In response, Northland stated:

> “this suggestion is totally baseless and must be rejected by the Board. There is simply no basis upon which to conclude that any such “double-counting” has or will occur, particularly in the context of NUL’s actual experienced returns and the forward Test Year method of regulation.” (Northland Reply, p.9)

The Board is concerned that the Company may have deferred spending in non-test years to the current test period. Although the Board recognizes Northland’s explanation regarding the level of work done with existing resources, the Board considers it within Northland’s abilities to contract additional help if required to ensure the necessary level of work was completed. The Board does not consider it appropriate to defer necessary expenditures for the safety, reliability and upkeep of the system to test years. The Board considers distribution maintenance expenditures included in revenue requirement should reflect a normalized level. Therefore, the Board directs Northland to reduce its forecast distribution maintenance by $18,500, representing the amount indicated by Northland as catch up or deferred maintenance, in each of the years 2005 and 2006. (BR-NUL-NWT-5b)) The Board notes that the above adjustments would bring the level of expenditure under account 87300 during the test years more in line with the average expenditures over the 6 year period from 1998 to 2003 with some allowance for staffing increases, inflation and other identified increases specified in BR-NUL-NWT-4(b).

6.5 Special Studies on Kakisa Hydro and Mackenzie River Crossing

Northland indicated that these are high-level studies, which are designed to assess the feasibility of projects that will be of benefit to its service area. Given the nature of the studies, Northland is proposing to expense these costs instead of capitalizing them.

The Town noted that the Kakisa Hydro study involves an office study to estimate the capital cost and potential output of the site. Although the project is forecast to be complete in 2005, the Town stated that it does not appear the $10,000 expenditure will be made in 2005. The costs should be held in Plant Held for Future Use ("**PHFFU**") until a decision is made on whether to proceed.

With regard to the Mackenzie River Bridge Crossing, the Town submitted that there is no reason to proceed with the study until a final decision is made to proceed with the bridge. In the event the bridge project proceeds, any study expenditures should be placed in PHFFU.

Northland considered the Town's recommendation to put the costs of the Kakisa study in PHFFU inappropriate and inconsistent with the requirements of GAAP. In particular, Northland submitted that GAAP dictates these costs be expensed, as it is not certain the underlying project will proceed. If held in PHFFU, shareholders would pay the costs if an actual project were not ultimately undertaken. Northland also stated that studies, such as the Mackenzie River line, are appropriate, particularly where consideration of whether to undertake a project must be done in a timely manner. Northland submitted that it is incumbent upon utilities to undertake studies when opportunities could have material benefits for customers.

The Board agrees that the Company requires sufficient flexibility in its management to properly consider opportunities related to projects such as the Kakisa and Mackenzie River Bridge crossing which may result in benefits to customers. Given the uncertainty of whether the project might proceed and the level of costs involved, the Board considers Northland's proposed treatment of these expenditures appropriate. With regard to the timing of the Kakisa study, the Board agrees it is unlikely the forecast expenditure will be completed before the end of 2005 and directs Northland to move this expenditure to 2006.

6.6 Training and Meetings

Northland forecasted increased costs related to trainings and meetings for a new supervisor of administrative services to increase visits to communities to conduct public safety programs, energy conservation, etc. Neither the Town nor the Hamlet provided comment on this issue in Argument or Reply.

Having reviewed the evidence on this expense and the purposes of the program, the Board is satisfied the forecast level of expenditures for training and meetings is reasonable and is approved as filed.

6.7 Brushing

The actual and forecast expenditures on transmission and distribution brushing expenditures are as follows:

	Actual 2003	Actual 2004	Forecast 2005	Forecast 2006
Transmission brushing	12000	13000	27000	29000
Distribution brushing	26000	29000	52000	55000

Northland submitted that brushing costs were below forecast levels in past years primarily due to vacancies. Further, Northland hired an outside consultant to examine brushing activity who indicated that additional brushing was required to bring the system back to desired levels.

The Town noted Ouimet Cunningham's 3 Year Projection to get the brushing cycle on track was $75,000 per year. The Town went on to note Northland spent $42,000 in 2004 on transmission and distribution brushing even after receiving the report. The Town also noted that the average expenditure on distribution brushing during 1999-2004 was $40,000, $16,000 less than forecast for 2000.

The Town considered that Northland should not be compensated twice for the same work. The lack of staff to carry out the program is simply not an adequate excuse. The Town submitted that, in the current test years, Northland claims they will fill vacant positions by contractors or by seconding from an affiliate. In the Town's view, Northland did not maintain its brushing program since the last GRA and is now faced with a serious catch up situation. The Town noted Northland spent $30,000 less than it forecast in the 1999/2000 GRA on transmission brushing over the period 1999-2004. For distribution brushing, the comparable figure is $96,000.

The Town noted that, with reference to in HR-NUL-NWT-11(b), Schedule 1, page 2 of 2, Northland would be required to spend $75,000 per year from 2004-2006 to get the brushing cycle back on track. Northland's 2004 actual brushing expenditures were only $42,000 and adding the forecast expenditures for 2005 and 2006 totals $205,000 which is just slightly less than the Ouimet Cunningham estimate to get the brushing cycle back on track. The Town submitted that Northland should be directed to bring the brushing program back to the standard recommended by its consultant by the end of 2006. However, since Northland has been compensated through rates for $77,000 per year but has only expended $56,000 per year over the last 6 years, customers should not be asked to pay a second time. The Town estimated that if Northland is allowed to include $19,000 for brushing in each of the 2005 and 2006 test years, it will have been fully compensated for brushing over the period 1999-2006. (Town Argument, p.7)

In Reply, Northland stated it is clearly not asking customers to pay a "second time" for costs that were recovered in rates in past years. Northland submitted that it has under-earned on its approved return because it incurred the costs necessary to provide safe and reliable service. While Northland does not consider the results of the Ouimet Cunningham study as "mandating" any particular course of action, it does use the study as a guide to assist in focusing its brushing efforts. Northland has prepared forecasts based on the costs it expects to incur in order to conduct an appropriate brushing program for each of the Test Years. (Northland Reply, p.11)

Although the forecast level of brushing appears higher than in previous years, the Board is more concerned that the necessary work be undertaken and completed to ensure the safety and reliability of the system. In this instance, the Board is very concerned with the findings of the Ouimet Cunningham report and the apparent failure of Northland to carry out significant brushing work over the preceding years. The Board expects and directs Northland to ensure the necessary brushing work is undertaken to ensure the system's safety and reliability and to provide a comprehensive status report on the state of the work as part of the next GRA.

For the purposes of these proceedings, the Board notes the annual expenditure of $75,000 required in each of 2004, 2005 and 2006 to bring the brushing program up to date under a 3-year program set out in the Ouimet Cunningham report. The Board considers this level of expenditure may not necessarily reflect a normalized level of brushing expenditure given the comment in the Ouimet Cunningham report that the 2007/08 budget should be less, pending completion of the 3-year program. The Board also notes the actual expenditure of $42,000 in transmission and distribution brushing in 2004. This level of expenditure in 2004, as well as the expenditure levels that are significantly lower than what was forecast for brushing in the last GRA, support the Town's view that there is some catch up expenditure reflected in the 2005 and 2006 forecasts. However, considering all of the circumstances, including the need to bring the brushing program up to date, the Board approves transmission and distribution brushing expenditures totalling $75,000 in each of 2005 and 2006. Northland is directed to reflect this finding in its refiling.

6.8 Franchise Retention Costs

Northland included $21,000 in 2005 and $19,000 in 2006 for amortization of Franchise Retention Charges. As noted in the Town's Argument, these costs are described as primarily legal costs to negotiate the Hay River Franchise Agreements in 2000 and 2004. Northland indicated these costs are amortized over the term of the Agreements. However, the Town noted the initial $54,000 in 2000 should have been fully amortized by 2004 and the $32,000 for the 2004 renewal should be amortized at a rate of $11,000 per year. In any event, the Town considered these are more appropriately shareholder costs and should not be paid by customers.

Northland submitted that the Town's proposed approach is entirely inappropriate as the retention of the franchise is critical to Northland's efforts to minimize costs for all customers. The loss of economies of scale associated with such a franchise loss would cause dramatic increases in costs.

The Board considers that the addition and retention of franchise areas provides the opportunity for benefits to customers of the utility in terms of customer growth and economies of scale. While there are also potential benefits to shareholders resulting from growth in the business, the Board considers the operation, including renewals, of franchise agreements an ordinary part of the utilities' business and properly included in the utility's operating expenses. That being said, the Board agrees with the Town's assessment that the 2000 Agreement should have been fully amortized by 2004 when it was again renewed. Therefore, the Board directs Northland to reduce the amount included for amortization of the Hay River franchise renewal to $11,000 per year.

6.9 Hearing Cost Reserve

Matters related to the hearing cost reserve are addressed in the No Cost Capital portion of this Decision.

7. TAXES OTHER THAN INCOME

The Board notes the total of property taxes included in revenue requirement amounts to $41,000 in 2005 and $45,000 in 2006. (Schedule 1.1) However, the total property taxes shown in response FP-NUL-NWT-8 are $34,200 in each of 2005 and 2006. The Board directs Northland to reflect the correct numbers for property taxes in revenue requirement in its refiling.

8. DEPRECIATION

In its Application, Northland filed a depreciation study prepared by Mr. Kennedy of Gannett Fleming. The Town suggested that Northland's use of monthly plant balances for the forecasts may result in a mismatch between the Company's forecast depreciation expense and booked depreciation expenses if the latter is based on year end plant balances. However, the Board notes Northland's position is actual account depreciation rates are multiplied by actual monthly account plant balances to arrive at the monthly actual depreciation expense. In view of the clarification provided by Northland, the Board does not consider a change in the proposed depreciation calculation is necessary.

With regard to survivor curves, Northland proposed the continued use of a 40-R3 Iowa Curve for Account 457, Transmission Substation Equipment. No change to this account was proposed by Northland due to the lack of adequate retirement data.

The Town submitted that the 50-R3 curve used by AE and provided in HR-NUL-NWT-14(a) is a better visual fit for account 457 than the 40-R3 curve provided at page III-21 of the Depreciation Study. The Town submitted that the Company did not adequately support the 40-R3 curve proposal for account 457. The Town noted that the Company relied on comparators from NWTPC and Yukon Energy Corporation, stating that they have similar physical forces of retirement to Northland. However, the Town that submitted, there is no evidence to support this assertion other than some anecdotal references to sizing, weather and load considerations. The Town submitted that the account 457 depreciation curve should reflect the one used by AE.

The Board notes the Town's concerns with respect to this account and considers the explanations in relation to northern peer comparators and to AE provided by Northland do not adequately demonstrate that the continued use of the 40-R3 curve is appropriate for this account. Accordingly, the Board directs Northland to provide further evidence in relation to account 457 with additional peer comparisons together with explanations for differences, as part of its next depreciation study and/or technical update. Given limited data on actual retirements for this account, and given the peer comparison to Northern Utilities provided by Northland, the Board is prepared to retain the 40-R3 curve for purposes of this test period.

For Account 474, Distribution Overhead Conductor, Northland proposed to increase the average service life from a 40-R2 Iowa Curve to a 45-R3 Curve. The Board notes the Town's suggestion that the 50-R2.5 Curve appears to fit retirements on this account better than the proposed 45-R3 curve. On the other hand, Northland's position is that the 45-R3 curve fits better in the mid-life portion of the asset account. Northland acknowledges that there is no clear fit for this account but, considering the two northern peer utilities, the 45-R3 is more appropriate. In view of this evidence, the Board will accept Northland's recommendation of 45-R3 for account 474.

Finally, Northland proposed a change in Account 479.10, Distribution Line Transformers, from a 27-R2.5 Curve to a 30-R2.5 Curve. The Town argued that the 37-R2 curve provides a better fit through the 0-15 year interval and a much better fit through the 30 – 40 year interval. Northland stated that only in the periods of insignificant retirement ratios post age 30 does the IOWA 37-R2 provide a better fit. Northland suggested retirements beyond age 30 are not statistically significant as less than 2.5% of the plant would still be exposed to retirement. The Board is not convinced the use of the 37-R2 Curve is superior to the recommended 30-R2.5 Curve and approves the proposed change from the 27-R2.5 Curve to the 30-R2.5 Curve.

9. RETURN

9.1 Capital Structure and Return On Equity

Northland requested a return on common equity of 10.75% in each of the test years based on its actual common equity ratio. Although prepared to use the 9.5% return utilized by the AEUB as a starting point for Northland's return, Northland submitted that it is a very different utility from those located in Alberta with different risks. Northland noted that its functions include generation and retail, recognized as being riskier functions than transmission and distribution. Northland also indicated that it has a concentration of customers in one franchise and has little diversification with respect to franchise retention. With regard to the equity ratio, Northland suggested a utility of its nature and size warrants an equity ratio far in excess of 40%, and in the range of 48-55%.

On the issue of equity return, the Town submitted:

> "NUL accepted the 9.5% starting point knowing full well that rate was based on 3 and 12-month forward long Canada rates of 4.9% and 5.2% as forecast in November, 2004, but which had dropped to at least 4.5% and 4.9% or 30-40 basis points by March, 2005, and further to 4.2% and 4.6% by July, 2006. Clearly, the 9.5% start point was generous to NUL at the time the application was filed." (Town Reply, p.4)

The Town noted that, while Northland submits it would be inappropriate to selectively update this portion of the Application by considering the more current consensus forecasts, the AEUB has accepted such updates up to the time of the hearing. Moreover, the Town suggested consideration should also be given to the recent AEUB decision concerning the 2006 generic return on equity, setting the return at 8.93%.

In discharging its mandate to determine fair and reasonable rates, the Board considers it prudent to utilize the best information available as at the time of the hearing in making its determinations. In this case, the Board notes the decline in long Canada rates from the November 2004 consensus forecast. Although not the only factor to be considered, the Board agrees the 9.5% starting point for Northland is generous. However, taking into account some of the differences in risk between Northland and other utilities, including its integrated structure, generation and retail components and focused franchise centre, the Board considers a return of 9.5% for 2005 is appropriate and fairly balances the interests of shareholders with those of consumers.

With regard to 2006, the Board notes the AEUB's decision concerning the 2006 generic return on equity. As the change in the consensus forecast would largely be accounted for in the 2006 return rate, the Board does not consider any further adjustment is required in this regard. However, again, taking into account the risks relative to Northland, the Board considers a return on equity of 9.5% in 2006 is also appropriate.

Northland is directed to reflect a return on equity of 9.5% for 2005 and 2006 in its refiling.

Although the Board agrees that there are differences between Northland and AE, differences of varying degrees and scope will always exist between companies. In this instance, while Northland's functions include generation and retail, the Board notes that the scope of the generation function is not extensive and may be offset, to some extent, by the fact a significant portion of Northland's power supply is purchased energy. Given the integrated nature of Northland, and considering the risks it faces relative to comparable utilities, the Board considers the aforementioned return applied to the Company's actual equity ratio in the range of 39% to 40% is reasonable for the test period.

9.2 Customer Deposits

The intervenors raised the issue of whether customer deposits should be included in Northland's no cost capital. With regard to customer deposits, Northland stated that these serve as security for unpaid bills and are required to be available to either be refunded to customers or to actually apply to the bills in the event of a default. Although the total remains approximately the same from year to year, Northland submitted that the funds are needed to be available to repay them when they leave or default on payment.

The Town submitted:

> “… Given the overall level of consumer deposits, the likely quantum of any particular refund and the sources of short-term capital available to the company, it does not seem necessary nor efficient to maintain a separate bank account when such funds could be used to fund longer term obligations which carries a higher cost of capital. Hay River submitted that $90,000 of estimated consumer deposits should be included in the capital structure for 2005 and 2006 at a rate of 2.54% being the current interest rate paid on consumer deposits.” (Town Argument, p.15)

The Hamlet submitted:

> “Customer deposits, net of the amounts NUL expects to apply towards uncollectible accounts, should be recognized as a reduction to NUL’s working capital. The use of these funds effectively reduces the total amount of necessary working capital otherwise necessary to run NUL’s operations. Fort Providence also submitted that NUL should be allowed to include the forecast interest costs payable on such deposits.” (Hamlet Argument, p.21)

Although the make up of these funds may fluctuate over time as a result of changes in customers and the payment and receipt of funds into and out of this account, the Board notes that the quantum of these deposits appears to be growing in a stable manner year over year. While the Board recognizes a portion of the funds may be payable to Northland for uncollectible accounts during the test period, the Board also considers it highly unlikely that a substantial portion of the net funds in the account would be paid out in a short period in the absence of the Company changing its policy on the requirement for deposits or otherwise terminating its business. Accordingly, the Board agrees with the position advanced by the Town, namely customer deposits, net of amounts Northland forecasts to apply towards uncollectible accounts, should be included in the Company’s capital structure at a cost rate reflecting the interest payable on customer deposits. The Board directs Northland to reflect this finding in its refiling.

9.3 No Cost Capital

9.3.1 Deferred Pension Liability

No cost capital includes the deferred pension account. Northland proposed to transfer $29,000 in each of 2005 and 2006 into the deferred pension account reflecting the accrual of liabilities with respect to other post employment benefits (“**OPEB**”).

Northland indicated:

> “…these benefits are expensed for rate making purposes according to General Accepted Accounting Principles. However, the accrued amounts are <u>not</u> deductible for income tax purposes and, therefore, are factored out of the income tax calculations. NUL confirmed that these amounts are not capitalized...” (Northland Argument, p.12)

On this issue, the Hamlet indicated:

> “…with respect to OPEB is two-fold. Firstly, while most of its accounting and regulatory treatment for all other pension items is consistent with its parent ATCO Electric, the matter of OPEB is the only exception. For example, the parent is on a cash basis with respect to the Defined Benefit Plan due to the surplus in its plan. NUL’s DB Pension Plan, is for the “North of 60 employees…so that NUL and (NWT) are part of a separate pension plan” and this pension plan currently has a surplus of about $1.7 million, and hence, NUL is also on a cash basis for the DB Plan. Likewise, both NUL and AE are on a cash basis with respect to the DC Plan.
>
> Next, when we look at the continuity schedule of the OPEB deferral account, it becomes evident that NUL has been collecting from customers

> amounts with respect to OPEB on an accrual basis since 2001, and has accumulated a total of $134,000 to December 31, 2004 with nil payments for this expense to date. If allowed to be on an accrual basis for the test years, the collection will balloon to $192,000 by December 31, 2006. Note that there is no forecast of payments out of this account for the test years either.
>
> Fort Providence recognizes that the balance accumulating in the Deferred Pension Account benefits ratepayers through a reduction in the return. However, there is no need to pre-fund the OPEB expense. The clear evidence is that there have been no payouts for the last at least 6 years (since 1999) for which information is provided in this GRA, and there is no expected payout for the next 2 years 2005-06 either. Fort Providence is of the view that consistent with the practice adopted by its parent, NUL should record OPEB expense on a cash "pay-as-you-go" basis." (Providence Argument, p.17)

In reply, Northland submitted:

> "…NUL considered that compliance with GAAP is extremely important and that, if a divergence in treatment is to occur, it be explicitly justified in the circumstances based on persuasive evidence. As well, there is simply no evidence before the Board which would indicate that the impact on NUL of switching to a cash basis would be consistent with the implications of adopting such action for ATCO Electric." (Northland Reply, p.22)

The Board notes the Hamlet's concern that OPEB for north of 60 companies is treated on an accrual basis and this treatment is different from that used by Northland's parent for its employees. The Board also notes that Northland uses a cash basis for the defined benefit pension plan due to the existence of a surplus in this plan. The Board notes that no OPEB payments are forecast to occur during the test years and under these circumstances the entire forecast OPEB contribution to the deferral account is subject to tax gross up (ie: not deductible for tax purposes) during the test years. This results in current customers providing not only the funding but also the associated taxes. Had there been forecast payments out of the fund in 2005 and 2006 the current customers would benefit from the associated tax deductions. The Board is concerned the continued funding of the OPEB account without payments out of the fund may lead to intergenerational inequities between current customers and future customers. Considering the surplus in the OPEB fund, the Board considers it appropriate to suspend accruals to the OPEB account for the two test years. Northland is directed to address why it considers it appropriate to continue to use the accrual basis for OPEB at the next GRA, given the use of the cash basis for other components of pension costs and the tax impact of accrual accounting for OPEB noted above. Northland is directed to adjust its filing to reflect the suspension of funding to the OPEB account in 2005 and 2006.

9.4 Deferred Charges and Credits

9.4.1 Hearing Cost Reserve Account

Northland submitted that the hearing cost reserve may, at any point in time, have a negative or positive balance and, therefore, should not be included as part of no cost capital. Instead Northland proposed the inclusion of the balance in the hearing cost reserve as part of deferred charges and credits. The Northland proposed treatment has the effect of reducing the 2005 and 2006 rate base by the mid year balance in the hearing cost reserve.

The Town submitted that the reserve should be brought to nil, thereby eliminating consideration of its use as no cost capital. The Town went on to indicate a provision of $3,000 per test year would bring the balance of the Reserve to nil by the end of 2006.

Northland agreed with the principle of targeting a zero balance for the hearing cost reserve. However, Northland indicated that the $47,000 provision should be maintained in order to provide for contingencies.

The Board considers the Northland proposed provision of $47,000 per year may be necessary to cover the contingencies related to hearing costs. Accordingly, the Board approves the $47,000 provision in each test year as proposed by Northland. The Board expects Northland to continue to transfer $47,000 to the hearing cost reserve each year following the 2006 test year, until the next GRA.

9.4.2 Reserve for Injuries and Damages (RID)

The Hamlet presented a number of concerns with regard to the criteria for claims to be included within the RID.

The Hamlet recommended that the Board direct Northland to amend the RID accounting policy to specifically state that only claims clearly and demonstrably outside management's control and not reasonably preventable or foreseeable are to be eligible for the RID. The Hamlet also submitted that losses due to events arising from gross negligence on the part of the Company or events that are compensated through the return on equity should not be eligible for RID treatment. The Hamlet submitted that Northland's current policy invites management to engage in potentially lax operating practices, methods and acts with the customers footing the bill. Approving Northland's current RID policy in this manner is also inconsistent with the practice approved by the AEUB for other utilities it regulates. The Hamlet stated that Northland should be required to provide, as part of its refiling, a complete accounting policy with respect to RID with the addition of the criteria as noted in the Hamlet's Argument (Hamlet Argument, p.24).

Northland noted that there is no evidence regarding the impact such a change would have on Northland's risk profile. Further, as no claims are forecast for the test years, this matter has not been specifically addressed in Northland's Application.

Notwithstanding the above, Northland indicated that it is prepared to monitor the evolution of the treatment of reserves similar to its RID in other jurisdictions, evaluate the applicability of any such changes to Northland and report on same to the Board in the context of Northland's next GRA. (Northland Reply, p.24)

The Board considers that there is merit in ensuring the criteria for charges to the RID are appropriate, even in the absence of forecast charges. Noting Northland's offer to address this matter, the Board directs Northland to address the criteria for charges to the RID account at the next GRA, having regard to the criteria identified by the Hamlet in these proceedings.

9.4.3 Plant Maintenance Reserve

Northland submitted that this account is to mitigate the impact of major overhauls by spreading out the costs over time. Northland stated that it is requesting to increase the annual write-off from $50,000 to $100,000 to reduce the balance in this reserve account. Further, Northland submitted that the reserve is part of rate base and that the Hamlet's suggestion the reserve is not financed with the weighted average cost of capital is unsupported.

In its Argument, the Hamlet submitted:

> "Maintenance expense increases including amortization of the Plant Maintenance Reserve account are increasing by $179,000 in 2005 over

> 2004 actual levels or 33.6% and $174,000 in 2006 over 2004 actual levels or 32.7%. Fort Providence submitted these increases are too high and cannot be explained by an increase in one additional line man. It is submitted that this provides further support for the labour expense reductions set out above under operations and maintenance expense. Fort Providence further submits, that the allowed amortization of the Plant Maintenance Reserve Account should be reduced by $50,000 in each of the test years." (Hamlet Argument, p.27)

The Board notes that the charges to the plant maintenance reserve averaged about $40,000 per annum in the period 1992 to 1998 but the annual average increased to about $100,000 in the period 1999 to 2004. (BR-NUL-NWT-7) The Board considers the existence of a deferral account while mitigating utility risk may not necessarily provide a strong incentive for cost control. For this reason, the Board is concerned by the increase in the level of average plant maintenance expenditures. In view of this concern, the Board directs Northland to demonstrate that the level of expenditures charged to the deferral account with respect to each type of maintenance (overhaul, top end overhaul) for the different plants are reasonable by reference to suitable benchmarks derived from other Northern utilities at the next GRA. Given the average expenditure level of about $100,000 in the period 1999 to 2004, the Board will approve the requested increase in the amortization amount to $100,000 for 2005 and 2006.

With respect to the cost of financing the plant maintenance reserve, the Board considers the plant maintenance reserve to be no different than any other component of working capital. Accordingly, the Board considers it appropriate to allow the plant maintenance reserve to be included in rate base, earning the same rate of return as other rate base assets.

9.5 Working Capital

The Hamlet submitted that Northland should be directed to incorporate the impact of the credit management system on revenue lag and accordingly reduce the revenue lag days in 2006. The Hamlet stated that since there is no evidence on the record with respect to the impact of this system, Northland should be directed to determine the impact of the credit management system on working capital and incorporate any changes in its compliance filing.

The Board notes Northland's view that implementation of the new credit management system would have an impact on revenue lags. (Tr., Vol. I, p.281-283) The Board considers that since the cost of implementing the credit management system is included in the Application, the corresponding working capital related benefits should also be reflected in the forecasts during the test period. Accordingly, the Board directs Northland to reflect the impact of the credit management system on forecast revenue lags, in its refiling Application.

10. CAPITAL ADDITIONS

Northland indicated that its capital budget is comprised of new extensions, distribution improvements, street and sentinel lights, meters, transformers, generation and general plant and equipment. The forecast capital additions are slightly below the 2004 actuals.

10.1 Distribution Extensions

With regard to new Distribution Extensions, the Hamlet noted that historical data indicates Northland over forecast new extensions in 1999 by $15,000 and 2000 by $49,000. As Phase I applications were not filed for the period 2001-2004, there is no data on the variances between forecast and actual. The Hamlet submitted that Northland is unable to explain variations in costs for different projects. Given the inconsistencies and history of over-forecasting, the Hamlet recommended a 20% reduction in the 2005 distribution extensions forecast.

In reply, Northland submitted that the Hamlet’s proposed reduction is arbitrary. With regard to the history of over-forecasting, Northland noted the period was covered by a ‘package deal’ negotiated settlement with no line items for rate base additions. Northland submitted that the Hamlet’s position ignores actual costs for new extensions have increased every year during the period 2001 to 2004. On unit costs, Northland noted each development has different characteristics driving the price. Regardless, new extensions referenced by the Hamlet are completely offset by customer contributions with no impact on rate base or revenue requirement.

Although the Board notes the forecast level of expenditures appears to increase significantly in 2005 before returning to levels similar to the average of previous years, it does not consider there is sufficient evidence to conclude Northland’s forecasts demonstrate a tendency towards over forecasting. With regard to the differences in unit costs, the Board recognizes that there may be some differences in the costs relative to different projects. While the Board does not consider a reduction in the forecast appropriate, in future, it will expect Northland to be able to provide further details on the unit costs for each project, including a full description as to the reasons why costs related to a project may vary materially from costs for a project of similar description or type.

10.2 Sentinel Lights

The Hamlet noted Northland forecasts $6,000 for sentinel lights in each of 1999, 2000, and the two test years. No amounts were expended on sentinel lights in 2001-2004. Based on Northland's failure to spend amounts over the 2001 through 2004 period, the Hamlet submitted that the sentinel light forecast should be denied in full.

In response, Northland submitted that the proposed reduction is arbitrary and there is no evidence demonstrating that this forecast is not reasonable.

The Board is concerned that Northland has not provided any reasons as to why expenditures on sentinel lighting is required in the test years notwithstanding the absence of expenditures related to this item from 1999 to 2004. In the absence of evidence supporting the proposed change in spending levels, the Board considers it likely the current forecast incorporates some level of catch up from prior periods. However, it is not clear to the Board whether all of the forecast work will be completed given the pattern of expenditure in non-test years. The Board considers therefore the forecast should be reduced by 50%. Accordingly, the Board directs Northland to reduce the forecast for sentinel lighting to $3,000 in each of 2005 and 2006.

10.3 Meters

The Hamlet recommended that the Meters forecast be reduced by $5,000 in each year as the average expenditure over 2001-2004 was 4,800 and the forecast in 1999 was 12,000 and $8,000 in 2000. Again, Northland submitted that the recommended reduction is arbitrary.

The variances in the level of expenditures in non-test periods relative to test periods are matters of concern to the Board as previously discussed in relation to sentinel lighting. In this instance, there is no evidence justifying the increase in spending from the prior periods. Accordingly, the Board considers a reduction in the Meter forecast to $6,500 in both 2005 and 2006 appropriate to reflect the average level of expenditures over the period 2001 to 2004 while recognizing some increase in costs over that same period. The Board directs Northland to reflect this finding in its refiling.

10.4 Office Computer Equipment

The Hamlet noted that Northland over-forecast office computer equipment by $1,000 in 1999 and $8,000 in 2000, or by 80%. In 2001 through 2004, Northland did not make any expenditure with respect to Office Computer Equipment. The Hamlet recommended Northland's forecast for 2005 be reduced to $2,000.

In reply, Northland submitted that the Hamlet ignores the Company's use of computer equipment services during the non-test period; instead of purchasing computer assets.

While the pattern of expenditures in the non-test period is of concern, in this instance, the Board is satisfied there is sufficient justification concerning the variation in spending on this type of asset during the non-test period. The Board approves Northland's forecast of Office Computer Equipment as filed.

11. INCOME TAX

11.1 Rainbow Type Expenses

Northland indicated that it is not proposing a deferral account for Rainbow type deductions, as it does not see any basis upon which such deductions are available to Northland.

Northland submitted that the approach taken by it is prudent and limits the exposure to customers by ensuring that they are not exposed to the potential interest and penalty charges associated with disallowed deductions. As also noted, customers still get the benefit of the income tax deductions over a number of years through the claims for capital cost allowance, instead of in the first year. (Northland Argument, p.15)

The Hamlet noted that Northland's parent, AE, recently indicated it filed amended tax returns claiming a number of items as capital repairs. Although not all items were approved by Canada Revenue Agency ("**CRA**"), the Hamlet submitted that Northland's views on the eligibility of items for Rainbow treatment are overly narrow and recommended a deferral account for Rainbow expenses to refund or collect differences between placeholder amounts and actual amounts claimed as tax deductions for capital. The Hamlet went on to list projects and costs included in AE's deferral account and recommended, at a minimum, all similar Northland projects be included in the proposed deferral account.

In addition, the Hamlet recommended Northland provide a detailed project-by-project submission of why certain transmission and distribution capital expenditures in excess of $5,000 are treated as repairs; whereas others are capitalized for income tax purposes. Placeholder amounts in the deferral account would be based on this review.

Finally, the Hamlet suggested that Northland obtain an advance tax ruling on these issues, if necessary.

The Town supported the position of the Hamlet on this issue.

In its reply, Northland submitted that its position is based upon the direct experience of its parent company in determining the appropriate course of conduct for the assessment and treatment of these capital repair costs. Northland indicated that it fully understands the criteria that are necessary for eligibility for a Rainbow type deduction and has systemically applied these criteria to Northland's forecast capital repair costs. (Northland Reply, p.28)

Northland went on to indicate its concern that the Hamlet is ignoring the potential interest and penalty costs associated with a disallowance of unqualified deductions by the CRA and noted this is an issue of timing on the writing-off of expenses. With regard to the proposed study, Northland suggested the costs would outweigh the benefits.

As neither Northland or the Hamlet can unequivocally determine what CRA will, or will not, allow for Rainbow treatment, the Board is not convinced customers should be resigned to accepting the write-off of potential Rainbow type expenditures over time. Accordingly, given the uncertainties over the claims for Rainbow type expenses, and noting the establishment of a deferral account for this specific purpose for Northland YK pursuant to Decision 12-2005, Northland is directed to propose a deferral account for capturing any benefits resulting from Rainbow type claims during the test period, along the lines approved for

Northland YK as part of its refiling application. For the purposes of the deferral account, the same criteria for claiming Rainbow type expenses should be used for Northland as used for Northland YK.

While the Board recognizes a review of the type recommended by the Hamlet may involve the Company's resources, given Northland's position that it has already considered the eligibility of its capital expenditures for Rainbow treatment, the Board's view is that completion of a more formalized study should only require marginally incremental effort and cost. At the time of its next GRA, the Board directs Northland to provide a detailed assessment of transmission and distribution capital maintenance expenditures in excess of $5,000, indicating which, if any, of the Rainbow criteria each expenditure meets. In determining which costs should be considered, Northland should have reference to examples provided by other utilities in Alberta and the North where similar reviews have been undertaken. Based on that review, the Board will address the issue of whether continuation of a deferral account is warranted and any placeholder amounts.

With regard to the Hamlet's recommendation that Northland obtain an advance tax ruling, the Board does not consider it appropriate to provide such a direction in this instance but requests Northland investigate the timing, costs and viability of such an exercise as part of the foregoing report.

11.2 Engineering, Supervision & General (ES&G) Costs

Northland submitted that the year-to-year ES&G costs are relatively flat and the changes in the overall provisions are caused by changes in customer contributions. However, the Hamlet noted that Northland is not able to provide the basis for the allocation of the ES&G amounts as between UCC classes.

The Board considers the allocation recommended by the Hamlet is not unreasonable, should not result in significant costs, and would be of assistance in examining the income tax impacts related to this item. Therefore, the Board directs Northland to provide the basis of allocation of ES&G amounts between the UCC classes in its next GRA.

PHASE II MATTERS

12. COST OF SERVICE

In BR-NUL-NWT-13(d), the Board requested Northland to comment on a direction provided in Decision 12-2005 respecting Northland YK to review all classification factors to determine if they remain appropriate and to reflect the results in the next Phase II application.

In response, Northland indicated if the Board deems it appropriate to review all classification factors, Northland would be ready to carry out the directive. In order to mitigate the economic impacts associated with such a study, Northland would investigate the possibility of a joint study with Northland YK in an effort to spread the costs across a greater number of customers.

The Board directs Northland to review all classification factors used in the cost of service study in conjunction with a similar study for Northland YK and provide the results as well as reflect the findings in the next GRA.

13. RATE DESIGN

13.1 General

Northland indicated that it used rate design criteria similar to those utilized in its previous Phase II application. Northland stated that the criteria used in the design of the proposed rates are as follows:

- Recover the total forecast revenue requirement by rate zone (community).
- Utilize the cost of service allocations of the revenue requirement.
- Avoid undue discrimination between customer classes.
- Consider the rate levels, structures and policies of other utilities, particularly those of similar load and service conditions.
- Promote ease of understanding and acceptance by customers, as well as ease of administration and economy of billing.
- Recognize the level and structure of existing rates.
- Promote efficient and cost effective use of power through price signals built into the rate structure.

For the 2006 test year, Northland proposed to recover the deficiency using individual rate zone Riders (Rider R) on the 2005 base rates. A Cost of Service study was not performed for 2006 and therefore to determine the individual riders, the net revenue requirement was allocated to the rate zones and rate classes using the following method:

1) Determined the total non-fuel cost by removing the total fuel and purchase power costs of $2,630,000;

2) Removed the incremental revenue requirement impact of the new Fort Providence generator amounting to $45,702;
3) Determined the non-fuel cost per rate zone by allocating the net 2006 non-fuel Revenue Requirement using the ratio of the 2005 non-fuel cost per rate zone over the total non-fuel cost;
4) Added $45,702 to the Fort Providence non-fuel Revenue Requirement to reflect the capital generation addition (Schedule 3.9);
5) Allocated the total non-fuel cost per rate zone to the respective individual rate classes based on the ratio of the 2005 non-fuel cost per rate class over the total non-fuel cost for the rate class;
6) Added on the respective fuel and purchase power costs per rate zone as provided in Phase I Schedules 3.1 and 4.1.

The 2006 impact on the Fort Providence non-fuel revenue requirement due to the addition of the new generating unit as set out in Schedule 3.9, was amended in Northland's letter dated November 22, 2005 to $32,130. (Revised Schedule 3.9)

13.2 Fort Providence's Capital Zone and Postage Stamp Proposal

The Hamlet stated that, using the revised Schedule 3.9 provided by Northland, the proposed rate base addition resulting from the new generating unit alone causes a 3% increase to the 2006 Revenue Requirement. Put another way, just one large capital addition contributes about 32% to the total increase in the cost of service to Fort Providence in 2006 ($32,130/(1,180,595-1,081,234)). The Hamlet considered this to be a significant portion of the total rate increase to Fort Providence.

In view of its concern about the impact of new capital additions on the revenue requirement and rates of diesel communities, the Hamlet submitted evidence suggesting that the Board should consider the establishment of a capital rate zone as a means of mitigating rate shock resulting from diesel-related generation additions. Under the capital zone proposal, the cost of new diesel generation additions would be systematized as part of the diesel generation capital related costs across all communities including the Town of Hay River. The Hamlet also suggested that the capital zone averaging concept outlined above for new generation additions may be extended to existing diesel generating plant as well. As a further step in the continuum of rate averaging, the Hamlet suggested the Board should consider postage stamp rates across the entire service territory of Northland.

In support of its proposed postage stamp approach the Hamlet, in its filed evidence, stated that the principle of cost causation suggests that the customer must pay the costs he gives rise to. The Board must ask how equity and fairness is fostered in the existing rate design when customers who reside closer to a natural resource (that is, hydro, which belongs to all of the residents of NWT) get a preferred rate simply for no other reason than by happenstance i.e. by virtue of their proximity to that resource. It is not that they cause less costs by their actions; lower costs result from the availability of cheap hydro power. The Hamlet noted that there is no basis in cost causation to suggest that just because the communities are not interconnected, postage stamp rates are not appropriate. The Hamlet provided examples of other jurisdictions where, in its view, the postage stamp concept has been applied.

The Town filed rebuttal evidence in response to the Hamlet's evidence, which stated that until there is specific legislation that directs the Board to require hydro communities or lower cost diesel communities to subsidize higher cost diesel communities, the Town sees no reason to cause the Board to depart from its findings in Decision 5-95. Clearly, any action with regard to postage stamp rates should await the Government's review, changes if any to the legislation and input from all affected parties, presumably following a detailed review by the Board.

The Hay River Chamber of Commerce made a submission expressing concern over the impact of any form of rate averaging between Hay River and other communities on the Hay River economy.

Northland submitted that, while it clearly understands the proposal brought forward by the Hamlet, it does not support the implementation of the proposed diesel generation capital rate zone. Northland submitted that the implementation of a capital rate zone will deviate from the community cost of service based rates and will cause additional cross-subsidization between communities. Northland submitted that the issue of a capital rate zone has been examined previously by the Board (when brought forward by Northland itself) and was not accepted by the Board (Decision 6-96).

The Board has given due consideration and weight to the evidence and testimony of the Hamlet as well as that of the Town. The Board continues to hold the view expressed in Decision 3-2003 that given the absence of a physical system integrating hydro and diesel communities, the creation of any form of cost averaging between hydro and diesel communities would be contrary to the principles of cost causation and rate making (Decision 3-2003, p.31). Accordingly, the Board considers the Hamlet's capital zone and postage stamp proposals are not consistent with the principles of cost causation and will therefore not accept these proposals.

The Board also expressed the view in the same Decision that rate design criteria are intended to balance the move towards cost based rates while mitigating rate shock, (Decision 3-2003, p.31) Accordingly, the Board considers any concerns respecting rate shock should be addressed through the application of the rate design criteria rather than through any adjustments to the cost of service study.

The Board asked the Hamlet by way of an information request to identify other mechanisms for mitigating significant rate impacts for smaller communities as a result of new plant additions, particularly during the first few years of rate basing such additions. The Hamlet provided the following response:

> "Fort Providence is aware that both NWTPC as well as NUL-NWT have in the past advanced some proposals to mitigate the significant rate impacts for smaller communities arising from new plant additions. These proposals have been rejected by the Board. There are obviously many other variations to the proposals advanced in this rate application by Fort Providence. For example, the Board may want to consider:
>
> (i) Inclusion of both generation as well as distribution related capital additions
> (ii) Capping the inclusion of rate impact stemming from a new capital addition to a pre-defined maximum percentage. For example, pooling would only be appropriate up to a pre-defined maximum % variance between the zonal and average rates.
> (iii) Setting a threshold dollar amount so that only rate impacts in excess of the threshold amounts be included for pooling
>
> In Fort Providence's views, any approach must be simple to apply, be understandable, and must result in rates that are not unduly preferential or unjustly discriminatory." (BR-FP-1b)

The Board recognizes the Hamlet's concern that diesel plant additions, particularly in small diesel communities, can result in significant rate shock. The Board notes some of the rate design solutions offered by the Hamlet as noted in BR-FP-1(b) items ii and iii and considers such approaches should be considered in the future where the rate impacts are significant. In the present case, the Board does not consider the approximately 3% increase in 2006 for Fort

Providence solely as a result of the addition of new diesel generation constitutes rate shock in the context of this Application.

13.3 Burden Of Cross Subsidization

The Hamlet submitted that it bears a higher burden of cross subsidizing other diesel communities whose revenue to cost ratios do not equal 100% in 2005 and 2006.

The Hamlet stated that Hay River's burden is only about a sixth of the burden imposed on Fort Providence on a revenue requirement basis. Also, this burden for Hay River amounts to 0.131 cents per Kwh ($44,468/33,925,300 Kwh per Exhibit 2, Schedule 4.1) whereas for Fort Providence, it amounts to 1.935 cents/Kwh, ($62,595/3,233,500 Kwh per Exhibit 2, Schedule 4.1), or some 15 times higher. The Hamlet submitted it should be self-evident who has the higher burden to bear.

The Board agrees that the subsidies provided to the diesel communities, and Dory Point/Kakisa in particular, in the interest of maintaining rate stability in the subsidy receiving communities, should be borne proportionately by all subsidy-providing communities. Accordingly, the Board directs Northland to design the proposed 2005 and 2006 rates for Hay River and Fort Providence so that the entire amount of dollars required to subsidize the remaining diesel communities, after the application of the 10% rate cap to those communities, is recovered from Hay River and Fort Providence proportionate to each community's forecast of revenues in each year. The Board also directs Northland to redesign Rider J so that the subsidy reduction as a result of gradually moving the community of Dory Point/Kakisa towards revenue to cost tolerance flows to Hay River and Fort Providence in proportion to the forecast revenues in the respective communities in each of 2007, 2008 and 2009. The Board directs Northland to reflect the foregoing changes in rate design in its refiling of the Application.

14. RATE SCHEDULES

14.1 Residential and Commercial Rates

Northland stated that the existing residential Customer charge captures between 28.5% and 53% of the Customers allocated customer cost per community. Northland indicated it has not adjusted the Customer charge in the proposed rates given that it is comparable to neighbouring utilities. Northland indicated that the existing demand charge for commercial Customers has been increased to improve the recovery of the demand related costs. (BR-NUL-NWT-14d)

The intervenors did not raise any concerns respecting Northland's residential and commercial rate design. The Board will accept the proposed fixed charges for residential customers and the proposed demand charges for commercial customers for the purposes of this Decision.

14.2 Rider A

During the hearing, discussions also took place with respect to the current Rider A trigger threshold level and the Board staff requested Northland to comment on the merits of using a pooled approach from the point of view of rate stability, and identify what may be appropriate threshold levels to trigger the Rider.

Currently, changes to the Rider A rates for each community are triggered based on whether or not the change in diesel cost causes a rate impact to a residential or general service "sample customer" of greater than 2%. Northland indicated that it has considered alternate mechanisms, such as the pooled approach used by the NWTPC, but does not consider this an improvement over the existing methodology. Northland indicated that it prefers the current process for determining Rider A rates because the analysis and Riders reflect cost causation in each community, whereas a pooled approach would cause cross-subsidization of fuel costs between communities (BR-NUL-NWT-14f). Further, Northland indicated that the current process reviews the rate Riders on a quarterly basis and keeps Rider balances to a minimum.

Northland submitted that if a pooled trigger level balance was implemented by community, or if the current rate impact threshold level methodology was maintained, they could equally provide the desired rate stability provided that the trigger levels are set at an appropriate level that would reduce the number of applications for changes to the rate and thus provide more stability.

The Hamlet indicated that the existing trigger mechanism for Rider A has resulted in frequent and in some cases very significant increases (decreases) in the diesel rates of communities. The Hamlet recommended that the Board establish a reasonable dollar threshold limit before approving the collection or refund of Rider "A". The Hamlet submitted the threshold should be set at about 10% of fuel costs or $100,000 rounded up. The Hamlet also noted that mid-year balance of the deferred account will attract interest at a rate equal to the Allowance for Funds Used During Construction (AFUDC), and therefore, should provide Northland and customers adequate compensation for any balances in the diesel fuel deferral account.

The Board notes Northland's view that if the Rider A deferral account balance adjustments were triggered by a certain threshold level balance in the deferral account by community, that could provide a similar level of rate stability as under the present trigger which is based on whether or not the change in diesel cost causes a rate impact to a residential or general service "sample customer" of greater than 2%. The Board shares the concern of the Hamlet that frequent Rider A adjustments results in rate instability. The Board considers the frequent Rider A adjustments of the past may at least in part relate to the fact Northland makes spot fuel purchases. Therefore, forecasts of months ahead fuel prices may have proved difficult in past Rider A applications. However, the Board considers that Northland should take necessary steps to take into account the forecast of fuel prices looking forward for a period of at least 12 months. The issue of fuel price stability is dealt with in Section 4.1. If the forward looking forecast of fuel prices results in a change greater than 2% for a sample residential or commercial customer based on 12 month recovery, a Rider A application should be filed. The Board directs Northland to propose a Rider A mechanism that reflects the above parameters as part of the refiling of the Application.

14.3 Rider I

When the proportion of actual diesel generation in a year exceeds 2.5% of total power required to supply the Town of Hay River, Northland records the costs attributable to the excess of diesel generation over the 2.5% threshold in a deferral account and recovers this amount by way of Rider I.

The Town expressed the view that Rider I should not be used to recover diesel costs over which Northland can exercise control. The Town considered only the outages related to purchased power over which Northland had no control should be reflected in the Rider I deferral account:

> “Hay River submits that the only diesel generation costs that should be included in the Rider I deferral account should be those over which NUL has no control, i.e. outages related to NTPC hydro or transmission. NUL’s forecast outage costs which are currently incorporated into the 2.5% forecast outage rate implicit in Rider I should include 20 hours of

> generating costs per year for outages that are attributable to NUL's transmission and substations. Hay River therefore submits that future Rider I true-ups should only be applicable to NTPC related outages. In the alternative, if outages on NUL's transmission line and substations continue to be included in Rider I, there should be a downward adjustment to NUL's business risks and rate of return on equity." (Town's Argument p.4)

Northland considered the inclusion of all outages impacting diesel generation in the Rider I deferral account as appropriate. Further, Northland considered if the risks covered by Rider I are to be changed as per the Town's proposal, Northland would need to ensure that its revenue requirement included the costs of operating the Hay River plant due solely to the forecast unavailability of Northland's transmission facilities

The Board notes from HR-NUL-NWT-5 that there were a number of instances where the Hay River diesel plant operated under circumstances where Northland had control over initiating such operation. Diesel preventive maintenance run would be an example of this type of operation. In principle, the Board considers deferral accounts should be used to record amounts over which the utility has no control or where the amount cannot be forecast with reasonable accuracy. The Board agrees therefore that additional diesel generation caused by reasons that are within Northland's control should not be included in the Rider I deferral account. Based on the evidence, the Board concludes failure of hydro power supply to be the only reason for diesel operation that is outside of Northland's control. Accordingly, the Board directs Northland to not include diesel generation costs other than those directly attributable to failure of hydro power supply in the Rider I deferral account, effective January 1, 2005.

The Board notes Northland's submission that if the Board were to accept the Town's proposal, the revenue requirements should be adjusted so that the costs of operating the Hay River plant due solely to the forecast unavailability of

Northland's transmission facilities are reflected. Northland is directed to reflect this change in the refiling of the Application.

15. TERMS AND CONDITIONS OF SERVICE

15.1 Maximum Investment Levels

Northland indicated that it has not conducted any formal studies pertaining to the maximum investment levels set out in Schedule A of the terms and conditions of service for this GRA because circumstances have not changed significantly. Northland stated that during the preparation of preceding GRA’s, the Company had conducted cursory reviews of these levels and has found them reasonable at those times. Northland indicated that it will conduct a formal study to review the maximum investment levels in the future. (BR-NUL-NWT-15c)

Given that a recent formal review of maximum investment levels has not been carried out, the Board directs Northland to complete such a study and reflect the results in the next GRA.

15.2 Amendments to Terms and Conditions (T&Cs) of Service

Northland proposed an amendment clause 3.1 of the T&Cs whereby amendments to the T&Cs would take effect following notice to the Board:

> “These terms and conditions have been approved by the Board. The Company may amend these terms and conditions by filing a notice of amendment with the Board. Included in the notice to the Board shall be notification of which Customer groups are affected by the amendment and an explanation of how affected Customers will be notified of the amendments. The amendment will take effect 60 days after such notice is filed, unless the Board otherwise directs.” (Article 3.1 in part)

In the Northland YK proceedings a similar amendment was proposed by that company and the Board directed the amendment be changed as follows:

Article 3.1

These terms and conditions have been approved by the Board. The Company may amend these terms and conditions by filing a notice of amendment with the Board and interested parties from the preceding General Rate Application. Included in the notice shall be notification of which Customer groups are affected by the amendment and an explanation of how affected Customers will be notified of the amendments. The Board will either acknowledge the notice of the amendment to the Terms and Conditions or direct a further process to deal with the requested change as the Board deems appropriate. If the Board acknowledges notice of the amendment, the amendment will take effect upon the date of such acknowledgement.

Northland indicated it is not opposed to adopting the wording as directed in Decision 12-2005 for Northland YK for the re-filing. Accordingly, the Board directs Northland to reflect the revised wording of clause 3.1 in the T&Cs filed as part of the refiling Application.

16. REFILING OF THE APPLICATION

Northland is directed to refile its application in accordance with the refiling instructions in this Decision within 30 days of this Decision. Northland is directed to refile all supporting material and schedules incorporating the Board's directions together with proposed rates and riders designed to recover the 2005 and 2006 revenue requirement resulting from the Board's findings. A summary of directions related to the refiling applications are set out below:

1. The Board notes that Northland expects to correct the residential sales forecast and revenues to reflect corrected customer growth numbers in 2005 and 2006 and directs Northland to reflect this change in its refiling of the Application.

2. The Board considers in accordance with Northland's stated method of forecasting heat rates the forecast fuel efficiencies of any new engines forecast to be in service should be reflected in the forecast heat rate calculations and directs Northland to adjust the 2006 heat rate calculation for Fort Providence to reflect the addition of the new generator in 2006.

3. The Board directs Northland to use a vacancy level of 0.5 FTE in each of 2005 and 2006 and to reflect the appropriate reduction in labour, benefits and other expenses in its refiling.

4. The Board is not convinced the $27,000 cost in 2004 for regulation and Phase II activities is likely to be incurred at this level in each of 2005 and 2006. The Board considers it more reasonable to spread the costs identified

as related to regulation and Phase II over the two-year test period and directs Northland to reflect a net reduction of $13,500 for this expenditure item in each of 2005 and 2006.

5. The Board will accept the Town's proposal to reduce administration by $14,000. The Board directs Northland to reflect a net reduction of $14,000 for this item in 2005 and 2006.

6. The Board directs Northland to reduce its forecast distribution maintenance by $18,500, representing the amount indicated by Northland as catch up or deferred maintenance, in each of the years 2005 and 2006.

7. With regard to the timing of the Kakisa study, the Board agrees it is unlikely the forecast expenditure will be completed before the end of 2005 and directs Northland to move this expenditure to 2006.

8. Considering all of the circumstances including the need to bring the brushing program up to date, the Board approves transmission and distribution brushing expenditures totalling $75,000 in each of 2005 and 2006. Northland is directed to reflect this finding in its refiling.

9. The Board directs Northland to reduce the amount included for amortization of the Hay River franchise renewal to $11,000 per year.

10. The Board directs Northland to reflect the correct numbers for property taxes in revenue requirement in its refiling.

11. Northland is directed to reflect a return on equity of 9.5% for 2005 and 2006 in its refiling.

12. The Board agrees with the position advanced by the Town, namely customer deposits, net of amounts Northland forecasts to apply towards uncollectible accounts, should be included in the Company's capital structure at a cost rate reflecting the interest payable on customer deposits. The Board directs Northland to reflect this finding in its refiling.

13. Northland is directed to adjust its filing to reflect the suspension of funding to the OPEB account in 2005 and 2006.

14. The Board notes Northland's view that implementation of the new credit management system would have an impact on revenue lags. The Board considers since the cost of implementing the credit management system is included in the Application, the corresponding working capital related benefits should also be reflected in the forecasts during the test period and directs Northland to reflect the impact of the credit management system on forecast revenue lags, in its refiling.

15. The Board directs Northland to reduce the forecast for sentinel lighting to $3,000 in each of 2005 and 2006.

16. The Board considers a reduction in the Meter forecast to $6,500 in both 2005 and 2006 appropriate to reflect the average level of expenditures over the period 2001 to 2004 while recognizing some increase in costs over that same period. The Board directs Northland to reflect this finding in its refiling.

17. The Board directs Northland to propose a deferral account for capturing any benefits resulting from Rainbow type claims during the test period, along the lines approved for Northland YK in Decision 12-2005 as part of its refiling Application.

18. The Board directs Northland to design the proposed 2005 and 2006 rates for Hay River and Fort Providence so that the entire amount of dollars required to subsidize the remaining diesel communities, after the application of the 10% rate cap to those communities, is recovered from Hay River and Fort Providence proportionate to each subsidy providing community's forecast of revenues in each year.

19. The Board directs Northland to redesign Rider J so that the subsidy reduction as a result of gradually moving the community of Dory Point/Kakisa towards revenue to cost tolerance flows to Hay River and Fort Providence in proportion to the forecast revenues in the respective communities in each of 2007, 2008 and 2009. The Board also directs Northland to reflect the foregoing changes in rate design in its refiling of the Application.

20. If the forward looking forecast of fuel prices results in a change greater than 2% for a sample residential or commercial customer based on 12 month recovery, a Rider A application should be filed and the Board directs Northland to propose a Rider A mechanism that reflects the above parameters as part of the refiling of the Application.

21. The revenue requirements should be adjusted so that the costs of operating the Hay River plant due solely to the forecast unavailability of Northland's transmission facilities are reflected.

22. The Board directs Northland to refile the proposed T&Cs for approval, subject to incorporation of the change noted above with respect to Article 3.1 as part of the refiling of the Application.

17. SUMMARY OF DIRECTIONS FOR FUTURE FILINGS

The following is a summary of directions not related to the refiling applications contained in this Decision:

1. The Board directs Northland to temperature normalize historical sales for the purposes of forecasting test year sales and use normalized sales for the purposes of determining the energy balance, including line losses, at the time of the next GRA.

2. Northland is directed to provide a preliminary assessment of feasible energy supply alternatives for diesel communities, including those referred to by the Hamlet, that may help alleviate the high cost of providing electricity supply to these communities, as part of its next resource planning cycle and provide Northland's recommendations thereon to the Board and interested parties by year end 2006. Following this filing, the Board may direct that further detailed studies or a further process be undertaken or may conclude that the matter needs no further action.

3. In order to address the concerns over fluctuations in line loss percentages from years to year Northland is directed to develop procedures for determining actual line loss factors for each year, which are reasonably reflective of the electrical line losses for that year. To the extent the unbilled consumption is a factor amongst others causing fluctuations in overall loss factors from year to year, the percent loss factor applicable to electrical losses should be identified separately from the loss factor applicable to other factors under the category of unaccounted for losses. Northland should institute the

above procedures with immediate effect and explain how these procedures address the accurate determination of forecast loss factors, at the next GRA.

4. Northland is directed to provide an engineering assessment of the level of line losses in each community given the community's particular system configuration and report and reflect the outcome of the study in the next GRA.

5. The Board directs Northland to ensure the necessary brushing work is undertaken to ensure the systems safety and reliability and to provide a comprehensive status report on the state of the work as part of the next GRA.

6. The Board directs Northland to provide further evidence in relation to account 457 with additional peer comparisons together with explanations for differences, as part of its next depreciation study and/or technical update.

7. Northland is directed to address why it considers it appropriate to continue to use the accrual basis for OPEB at the next GRA given the use of the cash basis for other components of pension costs and the tax impact of accrual accounting for OPEB noted above.

8. The Board directs Northland to address the criteria for charges to the RID account at the next GRA, having regard to the criteria identified by the Hamlet in these proceedings.

9. The Board directs Northland to demonstrate the level of expenditures charged to the deferral account with respect to each type of maintenance (overhaul, top end overhaul) for the different plants are reasonable by reference to suitable benchmarks derived from other Northern utilities at the next GRA.

10. At the time of its next GRA, the Board directs Northland to provide a detailed assessment of transmission and distribution capital maintenance expenditures in excess of $5,000, indicating which, if any, of the Rainbow criteria each expenditure meets.

11. The Board considers the allocation recommended by the Hamlet is not unreasonable, should not result in significant costs, and would be of assistance in examining the income tax impacts related to this expenditure item. The Board directs Northland to provide the basis of allocation of ES&G amounts between the UCC classes in its next GRA.

12. The Board directs Northland to review all classification factors used in the cost of service study in conjunction with a similar study for Northland YK and provide the results as well as reflect the findings of the in the next GRA.

13. The Board directs Northland to not include diesel generation costs other than those directly attributable to failure of hydro power supply in the Rider I deferral account, effective January 1, 2005.

14. Given that a recent formal review of maximum investment levels has not be carried out, the Board directs Northland to complete such a study and reflect the results in the next GRA.

18. BOARD ORDER

NOW THEREFORE, IT IS ORDERED THAT:

1. Northland Utilities (NWT) Limited shall refile its 2005/2006 GRA within 30 days of this Decision in accordance with the determinations and directions contained in this Decision.

2. Nothing in this Decision and order shall bind, affect or prejudice the Board in its Consideration of any other matter or question relating to Northland Utilities (NWT) Limited.

ON BEHALF OF THE
PUBLIC UTILITIES BOARD
OF THE NORTHWEST TERRITORIES

____

DATED March 31, 2006
John E. Hill
Chairman

Northwest Territories Power Corporation, Phase 1 GRA, Decision 13-2007
August 2007

THE PUBLIC UTILITIES BOARD

OF THE

NORTHWEST TERRITORIES

DECISION 13-2007 **August 29, 2007**

IN THE MATTER OF the Public Utilities Act, being Chapter 110 of the Revised Statutes of the Northwest Territories, 1988(Supp.), as amended.

AND IN THE MATTER OF an application by Northwest Territories Power Corporation for changes in the existing rates, tolls and charges for electrical energy and related services provided to its customers within the Northwest Territories.

TABLE OF CONTENTS

1. BACKGROUND & APPLICATION

By letter dated November 24, 2006, the Northwest Territories Power Corporation ("**NTPC, the Corporation**") submitted to the Northwest Territories Public Utilities Board ("**the Board**") its Phase 1 General Rate Application ("**GRA, Application**") for the fiscal years April 1, 2006 to March 31, 2007 and April 1, 2007 to March 31, 2008 ("**Test Years**").

In its Application (Ex.2), the Corporation requested an order or orders of the Board to approve the 2006/07 and 2007/08 Revenue Requirement at $79.909 million and $84.331 million, respectively, including approval as required of the operating and maintenance expenses, amortization expenses and return on rate base. NTPC is also requesting an order or orders of the Board to approve the forecast 2006/07 and 2007/08 Rate Base, approve revised Terms and Conditions of Service, approve revised Maximum Corporation Investment levels, stabilization funds and accounting provisions.

Pursuant to the provisions of section 13.(1) of the Rules of Practice and Procedure, the Board, by letter dated November 30, 2006, directed NTPC to publish notice of the public hearing of the GRA in newspapers that circulate in the Northwest Territories. The notices published in December 2006 included details and schedule of the GRA, and invited interested persons to file a request with the Board for intervenor status (Ex.1)

By letter dated December 4, 2006, NTPC informed all communities that they had filed a GRA with the Board (Ex. 21).

NTPC, by e-mail dated December 18, 2006, advised all registered parties, that the Corporation would be holding a technical workshop on January 8, 2007 in Yellowknife.

NTPC, by e-mail dated January 9, 2007, provided all registered parties with a list of parties who attended the workshop, a copy of NTPC's presentation and a list of undertakings (Ex. 3). NTPC responded to the undertakings on January 12, 2007 (Ex. 4).

Interested parties were provided the opportunity to make request further information through information requests of NTPC and to file evidence. The requests elicited written responses from NTPC. Written evidence was filed on behalf of the City of Yellowknife and the Towns of Fort Smith and Hay River ("**Hydro Communities**" "**HC**") by letter dated February 23, 2007 and on behalf of the communities of Fort Liard, Fort Simpson and Inuvik ("**Thermal Generation Communities**" "**TGC**") by letter dated March 16, 2007. Information requests were issued by the Board and NTPC to the HC and the TGC in response to their written evidence. All written information requests by the Board and intervenors together with the responses were made available to all parties before the hearing.

The Corporation submitted a letter, dated May 16, 2007, setting out certain revisions to its GRA and supporting materials (Ex. 13).

2. PUBLIC HEARING

The hearing was held in the City of Yellowknife on May 23, 24 and 25, 2007. During the course of the hearing, members of the public who had not requested intervenor status were invited to participate in the proceeding. NTPC's panels were cross-examined by counsels for the HC and the TGC on the elements of the GRA. The TGC and HC panels were cross-examined by the counsels for the NTPC.

Board staff examined NTPC's panels and the interveners' panels with respect to a number of issues arising out of an analysis of the Application, including community specific issues. During the hearing, NTPC provided responses to a number of undertakings given at the hearing.

All parties, at the hearing, agreed to file Argument by June 18, 2007 and Reply Argument by June 29, 2007.

TGC, by letter dated June 8, 2007, requested an extension to the Reply Argument from June 29, 2007 to July 3, 2007, because their consultant was involved in another proceeding commencing the week of June 27, 2007 and attending a regulatory conference during this period. By letter dated June 13, 2007, the Board approved the requested extension to July 3, 2007.

3. RATE BASE

This section of the Decision examines the issues raised with respect to determination of the Corporation's rate base for the test years. Rate base includes gross plant in service and working capital.

3.1 Gross Plant in Service

This section of the Decision examines the issues raised with respect to determination of the mid year gross plant in service.

3.1.1 L199 Re-commissioning

The L199 transmission line experienced difficulties with respect to splices in 1996/97. The line was recommissioned in 1999 and the Corporation sought to include the costs of the recommissioning in its rate base at the 2001/03 Phase 1 GRA. At the time, NTPC was also pursuing legal claims against various parties who were involved in the initial construction of L199.

Pursuant to the 2001/2003 GRA Negotiated Settlement ("**01/03 Settlement**"), the L199 recommissioning expenses were not included in NTPC's rate base pending resolution of the outstanding legal claims. NTPC was to establish a deferral account to record the expenditures made to recommission the transmission line, which accrued interest at the rate used for the Corporation's fuel and water stabilization funds.

The 01/03 Settlement further provided that "*Following the final resolution of the existing litigation respecting the Transmission Line L199, the Corporation will apply to the Board to determine the final disposition of the balance in the deferral account*."

The total cost of the project was $3.494 million. Interest charged to the deferral account since the 01/03 Settlement totals $0.765 million. The net recoveries from the legal claims were $1.191 million ($1.605 million gross proceeds minus $0.414 million legal and related costs). Consequently, the net addition to rate base is $3.068 million.

The HC submitted customers have already paid once in rates for the construction of the L-199 line and as a result of its having failed prematurely, they are being asked to pay again for all portions of the loss not assumed by one of the parties to the lawsuit (other than NTPC) through the 01/03 Settlement.

The HC noted the difference between the reported project costs of $3.494 million and the gross proceeds of the 01/03 Settlement of $1.605 million is $1.899 million. The HC submitted pursuant to Section 49 of the *Public Utilities Act ("**PUA**")* R.S.N.W.T. 1988, c.24 (supp.), the Board is to determine a rate base based on prudent costs. The Board is not empowered to reward the utility for the financial consequences of negligent (imprudent) behavior on its part. This is true whether the imprudence is characterized as the failure to properly inspect the splices and dead ends, as alleged by the parties to the lawsuit, or a failure to ensure that there were prudent contractual arrangements with contractors including the reasonable provisions for insurance and guarantees of proper workmanship and materials that a prudent owner would require.

The HC submitted failure on the part of NTPC to be prudent in this regard, should not lead to increased rate base or increased rates for customers. In light of the fact there is no evidence that the lawsuit was not pursued vigorously, and given that the deferral account, including interest, can be interpreted as arising at the request of customers at the time of approval of the 01/03 Settlement, the HC requested a reduction to the direct or “hard costs” identified by NTPC in Chapter 6 of Exhibit 2. Accordingly, the HC submitted that the net addition to rate base of \$3.068 million requested by NTPC should be reduced by \$1.899 million, being the difference between the total cost of the project and the amount recovered in the 01/03 Settlement. (HC Argument, p. 53 – 54)

In its reply argument, NTPC submitted that there is absolutely no evidence on the record with respect to the degree or truth that NTPC’s inspection of the splices during the original construction of the transmission line was inadequate. The Corporation stated the HC called no evidence on the inspection procedures followed by prudent utilities when supervising contractors on transmission projects, nor did they request any evidence on NTPC’s own procedures in respect of this project to permit a comparison in support of their allegation. NTPC submitted the HC provided no evidence that any inspection process commensurate with industry-standard practices in 1989 (which would clearly meet any reasonable test of prudency) would have uncovered the inadequate splices. The only material filed in this proceeding that relates in any way to the inspection of splices are the unsworn Statements of Defence filed by parties that were being sued by NTPC – which parties went on to pay substantial sums to NTPC in order to settle said lawsuit. NTPC submitted it is important to recognize that the allegations made by the Defendants reflect typical defendant pleadings, and were never proven or conceded by the Corporation. Consequently, the HC have failed to rebut the presumption of prudence and the Board has no basis whatsoever on which to make a finding of fact with respect to NTPC's 1989 inspection practices in relation to the splice failures.

With respect to the prudent contractual arrangements issue raised by HC, NTPC stated its contract with MacGregor Construction Ltd is not in evidence in this proceeding. The HC did not request it be put into evidence, nor did they call any evidence in respect of the contractual terms that "a prudent owner would require" to contrast to the contents of NTPC's contract with MacGregor Construction Ltd. The Corporation submitted such evidence could have been secured, for example, by expert testimony in regards to utility contracting procedures at the time of the 1989 contract, had the HC sought to have the Board make this determination. NTPC stated the HC have failed to rebut the presumption of prudence and, absent any evidence addressing contracting standards of the day, there is no basis for the Board to make a finding on NTPC's contractual arrangements with its L199 contractors. (NTPC Reply, p.38)

The NTPC submitted that the HC Argument is entirely premised on the fact that the Corporation agreed to settle the case for $1.605 million, rather than proceed to trial to pursue full recovery of the recommissioning costs; consequently, the HC conclude that a full finding of fault on the part of the defendants (and not on NTPC) is unavailable and further suggest that as a result, NTPC should be viewed to be partially at fault for the failures. NTPC stated this conclusion is incorrect and not appropriate. NTPC stated the reasons for its decision to accept the settlement, and not to proceed to trial, include the costs of a lengthy trial (which may not be all recovered even if the Corporation won at trial), the evidentiary difficulties stemming from the fact that the construction project was completed nearly 20 years ago and many of the parties to the project were no longer available, as well as substantial concerns over the ability of certain defendants to be able to satisfy any significant judgment against them. The

Corporation submitted a concern about a potential finding of fault did not factor into the Corporation's decision to settle the lawsuit. The Corporation submitted further that the decision of a plaintiff to accept a substantial sum of money in settlement of its lawsuit does not reflect an admission of negligence or even partial negligence on its part and any insinuation to this conclusion is wholly inappropriate.

Views of the Board

The Board is of the view that any disallowance of costs must arise from clear evidence that the Corporation was negligent in its actions with respect to the L199 repair project or that the management of the project or the lawsuit was in some other way imprudent. Based on the evidence in this proceeding, the Board finds that there is not sufficient evidence to arrive at a finding the Corporation was negligent, nor is there other evidence of poor management in respect of the L199 project or of a lack of prudence on the Corporation's part. Accordingly, the Board will allow the Corporation to include the $3.068 million cost of the L199 transmission repair in rate base for the 2005/06 fiscal year.

The Board expects NTPC, in its dealings with contractors, to establish prudent contractual arrangements including the reasonable provisions for insurance and guarantees of proper workmanship and materials that a prudent owner would require.

3.1.2 Fort McPherson Power Plant

The Corporation included the following rate base additions in 2004/05 and 2005/06 with respect to a plant rebuild and other improvements resulting from a fire in the community of Fort McPherson:

	2004/05	2005/06	Total
	$000	$000	$000
Diesel power plant additions	7336	660	7996
Insurance proceeds	-5085	0	-5085
Net Additions	2251	660	2911

NTPC indicated the $2.911 million net additions to rate base consisted of betterments amounting to $1.896 million as well as $820,000 for capitalized overhead expenses not covered by insurance and $193,000 deductible on the plant rebuild. (BR.NTPC-27)

The TGC submitted there is very little evidence on the significant difference between the forecast replacement costs ($5.5 to 7.0 million) and the actual cost to rebuild of $9.816 million. Given the sheer magnitude of the cost of the re-build, and the extent of cost overruns, the onus is on NTPC to demonstrate its costs were reasonably and prudently incurred. The TGC considered the Corporation might have incurred higher costs with respect to the project as a result of having to complete the project within a time frame stipulated by the insurance underwriter. TGC submitted there should be at least a 10% disallowance of costs incurred to re-build the Fort McPherson plant for the above reasons. (TGC Argument, p. 44)

NTPC indicated there is no evidence to suggest the Corporation incurred additional costs due to the requirement to complete the work within a stipulated timeframe. (NTPC Reply, p. 35)

Views of the Board

The Board notes the actual cost of plant rebuild excluding betterment costs is $6.1 million [$7.996 million total plant costs minus betterment costs of $1.896 million]. The Corporation recovered $5.085 million of the plant rebuild costs from insurance proceeds.

The Board notes from the response to TGC.NTPC-55(b) that the Corporation charged an amount of $315,000 to the reserve for injuries and damages ("**RFID**") in 2005/06 with respect to the Fort McPherson plant fire repair deductible and items not covered by insurance. Given that the plant fire repair deductible is already included as a charge against the RFID in 2005/06, the Board does not find NTPC's explanation in BR.NTPC-27 that the deductible on plant rebuild in the sum of $193,000 included again as a component of the plant rebuild costs, to be a credible explanation of the costs comprising the net capital additions in relation to the Fort McPherson plant. Accordingly, the Board directs NTPC, as part of its refiling, to reduce the opening plant balance for 2006/07 by $193,000 being that portion of the rate base addition for the Fort McPherson plant that has not been explained nor demonstrated to be a prudent expenditure by NTPC.

3.1.3 Bluefish Generating Station

NTPC added the Bluefish generating station to rate base in 2004/05. The purchase price plus the cost of capital works amounts to $12.603 million. In support of the Bluefish addition to rate base, NTPC stated as follows:

> "In response to BR.NTPC-9, the Corporation noted that at the time of the purchase, the Bluefish purchase was estimated to have a positive impact for ratepayers with a net-present value of $38.1 million. Since that time, the economics of the purchase have been affected by a number of factors,

> most notably increases in the price of diesel fuel, offset by actual and forecast capital improvement costs that are higher than was anticipated at the time of the Bluefish purchase. As a result of these factor, an updated project economic assessment was presented in BR.NTPC-9, which indicates that the net present value benefit to ratepayers is now expected to be $51.4 million (2005$) – an increase of 35 per cent from the forecast at the time of the project permit application.
>
> In summary, the Bluefish project was a prudent acquisition that is providing benefits to customers today and will continue to provide benefits into the future. No intervenor submitted evidence to suggest that the costs of the project were not reasonable. The Corporation submits that the project should be approved as part of the rate base for the test years." (NTPC Argument, p. 48, *ll*. 8 - 20)

Views of the Board

The Board considers the purchase of the Bluefish hydro plant to be prudent and approves the inclusion of the plant in rate base in 2004/05.

3.1.4 Snare Rapids Plant Upgrade

NTPC added $3.838 million in 2005/06 and proposed the addition of $1.305 million in 2007/08 to rate base with respect to the Snare Rapids plant upgrade. In support of the Snare upgrade additions to rate base, NTPC stated as follows:

> "The Snare Rapids Plant upgrade was reviewed and approved by the Board in Decision 8-2004. The project permit application included NTPC's proposed budget of $4.984 million, which was specifically noted as being a "budget level" estimate and not an "engineering pre-design" estimate. The GRA forecast costs are $0.159 million higher and include capital costs of $3.838 million in 2005/06 and forecast costs of $1.305 million in 2007/08 for total project capital costs by the end of the test period of $5.143 million. A breakdown of the costs included in the $3.838 million portion of the project was provided in response to HC.NTPC-60(a).

> The Corporation submits that the project costs included in the test period are reasonable and should be approved." (NTPC Argument, p. 49, *ll*. 15 - 23)

Views of the Board

The Board notes none of the interested parties raised any concerns respecting the Snare upgrade additions. The Board considers the Snare Rapids plant upgrade additions to be prudent and approves the inclusion of the plant in rate base as proposed.

3.1.5 Aklavik Power Plant

NTPC proposed the addition of $5.298 million with respect to a new modular power plant in Aklavik to rate base in 2007/08. NTPC indicated the existing plant was originally built in 1976. Since that time, the community has developed in the area around the plant. With this increased development, there have been complaints from local residents related to plant noise and air emissions. As a result, the Corporation indicated it has received support from the Aklavik Council to relocate and build a new modular power plant outside the town property.

The project permit for the modular power plant at Aklavik was approved at $4.9 million in Decision 11-2006. The Board notes the forecast costs are higher than the project permit estimate by $398,000 or about 8%. The Board also notes the project cost estimate was increased from $3.5 million to $4.9 million at the time the project permit application was submitted to the Board. At that time, NTPC indicated the increased costs are attributable partly to delays from the original schedule due to ongoing consultations with the community and due to deployment of the Corporation's engineering staff to address the fire at Fort

McPherson. (Decision 11-2006; p. 4) The Board notes that although the project permit application contemplated addition of the unit to rate base in 2006/07, the Corporation is now proposing to add the plant to rate base in 2007/08.

Views of the Board

The Board is concerned by the significant cost overruns noted at the time of the project permit application and the additional adverse cost variance between the project permit amount and the forecast addition for 2007/08. The Board considers some of the cost increases resulted from unforeseen circumstances, which resulted in delays in the completion of the unit, and the Board is not convinced the customers of Aklavik should bear the entire cost risk resulting from these delays. Accordingly, the Board considers the carrying costs and overheads associated with delays due to unforeseen community consultations and deployment of the Corporation's engineering staff to address the fire at Fort McPherson should be shared between the Corporation's shareholder and the customers of Aklavik.

The Board directs NTPC, in its Phase 1 refiling, to reduce the cost of the Aklavik plant addition by 50% of the cost increase resulting from the delays. The costs to be included for the 50% risk sharing adjustment are overheads and Allowance for Funds Used During Construction ("**AFUDC**") resulting solely from the delays in completion of the plant caused by the unforeseen length of time spent on community consultations and the fire at Fort McPherson.

3.2 Fort Liard Distribution Upgrade

NTPC proposed to add $900,000 to rate base in 2007/08 in the community of Fort Liard. NTPC indicated this project consists of upgrading the plant voltage from 600 volts to 4,160 volts. This increase in voltage capacity is required to meet any future load growth that may occur due to increased oil and gas activity in the area.

TGC argued that since this project is not expected to go ahead during the 2007/08 test year, the corresponding costs should be removed from rate base:

> “However, in Response TGC.NTPC-58, NTPC indicated there was uncertainty as to when the expected growth in oil and gas activity would materialize; further, at hearing, NTPC confirmed this project is not anticipated to proceed.
>
> Based on the foregoing, the TGC submit this project, with a forecast cost of $900,000 in 2007/08 should be removed from rate base. It is not clear what load growth is exactly included in the 2007/07 forecast for Fort Liard; obviously, if the capital project is removed, the TGC expect any associated load forecast should be removed as well, and NTPC should be directed to provide this information.” (TGC Argument, p. 24)

NTPC submitted it is not appropriate to recognize this one change in the capital forecast without regard to offsetting other projects.

> “…TGC argues for removal of this one project to reflect actuals despite having sought no evidence at any time in regards to the dynamic changes in the capital plan, the reprioritization that has occurred during the year and the offsetting other projects that have been changed or added to the plan on an actual basis that were not forecast.
>
> Under a future forward test year regulatory framework, the utility’s forecasts leading forward from the date of filing are the appropriate basis for developing and testing the revenue requirement. To the extent they are

> available, some actual results can aid in the testing of the reasonableness of the forecasts, but it is simply not appropriate to substitute those actuals for the utility's forecast. Were that to be the case, the form of regulation would be more akin to retrospective regulation with an assured earning of a fair net income and return, which is not the regulatory framework in NWT or any other Canadian jurisdiction." (NTPC Reply, p.3. *ll*. 7 - 17)

Views of the Board

The Board notes the Corporation appears to have recognized the forecast sales based on which the plant upgrade was predicated would not materialize at the time of the filing of the Application.

> "NTPC has forecast the load to reflect the latest information at the time of filing concerning the impact of oil and gas activity which is lower than when this project was first identified." (TGC.NTPC-58(c))

The Board is of the view that it was likely that the Corporation would have known the project would not proceed at the time of the filing of the GRA. Therefore in order to be consistent with the determination of the sales forecast, the Corporation's forecast plant upgrade should also be excluded from rate base additions in 2007/08. The Board directs NTPC, in its refiling, to exclude the capital addition related to the plant upgrade amounting to $900,000 from rate base additions for Fort Liard in 2007/08.

3.3 Working Capital

The Corporation's calculation of necessary working capital for the test years is set out in Schedules 5.8 and 5.9 of the Application. One of the components of working capital is the allowance of cash working capital. The purpose of allowing cash working capital is to recognize the time lag that occurs between when payments for expenses are made and when the corresponding revenues are received. The cash working capital was estimated on the basis of a lead lag study carried out by the Corporation.

The TGC expressed concern that the revenue lag days in the lead lag study were unduly high because they were estimated on the basis of the maximum time allowed for payment of bills before penalties are imposed:

> "The TGC submit NTPC's assumption all customers pay on the "maximum allowable time for payment prior to interest charges" may be over-stating the revenue lags to the extent customers pay their bills prior to the date interest charges commence. To this end, the Board should direct NTPC to incorporate, in its next GRA, a proper sampling of bill payments from various sources (industrial, wholesale, NWT Housing Association, Territorial Subsidy and Domestic/Commercial/Street Lighting) in order to properly assess the actual number of days it takes on average for customers to pay bills. To the extent payments received after the due date attract interest and/or late payment penalties, the Corporation should also address why such payments should be included in this sample for purposes of conducting the lag associated with revenue collection." (TGC Argument, p. 48)

The TGC also expressed concern that the expense items comprising the cash working capital do not reflect the corresponding net lag days associated with that expense item. TGC submitted the Board should direct NTPC, in its refiling, to provide a computation of its cash working capital for the Test Years using the net lead or lag associated with each expense item.

Views of the Board

The Board agrees with TGC that the use of the maximum number of days before penalties are imposed to estimate the revenue lag is unrealistic. Accordingly, the Board directs the Corporation to estimate the revenue lag based on sampling the number of days it takes for recovery of revenues, on average, from customers, for the next GRA.

The Board also agrees with TGC that each item of expense in the cash working capital calculation should reflect its corresponding lead or lag. This is to recognize the changes in the relative proportions of expenses included in the cash working capital calculation from year to year. Accordingly, the Board directs NTPC to provide, in its refiling, a computation of its cash working capital for the Test Years using the net lead or lag associated with each expense item.

4. RETURN ON RATE BASE

4.1 Cost of Debt

NTPC calculated the effective cost of long-term debt using the following formula:

Effective Cost of Long Term Debt= (I+AFC-SFE)/(DWAD-UFC-SFI)

Where:
I= Interest on Daily Weighted Average Long Term Debt
AFC= Amortization of Financing Costs
SFE=Sinking Fund Earnings in the year
DWAD=Daily Weighted Average Debt Principal
UFC=Unamortized Financing Costs
SFI=Sinking Fund Investment

The resulting debt rates proposed by NTPC for the two test years are as follows:

2006/07	10.532%
2007/08	10.927%

The calculation of the effective cost of long-term debt is provided in Schedule SM 3 of Exhibit 3 from the Technical Workshop. NTPC also provided a detailed continuity schedule of the sinking fund balance for each of the sinking fund debt instruments in Exhibit 4 Table NTPC.TWU-15. Further details respecting sinking fund investment terms were provided in HC.NTPC-23.

The HC in its filed evidence disagreed with NTPC's proposal to include sinking fund earnings and the sinking fund investment as part of the effective cost of long-term debt calculation. HC expressed the view the sinking fund earnings as well as the sinking fund balance should be excluded from the calculation of the effective cost of long-term debt.

> “Our recommendation is that the Board adopt the method of calculation prescribed by the Board in Alberta for this purpose, which considers no sinking fund earnings in the calculation. Further, we recommend that the resulting embedded cost of debt be used by NTPC for all its calculations, including but not restricted to AFUDC, working capital and capital lease. We recommend the method prescribed by the Board in Alberta because of the inequities in the current formula used by NTPC to calculate the cost of debt with sinking funds that are due to the formula’s construction and because the costs that are generated from the current formula explode as the debentures approach maturity. …” (Ex.8, p, 107)

The HC also recommended the Board consider some cost sharing with respect to certain sinking fund debentures, namely, the $20 million debenture issued in March 1989 with a coupon of 11%, the $15 million debenture issued in June 1991 with a coupon of 11.125% and the $20 million issued in March 1992 with a coupon of 10.75%. HC indicated cost sharing with the shareholder would be appropriate since these debentures did not include a call feature and the Corporation’s sinking funds investment policy prior to the proclamation of Bill 9 which permitted more diversified investments in the sinking fund, did not conform to best practice.

> “Yes, we would recommend that the Board consider some cost sharing between the rate payers and shareholders of NTPC that recognizes the ongoing excessive costs associated with the three earlier debentures with sinking funds and with earlier management of the investment policy of the sinking fund in addition to our recommendations at page 107. The reason for the former is that these debentures did not conform to “best practice” because they did not include a call feature, and the reason for the latter is that the earlier investment policy did not conform to the principles of “prudent portfolio” management because the portfolio of investments was not well diversified and could have achieved a higher return with about the same risk.” (Ex.8, p.108)

The HC submitted that it is appropriate to examine the terms of the sinking fund issues in this proceeding since the Corporation did not specifically request the current sinking fund treatment until the 2001/02/03 GRA and then it was implicitly approved as part of a 01/03 Settlement.

> "NTPC implies that each of the sinking fund issues was subject to Board review and approval, and from that perspective, it would be unfair to revisit the terms and conditions of bonds that were issued up to 17 years ago. It should be noted that while the Board approves the purposes of the bond or debenture at the time of issue, it typically defers approval of the specific terms and conditions, and in this case the regulatory treatment of debentures with sinking fund provisions, to the next GRA. NTPC did not specifically request the current sinking fund treatment until the 2001/02/03 GRA and then it was implicitly approved as part of a negotiated settlement." (HC Reply, p.10)

The HC also argued that, since NWT Energy Corporation (a more risky non-regulated entity) could issue debentures without sinking funds, NTPC could have issued debentures either without sinking funds or with less onerous sinking fund provisions. (HC Reply, p.9)

NTPC stated that the effective cost of long term debt formula recommended by the HC would put the utility's return on equity at risk, a risk for which the utility has never been compensated.

With regard to the effective cost of long term debt calculations where sinking fund investments are involved, NTPC indicated its proposed calculation is consistent with that used in four other jurisdictions.

> "…There are four jurisdictions in Canada (other than the Northwest Territories) with Crown utilities regulated on a rate base/rate of return basis and whose capital structures include sinking fund debt (with offsetting sinking fund assets). The utilities and the jurisdictions are: BC Hydro (British Columbia Utilities Commission), NB Power Transmission

> Corporation (New Brunswick Board of Commissioners of Public Utilities), Hydro Québec Distribution and TransÉnergie (Régie de l'Énergie de Québec), and Newfoundland and Labrador Hydro (Newfoundland and Labrador Board of Commissioners of Public Utilities). All four of these utilities calculate their embedded cost of debt using the same methodology as NTPC. In three of these jurisdictions (British Columbia, Québec, and Newfoundland and Labrador), the propriety of the embedded cost of debt calculation has not been questioned. In New Brunswick, the methodology was explicitly reviewed by the regulator in 2003 and found to be appropriate." (Ex.12 McShane Rebuttal, p.10 – 11, *ll*. 289 - 302)

With regard to the inequities referred to by HC concerning the debt rate formula, NTPC stated the calculated rate is primarily a function of the fact that (1) the specific debt issue is very close to maturity and thus the amount of the net proceeds (the denominator of the formula) is very small since the sinking fund was virtually fully funded in 2005/2006; (2) the projected earnings on the related sinking fund reflect the fact that the issue is to be retired shortly and thus the related investments have been immunized, i.e., their duration is similar to the remaining term to maturity of the debt; and (3) interest rates happen to be at a relatively low level at present compared to 1989 when the 11.0% issue was made. (Ex.12 McShane Evidence, p.7)

With regard to the prudence of the terms under which the three debentures referred to above were issued, the Corporation stated at the time the sinking fund debentures were issued (1989-1998), NTPC was a virtually unknown quantity from a creditworthiness perspective, and was issuing relatively small amounts of debt, and thus there would have been very few potential investors for NTPC's long-term debt. While its debt carried a guarantee from the Government of the Northwest Territories, neither NTPC nor the government itself had a credit rating.

With regard to HC's view that the Corporation failed to follow best practice in the management of the sinking fund, NTPC indicated the investments allowed under the *Financial Administration Act* ("***FAA***") prior to Bill 9 were substantively the same as those in which the sinking funds of other government-owned electric utilities continue to be invested. None of these entities invest the sinking funds designed to retire debt securities in equities, as NTPC has been permitted to do under the provisions of Bill 9.

Views of the Board

The Board considers sinking fund investments, together with earnings on such investments, are put in place in order provide some or all of the cash flow required to retire the corresponding sinking fund debt when it becomes due for payment. The funds transferred to the sinking fund are no longer available to the Corporation since they are set aside specifically for the purpose of retiring the debt. Therefore, to the extent earnings on sinking fund investments do not match the corresponding debt rate there is either a cost or benefit to the Corporation as a result of the investment in the sinking fund until such time as the sinking fund debt instrument is retired.

The Board notes the average sinking fund debt rate exceeds the average sinking fund return by about 6% in each of the two test years as shown below.

		Debt Interest Rate Vs Sinking Fund Return				
		$000				
		Debt Principal		Sinking Fund Investment		
		Mid Yr 06/07	Mid Yr 07/08	Mid Yr 06/07	Mid Yr 07/08	
1	11% Debt Mar 9/89	11.000%	20000	20000	19191	20830
2	11.126% debt Jun 6/91	11.125%	15000	15000	9087	10199
3	10.750% Debt May 28/92	10.750%	20000	20000	10434	11880
4	8.700% Debt Feb 27/96	8.410%	8700	8700	261	446
5	6.330% Debt Oct 27/98	6.330%	10000	10000	1150	1504
6	Total		73700	73700	40122	44858
			Debt Interest		Sinking Fund Earnings	
7	11% Debt Mar 9/89		2200	2200	553.00	602.00
8	11.126% debt Jun 6/91		1669	1669	453.00	507.00
9	10.750% Debt May 28/92		2150	2150	524.00	594.00
10	8.700% Debt Feb 27/96		732	732	12.00	21.00
11	6.330% Debt Oct 27/98		633	633	50.00	67.00
12	Total		7383	7383	1592	1791
13	Average Interest Rate/Sinking Fund Return		10.018%	10.018%	3.968%	3.993%
14	Difference between debt rate and sinking fund return				6.050%	6.026%
15	Carrying cost of sinking fund investments [L6*L14]				2427	2703

As shown in the above table, the difference between the average debt interest rate and the sinking fund return times the sinking fund balance constitutes the carrying cost to the Corporation of the sinking fund investments. This cost could also be a benefit if the earnings on sinking fund investments exceed the average debt rate in any given year. The Board notes the Corporation's proposed formula is designed to reflect the carrying cost of sinking fund investments in the effective cost of long-term debt for the two test years. On the other hand, the effective cost of debt formula recommended by HC does not recognize the carrying cost of sinking fund investments since it ignores both sinking fund earnings and sinking fund investments in the debt rate formula.

The terms of sinking fund investments are governed by the corresponding debt covenants. In the Board's view, the carrying costs associated with sinking fund investments are part of the cost of borrowing under a sinking fund debt instrument. Therefore the Board finds it appropriate to provide for recovery of sinking fund carrying costs or benefits, as the case may be, in the effective cost of debt formula.

Notwithstanding the above finding, the Board observes that instability in the effective cost of debt can be caused by variations in sinking fund returns from year to year. The annual average sinking fund investment returns for NTPC are shown in the following table:

Average Sinking Fund Earnings %	
2003	6.17
2004	6.52
2005	5.52
2006	9.72
2007	3.97
2008	3.99
Average	5.98

Note: 2003-06 from X8; P104

The Board notes the relatively low sinking funds returns in 2006/07 and 2007/08 are partly the result of immunizing the investments associated with the $20 million debenture debt issued in March 1989, in anticipation of the retirement of the debt in March 2009. These relatively low sinking fund returns have the effect of increasing the effective cost of long-term debt in the two test years.

The Board considers a normalized sinking fund return based on the average returns over the 6 year period shown above, rather than each test year's forecast return, would provide for stability in the effective cost of long term debt from year to year. The Board also notes from the term sheets for the $20 million 8.41% debenture debt issued February 1996 and the $10 million 6.33% debenture debt issued October 1998, that the expectation for the long term average return on sinking fund investments associated with these two debentures is 6%. The Board considers therefore that a 6% return reflects a reasonable estimate of expected and realized long-term average returns on sinking fund investments and would provide for a more stable effective cost of long-term debt calculation over time. Further the Board considers basing the sinking fund return on a long term average sinking fund return would avoid potential windfall gains or losses to the Corporation which could be the case if the sinking fund returns were based on specific test year forecasts. Accordingly, for the purposes of these proceedings, the Board directs NTPC to use a 6% sinking fund return for each of the test years for purposes of calculating the effective cost of long-term debt.

The Board notes the HC's argument that this is the first time the treatment of debt costs including sinking funds is being proposed by NTPC in the context of a proceeding other than the 01/03 Settlement and therefore it is appropriate to review the terms of the sinking fund debenture issues although they were issued several years ago. However, the Board considers the prudence of the terms of each issue should be examined based on evidence surrounding the specific circumstances of each issue. Given the passage of time since the debenture issues were made, the Board considers the evidence before it is insufficient to assess what the potential impacts on debenture debt rates would have been, had they been issued with call features and/or without sinking fund provisions and/or with less stringent sinking fund requirements. Therefore, the Board is not persuaded by the HC's recommendations that there should be a risk sharing adjustment on certain sinking fund debentures or that the terms of certain debenture issues including the sinking fund provisions should be re-examined in these proceedings.

In addition to the sinking fund treatment, the Board notes NTPC has calculated the debt interest and debt balance on a daily weighted average basis. Since the mid year convention is used for determining the rate base, the Board considers the debt balance and debt interest should also be calculated on a mid year basis in order to be consistent.

The Board, therefore, directs the Corporation to calculate its effective cost of long term debt as follows in its refiling:

Effective Cost of Long Term Debt= (I+AFC-SFE)/(MAD-UFC-SFI)

Where:
I= Interest on Mid Year Average Long Term Debt
AFC= Amortization of Financing Costs
SFE=Sinking Fund Earnings in the year based on long term averge return of 6%
MAD=Mid Year Average Debt Principal
UFC=Unamortized Financing Costs
SFI=Sinking Fund Investment

4.2 Capital Lease

NTPC proposed a cost rate for the Snare Cascades capital lease of 9.69% in 2006/07 and 9.70% in 2007/08. NTPC indicated the capital costs that the Corporation incurs with respect to the lease represent the Dogrib Power Corporation's ("**DPC**") costs of financing comprised of DPC's cost of debt raised to finance the construction of the project (9.6% on 93.26% of DPC's capital structure) and a return on DPC's equity position in the project (NTPC's allowed return on equity less 0.25% on 6.74% of DPC's capital structure).

DPC's cost of debt financing, in turn, reflects the actual cost rate of borrowing from NWT Energy Corporation an amount of $22.9 million under a loan agreement between the two parties. To provide the debt financing to DPC, NWT Energy Corporation issued three series of debentures as follows:

Date of Issue	Amount of Issue	Due Date	Coupon Rate
May-95	$8 million	May-25	10.00%
Oct-95	$8 million	Oct-25	9.75%
Sep-96	$9 Million	Sep-26	9.11%

The weighted average cost of the debt that was issued by NWT Energy and loaned to DPC was 9.6%. The 9.6% average cost of debt incurred by DPC is the same 9.6% rate that is included in the calculation of the capital cost of the lease that is part of NTPC's revenue requirement.

The $22.9 million loan is being amortized and repaid by DPC to NWT Energy Corporation in monthly installments of $195,068 over a period of 30 years.

The HC expressed the view the NTPC could have borrowed at a lower rate than its unregulated subsidiary NWT Energy Corporation at the point in time the lease arrangement was entered into. This would have lowered the cost of the loan to the DPC. In turn, this would have lowered the cost of the lease to the NTPC. HC's expert witness noted that NTPC's calculation uses weights of 6.74% equity and 93.26% debt while the standard approach is to employ a debt weight of 100%. Further, the HC expert witness noted that if the cost of the lease is to include an equity component then the cost of equity should be lowered by more than 25 basis points to capture the lower risk of the lease. (Ex.8, p. 110 - 111; HC Reply, p.13)

NTPC submitted reviewing the terms of the DPC agreement 10 years after it was entered into would constitute retroactive ratemaking.

> "…As stated in Board Decision 1-97 (January 14, 1997), the Board "examined the evidence before it and agrees with the parties that the above interest rates are reasonable for this portion of the capital structure.

> The Board approves lease interest rates of 10.063% and 10.044% for the Test Years 1996/97 and 1997/98 respectively." In my view, a retrospective reconsideration of the prudency of the capital lease arrangement entered into by NTPC more than 10 years ago constitutes retroactive ratemaking." (Ex.12 McShane Rebuttal, p.22, *ll*. 614 - 620)

NTPC indicated the cost of borrowing on the debt issued by NWT Energy Corporation to finance the loan to DPC is consistent with borrowing costs on B++ debenture debt at the time of issue.

> "Nevertheless, a comparison of the yields on the NWT Energy debentures to yields prevailing on outstanding long-term B++ rated Canadian utility bonds at the time the NWT Energy debt issues were made and the funds were loaned to DPC provides a clear indication that the cost of the debt component of the capital lease was reasonable." (Ex.12 McShane Rebuttal, p.22, *ll*. 622 - 626)

NTPC noted that in the event of a disallowance of the capital lease costs, the power acquisition agreement between DPC and the Corporation provides that DPC will pay to the Corporation the amount of the disallowed costs.

> "Were the Board to adopt the recommendations of Drs. Kryzanowski and Roberts, it is important to note the impacts that would arise. The Power Acquisition Agreement between the DPC and NTPC provides that the DPC will pay to NTPC the amount of all Disallowed Costs. Under that agreement, "Disallowed Costs" means amounts payable by NTPC under the agreement which the Board does not permit NTPC to recover in its rates, tolls and charges. The lease was structured to ensure that regulatory risk for recovery of the costs of the project from ratepayers was a risk that DPC bore, not NTPC. Ultimately, it is DPC that would be directly and adversely impacted were the Board to accept HC's recommendations. …" (Ex.12 NTPC Rebuttal, p.3, *ll*. 31 - 37)

In its reply argument, the HC submitted that the DPC capital lease arrangements were a three part commercial arrangement and all parties were aware of the contractual risks associated with strict application of their commercial arrangement.

> "…Furthermore, this is a three-way commercial arrangement that involved two interrelated entities (NTPC and NTEC), as well as two nonregulated parties (NTEC and DPC), and where all parties supposedly were aware of the contractual risks associated with the strict application of their commercial arrangement. Thus, Drs. Kryzanowski and Roberts do not recommend any changes to the commercial agreement between NTPC, NTEC and Dogrib nor do they recommend that the terms of that agreement be violated." (HC Reply, p.13)

Views of the Board

The Board considers the time for raising issues concerning the prudence of the DPC lease financing rate was the 1996/97/98 GRA when the inclusion of the DPC hydro plant in rate base and the related financing arrangements were examined and agreed to by interested parties. The Board does not consider a retrospective review of the long-term debt rate or the cost structure of the lease financing arrangement, approved in a previous proceeding, to be conducive to maintaining a climate of regulatory certainty in the NWT. Therefore, the Board does not accept the HC's recommendation that the debt financing rate reflected in the DPC capital lease be reviewed and reset.

The Board directs NTPC to include a capital lease rate that reflects, for the equity portion of lease financing, the equity rate of return approved by the Board in this Decision less 25 basis points, in its refiling application.

The Board notes the value of the annual lease payments to DPC over the 65 years is financially equivalent to DPC's cost of capital. The lease payments by NTPC to DPC include depreciation based on a 65-year amortization of the lease and carrying costs on the unamortized balance of the lease reflecting 93.26% debt at 9.6% interest and 6.74% equity at the allowed rate of return on equity minus 25 basis points. DPC's cost of financing the lease, on the other hand, is based on 93.26% debt owed to NWT Energy at 9.6% interest which is being repaid over 30 years and 6.74% equity at the allowed rate of return on equity minus 25 basis points. Since the 9.6% debt to NWT Energy is being repaid by DPC over 30 years, the cash flow profile of the lease payments by NTPC to DPC differs from the cash flow profile of DPC's debt repayments to NWT Energy. Given this mismatch in cash flow profiles, the Board considers there may be potential for DPC to reduce its cost of capital by substituting some of the higher cost debt included in its capital structure with lower cost debt as the 9.6% debt is being amortized over 30 years. The Board directs NTPC to address the potential for better matching the carrying cost of the lease to DPC with the cost of the lease to NTPC over the 65-year term of the lease, at the next GRA.

4.3 Capital Structure

The NTPC proposed capital structure for the two test years is as follows:

	2006/07	2007/08
Common Equity	45.53%	48.59%
Long Term Debt	44.53%	41.65%
Capital Lease Obligation	10.86%	10.61%
No Cost Capital	-0.92%	-0.85%
	100.00%	100.00%

The above capital structures reflect the Corporation's forecast capital structures, as opposed to deemed capital structures, in each of the test years.

In support of the proposed capital structure, Ms. McShane, expert witness for NTPC, stated NTPC would need a more conservative capital structure compared with a typical investor owned utility, in order to achieve a similar debt rating in light of its small size, higher business risks and non taxable status. Ms. McShane stated that in her opinion, a common equity ratio in the range of 45-50% would be adequate to allow NTPC to achieve a BBB rating on a stand-alone basis and NTPC's actual equity ratios are forecast to be in that range. Ms. McShane defined a benchmark utility as an A-rated utility and indicated NTPC's risk would remain higher than that of the benchmark which would suggest an incremental equity risk premium is required for NTPC. (Ex 12; McShane Evidence, p.18)

Among the business risks the utility is exposed to, Ms. McShane discussed market risks, supply and physical risks as well as regulatory risks.

With respect to market risks Ms. McShane stated the reliance on a small number of cyclical industries with a sparse population results in a higher level of market risk.

> "…While the outlook is one of strong growth in the near to medium term, the reliance of the NWT on a small number of cyclical industries, in conjunction with the sparse population, results in a higher level of market risk for NTPC relative to the typical Canadian utility which operates in a more diverse economic environment with higher population density." (Ex. 2, Appendix B, McShane Evidence, p. 12, *ll*. 323 - 327)

Ms. McShane indicated NTPC faces an inherently higher level of risk relative to other integrated Canadian electric utilities with respect to supply and physical risks.

> "With respect to supply and physical risks, NTPC faces an inherently higher level of risk relative to other integrated Canadian electrical utilities. The level of risk is in large part a function of the severe climate, the vast geographic expanse and rugged terrain of the service area, and the lack of a system grid to connect the communities served." (Ex.2, Appendix B, McShane Evidence, p.12, *ll*. 329 - 333)

Ms. McShane indicated the regulatory environment in the NWT has been even-handed in its approach and the use of rate stabilization funds mitigates risks.

> "With respect to regulatory risk, the regulatory environment in the NWT has been even-handed in its approach. The authorization and maintenance of the rate stabilization funds, which mitigate risks beyond the control of the utility, are an indication of that even-handedness." (Ex.2, Appendix B, McShane Evidence, p.13, *ll*. 354 - 357)

With regard to financial risks, Ms. McShane indicated in comparison to the interest coverage ratios of the major Canadian electric utilities, NTPC's 2003/2004 to 2005/2006 average of 1.7 times interest coverage ratio has been considerably weaker. The average (pre-tax) interest coverage for the major Canadian electric utilities with rated debt over the same period was 2.5 times. She indicated a key reason for the difference is the taxability of the major Canadian utilities because the income tax allowance provides a cushion that enhances interest coverage ratios.

Drs. Kryzanowski and Roberts, expert witnesses for the HC, recommended a deemed equity ratio of 42% for the two test years. The HC summarized the expert witnesses view with respect to business risk as follows:

> "In summary, NTPC's business risk is at an acceptable level with regard to the major factors causing business risk for a regulated electric utility in Canada. Drs. Kryzanowski and Roberts base this assessment on their view that the regulatory process and prudent management practices will combine to mitigate the potential risks discussed in their evidence. Two further favorable factors are the lack of competition and reliance on hydro generation which shields the company from the risk of rising energy prices. On the other side of the ledger, NTPC is smaller than the sample companies investigated by Drs. Kryzanowski and Roberts and faces challenges due to the geography of its service area. On balance, the Hydro Communities' view is that the business risk faced by NTPC is somewhat higher than that faced by the average integrated electric company or the average utility in Canada. …" (HC Argument, p. 42)

Drs. Kryzanowski and Roberts formed four estimates of the appropriate equity ratio for NTPC. The first two benchmarks represent measures of the average common equity ratio for utilities in Canada. The third benchmark captures equity ratios deemed appropriate for utilities of above-average risk by the Alberta Energy and Utilities Board. The fourth benchmark measures the equity levels approved for NTPC by this Board in the past.

The witnesses indicated that the benchmark equity ratios all fall in a range of 38% - 43%. Based on the analysis of the business risk faced by NTPC, the witnesses assessed NTPC's business risk as somewhat higher than that of the average shareholder-owned electric utility in Canada. Drs. Kryzanowski and Roberts considered a 42% equity ratio, just below the top end of the range, would be sufficient to result in a stand alone bond rating of BBB for NTPC.

With regard to NTPC's non-taxable status and its impact on coverage ratios and financial risks alluded to by Ms. McShane, the HC stated although bond rating agencies pay attention to ratios, there is no formula which translates ratios into bond rating. Considerable judgment comes into play. Simply having a key ratio (interest coverage, for example) below a certain level is not by itself grounds for a downgrade in practice. (HC Argument, p.47)

Views of the Board

The Board notes the expert witnesses' view that NTPC's business risk is higher (McShane) or somewhat higher (Kryzanowski and Roberts) than that of an average risk utility. The Board also notes Ms. McShane's view that the Corporation's non-taxable status has an impact on its coverage ratios and therefore the financial risk. The Board considers that although the coverage ratios do not necessarily dictate bond ratings, it would appear that the rating agencies include coverage ratios, among other factors, in their rating considerations and, to that extent, coverage ratios would appear to be relevant to the determination of capital structure for NTPC.

The Board notes NTPC's effective cost of long term debt somewhat exceeds the requested cost rate on equity. The Board sees this as an atypical cost structure because, for a typical utility, the cost of debt is generally less than the cost rate on equity. [Schedule 3.5] The relatively high debt cost appears to be largely the result of reflecting sinking fund earnings and investments in the effective cost of long term debt for NTPC and it would appear this situation may continue for some time until a substantial portion of the sinking fund debt instruments are retired. In the Board's view, any consideration of the appropriate capital structure for NTPC for the test years must take into account the reality of the presence of high cost debt in the capital structure since it has an impact on coverage ratios. The Board notes the capital structure recommendations of the HC witnesses reflect an equity ratio taking into consideration NTPC's business risks only. However, in the Board's view the Corporation's financial risk, as measured by indicators such as the coverage ratios, is also a relevant consideration in establishing an appropriate capital structure. The Board notes the HC calculated the coverage ratios excluding lease finance costs. (BR.HC-2) In the Board's view, the lease finance costs are a fixed contractual obligation by NTPC to DPC and should therefore be included in the calculation of coverage ratios.

For the purposes of this Decision, the Board accepts the capital structure proposed by NTPC as it appears to give due recognition to the relatively high cost of debt in relation to cost of equity in 2006/07 and 2007/08 and results in an acceptable level of interest coverage ratios for the test years.

The Board considers, with the eventual retirement of the high cost sinking fund debt, the coverage ratios and the financial risk of the utility would likely improve. Therefore, the capital structure accepted by the Board should not be viewed as solely reflecting NTPC's business risks but rather as one that takes into account NTPC's particular circumstances with respect to high cost debt.

4.4 Fair Return On Equity

NTPC requested allowed returns on equity of 10.5% and 10.75% for test years 2006/07 and 2007/08 respectively. Ms. McShane filed expert testimony supporting the NTPC proposed returns on equity. Drs. Kryzanowski and Roberts, who filed evidence on behalf of the HC, recommended returns on equity of 6.75% for 2006/07 and 7.20% for 2007/08.

Ms. McShane used the equity risk premium method; the discounted cash flow method and the comparable earnings test to estimate the returns on equity applicable to a benchmark utility as follows:

> "Ms. McShane's recommended returns on equity are based on the application of five different tests, three risk premium tests, the discounted cash flow test and the comparable earnings test. Ms. McShane used these tests to develop a fair return on equity for a benchmark Canadian utility, that is, a utility which, in light of its business and financial risks, would be able on a stand-alone basis, to achieve debt ratings in the A category. The returns on equity applicable to a benchmark utility would be approximately 10.0% for 2006/07 and 10.25% for 2007/08. A summary of the results of the tests applied by Ms. McShane (as updated in her Rebuttal Evidence, Ex. 12) are set out in the table below.

	Equity Risk Premium (ERP)
Test Year 2006/07	9.5%
Test Year 2007/08	9.75%
Discounted Cash Flow	9.0-9.5%
Comparable Earnings	12.0%"

(NTPC Argument, p.41, *ll*. 35 – p. 42, *ll*. 10)

Ms. McShane added a 50 basis points risk premium to the returns on equity applicable to the benchmark utility to reflect NTPC's higher risk in relation to the benchmark utility and came up with recommended returns on equity for NTPC of 10.50% for 2006/07 and 10.75% for 2007/08.

Drs. Kryzanowski and Roberts relied primarily on the equity risk premium test for their recommended returns. However, Drs. Kryzanowski and Roberts used the DCF Test to provide additional estimates of the Market Equity Risk Premium using both historical and forward-looking estimates of dividends and dividend growth at the market level.

Comparable Earnings ("CE") Test

The HC argued the results of the CE test should be given no weight in the determination of a fair return for the Corporation because the method is devoid of scientific merit, lacks theoretical underpinnings and suffers from substantive implementation difficulties.

> "Drs. Kryzanowski and Roberts point out that the basic problem is that there is neither a theoretical underpinning nor any empirical support for the comparable earnings approach to estimating a regulated fair rate of return for a utility. As an *ad hoc* approach to estimating a regulated fair rate of return, there are no agreed-upon rules for deciding upon how the Comparable Earnings Test should be implemented. They not only review 11 problems encountered in implementing a Comparable Earnings Test in their evidence but they illustrate the net effect of these problems by calculating the performance of the sample of 20 low risk Canadian industrials used by Ms. McShane over the 1994-2005 period to calculate accounting ROEs. They find that her sample outperforms the S&P/TSX Composite in that it not only has a higher mean return but also less risk. Thus, Ms. McShane has used a sample that has outperformed the S&P/TSX Composite over her test period both in terms of realized return and risk. Thus, Drs. Kryzanowski and Roberts recommend that the Board should not apply any weight to the Comparable Earnings evidence submitted by Ms. McShane. The method is not only devoid of scientific merit and theoretical underpinnings but its substantive implementation difficulties make it unsuitable to play a role in the determination of a fair rate of return for a utility." (HC Argument, p. 36)

Ms. McShane responded in detail to the HC's criticism of the CE test in her rebuttal evidence. (Ex.12 McShane Rebuttal) In essence, Ms. McShane's view as to the usefulness of the CE test may be summarized as follows:

> "…Regulation relies on an original cost rate base construct, or convention, rather than the market values to which the "scientific" cost of attracting capital tests apply. The comparable earnings test measures comparable returns measured in a manner compatible with the regulatory construct for measuring the equity investment in a utility, that is, on the basis of original cost. The cost of attracting capital tests do not." (Ex.12 McShane Rebuttal, p. 54, *ll*. 1581 - 1586)

Discounted Cash Flow ("DCF") Test

The HC submitted the DCF tests are unreliable when applied to specific firms in the same industry because of circularity problems and due to subjectivity in analysts' growth forecasts.

> "Ms. McShane also generates DCF estimates of a fair return on equity for a sample of U.S. gas and electric distributors. Due to a number of disadvantages, including circularity, discounted cash flow (DCF) tests are unreliable when applied to specific firms in the same industry." (HC Argument, p. 35)

In response, Ms. McShane submitted circularity is mitigated by using a sample of companies instead of the specific company and subjectivity is addressed by using a consensus growth forecast.

> "…However, circularity is mitigated by (a) using samples of companies, not the specific company to which the DCF test is being applied and (b) using the consensus of growth forecasts for the companies in the samples. With regard to the second, the use of the available consensus of analysts' earnings forecasts for the growth component eliminates the possibility that the results are colored by an analyst's own subjective views

of what the regulator should allow." (Ex.12 McShane Rebuttal, p. 44, *ll*. 1299 – p. 45, *ll*. 1305)

Equity Risk Premium ("ERP") Test

The benchmark equity return estimates under the ERP test provided by Ms. McShane are as follows:

	McShane	
	2006/07	2007/08
Risk free rate	4.25%	4.50%
Market equity risk premium	6.50%	6.50%
Beta	65% to 70%	65% to 70%
Equity risk premium	4.75%	4.75%
Allowance for financing flexibility	0.50%	0.50%
Benchmark utility return	9.50%	9.75%

The estimates for equity returns under the ERP test provided by the Drs. Kryzanowski and Roberts are as follows:

	Kryzanowski & Roberts	
	2006/07	2007/08
Risk free rate	4.20%	4.65%
Market equity risk premium	4.90%	4.90%
Beta	50.0%	50.0%
Equity risk premium	2.45%	2.45%
Allowance for financing flexibility	0.10%	0.10%
Benchmark utility return	6.75%	7.20%

The significant differences between the two sets of estimates are explained by differences in the estimates included for the market equity risk premium ("**MERP**"), the beta value (which is a measure of the risk of an average risk utility stock relative to the market) and the allowance for financing flexibility

Ms. McShane indicated her 6.5% market equity risk premium estimate recognizes the expected value of the equity market return developed from historic values in conjunction with the current and forecast low levels of interest rates.

> "Based on the analysis of the historic risk premiums, primarily in Canada and the U.S., with focus on the arithmetic averages and with consideration given to trends in the equity and government bond markets in both countries, a reasonable estimate of the expected value of the equity market risk premium at the forecast levels of long-term government bond yields is approximately 6.5%. The 6.5% estimate of the equity market risk premium explicitly recognizes the expected value of the equity market return developed from historic values in conjunction with the current and forecast low levels of interest rates." (Ex. 2, Appendix B, McShane Evidence, p.33, *ll*. 900 - 907)

The HC witness expressed several concerns with Ms. McShane's forecast MERP.

> "In contrast, Ms. McShane uses the historic average MERP for Canada, the U.S. and the U.K. over the period 1947-2006 to obtain an estimate of the MERP going forward of 6.5%. Her estimate is inappropriately high for four reasons. First, the chosen time period results in an inflated estimate of the going-forward likelihood of achieving the high realized returns on equities and low realized returns on bonds that followed World War II. This period begins with rapid economic growth due to pent up demand from the war period and administered low interest rates. Using the mean gives an equal weight to each year in this early period. Second, minimal or no weight is placed on the declining trend of MERPs for the three markets over this time period. Third, no adjustments are made for differences in risks across the market proxies used to calculate the MERP in the different countries. Fourth, no adjustments are made for the effect of equity re-valuations over this period of time unless one believes that price-to-dividend multiples will exhibit a similar three-fold increase over the next 60 years." (HC Argument, p. 30 - 31)

In her rebuttal evidence, Ms. McShane responded to the first 3 concerns of the HC. First, with regard to the time period chosen for the analysis, Ms. McShane stated as follows:

> "…It would be inappropriate to "cherry pick" the post World War II period. Equally, it could be argued that other sub-periods are not representative of future expectations and whose inclusion or exclusion might inflate or deflate the estimate of the expected long-term forward looking returns or risk premium..." (Ex.12 McShane Rebuttal, p.38, *ll*. 1131 - 1134)

Ms. McShane explained that observed risk premiums have declined because the achieved returns on long-term Canada bonds reflect historic yields that were much higher than they are expected to be and the significant capital gains that have occurred since long Canada bond yields began to decline.

> "..The reason that the observed risk premiums have declined is because the achieved returns on long-term Canada bonds reflect (1) historic yields that were much higher than they are expected to be; and (2) the significant capital gains that have occurred since long Canada bond yields began to decline…." (Ex.12 McShane Rebuttal, p. 40, *ll*. 1191 - 1194)

With regard to the HC's view, no adjustments have been made for the market proxies used because Ms. McShane did not consider such adjustments were needed.

> "With respect to the benefits of international diversification, one of the principal reasons for investing abroad is the opportunity to earn similar or higher returns than available in the domestic market while bearing similar or lower risk. From this perspective, there is no rationale for concluding that the returns and risk premiums that Canadian investors would anticipate from investing abroad would be reduced from those anticipated from domestic markets only. (Ex.12 McShane Rebuttal, p. 42, *ll*. 1236 - 1241)

Ms. McShane explained one of the reasons for difference between her estimate of market equity risk premium and Drs. Kryzanowski and Roberts' estimate relates to the weight given to the arithmetic versus geometric averages in the estimation of historic market risk premiums. Drs. Kryzanowski and Roberts gave more weight to geometric averages based on their finding that historically returns have been mean reverting. Mean reverting essentially means that low returns can be expected to be followed by high returns, so that investors can reasonably expect that, over time, returns will return to some long term average. Therefore, the estimate of the required future equity risk premium should take into account the predictability of future returns as indicated by the mean reversion, by giving some weight to the historic compound, or geometric, return.

Drs. Kryzanowski and Roberts indicated they had conducted a number of tests of robustness of their MERP estimate and conclude that it should not be increased from their estimate of 4.9%.

With respect to the beta values, the difference between the McShane approach and that of Drs. Kryzanowski and Roberts relates mainly to the fact Ms. McShane adjusted her raw beta estimates upwards to provide a better correlation between utility risk and return.

> "Using adjusted betas can mitigate the deficiencies in "raw" betas. Adjusting betas entails moving betas above and below the market mean of 1.0 toward the market mean. The adjustment that is used by the major commercial suppliers of betas uses a formula that gives approximately two-thirds weight to the stock's own beta and one-third weight to the market mean beta of 1.0. Use of adjusted betas implicitly recognizes that "raw" utility betas are not adequate explanators of utility returns. For example, "raw" betas do not capture utilities' interest rate sensitivity. The objective of the relative risk adjustment is to predict the investors' required return. Adjusted betas provide a better correlation between utility risk and return than "raw" betas." (Ex. 2, Appendix B McShane Evidence, p. 38, *ll*. 1031 - 1040)

Drs. Kryzanowski and Roberts disagreed with the upward adjustment of raw betas recommended by Ms. McShane.

> "…McShane uses the Value Line method to adjust her betas upwards when she should not. Drs. Kryzanowski and Roberts provide various rationales in Sections IV and VI of their evidence why the beta of an average-risk (never mind low-risk) utility should not be adjusted towards one. Not only is it logically inconsistent to assume that the average beta of a mature industry is equivalent to that of the overall market but empirical findings upon which this adjustment is based reveal that individual betas revert to the sample mean, which in the case of an average-risk utility is itself. Drs. Kryzanowski and Roberts also demonstrate why the interest-rate sensitivity rationale for using a variant of the adjusted beta method for utilities is flawed and is based on a misunderstanding of asset pricing theory and empirical tests. Since Ms. McShane basically uses the sample average utility beta as her beta estimate for a low-risk utility benchmark, no upward adjustment is needed to offset the tendency of the beta of a specific utility to regress to that same sample average utility beta..." (HC Argument, p. 32)

Drs. Kryzanowski and Roberts explained why in their view adjustment of beta's for interest rate sensitivity is not necessary.

> "…Over the long run, we would expect the average return on long Canada's to be equal to the yield on long Canada's (the proxy for the risk-free rate in rate of return settings). This is because our expectation is that rates would fluctuate randomly so that returns would be above yields to maturity in some periods and below them in others. Thus, while it is true that utility returns are sensitive to interest rates, it is not true that interest rate risk will have a positive risk premium over the long run. (Ex. 8; p. 83)

With respect to the financing flexibility allowance of 50 basis points recommended by Ms. McShane, Drs. Kryzanowski and Roberts noted the Board should consider the excess returns earned by utility investors when establishing the financing flexibility add-on to the return on equity ("**ROE**") in this rate hearing.

> "…In other words, providing generous rates of return allowances to enhance the financial integrity and flexibility of these utilities (without requiring these utilities to establish a reserve account to capture these insurance premiums) just over-compensates investors given the high dividend payout practices of many Canadian utilities. Drs. Kryzanowski and Roberts do not recommend the establishment of such a reserve account. Instead, they recommend that the Board consider the excess returns earned by utility investors when establishing the financing flexibility add-on (or kicker) to the ROE in this rate hearing..." (HC Argument, p. 38)

Additional Risk Premium on Benchmark Return Estimates

Ms. McShane recommended an additional 50 basis points risk premium on the returns on equity applicable to the benchmark utility to reflect NTPC's higher risk in relation to the benchmark utility. In her view, NTPC would be a BBB rated utility at the proposed capital structure and therefore she indicated an additional risk premium is required on the basis of cost of debt differentials between a BBB rated utility and a benchmark A rated utility.

> "The estimation of the difference in return that would be warranted for NTPC's higher business risks is in part a matter of professional judgment, but should be constrained by factual support. Ms. McShane's direct evidence demonstrates that the difference in the cost of debt as between a utility with debt ratings in the A category and a utility whose debt is rated in the BBB category is approximately 0.60%. The difference in the cost of debt between an A rated benchmark utility and a BBB rated utility (which NTPC would be on a stand-alone basis) serves as a proxy for the incremental return that an equity investor would require to invest in NTPC. On the basis of cost of debt differentials, Ms. McShane's incremental equity risk premium of 0.50% for the Corporation should be viewed as the minimal differential return required relative to a benchmark utility. Her proposed differential is fully consistent with the 0.60% differential adopted by the Board in respect of the allowed return for NUL in Decision 9-2006 (March 2006)." (NTPC Argument, p. 45, *ll*. 13 - 23)

Drs. Kryzanowski and Roberts did not agree that an incremental risk premium on the benchmark return is required because in their view Ms. McShane's estimated benchmark returns would have the effect of rewarding NTPC twice for the same incremental risk that is already reflected in the capital structure of an average-risk utility.

> “When she estimates the risk premium, she incorrectly uses a sample or an industry index, which is really for an average and not low-risk utility. Recognizing her error, Drs. Kryzanowski and Roberts challenged her view that an incremental equity risk premium is required. Such an equity risk premium would have the effect of rewarding NTPC twice for the same incremental risk that is already reflected in the capital structure of an average-risk utility.” (HC Reply, p. 21)

Views of the Board

The Board notes the CE method provides a measure of the actual realized returns on the book value of comparable risk securities. In this regard the CE test differs from other tests such as the equity risk premium test, which attempt to measure the expected return on the market value of securities. In an original cost rate base jurisdiction where the fair return is established on the basis of the book value of assets, the awarded returns must reflect investors’ expectations of market returns on comparable risk securities. These expectations of market returns cannot, in the Board’s view, be measured by the book returns of comparable risk securities because of differences between the book values and market values. Rather, the investors’ expectations are appropriately measured in relation to the market value of comparable risk securities. In the Board’s view the CE method fails to meet this requirement. Therefore the Board will not give any weight to the CE method in determining the fair return on equity.

The Board notes the DCF test, similar to other tests, has certain drawbacks. However, in view of the mitigating factors referred to by Ms. McShane, the Board considers it appropriate to consider the DCF test among other tests in determining the fair rate of return on equity.

The Board notes NTPC's submission that based on the British Columbia Utilities Commission's ("**BCUC's**") automatic adjustment mechanism, the market equity risk premium would be much closer to Ms. McShane's 6.5% than Drs. Kryzanowski and Robert's 4.9%.

> "The most recent regulatory determination of the market risk premium was in 2006 by the British Columbia in which, having heard all the evidence, concluded that the market risk premium was 5.8% at a long-term Canada bond yield of 5.25%. The forecast yield on long Canada bonds in this proceeding is considerably lower than 5.25% (4.5% and 4.65% for 2007/08 by Ms. McShane and Drs. Kryzanowski and Roberts respectively). Based on the BCUC's automatic adjustment mechanism, which, similar to those used by other Canadian regulators, is premised on an inverse relationship between interest rates and risk premiums, the indicated market risk premium at a 4.5% to 4.65% long Canada yield would be higher than 5.8%, much closer to Ms. McShane's 6.5% than Drs. Kryzanowski and Roberts's 4.9%." (NTPC Reply, p. 29, *ll*. 25 - 33)

The Board notes NTPC's submission that the risk premium looking forward should be higher than the historic values when bond market returns are expected to be lower.

> "…Ms. McShane's Rebuttal evidence pointed out that Drs. Kryzanowski and Roberts acknowledged that there has been no material change in the equity market return. If equity market returns are approximately the same, but bond market returns are expected to be lower, then it follows that the risk premium looking forward should be higher than the historic values." (NTPC Reply, p. 29, *ll*. 10 - 14)

The Board considers Drs. Kryzanowski and Roberts' estimated market equity risk premium to be downwardly biased since the witnesses do not appear have given recognition to market equity risk premium increases resulting from lower prospective bond market returns, compared to the historic period.

The Board, having reviewed the foregoing, considers a market equity risk premium of 6% to be appropriate under current long-term interest rate conditions.

The Board also considers Ms. McShane's adjusted beta values to be on the high side when viewed in relation to the raw beta estimates based on observations during a relatively stable interest rate environment such as the 30 month periods, January 2003 to June 2005 and July 2003 to December 2005. (Ex.12 McShane Evidence, p.36, Table 7)

The Board notes Drs. Kryzanowski and Roberts' view that beta values need not be adjusted for interest rate risk because interest rate risk will not result in a positive risk premium over the long run. However, the beta estimates provided by the witnesses in Schedule 4.10 of Exhibit 8 show wide variations in beta values for each 5-year period analyzed. This indicates inference of average beta values from such wide dispersions in beta values may not produce reliable results.

The Board considers a 50 basis point addition for financing flexibility is consistent with similar allowances awarded in other jurisdictions and is appropriate in order to maintain the financial integrity of the utility. The Board is not persuaded that past excess earnings need to be considered in assessing the appropriateness of an allowance for financing flexibility for a utility that is regulated on a forward test year basis. Under forward test year regulation, there is an expectation the probability of actual returns being higher or lower than the allowed return is about the same.

The Board notes Ms. McShane's view that the proposed capital structure would result in a BBB rating for the Corporation. The Board notes the high cost of debt in NTPC's capital structure and considers the 50 basis points upward adjustment recommended by Ms. McShane is reasonable under the circumstances to compensate for the relatively high financial risk of the utility.

Although the Board has accepted an upward adjustment to the equity return estimates as noted above, in future proceedings, the Board would prefer to see all of the business risk adjustment reflected in the capital structure rather than in the capital structure as well as in the return on common equity.

The Board notes NTPC filed its Application in November of 2006, about eight months into the first test year. Since the Corporation would have had knowledge of actual events pertaining to a substantial part of the first test year, the Board considers the Corporation's forecast risks were mitigated to some extent. Therefore the Board considers it reasonable to reduce the allowed rate of return on equity for 2006/07 by 40 basis points to recognize this risk reduction.

Having considered the ERP test and the DCF test and the factors discussed above, the Board determines the fair rate of return on equity to be 8.60% for 2006/07 and 9.25% for 2007/08.

For purpose of calculating the return component of the DPC lease payments, the Board does not consider the 40 basis point reduction in NTPC's return on equity for 2006/07 noted above should apply because this is a specific adjustment applicable to NTPC's particular circumstances in 2006/07. Accordingly, the Board directs NTPC to use fair returns on equity of 9.00% for 2006/07 and 9.25% for 2007/08 in order to calculate the DPC lease payments in the Phase 1 refiling.

5. PRODUCTION FUEL AND PURCHASED POWER

NTPC produces power using two fuels, diesel and natural gas, and also purchases power for resale in Norman Wells.

NTPC is seeking the Board's approval for $17.150 million and $17.848 million in production fuel and purchased power expenses in 06/07 and 07/08, respectively. These amounts represent increases of $2.635 million and $3.333 million, respectively, from the $14.515 million approved in the 01/03 Settlement.

Of the $17.150 million forecast in 06/07, $0.511 million will be expensed to the hydro water stabilization funds so only $16.639 million is included in the 06/07 revenue requirement.

Of the $17.848 million forecast in 07/08, $0.425 million will be expensed to the hydro water stabilization funds so only $17.423 million in included in the 07/08 revenue requirement.

NTPC has been attempting to reduce the fuel expenses with two notable projects being the addition of a third gas engine in Inuvik and the purchase of the Bluefish Generating Station. These efforts have allowed NTPC to offset approximately half of the fuel price impact on a Corporate-wide basis.

Three issues were raised by the interveners on this matter:

1) Diesel and natural gas engine fuel efficiencies;
2) Losses and station service; and
3) Fuel Pricing in Inuvik

These three issues are addressed by the Board in Sections 5.1, 5.2 and 5.3. Subject to the Board's directions in these three sections and in Section 10.1.1 concerning the water stabilization fund, NTPC's proposed production fuel and purchased power expenses forecast for 06/07 and 07/08 are approved by the Board.

5.1 Fuel Efficiencies

The topic of fuel efficiencies, for diesel in all communities and natural gas in Inuvik, was pursued by the TGC.

5.1.1 Diesel

Diesel efficiency data which has been provided over the course of this review is compiled in Table 5.1. The data is drawn from the Phase 1 Application (Schedules 2.1, 2.2 and 2.3, Schedules 3.3.1 and 3.3.2 and Appendix A) and information request responses (BR.NTPC-6, TGC.NTPC-20 and TGC.NTPC-32).

With 4 exceptions, on a community-by-community basis the 06/07 and 07/08 forecast fuel efficiencies are based on the approach agreed to in the 01/03 Settlement which calculates the forecast efficiency based on the last 3 years of actual efficiency, weighted 3 for the highest efficiency year, 2 for the middle efficiency year and 1 for the lowest efficiency year.

The 4 exceptions to this method of forecasting efficiencies are:

Yellowknife: With the addition of Bluefish and the reduced mining loads, generation at the Jackfish plant has been significantly reduced. Jackfish will primarily be used as a standby plant. Standby plants usually have lower efficiencies than primary plants as a result of fuel being used to warm-up and cool down the engines but with no power being produced. As a result, NTPC does not believe that Jackfish will achieve its historic efficiencies. The 3.500 kWh/L is an operational estimate for Jackfish's new status as a standby plant.

Fort Resolution: The plant is new so the only year of actual efficiencies (05/06) is used for 06/07 and 07/08.

Norman Wells: The plant has only 2 years of actual efficiencies so those 2 years were taken as representative of the actual plant efficiency with a weighting of 3 for the highest efficiency and 2 for the lowest.

Fort McPherson: The plant is new so the only year of actual efficiencies (05/06) is used for 06/07 and 07/08.

NTPC does not apply any weighting to new engines installed in the test years (unless it is for a new plant), nor does it make any adjustments for any decreased efficiency for older engines. NTPC also provided its view that in the future it is likely that new engines will be less efficient due to requirements to meet new emissions standards.

The TGC pursued questioning on the fuel efficiency issue but this questioning was not driven by differences with NTPC over the fuel efficiency data that was provided. The TGC was primarily concerned with bolstering arguments being put forward by the TGC with regards to 1) altering the forecast efficiencies of the Inuvik natural gas engines, which will be dealt with later in this section; and 2) the use of actual fuel efficiencies for the fuel stabilizations funds, which will be dealt with in Section 12.2 of this decision.

The TGC, in Undertaking 13, had requested an explanation from the NTPC as to the impact of changing fuel efficiencies (01/03 Settlement to 06/07 forecasts) on the overall costs of diesel fuel. NTPC's response explained that the change from the 02/03 to the 06/07 diesel efficiencies was responsible for a $122,000 decrease in diesel expense on a corporate-wide basis.

The TGC did not directly address the diesel fuel efficiency issue in either its argument or reply. In its argument, NTPC submitted that "*its fuel efficiency forecasts for the test years are reasonable and should be approved*."

Views of the Board

The Board approves of the alternative methods for calculating the forecast fuel efficiencies for Yellowknife, Fort Resolution, Norman Wells and Fort McPherson.

The Board notes that there are 4 communities (Nahanni Butte, Jean Marie River, Sachs Harbour and Colville Lake) with fuel efficiencies, which are substantially lower than the other communities; however no detailed explanation has been provided justifying this situation. The Board directs NTPC at the next GRA to provide a detailed analysis as to 1) why the fuel efficiencies in Nahanni Butte, Jean Marie River, Sachs Harbour and Colville Lake are so low; and 2) what NTPC has done and will do to improve the fuel efficiencies in these 4 communities.

The Board notes that unlike other aspects of the GRA, the 07/08 fuel efficiency forecasts do not incorporate the 06/07 forecasts. Given the generally upward trend in fuel efficiencies, it is the Board's view that calculating the 07/08 forecasts without including the 06/07 forecasts could result in customers forgoing a year's worth of fuel efficiency improvements. Since this matter was not fully canvassed as part of these proceedings the Board does not consider it appropriate to make any adjustments in this regard for the purposes of these proceedings. However, the Board directs NTPC to give due weight to the first test year forecast fuel efficiencies in order to calculate the second test year fuel efficiency forecasts, in the next GRA.

It is the Board's view that the analysis of this issue would have been simplified had the data shown in Table 5.1 been provided in such a format as part of the Phase 1 application. The Board directs NTPC, in the next GRA, to provide an updated version of Table 5.1 that includes the forecast and actual diesel efficiencies for 06/07 and 07/08, the forecasts for the test years in the next GRA, and the actuals for the intervening years.

5.1.2 Natural Gas in Inuvik

Gas efficiency data in Inuvik, which has been provided over the course of this review, is compiled in Table 5.2. The data is drawn from the Phase 1 Application (Schedule 2.3, Schedules 3.3.1 and 3.3.2) and information request responses (BR.NTPC-6 and TGC.NTPC-20).

Table 5.2 – Inuvik Gas Plant Efficiency (kWh/m^3)

	02/03 Settlement	02/03 Actual	03/04 Actual	04/05 Actual	05/06 Actual	06/07 Forecast	07/08 Forecast
Gas Efficiency	3.600	3.429	3.389	3.391	3.409	3.399	3.399

The 01/03 Settlement set the gas efficiency at 3.600 kWh/m^3. This was based on 2 years of actual experience with the 2 engines that had been installed in Inuvik in 1999.

Gas consumption is forecast to rise considerably as a result of the installation of a third gas unit in Inuvik in 2006. A 28.7% increase in gas consumption is forecast for 2006/07 and 1.3% for 2007/08. However, gas efficiency is forecast to be steady across the two test years at 3.399 kWh/m^3. This forecast is based on energy generation of 95% gas and 5% diesel as opposed to the historical average of 76% gas and 24% diesel.

In its evidence, the TGC took issue with NTPC's forecast gas efficiency. The TGC suggested that the addition of the third engine in Inuvik should result in an increase in the gas efficiency. The TGC suggested an efficiency increase of at least 5% is appropriate and that, based on a 5% improvement, the fuel costs for Inuvik should be reduced by $177,000 in 2006/07 and $179,000 in 2007/08.

In its rebuttal, the NTPC provided the following evidence to support its proposed gas efficiency.

> "Mr. Merani's evidence suggests that an increase to the fuel efficiency rate for Inuvik is warranted. He appears to arrive at this conclusion by relying on two factors:
>
> - the forecast efficiency is lower than the manufacturer's stated test efficiency rating; and
> - because replacing diesel engines in other communities has resulted in improved fuel efficiency.
>
> In the Corporation's view neither of these factors is a valid reason for adjusting the forecast gas plant efficiency in Inuvik.

The manufacturer's efficiency rating is seldom, if ever, achievable in practice. Actual operating conditions influence the efficiency achieved. The forecast fuel efficiencies used to calculate fuel expense reflect the overall efficiency of all units in a plant. The plant efficiencies are impacted by the operating loads; the efficiency of individual units; how the units are dispatched; and percentage loading on the individual engines. Also, fuel efficiencies calculated by the manufacturer do not include fuel consumed during unit start-up and cool down periods. It is therefore not reasonable to adjust the forecast gas plant efficiency based on the manufacturer's rated efficiency. Rather, the more accurate measure of fuel efficiency is to consider recent historical performance of the actual unit when available and, if not available, recent historical performance of similar units at the same generation plant.

Mr. Merani's evidence cites instances where replacing older diesel engines with newer diesel units improved the fuel efficiency at the plant. In the Corporation's view, comparing the efficiency improvements observed as a result of replacing older diesel engines with newer diesel engines to the installation of the 3rd gas genset in Inuvik is not a reasonable basis to suggest that the gas plant efficiency in Inuvik should be adjusted.

Newer diesel engines typically have electronic controls and/or electronic fuel injection – where the primary target is to produce as much power as possible while utilizing the least amount of fuel. This contrasts with the much older technology typically being replaced in diesel plants. In these situations fuel efficiency often is observed to improve. However, it should be noted that this may not continue to be the case in the future as current diesel technology has largely maximized fuel efficiency to the extent possible. Further, it should be noted that diesel engine manufacturers are in many cases faced with competing design objectives of fuel efficiency and reduced emissions. In some newer diesel engines, fuel efficiency is actually lower than previous technologies, in order to maximize emissions reduction objectives.

By contrast, the new natural gas genset in Inuvik is only 4-5 years newer than the existing natural gas gensets (it was manufactured in 2001). The new unit has the same engine control system/fuel system and the same efficiency ratings as the other 2 units. The 3rd gas genset was not justified based on improving efficiency but rather on displacing consumption of diesel fuel. In the Corporation's view there is no reasonable basis to expect that the 3rd gas genset will materially affect the gas plant efficiency in Inuvik. (Ex. 12 NTPC Rebuttal, p. 14, *ll*. 30 – p. 15, *ll*. 35)

Undertaking 9 at the hearing requested NTPC to provide the 2 years of actual data that was relied upon in setting the fuel efficiency to 3.600 kWh/m^3 in the 01/03 Settlement. NTPC reported that for 1999/2000, the actual gas efficiency was 3.51 kWh/m^3 and for 2000/2001, it was 3.65 kWh/m^3.

Undertaking 10 requested the manufacturer's rated efficiencies for the gas engines. NTPC's response was:

> "MR. STEPHEN KERR: The manufacturer's rated efficiencies for the Inuvik gas engines. At 50 percent load the efficiency is 3.7 kilowatt hours per metre cubed. At 75 percent load, 4.01 kilowatt hours per metre cubed. At 100 percent load, 4.23 kilowatt hours per metre cubed.
>
> And these efficiencies are based on one (1) hour of continuous operation at those loads, but it does not take into consideration any fuel consumed to warm up or cool down the engine." (Tr. Vol. II, p. 20, *ll*. 13 - 22)

This explanation for Undertaking 10 was questioned by the TGC.

> "MR. AZAD MERANI: Before I go on to my cross, just a quick question on the undertakings.
>
> Mr. Kerr, you mentioned the Inuvik gas engine had an efficiency rating depending on the percent loading; that was the manufacturer's recommended ratings.
>
> Are you able to tell me what the engines are running at on an actual basis? Are they fairly close to 100 percent or thereabouts?
>
> MR. STEPHEN KERR: Subject to check, I would say no. The Inuvik gas engines are -- they would follow the load in Inuvik, so I would say rarely are these engines base loaded.
>
> MR. AZAD MERANI: Certainly not 50 percent; you'd say it would be higher than 50, close to 75 percent or so?
>
> MR. STEPHEN KERR: Again, something to check. They probably operate somewhere between 50 and 75 percent, again, depending on the load." (Tr. Vol. II, p. 27, *ll*. 16 – p. 28, *ll*. 8)

In its argument, NTPC suggested that the Board should disregard the TGC suggestions of a 5% improvement in gas efficiency and provided the following explanation.

> "Fuel efficiency for the Town of Inuvik is forecast in the Application at 3.399 kW.h/m^3 for both test years. As discussed in section 4(b) above, that forecast is based on a weighted average of the past three years' actual plant efficiencies and no adjustment was made for the third Inuvik gas engine installed in 2006/07.
>
> Mr. Merani has suggested that "…there is no doubt the addition of the third engine in Inuvik should result in an increase in the gas efficiency. This review of changes in efficiency associated with a new plant or engine suggests an efficiency increase of at least 5% is appropriate."
>
> The evidence does not support Mr. Marani's suggestion. The third Inuvik gas engine is not likely to have a better fuel efficiency than the existing gas gensets that are only 4 to 5 years older. Further, manufacturer's fuel efficiency ratings are not useful for GRA forecasts. As Mr. Kerr noted, manufacturer's ratings "…are based on one (1) hour of continuous operation at those loads, but it does not take into consideration any fuel consumed to warm up or cool down the engine." Clearly the manufacturer's fuel efficiency ratings do not reflect real world conditions, which a GRA forecast is intended to mirror, and should not be applied in this case.
>
> Consequently, a 3.399 kW.h/m^3 forecast fuel efficiency for the Town of Inuvik is reasonable and the Board should disregard Mr. Merani's suggestion. (NTPC Argument, p. 69, *ll*. 7 – 22)

In its argument, the TGC restated its position as follows:

> "The TGC submit the recommendations in its evidence to increase Inuvik's gas efficiency rating for the Test Years 2006/07 and 2007/08, by 5%, from 3.399 Kwh/cubic meter to 3.569 Kwh/cubic meter, remain valid for the following reasons:
>
> - As noted in the TGC evidence, when a new engine is installed (for example, in Fort Providence), or when a new plant is installed, we

generally see an increase in fuel efficiency rate; this increase has been in the range of 5.60% to 6.99%

- Contrary to the evidence filed in TGC.NTPC-20, the 2002/04 has heat rate was filed based on actual experienced gas heat rates of between 3.510 Kwh/cubic meter in 1999/2000 and 3.650 Kwh/cubic meter in 2000/01
- The actual gas heat rate in 2002/03 was 3.429 Kwh/cubic meter
- At 50% loading, the manufacturer's test heat rate is 3.700 Kwh/cubic meter whereas as 75% loading, it is 4.010 Kwh/cubic meter; considering these engines run at about 50 to 75% loading, and taking into account the consumption of fuel during the warming up and cooling down processes, the recommended revised rate of 3.569 Kwh/cubic meter appears reasonable.
- The simple average of the above noted heat rates is 3.529 Kwh/cubic meter [(3.510+3.650+3.429)/3], significantly higher than the 3.399 Kwh/cubic meter used in the GRA.
- Using the weighting of 3:2:1 for the data available, a rate of 3.565 Kwh/cubic meter is obtained:

Year	Heat Rate	Weighting	Weighted HR
1999-00	3.5100	2	7.02
2000-01	3.6500	3	10.95
2002-03	3.4290	1	3.429
Total	10.5890	6	21.399
Simple Average	3.5297		
Weighted Average			3.5665

- The use of the most recent data available on the record is appropriate as acknowledged by NTPC:

Rather, the more accurate measure of fuel efficiency is to consider recent historical performance of the actual unit when available and, if not available, recent historical performance of similar units at the same generation plant. " (TGC Argument, p. 22 – 23)

The TGC and NTPC both discussed this issue further in their reply arguments.

Views of the Board

It is the Board's view that the TGC has not justified why NTPC should use actual gas efficiencies from 99/00, 00/01 and 02/03 when there is more recent (03/04, 04/05 and 05/06) actual data available for use. Similarly, the Board is not convinced that the 3rd gas engine in Inuvik will produce efficiencies substantially different than first two engines given the young age of the first two engines. It is the Board's view that the improved diesel efficiencies achieved when older engines have been replaced by newer engines is not comparable to the situation in Inuvik with the addition of a 3rd gas engine.

The Board approves of the forecast gas efficiencies for 06/07 and 07/08.

In keeping with the Board's direction on diesel efficiencies, the Board directs NTPC to give due weight to the first test year gas efficiency forecasts in order to calculate the second test year gas efficiencies, in the next GRA.

The Board is also concerned about two other issues.

Drop in Efficiency: For 1999/2000, the actual gas efficiency was 3.51 kWh/m^3 and for 2000/2001, it was 3.65 kWh/m^3. Since that time the efficiency has been substantially lower at about 3.4 kWh/m^3. NTPC has not provided a satisfactory explanation as to why the gas efficiency has decreased from the first two years of operation. The Board directs NTPC, at the next GRA, to provide an analysis as to why the recent gas efficiency has dropped substantially from 99/00 and 00/01.

Manufacturer's Rating: As acknowledged by NTPC, the gas engines generally operate in the range of 50% to 75% of capacity. The manufacturer's efficiency ratings at these loads are 3.7 kWh/m^3 and 4.01 kWh/m^3, respectively, which is substantially higher than NTPC's forecast of 3.399 kWh/m^3. While the Board can accept that the actual operation of the engines can differ from the manufacturer's ratings, the magnitude of the discrepancy is of concern to the Board. The Board directs NTPC, at the next GRA, to provide a detailed analysis as to why the actual gas efficiencies are so much lower than the manufacturer's ratings.

It is the Board's view that the analysis of this issue would have been simplified had the data shown in Table 5.2 been provided in such a format as part of the Phase 1 application. The Board directs NTPC, in the next GRA, to provide an updated version of Table 5.2 that includes the forecast and actual gas efficiencies for 06/07 and 07/08, the forecasts for the test years in the next GRA, and the actuals for the intervening years.

5.2 Losses and Station Service

5.2.1 Losses

Loss data which has been provided over the course of this review is compiled in Table 5.3. The data is drawn from the Phase 1 Application (Schedules 2.1, 2.2 and 2.3, and Schedules A.1 to A.27) and information requests (TGC.NTPC-32 and HC.NTPC-9(g)).

In the 01/03 Settlement, losses had been capped at 7%. Forecast losses for 06/07 and 07/08 represent the full uncapped losses on each system and are calculated as a rolling average of losses over the previous five years.

Overall the total forecast corporate-wide losses for 06/07 and 07/08 are approximately the same as the 01/03 Settlement. A slight increase in losses from 06/07 to 07/08 is due to modest sales growth.

According to NTPC, the Taltson system experiences substantial losses due to the long and lightly-loaded transmission system. This has a mitigating effect on overall loss reduction, however since the losses on Taltson are supplied by surplus hydro, there is no net cost to the losses on that system.

Outside of Taltson, NTPC asserts that losses have declined in both absolute and relative terms since the 01/03 Settlement which reflects NTPC's continuing efforts to reduce the overall level of line losses. However some communities still have losses higher than 7% despite NTPC's best efforts to reduce loss levels.

According to NTPC, the losses in the thermal communities are now confirmed by over a decade of experience. They are not anomalies and should be included in the calculation of the revenue requirement.

In BR.NTPC-5(a), NTPC provided the following explanation as to why losses are high in some communities.

> "The following communities have forecast losses as a percentage of generation to be greater than 7% for the two test years: Wha Ti, Fort Liard, Nahanni Butte, Jean Marie River, Norman Wells, Tuktoyaktuk, Deline, Tulita, Paulatuk, and Colville Lake.

Metering problems have been identified in Jean Marie River, Nahanni Butte and Colville Lake and steps have been taken to correct these problems.

Losses represented in Appendix A include losses from distribution transformers, conductors and the residual difference between metered generation and metered consumption. Factors that impact losses include, metering accuracy, conductor size relative to load, transformer size relative to load, distance from the source of generation to the delivery point.

As these communities have grown, customer loads are getting further from the generation source and the loads on feeders are increasing. In particular, Norman Wells and Tuktoyaktuk, losses are negatively impacted by the significant distance from the generation source. In addition, historical assets were not necessarily built with a view to reduce losses however as these assets are changed out over time, the Corporation considers current and future loads in assessing the best match for voltage, conductor and transformers in order to reduce future losses.

No other cost effective steps or investigations have been identified at this time to reduce losses."

NTPC provided further explanation in its argument.

"Except for Taltson, the Corporation's line losses as a percentage of sales have declined from 6.01% to 4.95% since the last GRA. In the case of Taltson, percentage losses are high reflecting the unavoidable characteristics of substantial and lightly loaded transmission, and in any event do not drive costs in the Revenue Requirement as they are served by surplus hydro.

BR.NTPC-5 requested NTPC to provide an explanation as to communities where losses were higher than 7%. The 10 communities listed reflect basically the same communities that have had losses in the higher end of the range going back to the Board's Decision 9-93 and that investigations have been done over a long period of time on these communities. While generic approaches that can be employed to reduce line losses (such as reconductoring or voltage conversion) are expensive and not practical in these cases, "[n]o other cost effective steps or investigations have been identified at this time to reduce losses". Consequently, NTPC submits that the line losses indicated in the GRA are a reasonable, valid and justified

> cost of operating its systems, and as such should be approved the Board as part of calculating the NTPC's Revenue Requirement.
>
> Ms. Goucher noted in her opening comments an error in the calculation of the line losses for Norman Wells. The Corporation proposes that this error be corrected (line losses reduced and consequently Revenue Requirement reduced) in its final GRA refiling. (NTPC Argument, p. 10, *ll*. 4 – 20)

As stated at the hearing, NTPC expects that the Norman Wells losses will be reduced from the 12.4% in the application to about 10%.

Views of the Board

Losses are comprised of two components: electrical losses and non-electrical losses, a major part of which is unbilled energy at year-end. The Board considers if there is variation in the cycle meter reading dates, the amount of unbilled energy may vary from year to year.

The Board is of the view that electrical loss data is similar to the use of fuel efficiency data in that both data sets are measurements of the efficiency of a particular portion of the electrical system. Given that both data sets are efficiency measures, it is the Board's view that electrical losses can and should be forecast with the 3-year 3:2:1 weighting procedure used for fuel efficiency forecasts.

While the 3-year 3:2:1 weighting system is preferred by the Board for dealing with electrical losses, the Board recognizes that this method might not be suitable for application to non-electrical losses. As well, the Board recognizes that there is insufficient evidence in this proceeding to effectively separate electrical losses and non-electrical losses.

The Board directs that, in the next GRA, NTPC is to include an examination of the pros and cons of separating losses into its two components (electrical losses and non-electrical losses) which would allow the electrical losses to be forecast using the same method as for fuel efficiencies while non-electrical losses could still be forecast using the 5-year rolling average method.

While the forecast 06/07 and 07/08 corporate-wide losses are approximately the same as the 01/03 Settlement, in the absence of many of the actual 02/03 losses, it is not possible for the Board to determine if any meaningful improvements in losses have been made by NTPC in many of the communities.

That being said, the Board is not satisfied with the level of effort or the results achieved by NTPC in reducing the high losses in some communities. While the high losses in Jean Marie River and Colville Lake might not be anomalies, the Board does not consider losses of 19.0% and 16.3% to be reasonable.

As part of the 01/03 Settlement, the Board approved a 7% cap on losses. It is the Board’s view that the continuation of this cap is necessary to protect consumers in high loss communities. The Board directs NTPC, as part of its Phase 1 refiling, to apply a 7% cap on losses.

It is the Board’s view that the analysis of this issue would have been simplified had the data shown in Table 5.3 been provided in such a format as part of the Phase 1 application. The Board directs NTPC, in the next GRA, to provide an updated version of Table 5.3 that includes the forecast and actual losses for 06/07 and 07/08, the forecasts for the test years in the next GRA, and the actuals for the intervening years.

5.2.2 Station Service

Station service data, which has been provided over the course of this review, is compiled in Table 5.4. The data is drawn from the Phase 1 Application (Schedules 2.1, 2.2 and 2.3, and Schedules A.1 to A.27) and information requests (TGC.NTPC-32 and HC.NTPC-9(g)). The station service as a percentage of generation was calculated by the Board from the information provided in these same sources where total generation was provided.

The forecast overall 06/07 station service has decreased from the 01/03 Settlement, both in absolute terms and as a percentage of sales. There has been a material increase however at the Jackfish diesel plant. The remaining communities are forecast by NTPC to achieve stable station service loads or reductions compared to 02/03.

With the decreased use of the diesel engines at Jackfish, the residual heat from the engines is no longer sufficient to provide heat to the plant. Surplus hydro is now used to heat the plant with electric heaters. It is NTPC’s position that the higher station service at Jackfish through the use of surplus hydro is a benefit to ratepayers as it avoids the use of more expensive heating oil.

The station service forecasts are set equal to the station service for the previous year with adjustments made where needed based on specific knowledge of plant requirement changes. The rationale for this approach is that station service normally doesn’t change unless there are material changes in a plant’s systems or structure.

As for station service targets, NTPC explained its approach in the Corporation 2005/06 Greenhouse Gas Report, which was attached to TGC.NTPC-13(a).

> “By diligently monitoring facility statistics, NTPC is able to identify sites where station service requirements are in excess of acceptable levels. NTPC set a target for each facility to achieve and maintain a station service less than or equal to 5% of its total generation. NTPC will continue to monitor station service and work to reduce it at the seven plants still exceeding the 5% target while maintaining all other site station service percentages below the target.” (TGC.NTPC-13(a) attachment, p. 14)

The Greenhouse Gas Report also described NTPC’s approach and techniques for reducing station service.

> “NTPC is continuously investigating ways to reduce its own consumption of power. Some of the equipment and design improvements utilized to reduce station service at our plants include:
>
> - replacement of in-plant electric space heating with residual heat from engine jacket water systems;
> - replacement of engine electric block heaters with residual heat circuits that utilize jacket water heat from operating engines;
> - replacement of inefficient lighting;
> - installation of separate lighting circuits so that only specific lights are on at certain times;
> - installation of variable frequency drives on radiators; and
> - installation of photo sensors on all outside lighting.
>
> Station service reductions have also come through the education and resulting heightened awareness of plant personnel. Small measures are highlighted, such as turning off lights when plants are unattended, turning heaters down or off when not required, and ensuring that any pipes or other equipment that require heat tracing during winter months are shut-off

during spring and summer months." (TGC.NTPC-13(a) attachment, p. 13 - 14)

NTPC states that it has significantly reduced station service as a percentage of generation over the last several years. It will continue to monitor station service and work to reduce it where cost effective.

At the hearing, the TGC questioned NTPC on why the station service target was set at 5%. NTPC responded that 5% was simply chosen by the operations staff as a reasonable target given the range of actual station service that was being used in the various communities.

> "MR. AZAD MERANI: …
>
> You -- you really don't have any – any better explanation for why 5 percent is more appropriate than a lower number? You just picked it because that was the target that you guys thought was a reasonable target?
>
> MR. STEPHEN KERR: The -- I guess you -- you are correct. Five percent was a number that the Power Corporation, its operation staff set…" (Tr. Vol. II, p. 48, *ll*. 2 – 11)

When asked by the TGC why some of the smaller communities had station service in excess of the 5% target, NTPC responded that there is certain amount of station service inherent in all of the plants but the only specific reason provided was that Jean Marie River has an office that is separate from the power plant and that uses electric heat. NTPC then reverted to a discussion of what it has done to reduce station service rather than providing direct answers to the question that had been asked.

The TGC questioned NTPC on what it would do if the Board were to establish a target lower than 5%.

> "MR. STEPHEN KERR: I guess for the Power Corporation to try to achieve something -- some target, arbitrary target, that would be imposed would probably take a lot of money and investment, particularly, in some of the older plants to try and go in and retrofit those facilities; that would mean fairly significant capital dollars in some place for probably minimal return.
>
> So I'll -- for us to undertake that, we could certainly attempt it, but at the end of the day I'm not sure it would be in the best interest of our customers." (Tr. Vol. II, p. 49, *ll*. 11 – 21)

TGC summarized its views on this matter in its argument.

> "NTPC's target station service loss ratio of 5% is arbitrary and unrealistic; since 1990/91, it has been able to achieve a reduction in the overall average station service losses from 9.0% to 4.4% in 2005/06, a reduction of some 51%. NTPC should provide evidence, at its next GRA, as to why it cannot, and has not been able to reduce station service losses to 1-2% of total generation experienced in several communities in 2005/06. Further, to the extent it is able to reduce station service loss ratios below those approved in this GRA, a deferral account should be set up to allow any savings, net of any incremental costs not included in the 2006/07 and 2007/2008 Revenue Requirements, to be flowed through to customers in the next GRA." (TGC Argument, p. 30)

NTPC submitted in its argument that:

> "No evidence was submitted by any intervenor challenging NTPC's station service or line loss forecasts. Consequently, NTPC submits that the station service, line losses and overall load forecast provided in Chapter 2 and Appendix A of the Application is reasonable and should be approved by the Board." (NTPC Argument, p. 11, *ll*. 29 – 32)

In its reply, NTPC directly addressed the recommendations from the TGC. On lowering the 5% target, NTPC cautions that there are limited economic opportunities to improve station service. NTPC also opposes the creation of a station service deferral account due to the hypothetical nature of potential station service projects and also due to the fact that station service projects are a normal component of NTPC costs with investments in capital improvements to reduce station service loads capitalized as with any other capital asset.

Views of the Board

The Board is of the view that station service data is similar to the use of fuel efficiency data in that both data sets are measurements of the efficiency of a particular portion of the electrical system. Given that both data sets are efficiency measures, it is the Board's view that they can and should be forecast in a similar manner. NTPC explains that station service forecasts are set equal to the station service for the previous year with adjustments made where needed based on specific knowledge of plant requirement changes. However, NTPC does not provide any justification for using this procedure as opposed to an alternative such as the 3-year 3:2:1 weighting procedure already used for fuel efficiency forecasts.

The Board directs NTPC that, in its Phase 1 refiling, station service is to be calculated using the same procedure used for fuel efficiencies. Forecast station service is to be calculated using 3 years of actual data with a weighting of "3" given to the lowest station service year, a weighting of "2" given to the middle station service year and a weighting of "1" given to the highest station service year. Consistent with its directions respecting fuel efficiencies, the Board directs NTPC to give due weight to the first test year station service forecasts in order to calculate the second test year station service forecasts, in the next GRA.

While the forecast 06/07 and 07/08 corporate-wide station service is a slight improvement over the 01/03 Settlement, in the absence of many of the actual 02/03 amounts, it is not possible for the Board to determine if any meaningful improvements have been made by NTPC in many of the communities over this time period. Over the longer term, however, it is apparent that significant improvements have been made in station service levels.

While the Board is encouraged by the improvements made in station service, the Board is still concerned that, in some communities, station service is still too high. In particular, the Board finds that station service levels in Gameti, Nahanni Butte, Jean Marie River and Sachs Harbour are unreasonably high.

Given the high station service in some communities, it is the Board's view that a station service percentage cap is necessary to protect consumers in these communities. The Board directs NTPC, in its Phase 1 refiling, to apply a 5% cap on station service as a percentage of generation.

It is the Board's view that the analysis of this issue would have been simplified had the data shown in Table 5.4 been provided in such a format as part of the Phase 1 application. The Board directs NTPC, in the next GRA, to provide an updated version of Table 5.4 that includes the forecast and actual station service for 06/07 and 07/08, the forecasts for the test years in the next GRA, and the actuals for the intervening years.

With the imposition of the station service percentage cap, the Board does not see any need to create a station service deferral account. However, the Board does direct NTPC to provide a more detailed analysis of station service levels and potential reductions at its next GRA.

5.3 Fuel Pricing in Inuvik

The TGC expressed concern with the 15-year contract that NTPC has for the supply of natural gas in Inuvik. Specifically, the TGC is concerned that the contract indexes the price of natural gas to local diesel prices rather than world gas markets. The NTPC provided an explanation in its response to TGC.NTPC-18(a).

> "The terms of the natural gas agreement dictate that the price be based on the Edmonton average unbranded regular diesel price as seen in Bloomberg Oil Buyers Guide. This is because natural gas price indices have no relevance to the gas system in Inuvik, as there is no way of getting the gas from lnuvik to a North American market. The value of gas in lnuvik is as a displacement to diesel fuel, and as a result diesel-linked pricing is the appropriate benchmark for both NTPC and the vendor."

In its Argument, the TGC provided the following analysis and recommendation.

> "NTPC also states it cannot change the index to an AECO-C or NYMEX gas price index because the contract with the Town of Inuvik is for a 15-year term, and "so changing the rules or underlying principles of the contract at this point is not an option. However, at renewal time we would be open to those discussions."
>
> The TGC submits NTPC's reluctance to review the terms of the contract on a bilateral basis is difficult to understand. As the price paid for natural gas, whether tied to a diesel index or gas index, is eventually part of the Fuel Stabilization Fund for Inuvik, there should be no impact on the Corporation's bottom line. That is, any cost or savings that arise from the use of an alternative index is to the account of customers in Inuvik, not the shareholder.
>
> As to NTPC's argument that a gas pricing index is irrelevant because of a lack of physical connection, the TGC submit to the extent the objective is to set a reasonable price, physical connection is an irrelevant consideration. What is relevant is that gas prices be tied to a gas index;

> there is no evidence that gas prices have any nexus to the world diesel prices.
>
> As such, the TGC submit the Board direct the Corporation to commence discussions with the Town of Inuvik with a view of determining if the use of a gas price index such as the AECO-C or NYMEX, can provide benefits (in terms of cost savings, or additional stability) to customers in Inuvik. In our view, as long as two parties are willing and agreeable, any contractual arrangement can be changed; hence, there is no need to wait, as NTPC asserts, for the 15-year contract term to expire." (TGC Argument, p. 19 – 20)

The NTPC responded to this recommendation in its reply.

> "The TGC requests that the Board direct the Corporation to commence discussions with the Town of Inuvik respecting the use of another gas price index. That request is supported by the statement that "…the contract with the Town of Inuvik is for a 15-year term…" and the TGCs' apparent misunderstanding that the Town of Inuvik is a party to the Inuvik Gas Sale Agreement. The Town of Inuvik is not, in fact, a party to that agreement. Rather, the Inuvik Gas Sales Agreement is an agreement among Ikhil Resource Ltd., Altagas Marketing Inc. and IPL Holdings Inc., and the Corporation.
>
> Recognizing the actual counterparties to the Inuvik Gas Sale Agreement, the TGC request amounts to a suggestion that the Corporation should break a contract negotiated in good faith among the above noted parties. That suggestion is simply unreasonable, particularly in the context of a contract that has provided substantial benefits to the Town of Inuvik. For example, the Inuvik Gas Sales Agreement has enabled savings related to the Inuvik 3rd engine of over $200,000 in 2006/07 alone. While Ms. Goucher agreed to consult with the Town of Inuvik at the time the agreement is up for renewal, any suggestion that NTPC should break the contract prior to renewal is untenable and should be summarily dismissed by the Board." (NTPC Reply, p. 16, *ll*. 9 – 23)

Views of the Board

The Board does not agree with NTPC's characterization that the TGC recommendation would require the NTPC to "break a contract". As pointed out by the TGC, the parties to a contract can review the terms of the contract and could potentially agree to alter them. This is simply a review which could lead to an amendment. Furthermore, it is clear that the TGC reference to the Town of Inuvik was a mistake which does not detract from their argument.

However, while the TGC is correct that changing the indexing mechanism for the price of Inuvik gas would not impact NTPC's bottom-line, if the ratepayers are to receive a benefit from the renegotiation of this contract then it would be the bottom-line of the other contractual parties that would necessarily be negatively impacted. The Board has no evidence of any consideration which could convince the other contractual parties to agree to a change to the contract at this point.

The Board is satisfied with the NTPC commitment that it will examine this issue in the negotiations for the next contract to replace the current 15-year contract.

6. OPERATION AND MAINTENANCE EXPENSES

The operation and maintenance expenses from the previous GRA to the current GRA forecasts are shown in Table 6.1. The data was obtained from Table 3.3 and Schedules 3.1 and 3.2 revised May 16th.

Table 6.1 – Operation and Maintenance Expenses ($000s)

	02/03 Settlement	02/03 Actual	03/04 Actual	04/05 Actual	05/06 Actual	06/07 Forecast	07/08 Forecast
Hydro	Not Provided	Not Provided	Not Provided	Not Provided	Not Provided	13,982	14,540
Thermal	Not Provided	Not Provided	Not Provided	Not Provided	Not Provided	17,002	17,904
Overall	25,780	Not Provided	Not Provided	27,780	28,014	30,984	32,444

NTPC is seeking Board approval for operation and maintenance expenses of $30.984 million in 06/07 and $32.444 million in 07/08. Less corporate donations of $0.103 million in 06/07 and $0.103 million in 07/08, the operation and maintenance expenses included in the revenue requirement each year is $30.881 million and $32.341 million, respectively.

The 4 components of operation and maintenance expenses are:

- Salaries and Wages
- Non-Production Fuel
- Supplies and Services
- Travel and Accommodation

Interveners raised various issues with respect to these 4 components and these issues are discussed in detail in Sections 6.1, 6.2, 6.3 and 6.4.

Subject to the Board's directions in Sections 6.1 to 6.4, NTPC's proposed operation and maintenance expenses for inclusion in the 06/07 and 07/08 revenue requirement are approved by the Board.

6.1 Salaries and Wages

NTPC is seeking approval for its salaries and wages forecast expenses of $17.730 million for 06/07 and $18.552 million for 07/08.

Table 6.2 summarizes the total salaries and wages data provided in the Application (Table 3.3 and Schedules 3.1 and 3.2 revised May 16th) and subsequent material (HC.NTPC-42 and Table BR.NTPC-10(a) revised May 19th).

Table 6.2 – Salaries and Wages ($000s)

	02/03 Settlement	02/03 Actual	03/04 Actual	04/05 Actual	05/06 Actual	06/07 Forecast	07/08 Forecast
Hydro	Not Provided	Not Provided	Not Provided	6,531	Not Provided	7,403	7,832
Thermal	Not Provided	Not Provided	Not Provided	8,499	Not Provided	9,967	10,720
Overall	14,696	15,569	Not Provided	15,030	16,543	17,370	18,552

The salaries and wages expense includes all pay for full time and casual employees as well as related benefits. The $2.674 million increase from the 01/03 Settlement to the 06/07 forecast is a result of increases required by the collective agreements as well as changes in staff complement. Major components of the increase are:

Safety and Environmental Legislation ($0.293 million) – Legislative requirements has forced the addition of three positions.

Bluefish ($0.409 million) – The addition of the Bluefish Generating Station has increased salaries and wages.

Apprenticeship Program ($0.278 million) – NTPC has undertaken an apprenticeship program by adding three new line positions and two journeyman supervisors. The program will be expanded by another $0.633 million in 07/08 by adding two apprentice mechanics and two apprentice electricians.

Job Evaluation ($0.261) – Implementing a new job evaluation program required an increase in salaries and wages.

Outside of these 4 factors, the salaries and wages increase from the 01/03 Settlement to the 06/07 forecast is $1.433 million or 2.4% average annual growth per year. NTPC attributes this residual growth to wage information and the tight labor markets.

The interveners raised concerns with 4 aspects of the salaries and wages expense:

1. Operational Savings from Bluefish
2. Benefits from Automatic Meter Reading ("**AMR**")
3. At-Risk Compensation
4. Apprentice Salaries

These four issues are addressed by the Board in the following sections.

NTPC's salaries and wages forecasts for 06/07 and 07/08 are approved by the Board subject to the Board directions in Sections 6.1.2 and 6.1.3.

6.1.1 Operational Savings from Bluefish

NTPC purchased the Bluefish Generating Station in 2002. The benefits expected by NTPC included avoided diesel generation, reduced future diesel engine replacement at the Jackfish Lake plant, and an increased ability to meet future load growth on the Snare-Yellowknife system.

NTPC states that while Bluefish has resulted in significant reduced overall costs with large savings in diesel fuel use being offset somewhat by increases by the operating and capital costs of Bluefish. In the area of salaries and wages, Bluefish's forecasts are $0.409 million for 06/07 and $0.423 million for 07/08.

The difference between what was forecast for Bluefish at the time of purchase and the forecast for the 2 test years was explored in BR.NTPC-9. The Project Permit forecast salaries and wages for 02/03 and 03/04 as $0.262 million so the 06/07 and 07/08 forecasts represent $0.147 million and $0.161 million increases, respectively. The explanation provided for these increases is:

> "Salaries are analyzed as a group since variations in the allocations of salary costs between labour accounts are a result of a lack of working experience when the project permit was completed in managing the labour needed between operations and maintenance and regular time, overtime or casuals, as well as in managing the Bluefish labour requirements with those at Snare and Jackfish. Compared to the project permit projections, salaries have increased by $145,000. This is a result of more work required than originally expected to maintain the facility coupled with average labour cost increases over the period between 2003/04 and 2006/07." (BR.NTPC-9, p. 1 of 6)

In HC.NTPC-13(g), the HC requested the salaries and wages for Jackfish, Bluefish and Snare for 02/03 through 07/08. NTPC provided the following table:

	2004/05 Actual	**2005/06 Actual**	**2006/07 Forecast**	**2007/08 Forecast**
Jackfish	1,598	1,515	1,646	1,882
Snare	1,057	1,195	1,230	1,271
Bluefish	74	358	409	423
Totals	2,729	3,068	3,284	3,576

> Note: the costs for General & Administration are not tracked separately between Bluefish, Jackfish and Snare, therefore they are all included with costs for Jackfish

The HC pursued this line of questioning at the hearing and again in their argument. The basic thrust of the HC position is that the purchase of the Bluefish Generating Station should have provided reductions in salaries and wages at Jackfish due to the reduced need for diesel generation. When questioned by the HC, NTPC responded that personnel, and therefore their salaries, are deployed across the Snare, Bluefish and Jackfish system on an as-needed basis. Since specific positions are not dedicated to Snare, Bluefish or Jackfish, NTPC cannot provide the information requested by the HC. Across the combined system, the number of positions has been relatively constant with 41 (04/05), 39 (05/06), 39, (06/07) and 41 (07/08). The HC's evaluation of this information was summarized in its argument:

> "…NTPC was requested to provide the positions represented by the salary costs in HC.NTPC-13(g) to determine whether the operating savings as a result of the Bluefish purchase had materialized. NTPC advised that it was unable to make that distinction and could only advise that the number of positions across the Snare system for 2004/05 onward including the two test years were 41, 39, 39 and 41 respectively and that the number of operator positions at Jackfish had been reduced by 5. That information does not demonstrate any labor savings as a result of the Bluefish purchase because those FTE's include system operators for the thermal communities as well." (HC Argument, p. 16)

Given that the information provided by NTPC did not permit a clear calculation of salaries and wages reductions at Jackfish due to Bluefish, the HC recommendation to the Board is:

> "…The Hydro Communities submit absent any demonstrated savings in operating expenses as a result of the Bluefish purchase, the Board should

> maintain Jackfish salaries … at the 2005/06 levels shown in HC.NTPC-13(g)…" (HC Argument, p. 17)

The NTPC countered in its reply:

> "It is clear that at the time of the project permit application, the feasibility of the project did not hinge on achieving any non-diesel fuel operating expense savings. Rather, the project was and continues to be justified on basis of avoided diesel fuel and engine replacement costs. This is clearly demonstrated in the attachment to BR.NTPC-29(k), which indicates that the only variable (meaning O&M, Salaries and Wages, and Supplies and Services) savings from Bluefish included in the project permit application economics was based on 2.5 cents per diesel kW.h displaced. This savings reflects the costs of overhauls and other related savings, such as oil changes at the Jackfish units, which would have otherwise been part of NTPC's revenue requirement over time. In short, in contrast to Hydro Communities' assertions, the purchase of Bluefish was not predicated on saving in Salaries and Wages and Supplies and Services at Jackfish. Despite this, Ms. Goucher noted that the purchase of Bluefish, in combination with changes to the industrial loads on the Snare-Yellowknife system, has allowed NTPC to reduce Jackfish plant operators by five positions, a benefit in excess of those assumed at the time of the Bluefish purchase.
>
> …
>
> The reduction in salaries and wages related to the Bluefish acquisition requested by the Hydro Communities is arbitrary, unsupported by the evidence and should be rejected by the Board. The Corporation addressed this issue in its Written Argument at page 13 and has provided considerable evidence to support the increases in operations and maintenance costs in the test years over the 2005/06 levels. The Corporation submits that these costs are reasonable and should be approved." (NTPC Reply, p. 11)

Views of the Board

The Board agrees with NTPC that the Bluefish purchase was not predicated upon, and might not result in, demonstrated operational savings in salaries and wages at Jackfish. While such savings can and should be sought by NTPC whenever feasible, the Board is satisfied that the salaries and wages forecasts provided by NTPC do not require an adjustment by the Board. The Board will not act upon the recommendation from the HC to maintain the Jackfish salaries and wages at 05/06 levels.

6.1.2 Benefits from Automatic Meter Reading ("AMR")

Appendix C of the Phase 1 GRA described 4 AMR projects:

Date	Location	Project Number	Description	Cost
2004/05 Actual	Norman Wells	3045049	Turtle Meter Reading Conversion	$107,000
2005/06 Actual	Fort Smith	2015157	Turtle Meter Reading Conversion	$206,000
2006/07 Forecast	Fort Simpson	2055090	Turtle Meter Reading Conversion	$150,000
2007/08 Forecast	Ops Support	9905021	Turtle Meter Reading Conversion	$200,000

The Norman Wells, Fort Smith and Fort Simpson projects converted all customers in these communities to meters for the Hunt Technologies Turtle AMR System. NTPC stated that the previous meter system was time-consuming and inefficient and that the technical support had been discontinued. The new meter system allows NTPC to better utilize line personnel. The projects were undertaken for cost savings.

The 2007/08 project, which is listed under Ops Support, is intended to ensure that a funding allocation is in place to enable the continuation of this conversion project in one or two more communities. NTPC is undertaking a review to determine which communities are the most suitable to upgrade.

The Fort Smith project is noted in a couple of locations (Table NTPC.TWU-9 and Table HC.NTPC-64) as being "Partial Close Out", indicating that the actual cost is higher than the 2005/06 actual of $206,000 listed in Appendix C.

For the Fort Simpson project, the alternatives are listed in Table NTPC.TWU-8a as being:

1) Do Nothing
2) Contract meter reading locally
3) Convert meters to the Turtle System

NTPC provided additional details on their projects in BR.NTPC-29(m).

> “In 1996/97 NTPC undertook research and investigated the emerging technologies related to Automatic Meter Reading (AMR). The Hunt Technologies AMR system (Turtle) utilized Power Line Carrier (PLC) to transfer data. This meant that NTPC's existing distribution system could be utilized instead of 3rd party communications (i.e. telephone lines). In this way, the Corporation would eliminate the cost of telephone charges to download information or interrogating the system. The meters could be read remotely without driving or walking the community routes with a radio system.
>
> At that time, the only other PLC based AMR system was TWACS or DCSI, which was much more expensive than the Hunt Technologies system. Other considerations were:
>
> - Hunt Technologies superior design of substation interface between the reading collector and meter transmitter
> - Hunt Technologies could also supply all NTPC's meter needs while others could only supply domestic energy meters
> - Hunt Technologies also had water meter transmitters and NTPC was supplying water to the Town of lnuvik at that time. This also provides the Corporation with the flexibility of potentially offering water meter reading services to other communities in the future.
>
> To date, the installation and utilization of this system has been a success. It has reduced time required to read meters, improves accuracy of meter reads, and reduces administrative time for data entry and significantly reduces billing errors which improves customer relations. Finally, the Turtle meters free up line personnel to take on more meaningful and productive work.

> Prior to the utilization of the AMR system, meter reading costs were approximately $30-$35 per meter per year (depending upon the community). With the AMR system, meter reading costs are $2.00 - $2.50 per meter."

Both the HC and the TGC questioned NTPC on this issue at the hearing. These exchanges were summarized by NTPC in its argument.

> "In 1996/97 NTPC undertook research and investigated the emerging technologies related to Automatic Meter Reading ("AMR"). The Hunt Technologies AMR system (Turtle) used Power Line Carrier to transfer data. This meant that NTPC's existing distribution system could be utilized instead of 3rd party communications. To date, the installation and utilization of the system has been a success. It has reduced time required to read meters, improves accuracy of meter reads, and reduces administrative time for data entry and significantly reduces billing errors which improves customer relations.
>
> The Board requested more information on studies undertaken to justify the Norman Wells AMR project in 2004/05, the Fort Smith AMR project in 2005/06 and the Fort Simpson AMR project forecast for 2006/07. In BR.NTPC-29(m) NTPC provided a series of net-present value analyses that showed all of the projects had positive net preset value under the assumptions both at the time the projects were proposed and using current cost variables.
>
> During the hearing, the TGC's consultant requested more detail with respect to the net preset value analysis undertaken for the Fort Simpson AMR project. The Corporation responded to this request in Undertaking No. 15. Counsel for the Hydro Communities also asked whether there was any reduction in staff levels related to meter reading or administrative data entry, to which Ms. Goucher replied that "…installation of the automatic Turtle meter reading system has allowed us to utilize our line persons for other line-related work, as opposed to meter reading."
>
> The evidence demonstrates that the AMR projects have improved the efficiency of the Corporation's operations and have a net benefit to customers. However, this does not mean that staff positions can be reduced or eliminated as a result of the projects. The Corporation submits

> that costs related to the AMR projects are reasonable and should be approved. (NTPC Argument, p. 51, *ll*. 22 – p, 52, *ll*. 8)

As described in its argument, the HC were concerned that there has been no change in the Fort Smith NTPC staff levels as a result of installing the new AMR with the net result being a rate base addition of $206,000 but no operating savings. The HC argued that if the project is added to rate base then labor costs in Fort Smith should be reduced by $35,000/year so that there is no net impact upon the rate payers due to this project.

In its reply, the NTPC urged the Board to disregard the HC recommendation. NTPC stated that a portion of Fort Smith lineman costs will not be allocated to Fort Smith in the Phase 2 GRA. As well, the elimination of technical support for the previous system necessitated that a new system be installed. The chosen system also provides greater accuracy and reduces billing errors.

In its reply, the HC proposed an alternative recommendation to that provided in its argument.

> "At page 52, NTPC asserts that the AMR projects have improved the efficiency of the Corporation's operations and have a net benefit to customers. This statement assumes there were benefits which is not true. The net present value analysis in BR.NTPC-29(m) indicates a 10-year net present value of $75,000. However, as noted at pages 18-19 of the HC Argument, there are no labor savings because linemen have been redeployed to other areas. The Hydro Communities reiterate that if the $206,000 net rate base addition is approved, then labor costs should be reduced by $35,000 per year so that customers are indifferent. Alternatively, the project should be excluded from rate base until such time as the $35,000 of labor savings can be demonstrated." (HC Reply, p. 23)

Views of the Board

The Board is concerned that it does not have complete and accurate analyses of the costs and benefits of these AMR projects as reflected in the application, which includes the impact on community operating expenses.

The HC argues that NTPC "*assumes there were benefits which is not true*". While the Board does not agree that the asserted benefits have been proven to not be true, the Board does believe that the asserted benefits have not been completely and accurately quantified. By not incorporating the effect of the redeployed linemen (along with justification for this redeployment) in the filed material, it is not possible for the interveners or the Board to properly assess and test the assertions being made by NTPC.

While the HC was only advancing its arguments on behalf of Fort Smith, the Board notes that this issue of redeployment of linemen appears to affect all of the AMR projects. Given that NTPC is asserting that a benefit of these projects are the allocation of linemen costs to outside of the community in which they are based, the economic analyses and cost tracking provided by NTPC should be completed from the perspectives of both NTPC and the specific communities in which these projects have been completed/proposed.

The Board is prepared to approve the addition of these four AMR projects (Project Numbers 3045049, 2015157, 2055090 and 9905021) to NTPC's rate base. However, pending this approval, the Board directs NTPC, as part of the Phase 1 refiling, to provide complete and accurate analyses of the costs and benefits of these projects that incorporate the reasons for and the effects of the redeployment of the linemen. These analyses are to be provided both from the perspective of the individual communities and NTPC.

6.1.3 At-Risk Compensation

There was no mention of at-risk compensation in the Phase 1 Application. At-risk compensation was first mentioned on the record on page 42 of NTPC's 2005/06 Annual Report, which was submitted as an attachment to HC.NTPC-1. At-risk compensation falls under the responsibilities of the NTPC's Board of Director's Compensation Committee. The following description is from the Annual Report.

> "The compensation committee should be responsible for:
>
> (a) reviewing and approving corporate goals and objectives relevant to CEO compensation, evaluating the CEO's performance in light of those corporate goals and objectives, and determining (or making recommendations to the board with respect to) the CEO's compensation level based on this evaluation;
>
> (b) making recommendations to the board with respect to non-CEO officers and director compensations, incentive-compensation plans and equity-based plans; and
>
> (c) reviewing executive compensation disclosure before the issuer publicly discloses this information."

According to the Annual Report, the Compensation Committee should be composed entirely of independent directors. The members of the committee at that time were:

1. Peter Allen – Committee Chairman and Board Member
2. Richard Nerysoo – Board Chairman
3. Leon Courneya – President and CEO

The at-risk compensation system was described in detail in BR.NTPC-10(b&c).

"NTPC's Senior Management (SM) Salaries and At-Risk (performance based component) are set by the Board of Director's Governance and Compensation Committee (Committee) and approved by the Board of Directors with the assistance of outside consultants. NTPC's SM salaries are set in comparison to a group of utilities selected by the Committee as the organizations which NTPC competes with for staff.

The Committee retains Towers Perrin HR Services to perform a detailed survey every 3 years of a group of utilities to compare NTPC Senior Management compensation to for salary and incentive plans. The last detailed survey was prepared in March 2004. In years between detailed surveys an informal review is done to ensure there have been no material changes to Senior Management compensation in the intervening years.

The Corporation cannot release the details of the study as it is considered proprietary information of Towers Perrin. The Committee adopted the process of setting SM salaries based on being within 10% (plus or minus) of the 50th percentile. The survey compares total target cash compensation (salary, plus incentive plan/at risk). The method for setting the salary component of SM salaries has not changed since it was adopted. The comparability of the different sizes (revenues) of the companies in the survey is increased through the use of regression analysis.

The results of the last detailed survey in 2004 found that the President's & CEO's total compensation (salary and incentive) were within the target range. The survey also found that while the salaries for the Directors' positions were within the target range the incentive component of Director's compensation was, in general, below the target range.

The last informal survey completed in November 2006 indicated that at the President & CEO's annul salary increase were competitive with the market the Director level annual salary increases were typically below the competitive market and that NTPC's short term target incentive opportunities were below the competitive market.

The Corporation's incentive plan is considered at risk compensation. The At-Risk plan covers all management and excluded positions currently includes approximately 40 positions. Effective April 1, 2007 excluded employees will no longer be eligible for At-Risk (they will receive overtime instead) and the number of positions in the plan will be approximately 30.

Currently there are 3 components to the plan. For each position's eligible pool, 50% of the potential amount is based on net income targets, 25% is based on the achievement of individual objectives and 25% is based on the achievement of operational targets.

Employees under the plan are eligible to earn At-Risk compensation up to 15% of their salary (excluded and Managers), up to 20% of their salary (Directors), up to 30% of their salary (Vice Presidents) and up to 40% for the President & CEO. The system supports achievement of results by setting financial and operational targets. Performance measurement targets are set for system availability, debt/equity ratio, efficiencies, operating cost per kwh generated, customer service (based on external survey), staff turnover, safety (accident severity, lost time accidents, lost time days), MWh generated per hours worked, hazardous materials spills, employee satisfaction (based on external survey).

Management and excluded employees compensation packages are based on the same principles/objectives as the Senior Management Compensation with the exception of how the salary ranges are determined. Excluded and middle management employees positions have been evaluated using the Hay Methodology of job evaluation.

In order to ensure the Corporation remains compliant with equal pay for work of equal value legislation under the Public Service Act, salary ranges are based on the formulas used to determine the bargaining unit salary scale. Excluded employees and Managers do not currently receive overtime. At-Risk compensation is provided in part to recognize an employee for the extra time and effort employees put in to achieve Corporate and individual objectives. Effective April 1, 2007 excluded employees' compensation package is being adjusted to be similar to that of bargaining unit employees. Excluded employees will be eligible to receive overtime and other leave entitlements provided to unionized employees to ensure compliance with equal pay for work of equal value legislation. Management employees will continue to receive at-risk compensation and are not entitled to overtime. At-Risk payments are non-pensionable.

The Corporation does not have a long-term incentive plan.”

Table BR.NTPC-10(a) provided the following at-risk compensation amounts:

- 2002/03 GRA Forecast $586,000

- 2002/03 Actual $608,000
- 2004/05 Actual $547,000
- 2005/06 Actual $595,000
- 2006/07 GRA Forecast $540,000
- 2007/08 GRA Forecast $558,000

The Community of Behchoko suggested in its letter that a clear bonus structure, as well as performance benchmarks tied to levels of service, should form part of the executive compensation model and that the model should be publicly available.

In its argument, NTPC submitted that, given the evidence on the record, its forecast salary and wage expenses in the test years, including at-risk compensation, are reasonable and necessary, and should be approved.

The HC argued that since the Towers Perrin review is considered proprietary and was not filed before the Board, no evidentiary value can be placed on whether or not the total target cash compensation is within 10% of the 50th percentile as adopted by the Governance and Compensation Committee. Nor can any weight be attributed to the informal internal reviews, the last of which was conducted in November 2006, as they are directly linked to the Towers Perrin review.

During HC questioning at the hearing, NTPC confirmed that the 50% of the potential amount that is based on net income targets is based on the rate of return on equity on the regulated business. In argument, the HC took the following position:

> "…Although the Hydro Communities are not opposed to incentive pay, this component is of primary concern because it results in and is motivated

> almost exclusively by benefits to shareholders rather than benefits to customers. This component of the at-risk pay provides perverse incentives to staff, in that cutting service levels may be used to improve the bottom line. For example, deferring maintenance, deferring brushing or charging an engine overhaul or repair to a deferral account may improve the bottom line to the benefit of shareholders and management through at-risk compensation, but customers would be faced with higher costs in the future. Any costs related to improvement of net earnings should be borne by the shareholders who will benefit, not by customers." (HC Argument, p. 21 – 22)

Although it did not cite any decisions, the HC asserted that the Alberta Energy and Utilities Board has consistently disallowed that portion of at-risk or variable pay that is related to or is a function of earnings.

The HC submitted that the achievement of higher earnings will not necessarily translate to improved efficiency to customers and in fact may well have the opposite effect and therefore the 50% of at-risk pay that is a function of net income targets should be excluded from the revenue requirement. Accordingly, the HC submitted that salaries and wages should be reduced by $270,000 and $279,000 respectively in the test years.

For the 25% of at-risk compensation based on individual objectives, the HC seemed to express some concern that these objectives could also relate to financial performance but did not provide any recommendations to the Board.

For the 25% based on operational objectives, the HC consider that for the most part, these objectives would primarily be to the long-term benefit of customers.

NTPC replied that that the Towers Perrin study was not provided because Towers Perrin refused the Corporation's request to file it in this proceeding. In

NTPC's view, however, there is sufficient evidence on the record for the Board and that the HC claim regarding the Towers Perrin study should be disregarded.

Regarding the HC's recommendation that the 50% of at-risk compensation related to net income be disallowed, the NTPC responded as follows.

> "Regarding the Hydro Communities speculation about managements' actions, it is important to recognize that net income objectives are balanced with personal objectives that ensure an on-going benefit to customers by maintaining service levels (through, among other things, efficiency gains, customer satisfaction and employee satisfaction) or avoided costs (such as avoided labour disputes in the event that a collective bargaining agreement is not reached)…" (NTPC Reply, p. 13, *ll*. 1 - 5)

NTPC went on to state the following.

> "Further, if NTPC's managers strive to ensure earnings objectives are met (which by necessity means some combination of lower costs due to efficiencies, or higher revenues), it is in fact customers who will benefit in longer run from lower rates than would otherwise be required, or avoided rate increases and deferred rate cases.
>
> In any event, there is no evidence on the record to suggest that NTPC employees act in the manner described by the Hydro Communities to impair customer service to the benefit of the shareholder. If the Hydro Communities' speculation were true, one would see the performance targets not being met. For example, if management cut costs related to maintenance programs, one would expect problems with safety, reliability, customer service and employee satisfaction. That has not been the case.
>
> There is evidence, however, that the actual amounts paid out by the Corporation as part of the at-risk compensation program have typically been higher than the amounts included in the Corporation's revenue requirement. This means that a portion of the actual costs of the at-risk compensation program is in fact already borne by the shareholder and not by ratepayers. Further, at-risk compensation avoids having to pay overtime – the avoided cost of paying overtime instead of at-risk

> compensation for all positions excluding the Officers of the Corporation is estimated at $425,000.
>
> Lastly, while the Hydro Communities states that the "[t]he Alberta Energy and Utilities Board has consistently disallowed that portion of at risk or variable pay that is related to or is a function of earnings" and lists a number of public utilities, it does not provide any references to regulatory authorities in support of its claim.
>
> NTPC is a regulated entity that must submit its revenue requirement to the review of the PUB and intervenors. The costs included with respect to the at-risk compensation program are typical of such programs for other utilities, are reasonable and should be approved." (NTPC Reply, p. 14, *ll*. 11 - 34)

TGC stated in its reply that it was in agreement with the position taken by the HC in its argument.

Views of the Board

The objective of the Towers Perrin review was to compare NTPC's executive compensation program to other utilities, with NTPC's Governance and Compensation Committee having established a total target cash compensation that is within 10% of the 50^{th} percentile of the other utilities. The Board agrees with the HC that since the Towers Perrin review is not in evidence before the Board, the Board cannot apply any weight to the review when making its decision.

However, the HC has not provided any recommendations or evidence for the Board to use in evaluating the target established by NTPC. The HC does not dispute the 10% of the 50^{th} percentile as being a suitable target for NTPC. Nor did the HC provide any evidence on other utilities' compensation programs. As noted by the HC during questioning, Towers Perrin has provided information in several proceedings in Alberta. It is the Board's view that the HC could have filed this information from other proceedings before the Board.

It is the Board's view that it has no evidence or reason upon which to dispute the NTPC's total target cash compensation range of 10% of the 50th percentile as being acceptable for NTPC.

While the range is not in dispute, what is in dispute is which party should pay for the at-risk compensation: the shareholders or the ratepayers. It is the view of the Board that any at-risk compensation that is included in the revenue requirement should result in clear benefits to customers.

The Board notes that under the Corporation's at-risk compensation program, 50% of the potential compensation amount is based on net income targets, 25% is based on the achievement of individual objectives and 25% is based on the achievement of operational targets.

The 50% of NTPC's at-risk compensation, which is based on net income, is based on the return on equity of the regulated business. The Board agrees with the HC that the potential exists for management to improve net income, and hence increase at-risk compensation, in manner that is detrimental to the ratepayers and exclusively to the benefit of the shareholders.

While NTPC argues that there is no evidence of this occurring, the Board is of the view that no such evidence is necessary for the Board to take action as it is the compensation model that is at question, not any specific actions of management. It is the Board's view that an at-risk compensation model that allows for actions that benefit the shareholders, but not the ratepayers, is not appropriate in NTPC's regulated business.

The Board is also concerned that the 50% based on net income sets up a no-win situation for ratepayers and a no-lose situation for the shareholders.

1) If the net income targets are met, that is a benefit to the shareholders and the at-risk compensation is paid out of money collected from the revenue requirement. However, there is no certainty that there was any benefit for the ratepayers.

2) If the net income targets are not met, the at-risk compensation is not paid but the shareholders retain those dollars collected for that purpose from the ratepayers.

Both ways, the shareholders come out ahead and the ratepayers come out behind.

The Board is also concerned about the entire at-risk compensation program based upon NTPC's statement in the following exchange.

> "MR. TOM MARRIOTT: …What happens to money that is budgeted for this program but not paid out in a given year?
>
> MS. JUDITH GOUCHER: The ***amounts paid out have typically always been higher than what's included in rates***, so I have no knowledge of what would have occurred had the amounts not have been paid out other than it would have been a -- been an expense not incurred." (emphasis added) (Tr. Vol. I, p. 167, *ll*. 11 - 20)

It is the view of the Board that if the ratepayers are to contribute to an at-risk compensation program for senior management, then that compensation should truly be "at-risk" by setting sufficiently demanding targets that are not routinely met. If, as stated by Ms. Goucher, the amounts paid out are always higher than budgeted in the rates, then where is the risk for the senior management from the perspective of the ratepayers? If the targets are being set so low as to ensure that the at-risk compensation is always being paid then the Board fails to see where the incentive lies for management to strive to improve performance. Apparently, the at-risk compensation program is merely base pay in another form.

The Board considers the at-risk compensation to be included in revenue requirement should result in clear benefits to customers. Therefore, in addition to giving weight to achievement of operational targets and individual objectives, consideration may also be given to designing the program to incent efficient planning and execution of capital projects, efficient management of the deferral accounts such as the overhaul deferral account and achievement of safety, reliability and customer satisfaction targets. The Board recognizes some of these targets might presently be part of the operational or individual targets. However, the Board considers greater transparency with respect to the operation of these incentive schemes would be useful in future proceedings.

The Board is also concerned that NTPC has exhibited questionable corporate governance by including Mr. Leon Courneya, the President and CEO and the only non-independent Director, as a member of the Governance and Compensation Committee. This Committee is responsible for evaluating the CEO’s performance and approving the at-risk compensation model and payments to the CEO and other senior management. As noted by NTPC in its Annual Report, this Committee should be exclusively made up of independent directors however Mr. Courneya for some reason is a member of the Committee.

In light of its various concerns, the Board directs NTPC to:

1) Remove the 50% net income component of its at-risk compensation program from the revenue requirement calculations for NTPC's regulated business. For 06/07, the amount is $270,000 and, for 07/08, the amount is $279,000;

2) Ensure that the Governance and Compensation Committee is exclusively made up of independent directors; and

3) Undertake a comprehensive review of the at-risk compensation program; make any necessary changes in light of the concerns expressed by the Board and report back to the Board in the next Phase 1 GRA.

6.1.4 Apprentice Salaries

NTPC views the apprenticeship program as key to ensuring that the Corporation has qualified, highly skilled employees in these positions at a time when workers in these fields are in high demand.

TGC.NTPC-36 identifies that 6 line positions were added in 04/05, 1 line position in 06/07, two journeyman supervisors in 06/07 and 2 apprentice mechanics and 2 apprentice linemen in 07/08.

As already mentioned, the apprenticeship program has driven a $0.278 million increase in salaries and wages from the 01/03 Settlement to the 06/07 forecast. A further $0.633 million is required for the 07/08 forecast.

According to TGC.NTPC-36, the 4 new apprentice positions in 07/08 will cost $490,000 with another $112,000 required for the two journeyman supervisors that were added in 06/07.

In its argument, the HC took issue with the $490,000 required in 07/08 for the 4 new apprentice positions. HC stated:

> "However, NTPC did note that it was adding 4 apprentice positions in 2007/08 at a cost of $490,000 for salaries and benefits. Based on the average union salary of $71,800, the Hydro Communities consider this amount (average of $122,500) is apparently an error and should conservatively be reduced to $71,800 per position, a reduction in salaries and wages of $203,000." (HC Argument, p. 15)

The TGC stated in its reply that it agreed with the argument presented by the HC on salaries and wages.

NTPC responded to the HC recommendation in its reply:

> "Counsel for the Hydro Communities reviewed the forecast of $122,500 on average for the four apprentice positions with Ms. Goucher, who indicated it was not an error. While the average base salary for a union employee is indeed $71,800 for 2007/08, this figure does not include other aspects of the total salaries and wage costs, including fringe benefits ($26,600 average per FTE) and overtime ($7,300 average per FTE). Overtime costs are higher than average for the apprentice positions as they are deployed across the entire NTPC system, often on short notice for unscheduled periods in response to system emergencies. The Hydro Communities' analysis also ignores that apprentice positions will receive greater benefits due to higher than average location differentials due to being based in more remote communities. Consequently, the Hydro Communities recommendation does not fairly reflect the costs of providing four apprentice FTE positions and should be dismissed by the Board." (NTPC Reply, p. 10, *ll*. 10 – 20)

Views of the Board

The Board finds that NTPC has provided a satisfactory explanation for the seemingly high 07/08 forecast cost for the 4 apprentice positions. The Board will not act on the HC recommendation to reduce the forecast 07/08 salaries and wages for these 4 positions.

6.2 Non-Production Fuel

The non-production fuel expenses from the previous GRA to the current GRA forecasts are shown in Table 6.3. The data was obtained from Table 3.3 and Schedules 3.1 and 3.2 revised May 16th.

Table 6.3 – Non-Production Fuel Expenses ($000s)

	02/03 Settlement	02/03 Actual	03/04 Actual	04/05 Actual	05/06 Actual	06/07 Forecast	07/08 Forecast
Hydro	Not Provided	Not Provided	Not Provided	448	69	247	252
Thermal	Not Provided	Not Provided	Not Provided	477	393	484	494
Overall	588	Not Provided	Not Provided	925	461	730	745

NTPC is seeking Board approval for non-production fuel expenses of $0.730 million in 06/07 and $0.745 million in 07/08. The increases ($0.142 million and $0.157 million, respectively) over the 01/03 Settlement reflect the pressures of higher fuel prices.

The interveners did not raise issues with respect to non-production fuel.

Views of the Board

The Board has not identified any issues to warrant deviating from NTPC's forecasts for 06/07 and 07/08. NTPC's forecast non-production fuel expenses for 06/07 and 07/08 are approved by the Board for inclusion in the revenue requirement.

6.3 Supplies and Services

NTPC is seeking Board approval for its supplies and services forecast expenses of $10.889 million for 06/07 and $11.091 million for 07/08.

Table 6.4 summarizes the total supplies and services data provided in Table 3.3 and Schedules 3.1 and 3.2 revised May 16th.

Table 6.4 – Supplies and Services ($000s)

	02/03 Settlement	02/03 Actual	03/04 Actual	04/05 Actual	05/06 Actual	06/07 Forecast	07/08 Forecast
Hydro	Not Provided	Not Provided	Not Provided	Not Provided	Not Provided	5,482	5,581
Thermal	Not Provided	Not Provided	Not Provided	Not Provided	Not Provided	5,266	5,368
Overall	8,587	Not Provided	Not Provided	10,120	9,189	10,748	10,948

The supplies and services expenses include the costs for maintaining the plants and equipment and include such costs as supplies, freight, contractors, professional development and administration. There is a $2.161 million increase from the 01/03 Settlement to the 06/07 forecast. Major components of the increase are:

Insurance and the RFID – The Corporation's cost for external insurance and self-insurance via the Reserve has increased substantially.

Bluefish – The addition of the Bluefish Generating Station has increased supplies and services.

Brushing – NTPC has increased its brushing efforts to reflect a normal annual level of brushing work.

Computer Licensing – This is largely due to new annual licensing costs replacing one-time costs that were previously capitalized.

Satellite and Communication Costs – The Corporation has required increased telecommunication and bandwidth requirements since 02//03.

Outside of these 5 factors, the increase in supplies and services from the 01/03 Settlement to the 06/07 forecast is less than the rate of inflation.

The interveners raised concerns with 2 aspects of the supplies and services expense:

1. Transmission and Distribution Brushing
2. Operational Savings from Bluefish

These two issues are addressed by the Board in the following sections.

NTPC's supplies and services expense forecasts for 06/07 and 07/08 are approved by the Board subject to the Board directions in Sections 6.3.1 and 6.3.2.

6.3.1 Transmission and Distribution Brushing

In recognition that brushing is an essential component of maintaining the reliability of transmission and distribution systems, NTPC proposes to significantly increase its brushing expenses, as compared to 2002/03, to reflect a normalized annual level of brushing work. In TGC.NTPC-38(e), NTPC clarifies that in referring to an annualized level of brushing, NTPC meant that it has attempted to set brushing budgets for each area at a level that is generally representative of the typical average annual level of effort required to address all brushing requirements in a timely fashion.

In BR.NTPC-12, NTPC provided descriptions of its 03/04, 04/05 and 05/06 actual brushing activities and its 06/07 and 07/08 forecast brushing activities. NTPC also provided two tables (BR.NTPC-12(b).1 and 2) that showed its 01/02 and 02/03 forecast costs, its 04/05 and 05/06 actual costs and its 06/07 and 07/08 forecast costs.

The data in BR.NTPC-12 was supplemented with the 01/02, 02/03 and 03/04 actual costs by Undertaking 7. Table 6.5 provides a summary of the brushing expenses.

Table 6.5 – Brushing Expenses

	Transmission	Distribution	Total
2001/02 Forecast	$114,000	$79,000	$193,000
2001/02 Actual	$8,000	$10,000	$18,000
2002/03 Forecast	$116,000	$80,000	$196,000
2002/03 Actual	$33,000	$11,000	$44,000
2003/04 Actual	$17,000	$129,000	$146,000
2004/05 Actual	$207,000	$71,000	$278,000
2005/06 Actual	$130,000	$16,000	$146,000
2006/07 Forecast	$213,000	$180,000	$393,000
2007/08 Forecast	$217,000	$184,000	$401,000

When the HC questioned NTPC regarding its brushing policy, NTPC responded as follows.

> "MR. TERENCE COURTOREILLE: Historically the Corporation would conduct its brushing requirements on an as-and when-needed basis.
>
> Recently, however, the Corporation undertook an internal evaluation of its brushing requirements and the forecast numbers that you see proposed for the test years in this table would represent what we're proposing as our minimum brushing requirements on an annual basis.
>
> MR. TOM MARRIOTT: And can you explain what those are? Is it -- is it quite a complicated series of steps or is it something that you could describe at a high level? Like, I'm looking for perhaps a brushing cycle, something along those lines.
>
> MR. TERENCE COURTOREILLE: It's certainly more defined for the transmission line. For the areas that have road access, we would brush on a rotating annual basis every five (5) to six (6) years. For those areas that do not have road access, we would brush on an annual rotating basis every twelve (12) years.
>
> MR. TOM MARRIOTT: Okay. And is there no set time for distribution?
>
> MR. TERENCE COURTOREILLE: Distribution is not as structured because a lot of our plants have very little sp -- particularly the plant -- the plants in the northern part of the territory, would have very little brushing requirements. So, in regards to those plants, we're still brushing on an as and when-needed basis.
>
> In the southern communities where vegetation growth is much more rapid, we're proposing an annual budget of sixty thousand dollars ($60,000) per year for the Dehcho region and an additional sixty thousand dollars ($60,000) per year for the North Slave Region." (Tr. Vol. I, p, 155, *ll*. 6 – p. 156, *ll*. 15)

The HC summarized the brushing data and provided its views in its argument.

> "… it is noteworthy that NTPC's rates had provided for $115,000 per year for the period 2001/02 through 2005/06, but it only expended $79,000 per year on average or 32% below forecast for transmission. NTPC's rates provided for $80,000 per year for the period 2001/02 through 2005/06 but it only expended $47,400 per year on average or 40% below forecast for

> distribution. It is apparent from the above table that NTPC is catching up in the test years for not maintaining brushing activities over the last 5 years. This has all the attributes of yet another retroactive deferral account.
>
> NTPC advised that it did not have a written brushing policy and historically conducted its brushing "on an as when and needed basis" although it recently undertook an internal evaluation of its brushing requirements to determine its forecast for the test years. While there is no evidence to dispute the test years forecast per se, NTPC should not be compensated twice for the same work. Clearly, NTPC did not maintain its brushing program since the last GRA and is now faced with a serious catch up situation.
>
> NTPC under spent by $185,000 on transmission and by $163,000 on distribution over the last 5 years. Assuming the forecast test year expenditures are now in fact required to bring brushing up to standard, the normalized annual brushing over the 7 year period will have been approximately $92,000 per year for transmission and $86,000 for distribution. On this basis, the Hydro Communities submit that transmission brushing should be reduced by $121,000 and $125,000 in the test years and distribution brushing should be reduced by $94,000 and $98,000 in the test years to ensure that NWTPC is not compensated twice for the same work." (HC Argument, p. 19)

NTPC responded to the HC in its reply.

> "Clearly the forecast brushing expenses for the test years are intended only to reflect normal annualized amounts for brushing requirements and are not in any way to address a "serious catch up situation" for previous years. The appropriate basis for regulatory review is the level of costs forecast to be incurred in the test years, in this case to maintain a standard annual brushing requirement. The only evidence is that NTPC has forecast 2006/07 and 2007/08 brushing costs based on what will normally be required annually over the long-term to maintain an appropriate and safe brushing program. As a result, the Hydro Communities' speculation regarding a "serious catch up situation" is incorrect. The Board should reject the Hydro Communities' recommendation and approve the Corporation's forecast brushing requirements." (NTPC Reply, p. 15, *ll*. 11- 19)

TGC stated in its reply that it was in agreement with the position taken by the HC in its argument.

Views of the Board

The Board is concerned about the large discrepancy from 01/02 to 05/06 between revenue collected by NTPC for brushing and the actual brushing expenditures. The Board calculates this discrepancy to be $345,000.

The HC argues that NTPC under-spent on brushing from 01/02 to 05/06 and that the increased brushing expenditures forecast for 06/07 and 07/08 are a result of NTPC now being in a catch-up situation. The HC assert that NTPC should not now be compensated for work for which it has already been compensated.

NTPC argues that the increase in brushing expense for the test years is not because it is in a catch-up situation. NTPC asserts that its proposed brushing expenditures in 06/07 and 07/08 accurately reflect the necessary level of normalized annual brushing and is not a result of under-spending in 01/02 to 05/06.

The Board finds the characterization of the situation to be beside the point. NTPC has either 1) under-spent $345,000 from 01/02 to 05/06 or 2) over-collected $345,000 in 01/02 to 05/06. Either way, the ratepayers paid $345,000 for brushing services that they did not receive and the Board finds this to be unacceptable.

As there is no evidence to the contrary, the Board accepts NTPC's argument that the forecast expenditures of $393,000 for 06/07 and $401,000 for 07/08 represent the necessary, normalized level of brushing on a go-forward basis.

Accepting NTPC's argument on this point effectively means that NTPC over-collected $345,000 from the ratepayers from 01/02 to 05/06.

The Board directs NTPC, in its Phase 1 refiling, to calculate its total 06/07 and 07/08 supplies and services expenses using its forecast brushing expenditures of $393,000 for 06/07 and $401,000 for 07/08.

The Board directs NTPC, in its Phase 1 refiling, to propose a procedure for returning to the ratepayers over a 3-year period the $345,000 that was over-collected by the Corporation for brushing over the 01/02 to 05/06 period. To be clear, the refunded $345,000 is to be obtained from NTPC's non-regulated cash flow, not by reducing the test year brushing expenditures.

The Board recognizes that there will be year-to-year fluctuations in what is spent on brushing. However, to ensure that such a situation does not occur again and also to capture NTPC's assertion that the normalized brushing expenditure represents the minimum required annually, the Board directs NTPC that, commencing with the 06/07 test year, NTPC's 3-year rolling average actual brushing expenditures must be no less than 10% below the 3-year rolling average forecast brushing expenditures. NTPC's 5-year rolling average actual brushing expenditures must be no less than equal to the 5-year rolling average forecast brushing expenditures.

6.3.2 Bluefish Supplies and Services

NTPC purchased the Bluefish Generating Station in 2002. The benefits expected by NTPC included avoided diesel generation, reduced future diesel engine replacement at the Jackfish Lake plant, and an increased ability to meet future load growth on the Snare-Yellowknife system.

NTPC states that while Bluefish has resulted in significantly reduced overall costs with large savings in diesel fuel use being offset somewhat by increases by the operating and capital costs of Bluefish. In the area of supplies and services, the 06/07 and 07/08 forecasts are $0.277 million and $0.282 million (Table BR.NTPC-9), respectively.

The difference between what was forecast for Bluefish at the time of purchase and the forecast for the 2 test years was explored in BR.NTPC-9. The Project Permit forecast supplies and services for 02/03 and 03/04 as $0.146 million so the 06/07 and 07/08 forecasts represent $0.131 million and $0.136 million increases, respectively. The two primary reasons given by NTPC for these increases are:

1. Initially significant work had to be undertaken in order to meet safety requirements and to improve operational efficiencies. On an on-going basis, more work is required than originally expected to maintain the facility. This also accounts for the increased use of contractors as well.
2. The Bluefish project permit did not specifically identify the impact of Bluefish on the Corporation’s insurance costs. For the purposes of budgeting in 06/07 and 07/08, Bluefish has been allocated $96,000 of NTPC’s insurance costs.

In HC.NTPC-13(l), the HC requested the supplies and services expenses for Jackfish, Bluefish and Snare for 02/03 through 07/08. NTPC provided the following summary:

	2004/05 Actual	**2005/06 Actual**	**2006/07 Forecast**	**2007/08 Forecast**
Jackfish	1,882	1,722	2,189	2,225
Snare	497	532	746	761
Bluefish	65	280	254	259
Totals	2,445	2534	3,189	3,244

Note: The costs for General & Administration are not tracked separately between Bluefish, Jackfish and Snare, therefore they are all included with costs for Jackfish

It appears to the Board that the 06/07 and 07/08 forecasts for Bluefish in the above table are in error and should be approximately $0.277 million and $0.282 million, respectively, to be consistent with Table BR.NTPC-9. These corrected figures would also be consistent with the 05/06 actual expense of $0.280 million. However, NTPC's response to NUL.NTPC-15(b) further confuses the issue.

The HC pursued this line of questioning at the hearing and again in their argument. The basic thrust of the HC position is that the purchase of the Bluefish Generating Station should have provided reductions in supplies and services at Jackfish due to the reduced need for diesel generation. When questioned by the HC, NTPC responded that there were three primary reasons why the Jackfish supplies and services expenses have increased despite the decreased generation:

1) General and administration expenses for Snare, Bluefish and Jackfish are all included in the Jackfish supplies and services;
2) The change to the RFID required a budget be established for events between the old threshold of $5000 and the new threshold of $100,000; and
3) Increases to computer licensing costs.

The HC's evaluation of this information was summarized in its argument:

> "HC.NTPC-13(l) provided a breakdown of supplies and services for each the Jackfish, Snare and Bluefish generating facilities. Again, rather than a decrease in operating expenses, supplies and services are forecast to increase. It appears that the Jackfish supplies and services include far more than just the supplies and services required for the operation of Jackfish (i.e. collection of bad debts, long service awards, termination costs, general and administration for the entire Snare/Yellowknife system, administration for the region). Again, it is impossible to determine from HC.NTPC-13(l) whether there have been any savings in supplies and services as a result of the Bluefish purchase." (HC Argument, p. 16 – 17)

Given that the information provided by NTPC did not permit a clear calculation of salaries and wages reductions at Jackfish due to Bluefish, the HC recommendation to the Board is:

> "…The Hydro Communities submit absent any demonstrated savings in operating expenses as a result of the Bluefish purchase, the Board should maintain Jackfish salaries and supplies and services at the 2005/06 levels shown in … HC.NTPC-13(l)." (HC Argument, p. 17)

The NTPC countered in its reply:

> "It is clear that at the time of the project permit application, the feasibility of the project did not hinge on achieving any non-diesel fuel operating expense savings. Rather, the project was and continues to be justified on basis of avoided diesel fuel and engine replacement costs. This is clearly demonstrated in the attachment to BR.NTPC-29(k), which indicates that the only variable (meaning O&M, Salaries and Wages, and Supplies and Services) savings from Bluefish included in the project permit application economics was based on 2.5 cents per diesel kW.h displaced. This savings reflects the costs of overhauls and other related savings, such as oil changes at the Jackfish units, which would have otherwise been part of NTPC's revenue requirement over time. In short, in contrast to Hydro Communities' assertions, the purchase of Bluefish was not predicated on saving in Salaries and Wages and Supplies and Services at Jackfish. Despite this, Ms. Goucher noted that the purchase of Bluefish, in

> combination with changes to the industrial loads on the Snare-Yellowknife system, has allowed NTPC to reduce Jackfish plant operators by five positions, a benefit in excess of those assumed at the time of the Bluefish purchase." (NTPC Reply, p. 11, *ll*. 8 – 20)

Views of the Board

The Board agrees with NTPC that the Bluefish purchase was not predicated upon, and might not result in, demonstrated operational savings in supplies and services at Jackfish. While such savings can and should be sought by NTPC whenever feasible, the Board is satisfied that the supplies and services forecasts provided by NTPC do not require an adjustment by the Board. The Board will not act upon the recommendation from the HC to maintain the Jackfish supplies and services at 05/06 levels.

The Board directs NTPC to reconcile the 06/07 and 07/08 Bluefish supplies and services forecasts shown in Tables BR.NTPC-9 and HC.NTPC-13(l) and described in NUL.NTPC-15(b). NTPC is to adjust the Bluefish supplies and services forecasts as needed to account for any errors in their information request responses.

6.4 Travel and Accommodation

NTPC's travel and accommodation expense includes all the travel, accommodation and meal costs associated with staff travel for operational and professional development purposes.

Table 6.6 summarizes the travel and accommodation data provided in Table 3.3, Schedules 3.1 and 3.2 revised May 16th and Undertaking 8.

Table 6.6 – Travel and Accommodation ($000s)

	02/03 Settlement	02/03 Actual	03/04 Actual	04/05 Actual	05/06 Actual	06/07 Forecast	07/08 Forecast
Hydro	Not Provided	Not Provided	Not Provided	685	714	851	876
Thermal	Not Provided	Not Provided	Not Provided	1,020	1,107	1,284	1,323
Overall	1,939	1,594	Not Provided	1,705	1,821	2,135	2,199

NTPC's forecast for 06/07 is $2.135 million, which represents an increase of $0.196 million from the 01/03 Settlement. That increase represents about an average annual increase of 2.4%, which is approximately equal to overall inflation. The 07/08 forecast of $2.199 million is a further increase of $0.064 million (3%) over the 06/07 forecast.

Both the TGC and the HC requested that the travel and accommodation expense be broken out into operations versus professional development and training (TGC.NTPC-39(c), HC.NTPC-13(o) and Undertaking #8). This is shown in Table 6.7.

Table 6.7 – Travel and Accommodation Separated into Accounts ($000s)

	01/02 Actual	02/03 Settlement	02/03 Actual	03/04 Actual	04/05 Actual	05/06 Actual	06/07 Forecast	07/08 Forecast
Operations	1,735	Not Provided	1,497	Not Provided	1,552	1,774	1,786	1,840
PD and Training	103	Not Provided	97	Not Provided	154	87	349	359
Total	1,838	1,939	1,594	Not Provided	1,706	1,861	2,135	2,199

The Board notes that there is a discrepancy of $40,000 in the 05/06 actual provided by Schedules 3.1 and 3.2 as compared to TGC.NTPC-39(c).

The Board also requested a break-down of the travel and accommodation expenses but according to Head Office versus Plants. NTPC provided the following data in its reply to BR.NTPC-13. This is shown in Table 6.8.

Table 6.8 – Travel and Accommodation – Head Office vs. Plants ($000s)

	04/05 Actual	05/06 Actual	06/07 Forecast	07/08 Forecast
Plants	1,411	1,474	1,665	1,715
Head Office	294	347	470	484
Total	1,705	1,821	2,135	2,199

The 06/07 and 07/08 forecasts for Plants and Head Office are broken out further in SM-5 and Tables NTPC.TWU-13(a) and (b) according to Hydro vs. Thermal and also into the individual plants.

An additional breakdown of the travel and accommodation expense into its components is provided in Table BR.NTPC-8.

NTPC justified the increases from 04/05 to 06/07 in its reply to BR.NTPC-8.

> "Increases from 2004/05 to 2005/06 reflect overall higher travel costs as well as the full year impact of the addition of Bluefish to the system. From 2005/06 to 2006/07 increases reflect two factors outside of inflation: First, additional amounts are included to address additional costs that will arise in O&M expenses as a result of the changes to the RFID policy, as noted above. An additional factor in the increase is related to increased training requirements discussed above under Administration."

The increase in the travel budget in the test years due to the change in the RFID is $100,000/year. NTPC does not quantify the increase in travel due to the increased training requirements.

The TGC questioned NTPC about the controls that are in place to minimize these expenses. NTPC provided the following response to TGC.NTPC-39(b):

> "In order to ensure that travel and accommodation costs are properly contained the Corporation has a number of controls in place. The first control is during the budget process where travel expenses are reviewed by Senior Management against historical travel and in consideration of

> other lower cost options (e.g. video conference, conference call, telephone interviews). Employees are encouraged to combine travel for different purposes where possible (e.g. community meetings, plant visits, medical travel, etc.). Supervisory approvals are required for all travel and additional approval is required for certain types of travel (e.g. Human Resources approves medical travel, Senior Management approves travel outside of NWT). Travel claims are reviewed and signed by Supervisors to ensure that low cost travel options are selected (e.g. economy airfares, direct routing, government rates for accommodation and rental vehicles) and that costs are supported by receipts. Travel expenses are subject to regular review by the Internal and External Auditors."

In its argument, the HC provided its analysis and recommendation to the Board.

> "The travel and accommodation related to operations appears reasonable to the Hydro Communities. Although NPC identified environmental training (including fuel handling) and safety training (under emerging WCB regulations), it is still difficult to fathom close to a 200% increase in professional development travel and accommodation over the $113,000 average of actual costs in the three prior years shown in the table above. Under the circumstances, the Hydro Communities submit that no more than a doubling of the $113,000 average professional development costs should be allowed, that is $226,000 per test year." (HC Argument, p. 20)

NTPC countered this recommendation in its reply.

> "The Hydro Communities' comment, however, fails to acknowledge the difficulty in tracking professional development travel costs versus operational travel costs as the Corporation will often schedule operational meetings and professional development events for the same trip, thus minimizing overall travel costs. Consequently, the Corporation's travel and accommodation forecasts should be evaluated having regard to the total budgeted expense, as opposed to individual components. In total, despite major increases in industry travel costs since 2001/03, including fuel surcharges, and the fact that apprentice positions require more travel and accommodation expenses because they are used system wide, the Corporation has kept the growth in travel and accommodation budgets to approximately 2.4% per year – well within the level of simple inflation. As a result, the Corporation submits that there is sufficient evidence on the record for the Board to be satisfied that the travel and accommodation

> forecasts in the test years are reasonable and therefore should be approved." (NTPC Reply, 15, *ll*. 31 – p. 16, *ll*. 7)

The TGC stated in its reply that it agreed with the recommendation of the HC.

Views of the Board

The Board finds NTPC's referral to a 2.4% annual average increase since 02/03 to be unhelpful given that this figure is calculated based upon the 01/03 Settlement, not the 02/03 actual. Using the 02/03 actual as the base year figure, the Board calculates that the actual annual average increase in the travel and accommodation expense is 7.6%, which the Board finds to be excessive. However, the Board recognizes that the 06/07 forecast also includes two new cost drivers that were not present in earlier years: the change in the RFID and increased training due to regulatory requirements.

While NTPC has quantified the impact of the change in the RFID as $100,000/year, it has unfortunately not quantified the impact of the increased regulatory training, which is cited as the other major cost driver.

Assuming a range of $50,000 to $100,000/year for the increased regulatory training and using the $100,000/year identified by NTPC for the change in the RFID, the Board calculates the annual average increase absent these 2 cost drivers to be in the range of 5.0% to 5.6%, which, while still high, is reasonable over that time period.

The Board approves NTPC's 06/07 and 07/08 forecast travel and accommodation expenses.

7. AMORTIZATION

7.1 Fixed Assets Amortization

NTPC requested approval of amortization expenses (net of customer contributions) of $9.568 million and $10.115 million in 2006/07 and 2007/08 respectively for fixed assets.

NTPC used the same rates as accepted in the 01/03 Settlement. However, NTPC indicated the amortization true up from the negotiated settlement has ended.

NTPC explained why it did not complete a depreciation study for the test years:

> "NTPC began but did not complete a depreciation study. NTPC did full depreciation studies for the last two GRA's which provided detailed reviews of asset lives and site restoration costs. Utilities do not normally do full depreciations studies for every GRA.
>
> The current GRA requires a large increase to deal with fuel price increases, loss of credits, investment, regulation and inflation. The preliminary work on the depreciation study was indicating the need for additional increases due to depreciation and NTPC did not want to apply for any potential increases at the same time as the other increases and not without a more thorough review of the study results and more information on how Asset Retirement Obligations (ARO) recommendations of the Canadian Institute of Chartered Accountants (CICA) will impact depreciation rates, true ups, equity and the Revenue Requirement.
>
> The various methods of dealing with the new ARO's have the potential to have a material impact on NTPC's GRA and depreciation rates depending on whether the recommendations of the CICA are followed or ignored for rate making purposes or whether the Board approves NTPC's proposal in

> the GRA or whether the Board approves another approach to for dealing with ARO's.
>
> Once the question of how ARO's will be handled NTPC will complete a new depreciation study reflecting newer historical information, updated site restoration information and the approved ARO treatment." (NTPC Argument, p. 21, *ll*. 3 - 22)

Views of the Board

The Board notes there could be differences between regulatory requirements and reporting requirements. The procedures and rules concerning depreciation accounting for regulatory purposes are long established. Therefore, in the Board's view any new CICA reporting requirements need not deter NTPC from completing a depreciation study based on established procedures and rules in a timely fashion.

The Board accepts NTPC's proposed amortization of fixed assets subject to the comments in Section 7.2 of this Decision.

7.2 Reserve for Future Removal and Site Restoration

The amount included in the accumulated amortization with respect to future removal and site restoration is set out in BR.NTPC-16 for each asset category.

In response to a Board directive in Decision 1-2002 to provide an updated estimate of soil remediation costs, including an estimate of the costs that are considered recoverable from the Federal Government, NTPC indicated it has completed an updated soil remediation assessment, based on estimated volumes of impacted soil and unit costing of remediation for similar projects carried out in northern Canada. NTPC stated the estimated soil remediation cost was $12.959 million in 2005 based on a study conducted by Biogenie in January 2006. A copy of the study was provided in Exhibit 4 and Undertaking #6.

NTPC submitted in regards to estimates of the costs considered to be recoverable from the Federal Government, NTPC has pursued Canada in regards to the commitments of the Acquisition Agreement. However NTPC indicated the Corporation has not been successful with those discussions.

The Corporation submitted it does not expect any recoveries and may risk undermining the discussions/negotiations by providing speculation at this point in time. Any recoveries that NTPC secures will be credited against the Net Salvage Reserve, and will ultimately go to lower the amounts ratepayer would otherwise pay to that reserve for site restoration. (Ex. 2, p. 6-2, 6-3)

NTPC indicated the recording of future removal of assets and site clean up costs was supported by Generally Accepted Accounting Principles ("**GAAP**"), and approved by the Board as part of the Corporation's periodic depreciation reviews. Changes to GAAP in the last few years now require the recording of a liability only in cases where there is a "legal obligation" for the asset disposal or site clean up and to reverse to equity any other retirement obligations liabilities.

NTPC submitted to ensure fair intergenerational allocation of costs (that customers are paying for the cost of the assets they are using, including costs of disposing these assets and restoring the facility sites) as well as smoother rates, NTPC would like to continue with its past practice of maintaining a liability (the Reserve for Future Removal and Site Restoration) for the removal and clean up of all its assets regardless of legal obligations or otherwise. (Ex. 2, p. 3-12, 3-13)

The HC submitted the Corporation was directed to provide an updated estimate of soil remediation costs including an estimate of the costs that are considered recoverable from the Federal Government, at the time of its next GRA. NTPC filed an updated soil remediation estimate of $12.959 million in 2005 dollars. NTPC has included an annual appropriation of $600,000 per year for Future Removal and Soil Remediation. The study indicated that approximately 90% of the costs related to the period when Northern Canada Power Corporation ("**NCPC**") was owned by the Federal Government.

The HC submitted they expect the Corporation to continue to monitor and pursue funding from the Federal Government for the soil remediation that they are responsible for. (HC Argument, p. 23)

In its reply submission, the Corporation undertook to continue to monitor the situation and pursue the Federal Government further should there be new developments or programs. NTPC submitted the Corporation's efforts with respect to recovering funding from the federal government have been prudent and reasonable to date. NTPC stated the Board and Hydro Communities can take comfort from the Corporation's commitment for future monitoring of the issue. (NTPC Reply, p. 21)

The adequacy of the current balance to deal with these anticipated future costs is at the present time uncertain. This is part of the assessment underway over the next number of years with respect to NTPC's current depreciation rates, reserve for future removal balances and treatment of Asset Retirement Obligations as they relate to regulatory accounting and rate setting.

Views of the Board

The Board notes the accumulated site restoration component included in accumulated amortization is as follows:

	2004/05	2005/06	2006/07	2007/08
	$000	$000	$000	$000
Accumulated reserve for site restoration	37154	37780	38853	39967

Source: BR NTPC 16 Table 1

The Board considers that although there might be other costs related to site restoration in addition to soil decontamination, there appears to be a very large difference between the accumulated reserve for site restoration as of fiscal year end 2004/05 of $37.154 million and the estimated cost of soil decontamination, in the sum of $12.959 million in 2005 dollars, as per the Biogenie study. The Board notes NTPC's evidence at the time of the 2001/02 and 2002/03 GRA that the estimate of negative salvage for diesel plant site restoration, excluding soil remediation costs, was in the vicinity of $12.9 million. (Decision 1-2002; p. 6)

The Board notes NTPC's view that the adequacy of the current balance in the accumulated reserve to deal with anticipated future costs is at the present time uncertain. However, the Board is concerned by the significant and growing gap between the potential amount required for site restoration including soil remediation as reflected in the Biogenie study and as per the evidence referred to in Decision 1-2002, and the accumulated balance in the reserve for site restoration. The Board notes from the above table $1.073 million in 2006/07 and $1.114 million in 2007/08 will be added to the reserve for site restoration, thereby contributing to the gap between the potential amount required for site restoration and the accumulated balance in the reserve for site restoration. The Board notes the Corporation has not had an opportunity to respond to this perspective on the accumulated balance in the reserve for site restoration. The Board, therefore, directs NTPC to provide, as part of the refiling, an assessment of the significant and growing gap between the accumulated balance in the reserve for site restoration and the estimated site restoration costs in light of the above discussion and propose a cap to the accumulated reserve balance until such time as studies on the adequacy of the current balance can be completed. In this regard, the Board estimates if the accumulated reserve is capped at the 2005/06 year end level, amortization expense would be reduced by $1.073 in 2006/07 and $1.114 million in 2007/08.

NTPC is directed to complete the assessment of the adequacy of the current balance in the accumulated reserve to deal with NTPC's share of anticipated future costs for site restoration including soil remediation and reflect this assessment in the amortization rates at the time of the next GRA.

The Board accepts NTPC's request to maintain the reserve (the Reserve for Future Removal and Site Restoration) for the removal and clean up of all its assets regardless of legal obligations or otherwise until an assessment of the adequacy of the current balance in the accumulated reserve to deal with NTPC's share of anticipated future costs for site restoration including soil remediation is completed.

7.3 Amortization of Deferred Charges

NTPC set out details of each of the deferral account amortizations in BR.NTPC-21.

7.3.1 Overhaul Deferral Account

The Corporation requested permission to set the annual appropriation for overhauls at $1.693 million. A continuity schedule of the overhaul deferral account since March 31, 2004 was provided in BR.NTPC-21.

Views of the Board

The Board accepts the overhaul deferral account forecast as proposed.

7.3.2 Water Licensing Fee Deferral Account

Due to increasing uncertainty related to the costs and terms of water licenses, NTPC proposed to establish a new deferral account for water licensing fee. A continuity schedule of the water licensing fee deferral account is provided in HC.NTPC-15 Table 3.

The HC did not object to the establishment of a water licensing fee commencing in 2006/07. However, the HC submitted that NTPC should not be able to recover through the deferral account any deferred water license fees from prior years when the water license fee deferral was not in existence:

> "…The costs that NTPC incurred for water licensing fees between rate cases are no different than any other unplanned maintenance expenses or any other unbudgeted expense. This is the very reason that utilities receive a risk premium. Utilities should not be allowed to add to their earnings without scrutiny and then apply for retroactive recovery of such expenses. There is no evidence before the Board to demonstrate that such unplanned expense would have been allowed in the years when the expenses regarding water license fees were incurred. For that matter, NTPC admits that $0.04 million was included in the 2002/03 revenue requirement. The Hydro Communities submit that the Board should

> specifically deny the $611,000 (sic) of retroactive expenses related to water license fees incurred prior to the two test years as a matter of principle…" (HC Argument, p. 58)

NTPC submitted deferral and amortization of water licensing fees has been accepted in the past. (NTPC Reply, p. 18) What is being proposed in this application is an approach designed to address the increasing uncertainty over the cost and term of a license. Accordingly, NTPC proposed to amortize the forecast water license fees to 2021/2022 of $1.551 million and an opening unamortized balance of $0.634 million over 16 years. (HC.NTPC-15)

Views of the Board

Noting that the deferral account treatment of water license fees is designed to address uncertainty over the cost and term of each license and since amortization of water license fees has been accepted in the past, the Board accepts NTPC's proposed deferral account treatment for water license fees.

7.3.3 Job Evaluation

NTPC incurred $256,000 in 2003/2004 and 2004/05 in order to carry out a job evaluation study following incorporation of the Equal Pay for Equal Value legislation into the public service act. NTPC proposed to treat the cost of this study as a deferred cost and amortize it over a period of 5 years for the reason the expenditure has enduring benefits beyond the year of expenditure.

The HC took exception to the proposed inclusion of the annual amortization portion of the job evaluation costs in the amount of $61,000, in the test year revenue requirements since NTPC did not have prior Board approval to treat these costs as a deferral account. The HC submitted it is just like any other unbudgeted expense between rate cases and this is the very reason that utilities receive a risk premium. (HC Argument, p. 55)

NTPC stated the Job Evaluation System is properly treated as a deferred cost since it meets the accounting definition of an asset; i.e., it provides long-term or enduring benefits (the previous study related to job evaluation was in 89/90). The deferred cost is amortized over a five-year period. (BR.NTPC-16(c))

Views of the Board

Given the significance of the amount, its enduring benefits beyond a single year and noting the expenditure was the result of a legislative requirement, the Board considers the capitalization and amortization of the job evaluation study expenditure over a period is appropriate. The Board therefore accepts NTPC's proposed deferral account treatment of the job evaluation study expenditure.

In order to address the concerns of HC that the ability to defer certain expenditures should not result in changing the risk assumptions made at the time the fair return on rate base was established, the Board directs NTPC to file a written policy with regard to the criteria that are to be used to determine the eligibility of expenditures for deferral account treatment, at the time of the refiling.

8. DEFERRAL ACCOUNTS

8.1 Reserve for Injuries and Damages ("RFID")

In response to a Board Directive from Decision 1-2002, NTPC filed a proposed policy with respect to the charges to the RFID. NTPC also requested to increase the annual appropriation to the RFID from $485,000 per year to $670,000 per year.

The HC submitted the proposed policy still leaves events that are uninsured or uninsurable to the discretion of NTPC. The HC submitted that these higher impact uninsurable or uninsured events must meet a higher test or degree of scrutiny. The HC also submitted that the only practical solution appears to be to defer disposition of these higher impact events until the next GRA and, if considered appropriate, appoint a qualified independent individual to determine whether the event truly meets the test of "accidental." (HC Argument, p. 57)

NTPC stated that the charges to the RFID are reviewed in detail at each GRA, and as such the Board currently retains full jurisdiction to review all reserve charges as it sees fit. The Hydro Communities' recommendation to have each and every charge reviewed by a third party, and defer confirmation of the charges until such review has occurred, is unreasonable, unnecessary and cannot practically be implemented. (NTPC Reply, p. 20)

Views of the Board

The Board considers all charges to the reserve will be subject to review by the Board and interveners at the next GRA. The Board expects the Corporation to maintain the necessary records to facilitate full scrutiny of the costs and details of the circumstances relating to each accidental event giving rise to a claim against the reserve.

Having reviewed the proposed policy and the continuity schedule of the RFID account, the Board approves the RFID policy as filed and the increase in the annual appropriations from $485,000 per year to $670,000 per year.

8.2 Employee Future Benefits

The employee future benefits deferral account was established in the context of the 01/03 Settlement. The settlement contemplates actual employee termination payments would be charged to this account on a pay as you go basis.

Table 6.7.of the Application shows the changes in this account since March 31, 2001:

	$000
Credit balance as at March 31,. 2001	889
2001/02 Expense	-274
2002/03 Expense	-205
2003/04 Expense	-106
2003/04 Adjustment	250
2004/05 Expense	-44
2005/06 Expense (Forecast)	-353
Credit balance as at March 31, 2006	157
Transfer in ultimate removal portion	495
Revised balance as at March 31, 2006	652
2006/07 Expense (Forecast)	-165
2007/08 Expense (Forecast)	-88
Credit balance as at March 31, 2008	399

With respect to the $250,000 adjustment shown above, NTPC stated this relates to amounts that had been previously recognized in other accounts which fit the appropriate definition of this account. These amounts were therefore consolidated into this account.

With respect to the $495,000 transfer, NTPC stated the amount was included in NTPC's 2001/03 revenue requirement. This amount has since been appropriated from net income.

The TGC indicated it has reviewed the above adjustments and concurs with the NTPC proposals. (TGC Argument, p. 33)

Views of the Board

The Board accepts the NTPC proposed balances for employee future benefits deferral account for inclusion as a component of no cost capital.

9. SALES AND REVENUE FORECAST

The sales forecast by customer class is provided in Schedule 2.1 of NTPC's application. Appendix A to the application shows the sales forecast by customer class by community.

9.1 Industrial Sales Forecast

The HC recommended the Giant mine sales included under the industrial sales forecast in Yellowknife should be increased considering the recorded sales in the last two quarters of 2006/07:

> "…However, the preliminary actual Giant Mine sales for 2006/07 were 4,988 MWh as compared to the forecast of 4,113 MWh for 2006/07 and 3,781 MWh for 2007/08. Although NTPC had forecast the Giant Mine care and maintenance sales to level out at about 315 MWh per month for the last two quarters of 2006/07, that forecast proved to be pessimistic and instead averaged about 416 MWh and there is no discernible downward trend to 315 MWh per month. The average for 2006/07 also was 416 MWh per month. The Hydro Communities submit that, based on the best available information up to the time of the application and to the time of the hearing, it appears that 4,988 MWh for each of test years 2006/07 and 2007/08 would be a reasonable forecast for the Giant Mine care and maintenance sales. The forecast energy and billing demand units should both be increased for purposes of determining revenues." (HC Argument, p. 8)

NTPC submitted the higher sales recorded in the last two quarters of 2006/07 reflects a one-time experience related to high water levels in winter that were not expected by NTPC or the mines. (NTPC Reply, p. 7)

Views of the Board

The Board considers it appropriate to review recorded sales in order to test the forecast assumptions used; however, the Board does not consider it appropriate to substitute actual results for forecasts on a selective basis. With regard to the forecast assumptions, the Board notes NTPC's view the higher recorded sales in the last two quarters of 2006/07 is a one time event and might not be repeated. The Board concludes therefore that the forecast assumptions used by NTPC in regard to sales to the Giant mine are appropriate.

The Board accepts NTPC's industrial sales forecast as proposed.

9.2 Retail Sales Forecast

The Corporation's load forecasting approach is a balance of two broad methods:

- **“"Top-down"** assessment of the activities and plans underway in a community, such as statistics from the GNWT capital spending plans, NWT Housing Corporation plans, and known developments occurring in a community such as construction activity and forecasts provided by other third parties (e.g. NUL, mines, etc). The Corporation's loads are also reviewed by its Operations and field personnel.
- **"Bottom-up"** analysis of loads experienced over the previous period up to 10 years, including two regression methods - one that is simply based on 10 year load patterns (called the "trend" analysis), and one that is based on weather-normalized loads. The regression is not a simple calculation, but rather a methodology that provides outputs of monthly loads.” (BR.NTPC-4, p. 20 of 23)

Fort Smith

For Fort Smith, NTPC indicated it had used the top down approach to arrive at the sales forecasts.

HC expressed concern the forecast of sales for the community of Fort Smith were understated when compared with the normalized actual sales in prior years:

> “Based on the various pieces of information provided, the Hydro Communities have compiled the following summaries of actual and forecast sales per customer (BR.NTPC-4 and Schedule A.8) and HDD (Exhibit 34) for Fort Smith since 2001/02:

	Residential	General Service	HDD	
2001/02A	10660	53660	7120	
2002/03A	10640	52300	7733	
2003/04A	10310	51280	7058	
2004/05A	10470	55390	7726	
4 Year Ave	10520	53140	7409	
2005/06A	9690	53330	6294	
2006/07F	9370	52410	7439	(30 Year Normal)
2007/08F	9270	53120	7439	(30 Year Normal)

> It is obvious from the above that 2005/06 was an extremely mild year in terms of HDD (15% less HDD than the 30 year average) and that the average sales per customer were also well below the preceding 4 year average (residential sales 8% below 4 year average). The HDD in those 4 years were close to the 30-year average. To use this year as the base upon which to add 1% defies logic...” (HC Argument, p. 10)

The HC submitted that the use of the four year average sales per residential and general service customer times the forecast number of customers should be used for the 2006/07 and 2007/08 sales forecasts. HC recommended residential sales per customer should be increased to 10,520 kWh per forecast customer for each test year and general service sales should be increased to 53,140 kWh per forecast customer. (HC Argument, p. 10 – 11)

NTPC explained sales per customer in Fort Smith may be declining for reasons other than heating degree days. NTPC considered conservation may be a factor in the decline:

> "…Sales are indicated by the Hydro Communities to be low in 2005/06 consistent with the warm winter. However, other clearly material factors are impacting the residential sales forecast. For example, 2005/06 sales per customer (at 9.69 MW.h) were below 2003/04 levels (at 10.310 MW.h) by 6.40% at a time when the heating degree days ("HDD") were down by 12.14% (from 7058 to 6294). The correlation, however, does not hold in other cases, such as 2002/03 compared to 2001/02 which indicates a year with HDD 8.6% lower (7120 versus 7733) but results in sales per customer that are 0.2% higher (10.660 MW.h versus 10.640 MW.h). In short, the Hydro Communities' simplified analysis with respect to HDD does not bear out.
>
> In contrast the evidence in this proceeding with respect to Fort Smith is that sales continue to materially decline, whether due to conservation efforts or population declines, such that July 2006 was the second lowest month of sales in Fort Smith for the last ten years. The HC Argument appears to try to dismiss this fact by indicating that it is clearly not related to HDDs. In this respect, the Hydro Communities are correct because HDDs will not affect loads in July, however, it also serves to clearly illustrate how many other factors are driving loads in this community and the degree of downward rate driver that this combination represents – a fact that is dismissed out-of-hand by the Hydro Communities. (NTPC Reply, p. 8, *ll*. 9 - 35)

Fort Resolution, Behchoko and Dettah

Fort Resolution, Behchoko and Dettah are communities where NTPC indicated it had used the top down approach to arrive at the sales forecasts.

The HC submitted that the same rationale as for Fort Smith should be applied to sales in Fort Resolution. Sales per residential customer would increase from 6,580 and 6,510 kWh per customer to 6,720 kWh per customer. The HC submitted the 4-year average for Fort Resolution general service customers is only marginally higher than the NTPC forecast and thus no change appears necessary for the general service class. (HC Argument, p. 11)

HC expressed concern that as with the Fort Smith and Fort Resolution Sales Forecasts, 2005/06 residential sales for Behchoko and Dettah appear to be down due to the extremely mild year in terms of HDD and that the average sales were also well below the preceding 4 year average (4.3% and 2.1% respectively for Behchoko and Dettah).

In light of these observations, the Hydro Communities submitted that four year average sales per residential customer times the forecast number of customers should be used for the 2006/07 and 2007/08 sales forecasts. HC submitted Residential sales per customer should be increased to 7,135 kWh per forecast residential customer in Behchoko for each test year and to 8,045 kWh per forecast residential customer in Dettah for each test year. The HC noted the general services sales forecasts do not appear to be unreasonable. (HC Argument, p. 14)

NTPC submitted there is a fundamental flaw in the Hydro Communities' overall analysis, which overextends the type of HDD correlation that might exist on a larger and more diverse load population as compared to the extremely small centers. (NTPC Reply, p. 9)

Thermal Communities

TGC noted since NTPC uses normalized sales for only a few thermal communities and considering the difficulties involved in preparing accurate sales forecasts for these communities, the Board should adjust up the sales forecasts for thermal communities by 1.17% being the percent by which actual sales for thermal communities exceed the forecast in 2006/07. (TGC Argument, p. 37)

The TGC submitted the average use per customer should provide the Board with a useful tool to assess the reasonableness of the total forecast sales. The TGC noted a consistent overall downward bias in the 2007/08 sales per customer in most of the thermal communities. TGC submitted a 1.17% upward adjustment to sales in 2007/08 should cater for whatever bias is built into the 2007/08 sales/load forecast arising from a downward trend in the sales/customers observed in most of the thermal communities. The TGC submitted the Board should direct NTPC to provide, at its next General Rate Application, a comprehensive assessment of the annual changes in the sales per customer and address whether NTPC should employ average, as opposed to year-end number of customers. (TGC Argument, p. 38 – 39)

NTPC submitted that simply because preliminary actuals are now available (and TGC appears to prefer those results), there is no reason for the Board to reject NTPC's reasonable GRA forecasts.

NTPC submitted the 1.17% adjustment bears no linkage whatsoever to 2007/08 forecasts, as it is not based on any values arising from that year, and as such the TGC recommendation with respect to 2007/08 should be dismissed by the Board. (NTPC Reply, p. 5)

NTPC submitted, while sales per customer multiplied by total number of customers may be the methodology utilized by some utilities, it is not utilized by NTPC. Rather, the Corporation's sales forecast is done in aggregate for each customer class and community solely based on the total sales in kWh. (NTPC Reply, p. 6)

Views of the Board

The Board notes that, due to certain data limitations, regression analysis for both trend and weather normalized conditions are not always used. Instead alternative methods of forecasting based on averages of consumption from the same month in previous years or averages of the most recent month's consumption are used.

> "…In each case, the regression analyses for both trend and weather-normalized conditions are run, and the fit assessed for reasonableness. However, data limitations are often encountered due to the small size of the communities (for example, in certain billing cycles, no consumption will be recorded for a given month and double consumption the following month, due to meter read cycles varying for example from on the order of 28 days to 35 days for practical reasons - if only a few customers are out of cycle, this can materially affect the usefulness of the monthly data for regression-type analysis). As a result, NTPC also considers other alternative methodologies, such as:
>
> - straight-line growth
> - averages of consumption from the same month in previous years
> - averages of the most recent month's consumption.
>
> Each of these methodologies will be used in certain cases in order to ensure the "bottom-up" analysis results in loads that are consistent with the "top-down" assessment by the field personnel familiar with the communities." (BR.NTPC-4, p. 21 of 23)

The Board notes NTPC's difficulty in forecasting monthly sales given the small size of several communities and the concern that if a few customers are out of cycle, this can materially affect the usefulness of the monthly data for regression-type analysis. The Board considers that while these might be concerns, they are nevertheless not insurmountable.

The Board considers that while the bottom up and top down approaches described above are consistent with prudent forecasting practice, the Board is concerned by the lack of complete explanations or support for the load forecast assumptions used for certain communities as reflected in Table BR.NTPC-4(d). The Board notes NTPC's analytical methods do not consider normalized average use per customer. The Board considers normalized average use per customer to be a useful forecasting tool, among others, because it takes into consideration the impact of changes in customer numbers on the sales forecast. It can also provide indications of trend in customer usage and usage patterns.

The illustration provided by HC in relation to Fort Smith is an example of how a four-year average of average use per customer may be used to test the forecast sales. The use of historical averages could be useful particularly if a single year use per customer might not be accurate as a result of out of cycle metering issues. The Board also notes TGC's views on the use of average use per customer in forecasting sales in future proceedings.

The Board considers NTPC should consider historical normalized average use per customer, among other methods, in determining its sales forecast for residential and general service customers by community. The historical normalized average annual use should be averaged over the most recent four years if there are out of cycle metering issues. The Board directs NTPC, as part of its Phase 1 refiling, to adjust the Test Year sales forecasts by community having regard to historical normalized average use per customer and any other relevant factors considered in the top down and bottom up approaches. The Board also directs NTPC to reflect any consequential impacts of any changes in sales forecasts on fuel costs and any other second order impacts, in the refiling.

The Board directs NTPC to consider among other forecasting techniques normalized average use per customer, for purposes of future GRA filings.

9.3 Revenue Uncertainty Due to Material Load Additions

The Hydro Communities submitted that there is sufficient uncertainty surrounding the potential increases and treatment of incremental revenues to NTPC prior to the next GRA from new mining loads or the diamond mines and through corporate restructuring such that a deferral account to capture these incremental revenues and any related costs is warranted. The HC submitted the potential for these incremental revenues should be considered not just over the term of the Test Years in this Application but over the next 5 years, which is the interval since NTPC's last GRA. (HC Argument, p. 6)

HC also submitted that Northland Utilities (NWT) Limited should continue to be supplied by hydro power from the existing Taltson Hydro Plant facilities in preference to new customers to be served by the proposed non-regulated NTHC. HC submitted this may require the negotiation of a new wholesale power supply if that situation arises. (HC Argument, p. 7)

In reply, NTPC submitted the timing of any new mining load is simply not known at this time and certainly beyond the Test Years. Further, NTPC stated the Corporation requires a rate schedule to be approved by the Board for new mining load. In the event that NUL were to serve a new mine load, the Corporation would be back before the Board on its own accord or at the direction of the Board if NTPC's incremental wholesale revenues were material and changed its level of earnings to the extent that its rates were no longer appropriate. (NTPC Reply, p. 4)

Views of the Board

The Board recognizes the potential for significant changes in the costs and revenues of the Corporation if significant new loads were to develop. The Board therefore considers a mechanism is required to review and assess the impact of these changes in the Corporations rates. Accordingly, the Board directs NTPC to provide to the Board and to all interested parties a report on the costs and revenues associated with new industrial, mining or wholesale loads, or load increases, that would have a material impact on its level of earnings and/or rates. This information should be provided at the time when the Corporation becomes aware of such load increases. For the purpose of initiating the report, the Board considers net revenue increases exceeding $500,000 to be material.

The Board recognizes HC's concern respecting the potential for conflict of interest with respect to the allocation of hydro power output from the Taltson facility between NTPC and NTHC. The Board has addressed this matter in the context of the Corporation's code of conduct, under Section 12.1 of this Decision.

9.4 Miscellaneous Revenue

Miscellaneous revenues consist of items such as pole rentals, connection charges, contract work, building and equipment rentals, and connect and disconnect charges.

The HC submitted revenues from contract work are forecast to reduce from the 4-year actual average of $239,000 to $170,000. The HC noted NTPC's explanation that the average was being skewed by $120,000 of contract revenues in Yellowknife in 2004/05.

The HC submitted that given the overall difficulty of forecasting contract work revenues in advance, the actual amounts from the previous 4 years adjusted for the one identified anomaly is the best estimate for these revenues. HC submitted reducing the $120,000 of contract work in Yellowknife in 2004/05 to a more normal $30,000, results in an average of $215,000 of contract work as compared to the $170,000 forecast by NTPC.

NTPC noted HC's recommendation that miscellaneous revenues for both contract work and customer connections should be forecast using a four-year average of the most recent actuals adjusted for anomalies. NTPC estimated that using that methodology results in forecast miscellaneous revenues of $914,000 for 2006/07 and $817,000 for 2007/08. The Corporation indicated it accepts that methodology and the resulting forecasts. (NTPC Reply, p. 32)

Views of the Board

In view of NTPC's concurrence with the HC's proposed method of forecasting miscellaneous revenues, the Board directs NTPC to reflect the revised forecast of miscellaneous revenues in its Phase 1 refiling.

9.5 Impact of Wholesale Contracts on Revenues

The TGC noted that while NUL(YK) has a demand rate of $8.10/KVA for wholesale primary service, there is no corresponding demand charge for NUL (NWT). TGC was concerned if a different set of rates were established as part of the Phase 2 proceedings and in particular a demand charge were instituted for NUL (NWT) the overall revenues could change. In this regard, TGC stated:

> "…These are obviously matters for a Phase 2 proceeding. However, to the extent the absence of contracts with these two large wholesale customers affects the level of rates from these customers it may be a Phase 1 matter. To this end, the TGC recommend the Board direct NTPC to provide, in its Phase 1 GRA Refiling, an assessment of the impact on revenues were a contract signed with the each of the two wholesale customers." (TGC Argument, p. 51 – 52)

In its reply, NTPC submitted TGC appears to be under the misapprehension that entering into wholesale contracts with NUL will impact rates. That is simply not the case. NTPC submitted there are currently no bulk power agreements in place with NUL(YK) and NUL(NWT). NTPC submitted wholesale rates have historically been and will continue to be set by the Board regardless of whether wholesale contracts are ultimately negotiated with NUL. (NTPC Reply, p. 48)

Views of the Board

The Board notes that if the wholesale rate levels or structure were to change as a result of the Phase 2 proceeding or as a result of any contractual arrangements with wholesale customers, the Board will be privy to the revenue impacts of such changes at the time. Accordingly the Board considers no action is required with respect to this matter at this time.

10. STABILIZATION FUNDS

NTPC proposed to continue and maintain its fuel and water stabilization funds, all as active funds. This includes five fuel stabilization funds (Norman Wells, Inuvik, Taltson, Snare-Yellowknife and Diesel communities) and two water stabilization funds (Snare-Yellowknife and Taltson). Subject to the comments below, the Board accepts NTPC's proposed stabilization funds as proposed.

10.1 Water Stabilization Funds

10.1.1 Snare-Yellowknife Water Stabilization Fund

The Snare-Yellowknife water stabilization fund has historically operated on the basis of 177 Gwh as the long term average for hydro generation on the Snare Yellowknife system. In this Application, NTPC requested an increase in the long term average generation to 220 Gwh to reflect the addition of the Bluefish generating plant in 2004/05 (Bluefish as 42.5 GW.h per year and the remaining Snare at 177.5 GW.h per year).

Risks Covered by Water Stabilization Fund

The HC expressed concern that the Snare-Yellowknife water stabilization fund should not have to absorb diesel fuel cost risks associated with hydro or transmission outages:

> "...all diesel generation is automatically run through the Water Stabilization Fund, which was never the intent. In 2005/06, NTPC charged $112,000 to the Fund as a result of work on the Snare Rapids Upgrade and a further $161,000 as result of the tower failure on the Rae Transmission Line. As a

> consequence of the change in 2001/02/03, the Fund operates more like a Fuel Stabilization Fund (volume only) which removes all risks associated with hydro or transmission outages…" (HC Argument, p. 24)

NTPC submitted the Corporation's proposed treatment of diesel fuel expenses for the Snare-Yellowknife and Taltson systems is transparent, consistent with the operating rules of the stabilization funds agreed to by the parties to the 1995/98 Phase 1 Negotiated Settlement and results in the Corporation fairly recovering diesel fuel costs required to maintain safe and reliable service to its customers.

NTPC submitted in the event the Board would prefer an alternative treatment of diesel fuel costs related to unavailability of hydro generation or transmission facilities in the future – along the lines of those suggested by the Hydro Communities, the Corporation should be allowed to consider how it might reasonably implement such a consideration and propose an alternative treatment at a later date. (NTPC Reply, p. 42)

Long Term Average Generation

The HC submitted that the impact of capital additions to the Bluefish plant on the long term average generation of the plant should be addressed by NTPC before the Bluefish generation impacts the water stabilization.

> "In BR.NTPC-19, NTPC was asked to comment on increases to the 42.5 GWh as a result of capital projects at Bluefish. NTPC indicated that the focus of projects to date has been on the safety and condition of Bluefish and not on enhancing the output because the system still had excess hydro capacity. In summary, NTPC indicated that any increases in output would have no impact on test year revenue requirements due to the forecast load being below the 220 GWh system capability. When asked when NTPC would suggest the Board address the Bluefish generation for purposes of the Water Stabilization Fund, NTPC indicated that it would do so following the capital projects that increase output and when the system

> needs hydro power. Although it has no impact today, the Hydro Communities submit that NTPC be required to address the long term output of Bluefish at the time of its next GRA in order to ensure there is a forum to test the long-term output in advance of when the Water Stabilization Fund needs to be updated." (HC Argument, p. 25)

NTPC indicated the Corporation will revisit the long-term average output of Bluefish when it becomes a material consideration in the development of the Corporation's Revenue Requirement. (NTPC Argument, p. 62)

Views of the Board

The Board considers the purpose of a stabilization account is to mitigate the utility's risk for items that are difficult to forecast and where the impacts of variances from forecasts can be significant. In this instance the intent of the water stabilization fund is to mitigate the risk of the availability of the hydro resource for power generation. Given this intent, there does not appear to be a valid reason to insulate NTPC from risks associated with incidents that are not directly related to the availability of the hydro resource.

The Board notes costs associated with hydro plant or transmission outages are generally considered part of the utility's risk. Including such costs and associated risks in the water stabilization account could potentially weaken the utility's incentive to efficiently manage its generation and transmission outages. The Board therefore, concurs with the HC that it would be appropriate to not include the diesel costs associated with generation and transmission outages in the water stabilization account. However, the Board considers the benefits of an approach designed to isolate different risks must be balanced against the administrative costs of implementing it. Therefore, the Board directs NTPC to propose in its refiling, a cost effective approach to excluding the costs and risks associated with generation and transmission outages from the water stabilization account, having regard to the administrative costs involved, and to reflect these proposals, in the refiling.

The Board agrees with the HC that the long-term average generation from Bluefish should be determined as soon as it is practical to do so and before the Bluefish generation impacts the water stabilization fund. Equally, the Board considers given the length of time since the long-term average generation for the Snare system was established this matter should also be revisited on a timely basis. Accordingly, the Board directs NTPC to address the long-term average Bluefish and Snare generation at the time of the next GRA or earlier if the Corporation's forecasts indicate the water stabilization fund might be impacted in any given year.

10.1.2 Taltson Water Stabilization Fund

NTPC proposed to reactivate the Taltson water stabilization fund in order to maintain a parallel fund with the Snare water stabilization fund.

The HC submitted that the level of the surplus hydro available on the Taltson River is still so large that there is no need to establish a fund to deal with water variance from year to year. Therefore, the proposal to reactivate this fund appears to be nothing more than an attempt to further reduce the Corporation's risks.

The HC submitted that the rationale provided for reactivating the Taltson water stabilization fund is not compelling and NTPC's request should be denied. However, should the Board decide to approve this fund, the balance at March 31, 2006 should be deemed to be zero consistent with the fact the fund was deemed to be inactive in the 01/03 Settlement.

NTPC submitted formally reactivating the Taltson stabilization fund with a zero opening balance in the 2006/07 test year is reasonable and should be approved by the Board. NTPC indicated any need to address the related “triggers” for the fund to determine when any refund or riders are required could be suitably addressed during the Corporation’s Phase 2 proceeding.

Views of the Board

The Board is not convinced that there is a need to reactivate the Taltson water stabilization fund at this time given the surplus hydro situation on the Taltson system. However, if this situation is expected to change, NTPC should make an application to reestablish the fund at that time and request approval of the triggers for charges or credits to the fund. Accordingly, the Board directs NTPC to file an application to reactivate the Taltson water stabilization fund when the circumstances surrounding surplus hydro on the Taltson system change, as a result of which NTPC forecasts a need to reestablish the fund.

10.2 Fuel Stabilization Funds

10.2.1 Separate Fuel Stabilization Funds by Community

NTPC operates a single fuel stabilization fund for all diesel communities except for Norman Wells (purchased power) and Inuvik (gas stabilization) for which separate funds are maintained because of the difference in fuel cost causation factors applicable to these latter two communities. The TGC expressed concern that the use of a single fuel stabilization fund and single rider to pass through fuel cost changes for diesel communities is contrary to the premise of community based rates upon which the base rates for each community are established. The TGC submitted that separate fuel stabilization funds should be maintained for each of the communities with separate fuel stabilization riders for the following reasons:

- “Management of a fairly major component of the Revenue Requirement at the time of true-up on a postage stamp basis is inconsistent with the community-based rate making approved by the Board.
- The FSF rider has the impact of averaging fuel efficiencies and delivery costs. Hence, even if there is no difference in the landed cost, the fact that delivery/shipping costs vary significantly as between communities, a common rider results in the cross subsidization. That is, communities with higher delivery/shipping costs are being subsidized by those with lower delivery/shipping costs.
- While the TGC proposal would require a need to develop and maintain riders by community, this is a reality NTPC must live under its presently approved community-based rates. NTPC currently maintains all the information to provide riders by community; hence, development of community-specific FSF riders and implementation of the same should not, in our view, result in an undue additional expense or effort.
- Customer comprehension will be enhanced by a community specific FSF rate rider, not diminished as suggested by NTPC.” (TGC Argument, p. 25)

NTPC indicated the cost of tracking the fuel stabilization fund balance by community would be material.

> “...the Fuel Stabilization Fund has not been tracked on this basis and the history of costs by community cannot be broken out in the fund. Even on a go-forward basis there would be difficulties applying certain common costs, such as fuel hedge costs and credits, on an individual community

> basis. The costs involved in preparing regulatory filings, responding to information requests, and tracking and reconciling riders would be material while providing relatively few cost-tracking benefits. The Corporation has not included any such costs in its test year forecasts and would otherwise charge such costs to the regulatory deferral account. Further, community-by-community riders for fuel cost changes would be complicated to implement and monitor (including the process to turn on/turn off the riders by month for every community), would decrease customer comprehension with respect to the funds and would violate the basic premise for the funds as a collective "insurance" as they were designed in the 1995/98 GRA Negotiated Settlement, with involvement from diesel communities…" (NTPC Reply, p. 43, *ll*. 21 – 32)

Views of the Board

The Board agrees with the TGC that under community based rates, the fuel riders should follow the community costs as closely as possible. The Board notes the increase or decrease in fuel costs that are passed through to customers via the fuel rider would be approximately the same incremental costs per kWh for each community resulting from a common change in the reference price for crude oil. However, given the differences in fuel efficiencies by community as well as differences in station service and line losses by community, the fuel riders to pass through a given cost change can vary by community. For example, a community with a relatively low average fuel efficiency would require a higher fuel rider compared with one with a relatively high fuel efficiency in order to pass through a given cents per kWh increase or decrease in fuel costs. The present fuel stabilization rider mechanism does not recognize these differences by community.

The Board notes NTPC's concern respecting material costs for maintaining separate fuel stabilization accounts by community. However, the Board considers the premise of community based rates can be maintained if the change in fuel cost following a change in the reference price of oil can result in different fuel riders for each community based on the forecast efficiencies and station service/losses for that community. Since the change in the fuel cost on a per kWh basis could be expected to be approximately the same for all communities, there will be no requirement to maintain separate fuel stabilization accounts by community. The reconciliation of revenues and costs recorded in the fuel stabilization account could be carried out as at present using a single fund. The Board directs NTPC to consider these comments and propose a procedure for determining future fuel stabilization riders triggered by fuel price changes as part of the refiling.

10.2.2 Use of Forecast Vs Actual Fuel Efficiencies

NTPC indicated fuel efficiencies are forecast for the test years based on the last three years of actual efficiency, weighted 3 for the highest of the past three years, 2 for the middle efficiency year and 1 for the lowest efficiency of the three years. (Ex 2, p. 2-8, Footnote 8)

TGC submitted that for purposes of calculating the fuel stabilization rider, actual fuel efficiencies rather the forecasts should be used:

> "…As newer engines are installed, any resulting improvement in heat rates is not recognized in the calculation of fuel volumes to the detriment of customers. NTPC should therefore be directed to use actual heat rates in the computation of the FSF Rider." (TGC Argument, p. 27)

NTPC suggested the TGC recommendation would have minimal impact. (NTPC Reply, p. 43)

Views of the Board

The Board considers it appropriate to establish fuel efficiencies on a prospective basis after giving effect to any known changes in fuel efficiencies for the test period such as resulting from the addition of a new generating unit. The Board considers this approach would preserve the utility's incentive to improve efficiencies and is consistent with forward test year regulation. The Board also considers use of forecast efficiencies in the fuel rider calculation would be consistent with the use of forecast efficiencies in the establishment of base rates. Accordingly, the Board accepts NTPC's current practice of using forecast fuel efficiencies for the purpose of determining fuel riders.

11. TERMS AND CONDITIONS OF SERVICE

NTPC proposed a number of changes to its Terms and Conditions of Service "(**TCS**"). The proposed changes are approved with the exception of those noted in the following sections.

After the completion of the Phase 2 GRA, NTPC is directed to amend its terms and conditions of service in accordance with the Board's decisions and to file a copy of the amended terms with the Board. The Corporation should also take steps to advise its customers that the terms and conditions of service have been changed and make arrangements to provide a copy of the revised document to any customer who requests one.

11.1 Application for Service

There was an addition proposed to Section 4.1 (paragraph 4), which would allow NTPC to refuse service to an applicant because a customer in arrears resides at and might continue to reside at the applicant's premises.

Views of the Board

This amendment attempts to make the applicant assume some responsibility for the debt of the previous customer when there may be no legal relationship between these parties. The Board is not convinced that this is an appropriate provision to be included in the TCS and does not approve its inclusion.

11.2 Limitation of the Corporation’s Liability

NTPC proposed a replacement of Section 13.2 by a limitation clause which would prevent any claim for loss, injury or damages brought more than 180 days after the date of the occurrence of the incident which resulted in the loss. The intended effect of this clause is to bar any liability if the claim is made after the 180 day limitation period.

Views of the Board

In the Board’s view, such clauses belong in customer service agreements where the likelihood of notice to the customer is greater.

After questioning in the hearing, NTPC withdrew this proposed limitation period but it should be noted that the Board does not believe that it has the jurisdiction to establish a limitation of actions through the terms and conditions of service which varies from the limitations set out in the NWT *Limitations of Actions Act,* R.S.N.W.T 1988, c. L-8.

NTPC proposed further changes with respect to the text of Section 13.2 in its reply argument. Since this proposed limitation provision will affect all of the Corporation’s customers, the Board does not consider it appropriate to approve a change advanced for the first time in reply argument. The Board therefore directs the Corporation to include this proposed change in its Phase 2 filing in order to give interveners and customers the opportunity to respond to it.

11.3 Indemnity

The Corporation proposed the addition of a new indemnity clause in Section 14.1. This proposed change would require a customer to indemnify the Corporation against certain risks.

Views of the Board

The Board is of the view that such arrangements are best included in customer service agreements where proper notice of the risk assumed by the customer can be given. This amendment is not approved.

11.4 Maximum Investment Policy

NTPC requested approval of revised Maximum Corporation Investment levels of $1,500 per residence, $750/unit for multiple unit residential dwellings and $250/anticipated kW for General Service customers.

NTPC stated that the proposed changes were determined to be reasonable after having reviewed the (i) current corporate investment rates used by other utilities, (ii) NTPC’s current costs to connect new customers and (iii) a net present value analysis of the costs and revenues associated with connecting new customers. Based on that review, NTPC submitted the proposed corporate investment rates are comparable to other utilities, materially less in most sample cases than the costs for hooking up new customers and within levels that can be accommodated for an increase, respectively.

Views of the Board

The Board has reviewed the proposed investment levels and accepts them for purposes of this Decision.

11.5 Standby Interconnection Guidelines

NTPC requested approval of standby interconnection guidelines applicable to any customer who seeks to receive standby service or otherwise self-generate all or a portion of their power while connected to NTPC's distribution system.

Based on comments received at the Technical Workshop, the Corporation withdrew its proposed standby rate design principles until the Phase 2 portion of this proceeding.

The Standby Interconnection Guidelines are set out in Attachment 2 of Chapter 6 of the Application. NTPC indicated the guidelines were prepared in conjunction with Northland Utilities Ltd., allow customers to better evaluate self-generation options and are required by the Corporation for safe and reliable service in the event that standby service is provided.

Views of the Board

The Board notes none of the parties raised any issues respecting the guidelines. The Board has reviewed the guidelines and approves them on an interim basis for purposes of this Decision. The Board will examine the guidelines together with associated rates at the time of the Phase 2 proceedings and consider final approval at that time.

12. OTHER MATTERS

12.1 Code of Conduct

The NTPC has 4 wholly owned subsidiaries:

1. NWT Energy Corporation Ltd.
2. NWT Energy Corporation (03) Ltd.
3. Sahdae Energy Ltd.
4. 5383 NWT Ltd.

With the recent creation of the Northwest Territories Hydro Corporation ("**NTHC"**), NTPC has itself become a wholly owned subsidiary with NTPC's common shares being held by the NTHC.

Without access to the financial statements for these 5 affiliated companies, the TGC is concerned that it is not possible to:

- Gauge the size and results of the affiliates operations;
- Determine the amounts due to/from the NTPC; or
- Assess how the affiliates are being financed and their source of financing.

The TGC is concerned by the lack of transparency and states in its evidence:

> "Without adequate checks and balances to ensure transactions with affiliates are transparent and will not impair the operations of the regulated entity, having the NTPC affiliates engaged in operations similar to those provided by the regulated arm can be problematic. … Clearly, the activities undertaken by NTPC's affiliates are in competition to the

> activities engaged in by NTPC. Therefore, it is appropriate for safeguards to be put in place to ensure the resources of the regulated arm, if used, are properly priced and all such revenues are recorded in the books of the regulated operations." (Ex. 10, p. 3, *ll*. 20 – p. 4, *ll*. 7)

The TGC recommends that NTPC be required to develop a comprehensive code of conduct to govern its transaction with its affiliates. The rationale provided by the TGC is:

> "… A properly structured code of conduct will ensure:
>
> a) regulated operations do not subsidize the non-regulated operations undertaken by the Corporation;
> b) non-regulated subsidiaries do not subsidize the regulated operations;
> c) confidentiality of customer information is protected; and
> d) no preferential access to utility services is provided to the non-regulated operations.
>
> Further, a consistent application of the code of conduct and associated code-compliant reporting of financial results also has the potential to reduce hearing time.
>
> Currently, NTPC appears to provide, on a cost basis, a wide array of services to its subsidiaries, including purchasing, IT support, accounting and commitment of senior management time. In my view, this confers a significant benefit to the non-regulated businesses as these services should be offered on the basis of Fair Market Value (FMV) (i.e. pricing should be no different than if NTPC were providing such services to independent third parties)." (Ex. 10, p. 4, *ll*. 18 – p. 5, *ll*. 6)

The TGC recommends that NTPC is to provide, no later than its next GRA, its own comprehensive code of conduct. The TGC suggests that it could be modeled after the ATCO Group code of conduct. NTPC should also provide sufficient information to determine the exact nature and extent of the types of services provided to affiliates by NTPC, the market prices associated with these services, as well as the method of determining such transfer pricing, the costs of

NTPC senior management time charged to the affiliates and details of all overheads charged for services to affiliates.

The TGC provided substantially more information elsewhere in this process that can be found at the following locations:

- Response to BR.TGC-1
- Hearing Transcripts - Volume 3, Page 13 - Line 4 to Page 52 – Line 14
- Hearing Transcripts – Volume 3, Page 67 – Line 5 to Page 71 – Line 11
- TGC Argument Pages 4-14
- TGC Reply Pages 3-9

As a result of learning about the creation of the NTHC by Bill 4 during the course of this proceeding, the TGC updated the recommendation provided in its evidence to a three-part recommendation:

1. The Board should direct NTPC to adopt a more formalized inter-affiliate code of conduct which would establish principles related to transfer pricing and other matters governing all inter-affiliate transactions.

2. The Board should direct NTPC to file its inter-affiliate code of conduct as soon as possible in 2007, based on a collaborative approach as between NTPC, Board staff, customer representatives, as well as interested stakeholders.

3. The Board direct should NTPC to file, at its next GTA, details of all amounts it incurs in respect of non-regulated operations, basis of these amounts (direct charges as opposed to using allocation factors), allocation

drivers, as well as all amounts included in the Revenue Requirement with respect to costs incurred by non-regulated operations.

The HC is also concerned about Bill 4. The HC explained its concerns in its argument.

> "…Section 36 of Bill 4 calls for an addition to Section 2 of the Public Utilities Act whereby that Act would "not apply to the supply and sale of energy generated by the Twin Gorges Hydroelectric Generating Facility on the Taltson River and any expansion of, addition to or replacement of that Facility, and distributed over transmission lines that have not been constructed on the day this section comes into force." The Public Utilities Act would continue to apply to generation from that facility distributed to customers in and near Enterprise, Fort Resolution, Fort Smith, Hay River and the Hay River Reserve. In short, Bill 4 calls for the existing generation and distribution facilities to continue to be regulated and any expansion facilities to be non-regulated.
>
> This raises several questions. The existing Taltson Hydro Plant includes facilities that would be considered common to it and any expansion facilities such as upstream storage, spillways, other infrastructure and water licenses for example. It is unclear how the costs associated with these common facilities would be shared between the regulated and unregulated operations. Credits from the non-regulated to the regulated operations or adjustments to the rate base would be alternatives.
>
> If a new transmission line is constructed to connect the pilot project or fully reopened mine at Pine Point such as proposed by Tamarlane Ventures Inc., are the sales regulated or unregulated?
>
> How would the revenues from the sale of excess hydro from the existing Taltson Hydro Plant to either the Pine Point pilot/expansion or to the diamond mines be treated?" (HC Argument, p. 5 – 6)

The HC supported the TGC's recommendation on the need for a code of conduct. In its argument, the HC stated that "*Customers require assurance that the regulated operation of the utility is not subsidizing non-regulated affiliates…*".

In its reply, the HC went on to state that "…*the need for a formalized code is increasing in concert with new initiatives and Developments including, most notably, Bill 4 and the creation of the Northwest Territories Hydro Corporation as the new corporate parent of NTPC*."

NTPC's position was that adequate checks and balances exist in NTPC's current procedures to ensure that affiliate transactions are correctly and fairly recorded. The Corporation provided a detailed description of its inter-affiliate cost tracking procedures. NTPC's views on this issue were expressed at various points in this proceeding:

- NTPC Rebuttal Evidence Pages 4 to 9
- Hearing Transcripts – Volume 1, Page 222 – Line 16 to Page 247, Line 19
- NTPC Argument Pages 65 to 68
- NTPC Reply Pages 44 and 45

In its reply, NTPC summed up its position as follows:

> "The Corporation's Written Argument sets out the detailed "checks and balances" and discusses the procedures which it follows when implementing those checks and balances. The Corporation does not oppose codification of its inter-affiliate cost tracking measures and is prepared to make such a filing, based on its review of other applicable jurisdictions, with the Board. It is important to note, however, that a code of conduct in the nature of the ATCO Group code is not relevant (except for the inter-affiliate transfer pricing and cost tracking measures) because the ATCO Group's operating environment, unlike NTPC's operating environment, consists of non-regulated generation and retail functions. As NTPC's regulatory resources will be occupied with the preparation and prosecution of its 2006/08 Phase II GRA over the short term and running parallel proceedings would not be practical, the Corporation suggests that a filing date eight months following a final Phase II decision would be appropriate." (NTPC Reply, p. 44, *ll*. 24 – p. 25, *ll*. 2)

Views of the Board

NTPC's affiliates are becoming involved in increasingly complex and large projects that the Board needs to ensure do not negatively impact upon the regulated ratepayers. Additionally, the creation of the NTHC has exacerbated the already complex relationship that NTPC has with its multiple affiliates.

The Board agrees with the TGC that the NTPC is in need of a comprehensive code of conduct. Given that it is the regulated utility, NTPC, which is typically providing services to its non-regulated subsidiaries (and now potentially its non-regulated parent), merely codifying the Corporation's current cost-tracking measures will not provide the level of transparency and assurance of market-based transactions that is required to protect the regulated ratepayers.

Given the level of concern from the interveners in relation to the passage of Bill 4 and the creation of the NTHC, the Board has undertaken a review of Bill 4 and its implications for NTPC and the regulated ratepayers.

A major effect of Bill 4 was the creation of a new Section 2.1 in the *PUA*. Section 2.1 states:

> **2.1**. (1) This Act shall apply to the supply and sale of energy generated by the Twin Gorges Hydroelectric Generating Facility on the Taltson River and any expansion of, addition to or replacement of that Facility, and distributed to customers in and near Enterprise, Fort Resolution, Fort Smith, Hay River and the Hay River Reserve.
>
> (2) This Act shall not apply to the supply and sale of energy generated by the Twin Gorges Hydroelectric Generating Facility on the Taltson River and any expansion of, addition to or replacement of that Facility, and distributed to customers over transmission lines that have not been constructed on the day

> this section comes into force, unless those lines connect with and branch off transmission lines that had been constructed before that day.

Section 2.1(2) has the effect of creating a single facility, which is both regulated and unregulated at the same time. This will potentially make the regulatory process more complex and difficult due to the Board's requirement to ensure that the unregulated customers are not being subsidized in any way by the regulated customers. Regulated vs. unregulated costs for capital, head office, operations and maintenance, amortization and depreciation, fuel supply, etc. will need to be carefully untangled and closely scrutinized.

Section 2.1(2) does not seem to consider the potential customers north of this new development, which are not industrial. For example, if a deal were made to supply hydro power to Lutsel k'e with a transmission line off the new main transmission line to the diamond mines, it would appear that this transmission line would also be unregulated even though it is providing service to a regulated community. Without a defined franchise area, it is unclear if there is even any obligation to serve these other potential customers.

Section 2.1(2) applies partially based on the time of construction of transmission lines and might have the effect of taking new lines constructed in the existing hydro zone out of Board jurisdiction. Again, the effect could be to have an unregulated transmission line providing service to a regulated community.

While the new Section 2.1 of the *PUA* only refers to the expansion of the Taltson facility, it is clear that the mandate of the NTHC encompasses much more than that single project as Section 5 of Bill 4 states:

5. (1) The objects of the Corporation are:

(a) to generate, transform, transmit, distribute, deliver, sell and supply electricity on a safe, economic, efficient and reliable basis;

(b) to undertake programs to conserve electricity;

(c) to ensure a continuous supply of electricity adequate for the needs and future development of the Northwest Territories; and

(d) to undertake any other activity authorized by the Executive Council.

(2) In addition to the objects referred to in subsection (1), it is an object of the Corporation to facilitate the expansion of, addition to or replacement of the Twin Gorges Hydroelectric Generating Facility on the Taltson River, and to participate in the supply and sale of electricity generated by that Facility.

(3) The Corporation may, with the approval of the Executive Council, establish one or more subsidiaries of the Corporation to carry out its objects.

Not only is there the possibility of additional affiliates being created under Section 5(3), it is the Board's view that Bill 4 places NTPC into direct competition with its own parent company for new power customers. The effect is that there will be a conflict of interest created for the Board of Directors and Senior Management of the two Corporations from the perspective of protecting the interests of the regulated ratepayers. For example, if an opportunity for acquiring a significant new power customer was to arise, would NTPC or NTHC be allowed to pursue the opportunity? How would this decision be made? Where would the interests of the regulated customers be considered and protected in this process?

A decision by the Board and management of the two companies to forgo an opportunity (such as providing power to the diamond mines or other large industrial customers) for NTPC in favor of NTHC could have significant negative repercussions for regulated customers.

As part of its rationale against requiring a code of conduct, NTPC asserted that NTPC's operating environment does not include non-regulated generation and retail functions. The Board disagrees. With the creation of the NTHC, the NTPC operating environment clearly now does include non-regulated generation and retail functions with all the complexity that that entails.

While the Board is not in favor of running parallel proceedings, it is the view of the Board that the development of an NTPC code of conduct cannot wait until the next GRA or even the conclusion of Phase 2 of this GRA. The Board directs NTPC to:

1. By the end of January 2008, file with the Board a formalized inter-affiliate code of conduct which would establish principles related to pricing and other matters governing all transactions with the Corporation's parent, other affiliates and non-regulated operations.

2. As part of its next Phase 1 GRA, file with the Board details of all transactions with the Corporation's parent, other affiliates and non-regulated operations, including details of how the transfer pricing is determined (fair market value, allocated costs), the allocation drivers used, as well as identification of all amounts included in the Revenue Requirement with respect to costs or revenues related to parent, other affiliate and non-regulated operations.

3. By the end of November 2007, file with the Board a detailed policy that explains how the interests of the regulated ratepayers will be protected in

relation to decisions by the Board and Senior Management regarding the operations of NTPC and NTHC. In particular, the Board expects a detailed explanation as to how it will be decided which of the two companies will pursue new generation and sales opportunities and how the interests of the regulated ratepayers will be protected in that decision-making process.

12.2 Generation Using Sources Other Than Diesel

The TGC is recommending that the Board require NTPC to take a more aggressive approach to developing generation sources other than diesel. In its evidence, the TGC stated the following:

> "Customers expect NTPC to take an aggressive and proactive position in pursuit of whatever external funding is available for any green projects that may serve to reduce the dependence on diesel fuel and capitalize on the touted environmental benefits. To this end, NTPC should file quarterly reports of all its efforts to obtain funding from all levels of government to kick start projects to deliver electrical energy from 'green' sources and replace diesel fuel thermal power generation. NTPC should also report on any available private and/or public funding for projects using and exploiting renewable, and/or low-emission energy sources and comment on the viability of such endeavors. Finally, I recommend NTPC also be directed to report on the status of each of the renewable projects noted in TGC.NTPC-9 (c) (iii), pages 4 to 6, as noted above, as well as any other feasible, renewable projects with external funding." (Ex. 10, p. 8, *ll*. 10 – 20)

In its response to BR.TGC-2(b), the TGC clarified its reasons for requesting quarterly reporting by NTPC.

> "The objective in recommending the filing of quarterly reports is to provide the Board and stakeholders with a sense of how proactive and aggressive NTPC has been in the pursuit of federal and territorial funding available for green power. As the Board has broad general and supervisory powers, as

> well as a mandate to ensure prudent acquisition of capital property when first devoted to public use (s. 49 of *Public Utility Act*), the Board may as a result of a review of such quarterly filings direct NTPC to conduct further study, or direct to undertake or not to undertake such projects.
>
> The TGC recognize that approval of capital projects is typically in the context of a GRA; however, given the limited amount of environmentally focused funding, and the many demands placed by various parties for such funding, it may not be appropriate to wait until the filing of the next GRA to seek approval of such projects. As well, we note that NTPC currently has a significant number of potential "green projects" on the table (see TGC Evidence, page 8), which may only proceed if there is some external federal/territorial funding to defray the total costs of these projects. Absent the requested oversight in the form of quarterly reporting, and given the natural incentive for a utility to increase rate base in order to increase its return, there is no real incentive for NTPC to incorporate a "green portfolio" as part of its overall resource planning."

NTPC responded in its rebuttal evidence by stating that there are hurdles with regards to the economic and technical viability of alternative energy projects and that it is NTPC's view that such projects are better pursued by private business and government rather than a Crown Corporation, such as NTPC, as business and government typically have an easier time accessing third-party funding for alternative energy projects. NTPC concluded by stating:

> "…To the extent that Mr. Merani's proposition would require NTPC to aggressively pursue alternative energy funding beyond its current efforts and report quarterly on its efforts to the PUB, NTPC does not have sufficient resources to fulfill this request. NTPC maintains that the current level of effort to acquire third party funding either directly or though assisting communities to obtain funding is appropriate and that quarterly reporting on these efforts would be done at the expense of using resources to successfully acquire funding. If Customers in the diesel communities determine that this is a high priority, NTPC would be willing to amend its 2006/08 rate application to include a position to aggressively and proactively pursue alternative energy funding and make reports to the Board on a full time basis." (Ex. 12, p. 10, *ll*. 40 – p. 11, *ll*. 3)

NTPC added to this statement in its argument.

> "Absent consensus from NTPC's customers that additional resources should be applied to seeking out and reporting on third party funding for alternative energy projects, the Corporation submits that its current program is reasonable and nothing further is required from the Board." (NTPC Argument, p. 69, *ll*. 3 – 5)

The TGC discussed this issue at length in its argument and reply leading to the following summary of the TGC position:

> "NTPC's opposition to take any steps to seek out funding for alternate modes of electricity generation that would wean the thermal communities of their diesel-dependency and reduce fuel costs is contrary to its Vision Statement, and in our view, contrary to its obligation to demonstrate the projects it undertakes from amongst the various alternatives reflect the least short-term and long-term negative environmental impacts. NTPC's argument that it requires additional resources is not plausible given that it has successfully undertaken alternate energy projects in the past without a requirement for additional resources and external funding.
>
> Given the availability of federal and other external funding sources in respect for renewable energy, and the growing societal concerns respecting CO_2 emissions from the use of thermal fuels, NTPC needs to incorporate in its resource planning options a consideration of all of the costs, including impacts of carbon emissions. The Board should direct NTPC to:
>
> i. file quarterly reports of all its efforts to obtain funding from all levels of government to kick start projects that deliver electrical energy from 'green' sources and replace diesel fuel thermal power generation;
>
> ii. report on any available private and/or public funding for projects that use and exploit renewable, and/or low-emission energy sources and comment on the viability of such endeavors; and
>
> iii. report on the status of each of the renewable projects noted in TGC.NTPC-9 (c)(iii), pages 4 to 6 as well as any other feasible, renewable projects with external funding.

> In addition, any GHG credits NTPC becomes entitled to as a result of undertaking renewable energy projects prior to the next GRA, or credits earned from prior such projects, should be recorded in a deferral account for disposition at the next GRA." (TGC Reply, p. 14)

The NTPC position is summarized in its reply as follows:

> "While the TGCs' concerns around alternative energy and climate change is laudable, the TGC fails to recognize that the Corporation shares those concerns and is taking reasonable and prudent measures to address the matter. Consequently, there is no need for the Board to accept the TGCs' recommendations that (i) NTPC be provide with a clear direction to aggressively pursue these funding opportunities and greenhouse credits and (ii) file periodic reports with the Board to document efforts to obtain external sources of capital for the pursuit of alternative projects and developments in climate change credits. Further, as noted in the Corporation's Rebuttal Evidence, "[i]f Customers in the diesel communities determine that this is a high priority, NTPC would be willing to amend its 2006/08 rate application to include a position to aggressively and proactively pursue alternative energy funding and make reports to the Board on a full time basis."
>
> For the reasons discussed in section 4(c) above and in NTPC's Written Argument, the Board should also disregard the TGCs' recommendation that alternative energy projects undertaken before the next GRA be included in a deferral account." (NTPC Reply, p. 46, *ll*. 23 – p. 47, *ll*, 3)

Views of the Board

The Board shares the TGC's concerns with regards to the high cost of power in the diesel communities and supports the development of projects that would alleviate the burden on these communities.

While the Board notes that there have been some large successes by NTPC in lowering its diesel usage, such as the natural gas engines in Inuvik and the purchase of Bluefish, the Board is concerned with the lack of progress in the majority of the small, isolated diesel communities.

The Board is also concerned by the NTPC's apparent willingness to forego some projects in favor of allowing its non-regulated affiliated companies to take the lead with little to no justification being provided to the Board. The Board recognizes there are risks related to the economic and technical viability of certain alternative energy projects and notes NTPC's view that such projects are better pursued by private business and Government rather than a Crown Corporation, such as NTPC. However, the Board notes that NTPC was able to manage such risks in the past through appropriate business arrangements with third parties such as the DPC with respect to the development of hydro on the Snare River. Assuming risk considerations can be addressed through appropriate business arrangements as in the past, the Board expects NTPC to take the lead in aggressively pursuing, from a least cost planning perspective, alternative energy, demand side management and energy efficiency project opportunities while ensuring that project decisions are made in the best interests of NTPC's regulated ratepayers rather than NTPC's affiliates.

The Board finds that requiring NTPC to provide regular reporting on its efforts in the areas of alternative energy, demand side management and energy efficiency projects should not create an undue hardship for NTPC, particularly given that the Board expects the production and evaluation of such reports should be part of NTPC's own internal processes. The Board would, however, be satisfied with biannual reports rather than the quarterly reports recommended by the TGC.

The Board directs NTPC to provide the Board with biannual reports that discuss the following:

1. The efforts and progress of NTPC and its affiliates in pursuing alternative energy, demand side management and energy efficiency projects;

2. Justification for any projects being pursued by NTPC's affiliates rather than NTPC;
3. Funding programs that are, or will be, available and any efforts and progress by NTPC and its affiliates in obtaining funding.

In light of the currently underdeveloped market for the valuation and trading of greenhouse gas emissions, the Board will not act on the TGC recommendation that NTPC create a deferral account to capture the benefits of GHG reductions.

12.3 Accounting Provisions

NTPC indicated there are a number of new provisions in Canadian GAAP that are in effect since the 2001/03 GRA or are emerging and may be in effect over the next few months or years. NTPC indicated, in order to be proactive in addressing the implications for rate regulation, the Corporation is seeking approval and confirmation from the Board to continue to account for various regulatory assets and liabilities consistent with past practice and Board approvals.

The specific accounts referred to by NTPC in this context are

- The rate stabilization funds
- The overhaul deferral account
- Regulatory hearing costs deferral account
- Amortization of financing costs
- Reserve for injuries and damages
- Snare Cascades deferral account
- Employee future benefits deferral account
- Deferred revenues related to customer contributions to aid in the acquisition of property, plant and equipment

- Other regulated assets, comprised of capital studies waiting for capital asset construction or determined not feasible
- The water licensing deferral account
- The treatment of deferring future costs over a period of time, where costs incurred in one year have a longer term benefit to customers and are significant in magnitude (eg. job evaluation)
- Maintaining a liability for the Future Removal for Site Restoration for the removal and clean-up of all its assets regardless of legal obligations or otherwise

The Board confirms the above accounts should be maintained in accordance with past practice and Board approvals and as approved in this Decision.

13. SUMMARY OF BOARD DIRECTIONS

Phase 1 Refiling

1. The Board directs NTPC, in its Phase 1 refiling, to reduce the opening plant balance for 2006/07 by $193,000 being that portion of the rate base addition for the Fort McPherson plant that has not been explained nor demonstrated to be a prudent expenditure by NTPC.

2. The Board directs NTPC, in its Phase 1 refiling, to reduce the cost of the Aklavik plant addition by 50% of the cost increase resulting from the delays. The costs to be included for the 50% risk sharing adjustment are overheads and Allowance for Funds Used During Construction ("**AFUDC**") resulting solely from the delays in completion of the plant caused by the unforeseen length of time spent on community consultations and the fire at Fort McPherson.

3. The Board directs NTPC, in its Phase 1 refiling, to exclude the capital addition related to the plant upgrade amounting to $900,000 from rate base additions for Fort Liard in 2007/08.

4. The Board directs NTPC, in its Phase 1 refiling, to provide a computation of its cash working capital for the test years using the net lead or lag associated with each expense item.

5. The Board directs NTPC, in its Phase 1 refiling, to use a 6% sinking fund return for each of the test years for purposes of calculating the effective cost of long-term debt.

6. The Board directs NTPC, in its Phase 1 refiling, to calculate its effective cost of long term debt as follows:

   Effective Cost of Long Term Debt= (I+AFC-SFE)/(MAD-UFC-SFI)

   Where:
   I= Interest on Mid Year Average Long Term Debt
   AFC= Amortization of Financing Costs
   SFE=Sinking Fund Earnings in the year based on long term averge return of 6%
   MAD=Mid Year Average Debt Principal
   UFC=Unamortized Financing Costs
   SFI=Sinking Fund Investment

7. The Board directs NTPC, in its Phase 1 refiling, to include a capital lease rate that reflects, for the equity portion of lease financing, the fair returns on equity of 9.00% for 2006/07 and 9.25% for 2007/08 less 25 basis points.

8. The Board directs NTPC, in its Phase 1 refiling, to use a fair rate of return on equity of 8.60% for 2006/07 and 9.25% for 2007/08.

9. The Board directs NTPC, in its Phase 1 refiling, to apply a 7% cap on losses.

10. The Board directs NTPC, in its Phase 1 refiling, to calculate forecast station service using the same procedure used for fuel efficiencies. Forecast station service is to be calculated using 3 years of actual data with a weighting of “3” given to the lowest station service year, a weighting of “2” given to the middle station service year and a weighting of “1” given to the highest station service year.

11. The Board directs NTPC, in its Phase 1 refiling, to apply a 5% cap on station service as a percentage of generation.

12. The Board directs NTPC, in its Phase 1 refiling, to provide complete and accurate analyses of the costs and benefits of the AMR projects that incorporate the reasons for and the effects of the redeployment of the linemen. These analyses are to be provided both from the perspective of the individual communities and NTPC.

13. The Board directs NTPC, in its Phase 1 refiling, to remove the 50% net income component of its at-risk compensation program from the revenue requirement calculations for NTPC's regulated business. For 06/07, the amount is $270,000 and, for 07/08, the amount is $279,000.

14. The Board directs NTPC, in its Phase 1 refiling, to calculate its total 06/07 and 07/08 supplies and services expenses using its forecast brushing expenditures of $393,000 for 06/07 and $401,000 for 07/08.

15. The Board directs NTPC, in its Phase 1 refiling, to propose a procedure for returning to the ratepayers over a 3-year period the $345,000 that was over-collected by the Corporation for brushing over the 01/02 to 05/06 period. To be clear, the refunded $345,000 is to be obtained from NTPC's non-regulated cash flow, not by reducing the test year brushing expenditures.

16. The Board directs NTPC, in its Phase 1 refiling, to reconcile the 06/07 and 07/08 Bluefish supplies and services forecasts shown in Tables BR.NTPC-9 and HC.NTPC-13(l) and described in NUL.NTPC-15(b). NTPC is to adjust the Bluefish supplies and services forecasts as needed to account for any errors in their information request responses.

17. The Board directs NTPC, in its Phase 1 refiling, to provide an assessment of the significant and growing gap between the accumulated balance in the

reserve for site restoration and the estimated site restoration costs in light of the above discussion and propose a cap to the accumulated reserve balance until such time as studies on the adequacy of the current balance can be completed.

18. Board directs NTPC, in its Phase 1 refiling, to file a written policy with regards to the criteria that are to be used to determine the eligibility of expenditures for deferral account treatment.

19. The Board directs NTPC, in its Phase 1 refiling, to adjust the test year sales forecasts by community having regard to historical normalized average use per customer and any other relevant factors considered in the top down and bottom up approaches. NTPC is to reflect in the refiling any consequential impacts of any changes in sales forecasts on fuel costs and any other second order impacts.

20. The Board directs NTPC, in its Phase 1 refiling, to reflect the revised forecast of miscellaneous revenues.

21. The Board directs NTPC, in its Phase 1 refiling, to propose a cost effective approach to excluding the costs and risks associated with generation and transmission outages from the Snare-Yellowknife water stabilization fund, having regard to the administrative costs involved, and to reflect these proposals, in the refiling.

22. The Board directs NTPC, in its Phase 1 refiling, to consider these comments and propose a procedure for determining future fuel stabilization riders triggered by fuel price changes.

Phase 2 Application

23. The Board directs NTPC, in its Phase 2 application, to include this proposed change to Section 13.2 of the Terms and Conditions of Service to give interveners and customers the opportunity to respond to it.

Next Phase 1 GRA

24. The Board directs NTPC, in its next Phase 1 GRA, to estimate the revenue lag based on sampling the number of days it takes for recovery of revenues, on average, from customers.

25. The Board directs NTPC, in its next Phase 1 GRA, to address the potential for better matching the carrying cost of the lease to DPC with the cost of the lease to NTPC over the 65-year term of the lease.

26. The Board directs NTPC, in its next Phase 1 GRA, to provide a detailed analysis as to 1) why the fuel efficiencies in Nahanni Butte, Jean Marie River, Sachs Harbour and Colville Lake are so low; and 2) what NTPC has done and will do to improve the fuel efficiencies in these 4 communities.

27. The Board directs NTPC, in its next Phase 1 GRA, to give due weight to the first test year forecast fuel efficiencies in calculating the second test year forecast fuel efficiencies.

28. The Board directs NTPC, in its next Phase 1 GRA, to provide an updated version of Table 5.1 that includes the forecast and actual diesel efficiencies for 06/07 and 07/08, the forecasts for the test years in the next GRA, and the actuals for the intervening years.

29. The Board directs NTPC, in its next Phase 1 GRA, to give due weight to the first test year forecast gas efficiency in calculating the second test year forecast gas efficiency.

30. The Board directs NTPC, in its next Phase 1 GRA, to provide an analysis as to why the recent gas efficiency has dropped substantially from 99/00 and 00/01.

31. The Board directs NTPC, in its next Phase 1 GRA, to provide a detailed analysis as to why the actual gas efficiencies are so much lower than the manufacturer's ratings.

32. The Board directs NTPC, in its next Phase 1 GRA, to provide an updated version of Table 5.2 that includes the forecast and actual gas efficiencies for 06/07 and 07/08, the forecasts for the test years in the next GRA, and the actuals for the intervening years.

33. The Board directs NTPC, in its next Phase 1 GRA, to include an examination of the pros and cons of separating losses into its two components (electrical losses and non-electrical losses) which would allow the electrical losses to be forecast using the same method as for fuel efficiencies while non-electrical losses could still be forecast using the 5-year rolling average method.

34. The Board directs NTPC, in its next Phase 1 GRA, to provide an updated version of Table 5.3 that includes the forecast and actual losses for 06/07 and 07/08, the forecasts for the test years in the next GRA, and the actuals for the intervening years.

35. The Board directs NTPC, in its next Phase 1 GRA, to give due weight to the first test year forecast station service in calculating the second test year forecast station service.

36. The Board directs NTPC, in its next Phase 1 GRA, to provide an updated version of Table 5.4 that includes the forecast and actual station service for 06/07 and 07/08, the forecasts for the test years in the next GRA, and the actuals for the intervening years.

37. The Board directs NTPC, in its next Phase 1 GRA, to provide a more detailed analysis of station service levels and potential reductions.

38. The Board directs NTPC, in its next Phase 1 GRA, to undertake a comprehensive review of the at-risk compensation program, make any necessary changes in light of the concerns expressed by the Board and report back to the Board.

39. The Board directs NTPC, in its next Phase 1 GRA, to complete the assessment of the adequacy of the current balance in the accumulated reserve to deal with NTPC's share of anticipated future costs for site restoration including soil remediation and reflect this assessment in the amortization rates.

40. The Board directs NTPC, in its next Phase 1 GRA, to consider, among other forecasting techniques, the use of normalized average use per customer.

41. The Board directs NTPC, in its next Phase 1 GRA or earlier, to address the long-term average Bluefish and Snare generation if the Corporation's

forecasts indicate the water stabilization fund might be impacted in any given year.

42. The Board directs NTPC, in its next Phase 1 GRA, to file with the Board details of all transactions with the Corporation's parent, other affiliates and non-regulated operations, including details of how the transfer pricing is determined (fair market value, allocated costs), the allocation drivers used, as well as identification of all amounts included in the Revenue Requirement with respect to costs or revenues related to parent, other affiliate and non-regulated operations.

Other Directions

43. The Board directs NTPC, in its dealings with contractors, to establish prudent contractual arrangements including the reasonable provisions for insurance and guarantees of proper workmanship and materials that a prudent owner would require.

44. The Board directs NTPC to ensure that the Governance and Compensation Committee is exclusively made up of independent directors.

45. The Board directs NTPC that, commencing with the 06/07 test year, NTPC's 3-year rolling average actual brushing expenditures must be no less than 10% below the 3-year rolling average forecast brushing expenditures. NTPC's 5-year rolling average actual brushing expenditures must be no less than equal to the 5-year rolling average forecast brushing expenditures.

46. The Board directs NTPC to provide to the Board and to all interested parties a report on the costs and revenues associated with new industrial, mining or

wholesale loads, or load increases, that would have a material impact on its level of earnings and/or rates. This information should be provided at the time when the Corporation becomes aware of such load increases. For the purpose of initiating the report, the Board considers net revenue increases exceeding $500,000 to be material.

47. The Board directs NTPC to file an application to reactivate the Taltson water stabilization fund when the circumstances surrounding surplus hydro on the Taltson system change, as a result of which NTPC forecasts a need to reestablish the fund.

48. The Board directs NTPC, after the completion of the Phase 2 GRA, to amend its terms and conditions of service in accordance with the Board's decisions and to file a copy of the amended terms with the Board. The Corporation should also take steps to advise its customers that the terms and conditions of service have been changed and make arrangements to provide a copy of the revised document to any customer who requests one.

49. The Board directs NTPC, by the end of January 2008, to file with the Board a formalized inter-affiliate code of conduct which would establish principles related to pricing and other matters governing all transactions with the Corporation's parent, other affiliates and non-regulated operations.

50. The Board directs NTPC, by the end of November 2007, to file with the Board a detailed policy that explains how the interests of the regulated ratepayers will be protected in relation to decisions by the Board and Senior Management regarding the operations of NTPC and NTHC. In particular, the Board expects a detailed explanation as to how it will be decided which of the two companies will pursue new generation and sales opportunities and how

the interests of the regulated ratepayers will be protected in that decision-making process.

51. The Board directs NTPC to provide the Board with biannual reports that discuss the following:

1. The efforts and progress of NTPC and its affiliates in pursuing alternative energy, demand side management and energy efficiency projects;
2. Justification for any projects being pursued by NTPC's affiliates rather than NTPC;
3. Funding programs that are, or will be, available and any efforts and progress by NTPC and its affiliates in obtaining funding.

14. BOARD ORDER

NOW, THEREFORE IT IS ORDERED THAT:

1. The Board directs NTPC to provide to the Board and interested parties a Phase 1 refiling reflecting the findings and directions in this Decision within 30 days of this Decision.

2. The Board directs NTPC to provide as part of the Phase 1 refiling a working model, in Excel format, of all GRA schedules relating to the establishment of rate base, return, revenue requirement, revenues and revenue deficiencies and all relevant supporting schedules.

3. Nothing in this Decision or Order shall bind, affect or prejudice this Board in its consideration of any other matter or question relating to Northwest Territories Power Corporation.

ON BEHALF OF THE
PUBLIC UTILITIES BOARD
OF THE NORTHWEST TERRITORIES

DECISION AND ORDER 10

January 16, 2004 11

TABLE OF CONTENTS 12

1 THE APPLICATIONS AND THE PROCEEDING 14

The Applications 15

Union Gas Limited ("Union") filed an application for rates dated May 27, 2002 with the Ontario Energy Board, under section 36 of the *Ontario Energy Board Act, 1998 S.O. 1998*, c.15, Schedule B (the “Act”). Union filed evidence in support of its application on June 25, 2002. The Board assigned file number RP-2002-0130 to Union’s application. By letter dated August 1, 2002, Union added to its application a request for changes to the Board’s formula used to establish Union’s return on common equity (“ROE”). 16

Enbridge Gas Distribution Inc. (“Enbridge” or “EGDI ”) filed an application for rates dated September 2, 2002, with the Board, under section 36 of the Act. Included in its application was a request for a change to the Board’s formula used to determine EGDI’s ROE. The Board assigned file number RP-2002-0133 to the EGDI application. 17

The Proceeding 18

The evidence in relation to the ROE issue relied upon by Union and EGDI in their applications is essentially the same, and both Applicants rely upon the same consultant, Ms.K. McShane. With the consent of the Applicants, the Board decided to hear the ROE issue raised in the two applications in a separate stand-alone proceeding. The Board assigned file number RP-2002-0158 (EB-2002-0484) to this separate ROE proceeding. 19

On December 16, 2002, the Board issued Procedural Order No. 1 setting out the schedule for the proceeding. In accordance with that order, Union filed on February 7, 2003 updated evidence prepared by Ms. McShane. 20

Procedural Order No. 2 issued on March 3, 2003 amended the dates for the proceeding as follows: interrogatories on the Applicants’ evidence were due on April 11, 2003; interrogatory responses were due on April 29, 2003; supplementary interrogatories on the Applicants’ evidence was due on May 8, 2003 and responses to supplementary interrogatories, were due May 15, 2003; an Issues/ Technical Conference was to be held on May 21, 2003; an Issues Day proceeding was to be held on May 23, 2003; intervenor evidence was to be filed by June 27, 2003; interrogatories on intervenor evidence were due by July 11, 2003; interrogatory responses were due by July 25, 2003. 21

Procedural Order No. 3 issued on April 30, 2003 cancelled the Issues/Technical Conference and the Issues Day and specified that a Stakeholders Conference take place on May 23, 2003. Procedural Order No. 4 issued on July 3, 2003 set the commencement of the hearing as September 18, 2003. On August 12, 2003 the Board issued Procedural Order No. 5 which revised the hearing date to September 22, 2003. 22

The Hearing 23

The oral proceeding commenced on September 22, 2003, and concluded on September 26, 2003 after 5 hearing days. 24

The Applicants filed their written argument-in-chief after the close of business October 20, 2003, rather than October 17, 2003 as originally scheduled. Consequently, some intervenors requested a corresponding extension to file their reply argument, which the Board granted. Six intervenors filed their arguments by November 5, 2003. The Board also extended the date on which the Applicants' reply argument was due from November 7, 2003 to November 12, 2003. At the request of the Applicants, the Board further extended the filing date from November 12 to November 21, 2003. 25

Parties and their Representatives 26

Below is a list of parties and their representatives who participated actively by leading evidence or cross-examining witnesses in the oral hearing, or by filing argument. 27

28

Union Gas Limited	Michael Penny
	Marcel Reghelini
Enbridge Gas Distribution Inc.	Helen Newland
	Marika Hare
Board Counsel	Patrick Moran
Consumers Association of Canada ("CAC")	Robert Warren
London Property Management Association ("LPMA")	Randy Aiken
Industrial Gas Users Association ("IGUA")	Peter Thompson
Vulnerable Energy Consumers Coalition ("VECC")	Michael Janigan
Energy Probe	Brian Dingwall
Pollution Probe	Murray Klippenstein
Ontario Public School Boards' Association ("OPSBA")	Jay Shepherd
Canadian Gas Association ("CGA")	Laurie Smith

Witnesses 29

The Applicants called the following witness: 30

Kathleen McShane	Senior Vice President, Foster and Associates

IGUA/VECC/CAC called the following witness: 31

Lawrence Booth	Professor of Finance, Rotman School of Management, University of Toronto

32

33

CGA called the following witnesses:

Peter Case	Peter Case Consulting
Michael Cleland	President and Chief Executive Officer, Canadian Gas Association

34

The Board called the following witness:

William Cannon	Associate Professor of Finance, School of Business, Queen’s University

Submissions and Exhibits 35

36

Copies of the evidence, exhibits, arguments, and a transcript of the proceeding are available for review at the Board’s offices.

37

The Board has considered the evidence, submissions and arguments in the proceeding, but has summarized the evidence and the positions of the parties only to the extent necessary to provide context for its findings.

38

The Board, with industry participation, has developed standards and processes for the electronic regulatory filing (“ERF”) of evidence, submissions of parties, Board orders and decisions. This Decision and Order will be available in ERF form shortly after initial copies are issued in hard copy. The ERF version will have the same text and numbered headings as the initial hard copy, but may be formatted differently.

2 SUMMARY OF CURRENT GUIDELINES 39

40

The Ontario Energy Board currently uses a formula based approach to set the return on common equity (“ROE”) for most gas utilities under its jurisdiction. The Board’s approach is set out in its *Draft Guidelines on a Formula-Based Return on Common Equity* (“ROE Guidelines”). The ROE Guidelines were first applied in the EBRO 495 proceeding which set fiscal 1998 rates for The Consumers’ Gas Company Ltd. (now EGDI).

41

The ROE Guidelines start with the establishment of a benchmark ROE to provide, as it was described in the EBRO 495 decision, “a just and reasonable return on equity” for each gas distribution company. This benchmark ROE is then adjusted for each subsequent fiscal year in accordance with an adjustment mechanism.

42

The benchmark ROE for a utility is set by taking the forecast yield for long-term Government of Canada bonds and adding an appropriate risk premium to account for the utility’s risk relative to the long-term Government of Canada bonds. The equity risk premium test is used to determine the appropriate risk premium.

43

The Compendium to the ROE Guidelines, at p.5, described this method as follows:

44

> The equity risk premium test is also designed to measure the cost of equity capital from the capital attraction perspective. It relies on the assumption that common equity is riskier than debt and that investors will demand a higher return on shares, relative to the return required on bonds, to compensate for that risk. The premium required by an investor to assume the additional risk associated with an equity investment is taken to be the difference between the relevant debt rate, usually the yield on long-term government bonds, and some estimate of the stock's cost of equity. The recommended cost of equity value under the equity risk premium approach is therefore usually computed as the sum of the test-period forecast for the government yield and the utility-specific risk premium the analyst has estimated based on historical equity risk premium evidence and forward-looking considerations.

45

The benchmark ROE becomes the allowed ROE for the first year. EGDI’s benchmark ROE was set at 10.65% in the EBRO 495 proceeding, based on a risk premium of 340 basis points. Union’s benchmark ROE was set at 11.00 % in the EBRO 493-04/494-06 proceeding, based on a risk premium of 355 basis points. The 15 basis points difference reflects the relative risk of the two utilities. The difference of the returns over 15 basis points is accounted for by the difference in the timing of setting the rate or return for the two utilities.

46

Once the benchmark ROE has been established, the allowed ROE is automatically adjusted annually, using a formula. The change in the forecast yield for long-term Government of Canada bonds is multiplied by a factor of 0.75 to determine the adjustment to the allowed ROE. This adjustment factor is then added to the utility’s previous test year ROE and the sum is rounded to two decimal points to produce the new ROE.

47

<u>Example:</u>

Allowed ROE for test year 1		10.00%
Test year 2 long-term Government of Canada bond yield forecast	5.00%	
Test year 1 long-term Government of Canada bond yield forecast	<u>5.25%</u>	
change in interest rates	-0.25%	
adjustment factor of 0.75 applied		<u>0.1875%</u>
ROE for test year 2		9.8125%
Approved ROE for test year 2 (rounded to 2 decimal places)		9.81%

Regarding the need for review in the future, the ROE Guidelines, in the Compendium at p. 28, state: 48

> The Board believes that the rate of return formula should be reviewed as conditions arise that may call into question its validity (e.g., a change in the relative taxation of the income from debt and equity investments, or a fundamental change in business or financial market conditions). To set a particular time period may be artificial and necessitate an unnecessary review or stifle a review at another time when an adjustment would be appropriate. Parties to a proceeding may ask the Board to review the formula when they feel it is appropriate or the Board may do so on its own initiative. In either case it will be the Board’s decision as to the time for a review. 49
>
> From time to time the Board may request the presentation of other tests or require some weighting for other tests in the formula should the Board want to assure itself that the equity risk premium formula approach does not lead to perverse results and is directionally in line with other market indicators.

3 EVIDENCE AND POSITIONS OF THE PARTIES 50

The Applicants 51

The Applicants relied on Ms. McShane's evidence, in support of their request for a new benchmark 52
ROE and a change to the annual adjustment formula.

Ms. McShane concluded that the ROE Guidelines produce an ROE for EGDI and Union that is 53
unreasonably low. This conclusion was based upon her proposed methodology, her analysis of changes in the Canadian bond market since March 1997, and her consideration of the allowed returns for U.S. gas and electric utilities.

To formulate her recommendation for a new benchmark ROE in the range of 11.5 - 11.75%, based 54
on a forecast 6.0% yield for long-term Government of Canada bonds, Ms. McShane applied three equity return tests; the Equity Risk Premium (ERP) test, the Discounted Cash Flow (DCF) test and the Comparable Earnings (CE) test.

Ms. McShane used three versions of the ERP test which produced an ROE range of 10.5% to 11.25%. 55

Ms. McShane's DCF test, which she applied exclusively to a sample of U.S. utilities, produced an 56
ROE of 11.5%.

Ms. McShane applied her CE test to both Canadian and U.S. industrial returns covering the 1992- 57
2001 period, and giving primary weight to the Canadian evidence, this produced an ROE range of 12.75 - 13.25%.

Ms McShane then combined these results, weighting the ERP and DCF test results 37.5% each, and 58
the CE test results 25%, to produce her recommendation that an appropriate benchmark ROE would be in the range of 11.5 - 11.75% for an average risk utility. She recommended the mid-point of 11.625% as an appropriate benchmark ROE for Union, as an average risk utility, and 11.5% for EGDI, as a slightly lower risk utility.

Ms. McShane noted that the regulated ROE for U.S. gas and electric utilities were typically higher 59
than for utilities in Canada. She was of the view that this divergence could disadvantage Canadian utilities and their shareholders within the context of an increasingly integrated North American capital market environment.

Ms. McShane also pointed to a number of changes that had occurred in the bond and equity markets 60
after the ROE Guidelines were established, which she relied on to support her contention that the risk premiums used to set the original benchmark ROE for the Applicants are too low in today's context.

CGA 61

The CGA sponsored the evidence of Mr. Cleland and Mr. Case. Mr. Cleland was presented as a policy spokesperson for the CGA and his evidence was limited to confirming that the CGA supported a higher ROE for Canadian utilities, including the Applicants. 62

Although Mr. Case did not propose any changes to the current ROE formula or the annual adjustment mechanism, his view was that an ROE in the range of 10.5 - 11.0% would be viewed by equity markets as a fair return, based on his telephone discussions with various equity market participants and analysts. 63

His recommendation was based on the following five factors. 64

First, Mr. Case claimed that the formula no longer compensates investors appropriately for an increase in the perceived riskiness of utilities since 1997. 65

Second, according to Mr. Case, recent market conditions limit the usefulness of the Capital Asset Pricing Model (CAPM) because market conditions have artificially depressed utility stock betas. 66

Third, he suggested that the continuing globalization of capital markets since the Board issued its 1997 ROE Guidelines has made a comparison to higher US utility returns more relevant. The lower returns of Canadian utilities put them at a competitive disadvantage in attracting capital. Mr. Case pointed to the recent sale by Aquila Inc. of its Canadian utility as an example of an investor not willing to invest in a utility in British Columbia or Alberta because the ROE was too low. He also pointed to some examples of Canadian utility holding companies that experienced difficulty in raising common equity as a further demonstration that the current level of ROE for Canadian utilities was a problem. 67

Fourth, with the significant decline in bond yields since 1997, the formula has resulted in a decline in equity returns that is faster than the decline in the utilities' embedded cost of debt. As a result, there has been downward pressure on utility interest coverage ratios, which in turn puts pressure on utility debt ratings. 68

Finally, Mr. Case believed that the majority of institutional equity investors view the returns currently generated by the formula based approach used by the Board and other Canadian regulators as inadequate. 69

CAC, IGUA and VECC 70

CAC, IGUA and VECC sponsored the prefiled report prepared by Drs. Booth and Berkowitz. The authors concluded that a fair ROE for the Applicants is in the range of 8.5%, which includes a 50 71 basis point "cushion" above their estimates of the cost of attracting capital for these utilities. Only Dr. Booth testified in the hearing but he adopted the joint prefiled evidence.

72

In their report, Drs. Booth and Berkowitz came to their ROE recommendation by applying two versions of the ERP test and giving equal weight to the results. Their first ERP test was the single-factor Capital Asset Pricing Model (CAPM), while their second ERP test relied on a two-factor model which differentiated between the systematic risk due to changes in the equity market and changes in security returns due to fluctuations in interest rates.

73

Their application of the CAPM model yielded an ROE in the range of 8.02% to 8.47%. This was based on their assessment that (1) the market risk premium is now 4.5% and (2) a reasonable range for the beta risk of an average-risk regulated Canadian utility is 0.45 to 0.55.

74

Applying their two-factor model, which incorporates a term premium estimate of 1.00%, produced an ROE in the range of 7.66% to 7.74%.

75

In further support of their proposed benchmark ROE of 8.5%, Drs. Booth and Berkowitz produced DCF test results, based on a sample of U.S. utilities, that pointed to an ROE in the range of 7.89 to 8.57%.

76

In testimony, Dr. Booth indicated that he did not see a need to move away from the Board's ROE Guidelines, even though their analysis suggested that the ROE Guidelines produced an ROE that was more generous than it needed to be. In their report, Drs. Booth and Berkowitz stated their belief that the 75% adjustment factor was a reasonable compromise between (a) assuming that the overall required return on the stock market is independent of long-term Government of Canada bond yields implied by a 50% adjustment coefficient, and (b) assuming that the riskiness of the long-term Government of Canada bond relative to the equity market is constant, as implied by a 100% adjustment factor.

77

Finally, Drs. Booth and Berkowitz pointed out that the market-to-book-value ratios of all Canadian utilities, save one, were well in excess of 1.0. They stated that this was a clear indication that utilities have not suffered a loss of financing flexibility since Canadian regulators moved to automatic ROE adjustment mechanisms based on long-term Government of Canada bond yields, beginning in 1994.

78

Dr. Cannon

79

Dr. Cannon was retained by the Board to provide additional evidence on the ROE issues. He prepared a report that was provided to all parties and he answered interrogatories on his evidence. He also appeared as a witness and was cross-examined by the parties. His expert opinion, as with the other expert witnesses, was provided to the Board entirely on the public record.

80

In his evidence Dr. Cannon concluded that there had been a substantial decline in the equity capital costs for the average-risk Canadian gas utility and for Ontario's major gas distributors since 1996.

According to Dr. Cannon, there is no evidence to suggest that the application of the Board's ROE formula methodology had resulted in allowed returns which had violated either the fair return or financial integrity standards of regulatory rate setting. 81

He also submitted that the decrease in ROE under the ROE Guidelines had been less than it would have been, applying the capital attraction standard of regulatory rate setting instead. 82

It was Dr. Cannon's view that an appropriate benchmark ROE for the average-risk Canadian energy utility now lies in the range of 7.5% to 7.9%, lower than the ROE that would currently be produced under the ROE Guidelines. Dr. Cannon's benchmark ROE recommendation is based primarily on results from using the three equity return tests that Ms. McShane used. In using those tests, he applied different judgment and reached different conclusions than Ms. McShane did. 83

Using his ERP test, Dr. Cannon concluded that an appropriate ROE would be in the range of 6.35-6.55% for the average-risk Canadian energy utility, based on a mid-June estimate of 4.00% for the yield on a truly riskless long-term Canadian asset and a corresponding "all-in ERP" in the 2.35-2.55% range. His utility ERP test findings reflected the substantial decline in the prospective market risk premium in recent years as well as the continuing low relative investment riskiness of the typical energy utility. 84

Applying the DCF test to a sample of Canadian energy utilities produced a benchmark ROE in the range of 7.9% to 8.5%. 85

The CE test, using data for Canadian industrials over the 1991-2002 period produced an ROE of 10.2% for Dr. Cannon. 86

To arrive at his final recommendation for a benchmark ROE, Dr. Cannon applied different weights to his three test results than Ms. McShane. Dr. Cannon weighted his results from the three tests as follows: ERP - 60%, DCF - 15%, and CE - 25%. 87

Dr. Cannon's ROE recommendation reflected an "all-in benchmark ERP" of 2.93% above the long-term Government of Canada bond yields prevailing in mid-June. 88

With respect to the adjustment formula, Dr. Cannon proposed that the adjustment factor applied to changes in the forecast long-term Government of Canada bond yields be reduced to 70%, from the current 75% value. He based this on his view of the sensitivity of his equity return tests to changes in the long-term Government of Canada bond yields and his weighting of the three tests. 89

Dr. Cannon concluded that, all other things being equal, the ROE numbers produced by the ROE Guidelines in recent years are likely too high. 90

LPMA 91

LPMA did not rely on the evidence of any particular expert as, in its opinion, the analysis of any 92 one expert did not produce a definitive estimate of a fair return. Instead, LPMA gave equal weight to the results of the work done by Ms. McShane, Dr. Cannon and Drs. Booth and Berkowitz, with one exception. LPMA argued that zero weight should be given to Ms. McShane's CE test because, in the view of LPMA, the market risk premium was overstated.

LPMA's final recommendation for a new benchmark ROE was 8.96% based on giving equal weight 93 to the three expert's evidence, removing the CE test, applying a market risk premium of 325 basis points, and averaging the three ERP estimates produced by Ms. McShane, Dr. Cannon and Drs. Booth and Berkowitz.

LPMA submitted that the CE test should not be relied on because of the difficulty in assembling an 94 acceptable sample of comparable companies against which to assess the regulated utility. First, LPMA noted that both Dr. Cannon and Ms. McShane selected comparable industrials yet the results were 300 basis points apart. Second, there had been debate regarding the appropriate earnings to use and widespread concern regarding corporate reporting which placed the accuracy of the information in doubt. Third, the American returns were not suitable comparators as the American economy was generally more competitive resulting in higher risks and consequently higher returns. Fourth, LPMA noted that Canadian regulators often gave little or no weight to the CE test.

School Boards 95

School Boards also did not call any evidence. School Boards recommended that the Board approve 96 an ROE of 9.0% for EGDI, assuming a risk-free rate of 5.4%.

With respect to Union Gas, School Boards believed that there was no evidence to suggest that Union 97 Gas was any riskier that EGDI. The premium paid by Duke when it acquired Union suggested that Union was not as risky as Ms. McShane or Dr. Cannon believed. Further, the fact that the two utilities are at the same deemed equity ratio implied that they could be considered to be at the same risk level. Therefore, School Boards submitted that the Board should approve an ROE of 9.0% for Union Gas as well.

School Boards noted that the debate of the experts demonstrated that the same underpinning numbers 98 could produce different results. Therefore the expert evidence was suspect, as all of the experts chose and manipulated data in ways that limited the objectivity of their conclusions. The School Boards argued that, given this uncertainty among experts regarding the appropriate ROE tests, greater weight should be placed on evidence other than that of the experts.

School Boards' position was therefore not tied to that of the experts. Instead it proposed a different 99 approach. School Boards proposed five tests to arrive at its 9.0% ROE recommendation.

The first test, named the “mind experiment”, consisted of arriving at a number representing the intersection of the experts’ broadest ranges of ROE. 100

The second test, using the Seigel Tables, implied a long term market return for utilities of 7.56% to 7.74% if compound returns were used. If arithmetic mean returns were used, then the resulting ROE would be in the range of 8.46% to 8.72%. 101

The third test, based on expectations of pension funds, suggested that utility ROE should be no more than 8.5%. 102

The fourth test, the premium paid by Duke, Union’s parent company, demonstrated that the current ROE resulting from the formula was somewhat high. According to School Boards, assuming that the current ROE was too high by 50 basis points, the resulting ROE would be 8.76 for EGD and 8.91% for Union Gas. 103

The fifth test, a simple average of the experts’ recommendations, resulted in an ROE of 9.05%. 104

Combining these five approaches led School Boards to recommend a new benchmark ROE of 9.0% for both Applicants. 105

With respect to the adjustment mechanism, the School Boards supported the proposal of the Applicants to adjust the ROE annually by 50% of the change in the forecast long-term Government of Canada bond yields. 106

Energy Probe 107

Energy Probe also did not rely on the evidence of any particular expert. It submitted that there was no need to make any changes to the ROE Guidelines and that the ROE Guidelines should be re-affirmed to signal stability and predictability in Ontario’s natural gas environment. 108

Energy Probe submitted that there was no evidence that the Applicants had suffered any capital shortage under the current ROE Guidelines. In fact, the formula seemed to provide adequate consideration of costs related to maintaining access to capital markets. Furthermore, it was not necessary to make changes to the ROE formula to address changes to business and financial risk because other mechanisms, such as deferral accounts, were available to the Board for this purpose. 109

Energy Probe suggested that the actual financial performance of utilities demonstrated that they were low risk enterprises and that the argument for any alteration to the ROE formula was weak. Energy Probe noted that over the last decade, both utilities had consistently outperformed the Board allowed ROE. 110

Pollution Probe 111

Pollution Probe did not address the issue of the appropriate ROE formula. Rather it requested that the Board permit the Applicants to earn an additional ROE, over and above what the ROE Guidelines would produce, as an incentive to aggressively promote cost effective energy conservation and efficiency. 112

4 BOARD FINDINGS 113

The Board's ROE Guidelines suggest that there are two reasons which would justify a review of the formula. The first justification would be significant changes in market conditions. The second justification would be significant changes in the utility risk. The Applicants have based their request for a review on their assertion that there have been significant changes in the capital markets. There is no claim that the utility risk per se has increased. The Board recognizes that the ROE Guidelines are not binding and that it is always open to a party to propose a new approach. The Applicants have made such a proposal and the Board has considered on its merits. 114

The first issue for the Board is whether the adjustment mechanism contained in the current ROE Guidelines produces a prospective return on common equity that continues to be appropriate. The formula in the current guidelines produces an ROE of 9.71% for Enbridge and 9.86% for Union at a long-term Government of Canada bond yield of 6.00%. This reflects a risk premium of 371 basis points for Enbridge and 386 basis points for Union. At a long-term Government of Canada bond yield of 6.00%, the Applicants are asking the Board to set a new benchmark ROE of 11.50% for Enbridge and 11.65% for Union. This proposal reflects an increase in the risk premium to 550 basis points for Enbridge and 565 basis points for Union. They are asking the Board to move from sole reliance on the equity risk premium (ERP) test, as set out in the ROE Guidelines, to weighted reliance on three tests described in Ms. McShane's evidence: the ERP test (37.5%), the discounted cash flow (DCF) test (37.5%) and the comparable earnings (CE) test (25%). 115

The second issue for the Board is the Applicants request, based on Ms. McShane's evidence, for a change to the annual adjustment formula, so that in each succeeding year, the ROE is adjusted by 50% of the change in the forecast yield for long-term Government of Canada bonds, rather than the 75% required by the ROE Guidelines. However, this request was contingent upon the outcome of the first issue. 116

The third issue for the Board is the request by the Applicants, based on Ms. McShane's evidence, that the factor representing the yield spread between the 10 and 30 year Government of Canada bonds be fixed, rather than being calculated annually. Dr. Cannon makes the same suggestion, although he recommends a lower spread than Ms. McShane. 117

First, we will deal with the primary issue of whether a new benchmark ROE should be established for EGDI and Union. 118

In approving or fixing rates, the Board derives its jurisdiction from section 36 of the Act. Pursuant to that section, the Applicants can only charge rates for the distribution of gas with the approval of the Board. The burden of proof to demonstrate that the rates applied for are just and reasonable lies with the Applicants. The setting of just and reasonable rates involves the balancing of the interests of the Applicants, on the one hand, and the ratepayers, on the other hand. Rates will be just and reasonable when the ratepayers are paying a fair price for the distribution services that they receive and the Applicants have an opportunity to earn a fair return on their invested capital. Allowance for 119 a prospective fair return on common equity is therefore a component of establishing just and reasonable rates.

120

Section 36 (3) of the Act provides that the Board can adopt any method or technique for the setting of rates that it deems appropriate. The method to be adopted is at the Board's discretion, which the Applicants, the expert witnesses and other parties acknowledge. Currently, for the purpose of establishing the ROE for a utility, the Board uses a formula based approach, as set out in the ROE Guidelines, based on the ERP test. The institution of this formula and its application dates back to 1997. None of the parties have proposed that the Board should move away from a formula based approach. We are of the view that it is appropriate to continue with a formula based approach because it provides a significant degree of predictability and is compatible with both cost of service and performance-based regulation.

121

A great deal was made in the hearing by Ms. McShane and the Applicants about comparisons with American utilities and returns awarded by other Canadian jurisdictions. The Applicants argue that the returns of American utilities are higher and that this supports the need for higher returns for the Applicants. They also cite decisions by certain Canadian regulators in support of higher returns. Yet, they also argue that the Board should not be influenced by the unfavourable decisions for recalibrating the existing formula by certain other Canadian regulators, on the basis that this Board should lead rather than follow. Also, they state that the Board must consider the applications on their own merits.

122

Discussions of ROE decisions from other jurisdictions invariably come into the evidence and arguments of parties. We continue to view such evidence as informative. However, we do not believe that decisions in other jurisdictions are determinative of what ought to be a prospective fair ROE for Ontario utilities. There are many reasons why ROE may differ from one jurisdiction to another in North America. These may include differences in legislation, timing, tax laws, accounting practices, risk considerations arising from different capital structures and from regulatory practices which may or may not shield the utility from business or weather risks, and other regulatory considerations unique to each jurisdiction, including varying reliance on the common tests for determining a fair ROE. There was no evidence that would allow the Board to make a meaningful comparison of these factors, including the relative riskiness of Canadian and American utilities, in order to understand the difference in ROE between American and Canadian utilities. The bare fact that American utilities might earn a higher ROE than Canadian utilities, as suggested by Ms. McShane and argued by the Applicants, is an inadequate basis upon which to determine whether the ROE for the Applicants should be increased to a level similar to the ROE for American utilities. Similarly, the fact that some Canadian regulators may have awarded higher or lower returns than the Ontario Energy Board, while informative, is not determinative for largely the same reasons.

123

Ms. McShane suggested that the difference in ROE between American and Canadian utilities was a factor that could create a disadvantage for Canadian utilities and their shareholders. However, we find no evidence to suggest that such a disadvantage currently exists or is likely. Mr. Case suggests that Union, for example, must now compete for equity capital with the other global subsidiaries of Duke Energy, Union's parent; if Union cannot offer a competitive return with the other units, capital might be more difficult to obtain from the parent company. There was no evidence before the Board to suggest that the Applicants are experiencing any difficulty in raising equity capital from or through their respective parents.

A long standing regulatory principle espoused by the Ontario Energy Board, and by other regulators in North America, is the stand-alone principle. Applying this principle, the issue is what ought to be a prospective fair return on investment for a utility on a stand-alone basis, and not how a prospective return may compare or compete with other business units of the parent company. Should it be the case that the Ontario gas utilities are unable to attract equity capital by virtue of competition at the parent company level, whether the parent company is foreign or domestic, this would be of great concern to the Board. 124

There was no evidence before the Board to suggest that Canadian utilities in general were experiencing difficulty in raising capital, or doing so at unreasonable terms. Mr. Case mentioned that BC Gas had difficulty raising equity; the equity issue “sat on the shelf” until the dealers were willing to discount it. Dr. Booth countered this point by explaining that the reason that the equity issue sat on the shelf was due to the fact that there was a bidding war amongst investment dealers due to a shortage of such deals at that time. The winning dealer paid a premium for the equity issue in order to secure the underwriting fees. Dr. Booth suggested that this example was in fact a demonstration of how easily a utility could raise capital. 125

Mr. Case pointed to the recent sale of a Canadian pipeline utility by Aquila Inc. as an example of an investor unwilling to invest in Canada. However, the evidence revealed that Aquila was able to sell its pipeline utility to Fortis Inc. at a considerable premium, which would suggest that there are investors willing to invest in Canadian utilities. There was no evidence that Aquila Inc. sold its utility because of concern of the ROE earned by that utility. In fact, the evidence reveals that utility ownership transfers in recent history have taken place at above book value. While there may be many reasons that a company may be willing to pay more than book value for utility assets, there was no evidence to suggest that investors are deterred from investing in Canadian utilities because of inadequate prospective returns. 126

We found no evidence of the Applicants being in financial hardship as a result of the authorized ROE. The Applicants confirmed that they continue to be responsible for raising their own debt capital. There was no evidence, for example, that the allowed ROE has resulted in inadequate financial ratios to preclude raising debt capital on reasonable terms. Similarly, there was no evidence before the Board to suggest that credit ratings of the Applicants were deteriorating. The evidence is that the Applicants enjoy favourable credit ratings. In fact, Union’s credit rating is more favourable than its parent company. 127

Mr. Case made references to changes in the business risk faced by the Applicants, but that issue was not before the Board. The Applicants made their request for a change in ROE based on the capital markets and not on any financial or business risk that they were facing. Ms. McShane confirmed in responding to questions that business and other risks covered by the equity component of capital structure were not matters at issue in this hearing. The Applicants did not dispute this testimony. 128

Having found no evidence of returns being inadequate so as to jeopardize the financial and operational aspects of Enbridge and Union, the issue then is whether the rate of return resulting from the equity risk premium test under the current ROE Guidelines is appropriate. 129

Three tests, and their variants, were employed or critiqued by the experts. All three witnesses had varying views with respect to the appropriateness of relying on the ERP test, the DCF test and the CE test. This was a large contributor to the differences between their recommendations. The other large contributor to the difference was the results arrived at by employing the same tests. The evidence of Ms. McShane, Dr. Booth and Dr. Cannon makes it clear that a great deal of judgment is involved in determining what is an appropriate ROE for a utility. Those three witnesses, along with Mr. Case, were looking at the same capital markets but came up with significantly different recommendations to the Board. However, Dr. Booth and Dr. Cannon also conceded that the current ROE Guidelines were still generally appropriate, despite their recommendations for a lower benchmark ROE. Ms. McShane was more categorical in her view that the ROE Guidelines were no longer producing a fair ROE and that a new benchmark ROE and adjustment formula were needed. 130

On the basis of the evidence adduced in this proceeding, we find that the reservations the Board expressed in the compendium to the current ROE Guidelines about the CE and DCF approaches and the Board's decision not to employ these tests remain valid. With respect to the CE test, we continue to be concerned with the problems associated with the assembling of an acceptable list of comparable companies against which to assess the regulated utility, as well as the selection of a suitable time period from which to draw historical evidence. We note that the subjectivity involved in the selection of an appropriate sample of comparators and the selection of the time period were the primary factors in arriving at an ROE difference of 300 basis points between Ms. McShane and Dr. Cannon. We also reiterate our concern with this test's heavy reliance on past performance as an indicator of future performance. 131

With respect to the DCF test, we note the sensitivity of the results to assumptions, including growth estimates. We note that as a result of different assumptions, Ms. McShane's ROE result from the DCF test is over 200 basis points higher than the results obtained by Dr. Booth and Dr. Cannon. Further, in the context of the specific applications before us, we remain uncomfortable with the results of the DCF test given that the shares of the Applicants are no longer traded on the open market. 132

As a result of the above, we reiterate the Board's conclusions reached when it developed the existing ROE Guidelines that the results from the CE and DCF tests should be given little or no weight for purposes of these applications. 133

We do not accept the suggestions by certain parties to use the approach of averaging the recommendations or to embark on tests that do not have theoretical foundation. Therefore for the purposes of this proceeding we will rely primarily on the results of the ERP test. Other than Mr. Case, all expert witnesses used this test. 134

There are four basic components to this test: a determination of the risk-free rate; a determination of the equity risk premium for the market as a whole; an adjustment (beta) to reflect the lower risk of utilities; and an allowance for financial flexibility or "cushion". Supplemental analysis to the basic ERP test was performed by Ms. McShane and Drs. Booth and Berkowitz. 135

No party has disputed the use of the long-term Government of Canada bond yield as the basis of the risk free rate, or the basis for its forecast as contained in the current ROE guidelines other than the 136 suggestion to fix the spread between the 10 and 30 year bond yields. Also, there was no dispute about the 50 basis points cushion. The disputes are around the determination of the market risk premium and the risk adjustment to reflect the lower risk for utilities.

Ms. McShane calculates a market risk premium of between 600 and 650 basis points. Dr. Booth calculates the premium at about 450 basis points and Dr. Cannon at about 350 basis points. The recommendations of a benchmark return under the basic ERP test of about 400 basis points for Ms. McShane, about 200 basis points for Dr. Booth, and about 160 basis points for Dr. Cannon reflect their choice of a relative risk adjustment of 0.60-0.65, 0.45-0.55, and 0.45, respectively. Adding the 50 basis points of cushion, the recommended benchmark equity risk premium under the basic test for Ms. McShane is 450 basis points, for Dr. Booth 250 basis, and for Dr. Cannon 210 basis points. 137

On the basis of the record adduced in this proceeding, we are of the view that Dr. Cannon’s result is too low and Ms. McShane’s too high. We find that the record reasonably supports a risk premium for the market as a whole between 500 and 550 basis points. We note from the evidence that the Alberta Energy and Utilities Board which recently reviewed similar data concluded that the market premium is 525 basis points. This is the mid-point of our 500 to 550 range. Using this mid-point figure, and without any modifications to Ms. McShane’s recommended risk adjustment, one would obtain an overall equity risk premium of about 375 basis points, inclusive of the 50 basis points cushion. These equity risk premiums compare with 371 basis points for Enbridge and 386 basis points for Union under the current ROE Guidelines. Ms. McShane’s recommended risk adjustment is higher than the other experts. A lower risk adjustment than that recommended by Ms. McShane would result in the equity risk premium under the current formula being favourable to the Applicants. 138

Ms. McShane used two other tests under the risk premium method, both utilizing utility data only. The first was the DCF based equity risk premium test, which produced an equity risk premium of 460 to 470 basis points. For the reasons outlined in the discussion of the DCF approach above, and our observation that the results indicate a much higher equity risk premium than the basic test produces, we place little or no weight on these results. 139

The second is a historic test, using data from both Canadian and American utilities. This test produced an equity risk premium of 475 to 500 basis points. We similarly place little or no weight on these results. We are not comfortable with the circularity that is inherent using regulated utility data, and the inclusion of American utilities which may bias the results without a thorough understanding of the justification for the higher returns of these utilities. 140

We conclude that not only does the equity risk premium formula approach not lead to perverse results, but that the results it currently provides continue to represent fair and reasonable returns. If we had to set a new benchmark rate of return based on the ERP evidence in this proceeding, this rate would not be materially different from that produced by applying the current formula. 141

Therefore, with respect to the first and primary issue of whether a new benchmark ROE should be established for EGDI and Union, we find that the current ROE Guidelines methodology continues to produce appropriate prospective results. We have not found any demonstrated need to set a new benchmark ROE. 142

Given this finding, the second issue, the Applicants' request for the annual ROE adjustment to be decreased to 0.50 from 0.75 of the change in the forecast yield for long-term Government of Canada bonds, is moot. 143

As for the third issue, the suggestion that the factor representing the yield spread between the 10 and 30 Government of Canada bonds be fixed rather than being calculated annually, the Board does not consider this to be of sufficient consequence, by itself, to justify a change to the existing guidelines. 144

Accordingly, based on the foregoing findings, the Board orders that the applications are dismissed. 145

In making this determination, the Board also considered the proposal put forward by Pollution Probe to increase ROE as an incentive to promote cost effective energy conservation and efficiency. The Board notes that the Applicants currently have demand side management programs in place that have already been ruled upon. This proceeding is focussed on whether conditions in the capital markets warrant a change to the Board's formula based approach to setting the ROE for the Applicants. The Board also notes that Pollution Probe and the Applicants are participating in a broad Board initiative that is examining energy conservation and efficiency. 146

The Board will issue a separate decision on cost awards. 147

DECISION WITH REASONS

September 20, 2006

BACKGROUND

Natural Resource Gas Limited ("NRG" or the "Applicant"), filed an application dated March 30, 2006 with the Ontario Energy Board under section 36 of the *Ontario Energy Board Act*, *1998,* S.O. c.15, for an Order or Orders approving or fixing just and reasonable rates and other charges for the sale, distribution, transmission and storage of gas for the 2007 fiscal year, commencing October 1, 2006.

NRG is a privately owned utility that sells and distributes natural gas within Southern Ontario. The utility supplies natural gas to Aylmer and surrounding areas to approximately 6,500 customers with its service territory stretching from south of the 401 to the shores of Lake Erie, from Port Bruce to Clear Creek. A color coded map showing NRG's franchise area appears in Schedule A of this decision.

The Board issued a Notice of Application, dated April 13, 2006. Only Union Gas Limited ("Union") and Integrated Grain Processors Co-operative (IGPC) intervened. On May 26, 2006, the Board issued Procedural Order No. 1, establishing the procedural schedule for all events up to and including the oral hearing, which was scheduled to commence on July 24, 2006. The Board also ordered a Public Forum to be held in Aylmer on July 18, 2006, to provide NRG ratepayers an opportunity to voice their concerns, seek information, comment or ask questions related to services provided by NRG. The Company was required to attend this event and respond to questions posed by ratepayers. A Draft Issues List was attached to the Procedural Order.

NRG in this application forecasts a revenue deficiency of $135,879 for the 2007 fiscal year. This will result in an annual increase of approximately $4 or one percent to a typical residential customer's annual distribution charge. A typical Commercial customer will see no change while a Rate 1 Industrial customer will see an annual increase of $380 or 11 percent. A typical Rate 2 seasonal customer will see an increase of $504 or 22 percent to their annual distribution charge.

For reasons which follow, the Board grants the requested relief in part. The adjustments to the requested costs are summarized in Schedule B.

THE PUBLIC FORUM

A Public Forum to allow NRG ratepayers to voice their concerns was held in Aylmer on July 18, 2006. NRG participated and was represented by Mr. Mark Bristoll, the Chairman of NRG. The Mayor of Aylmer participated and expressed his appreciation to the Board for holding the hearing within the local community. He did not consider NRG's requested rate increase inappropriate but was concerned about NRG's ability to serve large industrial customers.

Mr. Bristoll indicated that NRG had received a request for significant new industrial load by a proposed ethanol plant. The Mayor wanted NRG to explore the possibility of building a larger pipe than that required to serve the ethanol plant so as to create additional capacity for future customers.

The proposed ethanol plant in the town of Aylmer is an initiative of a 650-member co-operative of southern Ontario corn producers. The $90 million plant will have a production capacity of 150 million litres of ethanol per year and will employ 35 people. The plant is estimated to consume 220 gigajoules of natural gas an hour and could add 50 to 60 million cubic meters to NRG's throughput volume. This would triple NRG's current throughput.

The panel asked NRG to comment on the status of the proposed ethanol plant. NRG indicated that IGPC, the owner of the ethanol plant was in the process of completing environmental assessments and that NRG expects to make a "Leave to Construct" application in the near future. The Mayor expressed concern that construction may not proceed in time to meet the requirements of IGPC. The mayor indicated that the financing of the project was dependent on the availability of required quantities of natural gas to the proposed plant in a timely manner. NRG promised full co-operation and stated that it is a community-based utility dedicated to its growth. Mr. Bristoll continued that NRG would be applying to the Board for the necessary "Leave to Construct" once negotiations with IGPC were completed.

Other issues brought forward by local residents included the difference in rates between Union and NRG, delays in switching to gas marketers and safety issues with respect to installing water heaters.

Some residents complained that NRG's rates were higher than Union's and provided recent bills to demonstrate their point. NRG responded that its average consumption per customer is considerably less than Union's. This was true across the different categories of customers and this resulted in higher operating costs per customer. In addition, NRG noted that its system was newer than Union's and therefore the capital cost for each cubic meter of gas was higher.

One customer expressed her frustration over the fact that her account has still not been moved to a gas marketer. The Company agreed that they have been slow and promised to switch all contracts within 60 days. NRG also provided a list of direct marketers that customers could switch to if they wish.

A safety concern was also brought to the attention of the Board by a customer of NRG. It was related to installation of rental hot water tanks and the customer claimed that NRG allowed self or private installation of hot water tanks. The Company disputed this claim and promised to investigate this particular incident that the customer brought to their attention.

NRG responded to customer concerns about difference in rates between Union and NRG at the oral hearing in Toronto and provided a detailed explanation. NRG's analysis indicated that its cost of providing gas to a residential customer is approximately 20% higher than a customer in Union's southern operations area and 8% higher than a customer in Union's eastern operations area. With respect to NRG's seasonal customers such as tobacco curing customers, the cost is 17% higher than for a similar Union customer.

The Company provided a number of reasons for the difference as outlined below:

- The volumes consumed by an average NRG customer are considerably less than the volumes consumed by an average Union customer. This is true for all classes of customers and essentially makes the NRG system a more costly system to operate.

- NRG has a higher return on equity as compared to Union.
- Union has embedded debt costs of 7.68% in its rates as compared to NRG's total debt cost of 8.45%.
- NRG has a relatively new rate base as compared to Union. This means that its meters, regulators and mains have not depreciated to the same extent as Union's. In other words, NRG is carrying a higher net book value in its rate base.
- NRG's franchise area is essentially rural with no urban centres while Union has large urban centres in its Southern Operations Zone including Hamilton, London and Windsor. This means that NRG has to put more pipes in the ground to get to the same number of customers. This is one of the reasons why Union's other operating areas that are sparsely populated reveal smaller differences in rates when compared to NRG.

Board Findings

The Board recognises and appreciates the concerns raised at the Public Forum by local residents and customers of NRG.

With respect to differences in rates between Union and NRG which was raised at the town hall meeting, the Board instructed NRG to provide an analysis. That analysis[1] explains the differences to the satisfaction of the Board. There are significant differences in operating costs which flow directly from the nature of the territory in which the two companies operate. Essentially NRG enjoys smaller economies of scale than Union. NRG also has newer plant and therefore higher level of capital costs including a higher level of equity and debt.

The Board is concerned about customer complaints that NRG delays moving customers from system gas to direct purchase. The Company has provided assurances to the Board that they are committed to completing the process within 60 days. The Board

[1] See transcript EB-2005-0544 volume 2, pages 103-108

urges any customers who experience difficulty switching their accounts to direct purchase to contact the Consumer Relations Centre of the Ontario Energy Board.

With respect to the new ethanol plant, the Board recognises that this is a major opportunity for both NRG and the town of Aylmer. The Board urges NRG to co-operate with the town and IGPC to the maximum extent possible, in order to ensure that negotiations proceed in an efficient and timely manner. The Board orders NRG to provide a monthly update to the Board on the status of its pending “Leave to Construct” application with respect to the proposed ethanol plant.

The Board further directs NRG to consider the economic feasibility of adding a larger pipeline than that required to accommodate volumes associated with the proposed ethanol plant. The mayor has indicated that this will help attract additional industries and mitigate the local impacts caused by falling tobacco production and the closing of the Imperial Tobacco plant in Aylmer. NRG should look into the possibility of adding additional capacity as long as it does not cause undue burden on existing rate classes or significant cost overruns for NRG and IGPC. Such a study must be filed with the “Leave to Construct” application.

RATE BASE

NRG's updated evidence indicates that its rate base will amount to $9,693,286 in 2007. This is $234,154 more than 2006 forecast and $421,792 more than the previous Board Approved level for the 2005 Test Year. The increase is the result of a $204,084 increase in capital expenditures and an increase of $30,070 in the working capital allowance.

NRG's forecast for capital expenditures is estimated to be $965,207 in 2006 and $867,657 in 2007. NRG is forecasting 44 fewer Rate 2 seasonal customers in 2006 and a further reduction of 27 customers in 2007. This is the result of a recent announcement of a 35% reduction in tobacco quota volumes by the Ontario Flue-Cured Tobacco Growers' Marketing Board[2]. NRG has correspondingly cancelled all capital projects related to Rate 2 customers. This translates to four projects in 2006 and two projects in 2007.

During cross-examination Board staff attempted to determine whether the excess capacity generated from the loss of Rate 2 customers could be used to offset NRG's proposed reinforcement project identified as the Nova Scotia Line. The concern arose from the fact that the benefit/cost ratio of this project is less than one.

The Company indicated that although the loss of Rate 2 volumes may result in some overcapacity, it is not in the appropriate area within NRG's franchise for it to be used for system reinforcement. Although the Nova Scotia Line has a benefit/cost ratio of less than one, NRG indicated that it will not be collecting aid from any customers as it was not possible to identify the customers at this point in time.

With respect to a justification for this project, the Company reiterated its explanation provided in Information Request (IR) No. 6 that the Nova Scotia Line will provide a second feed to the villages of Copenhagen and Port Bruce, as indicated in the colour coded map in Schedule A. In other words, if there was a supply disruption affecting one

[2] The Ontario Flue-Cured Tobacco Growers Marketing Board is a provincial marketing board that operates under the authority of the Farm Products Marketing Act, and the supervision of the Farm Products Marketing Commission. The Board's mandate is the control the production and marketing of all flue-cured tobaccos grown in the province of Ontario. It represents approximately 800 tobacco families plus approximately 150 sharegrowers. For more information, visit www.ontarioflue-cured.com

of the pipelines, the second line could take over providing reinforcement and security of supply. The Company also believes there is a potential to add 48 new residential customers as a result of this expansion with a further possibility of adding one commercial and two industrial customers beyond five years. However, the company indicated that it had not included projections beyond the five-year period in the economic analysis submitted in this application.

Another issue raised by Board staff was related to main additions projects that have been completed to-date in 2006. With less than three months remaining in NRG's 2006 fiscal year-end (September 30, 2006), only $34,358 out of a total of $162,882 has been spent to-date. The Company's testimony indicated that the completion of these projects required 970 man hours. Similarly, main additions for 2007 are estimated to be $232,585 and Board staff's position was that the forecast is overly optimistic. Despite cancellation of some main additions projects, the Company expressed confidence in completing the rest of them. The Company explained that capital expenditures were not added to rate base until the line went into service.

Board staff was also concerned about the substantial rise in the cost of meters for 2006. The Company indicated that a majority of the cost comprised the purchase of a Supervisory Control and Data Acquisition System (SCADA). This system would allow NRG to control the pressure from a central location as opposed to manually adjusting the meters. The balance of the costs was attributed to a new electronic metering system that would allow NRG to read meters remotely. The cost also included a new radio network capable of picking up the electronic signals. The company expected to connect 12 large customers to this new electronic metering system.

Board staff requested the company to clarify why the cost of meters and regulators did not fall in 2006 and 2007 given that a number of main additions projects had been cancelled as indicated in the updated evidence. The company responded in an undertaking that its original estimate for meters and regulators did not include requirements for tobacco loads because it had some meters in its inventory and furthermore it expected that some tobacco customers would terminate service and this would free up meters and regulators that could be re-used.

There was considerable debate on the cost of replacing the company's vehicle fleet. Board staff questioned the justification for replacing a cargo van that is expected to have only 100,000 km on it by the end of fiscal 2007. The targeted replacement cost of all five vehicles during the 2007 test year is $188,000. The Company argued in response that while the mileage on this particular van was relatively low, it was subject to more abuse than other vehicles.

Board Findings

NRG in this application has requested that the Board allow capital expenditures totalling $867,657. These are down from the levels experienced in the previous year. Given the significant reduction in tobacco quotas in the NRG service territory, the Board finds these costs to be reasonable and acceptable.

With respect to the cost of replacing the vehicle fleet, the Board approves the costs with the exception of the one van (2005 Chevrolet Cargo Van). Accordingly, the Board approves a cost of $150,000 ($188,000 - $38,000) for this purpose. The Board does note the subjective nature of NRG's vehicle replacement criteria and the absence of a formal policy in this respect. The Board accordingly directs NRG to develop a written policy for vehicle acquisition, disposition and replacement prior to the next rate case application.

OPERATING REVENUE

NRG's total operating revenue is divided into two components – gas distribution and transportation revenue, and other operating revenue (net.). This latter category is made up of the rental equipment program, contract work program, service work program, merchandise sales, direct purchase fees, delayed payment charges and transfer/connect charges.

NRG's updated evidence indicates that its operating revenue will amount to $4,570,085 in 2007. This is $107,859 more than 2006 forecast and $105,488 more than the previous Board Approved level for the 2005 Test Year. The increase in operating revenue is associated with the forecast of 325 additional customers (net) in 2006 and 367 customers (net) in 2007[3].

Gas distribution and transportation revenue totals $3,889,059 or 85.1% of total revenues. Other operating revenues (net) accounts for the remaining revenue of $681,026. Total customers forecasted for the fiscal 2007 test year is 6,872 with an associated throughput volume of 23,566,141 cubic meters.

NRG's forecast for operating revenue in 2006 and 2007 are lower than the original pre-filed evidence and is attributed to a forecasted loss of Rate 2 tobacco curing customers. NRG is forecasting 44 fewer Rate 2 seasonal customers in 2006 and a further reduction of 27 customers in 2007. This is the result of a recent announcement of a 35% reduction in tobacco quota volumes by the Ontario Flue-Cured Tobacco Growers' Marketing Board.

The original pre-filed evidence did not include volumes related to Imperial Tobacco because NRG forecasted the loss of that customer in fiscal 2007. However, a response to an Information Request[4] revealed that the customer could be in operation until mid to late calendar 2007. NRG's updated evidence indicated a volume forecast of 3,391,247 cubic meters for this customer through to the end of June 2007.

[3] Exhibit C1/Tab1/Schedule 4 Updated Evidence
[4] Board staff IR Number 8

Board staff questioned NRG’s residential additions forecast for fiscal 2006 and argued that NRG’s prediction of 353 new residential customers in 2006 seemed to be very optimistic.

As of June 2006, NRG added 200 new residential customers. Data from the last ten years for additions by month suggests that NRG may end up adding another 25 to 30 customers by the end of the 2006 fiscal year (September 30, 2006). Board staff added that in order to meet its forecast figure of 353, NRG required the addition of approximately two customers per day till the end of September 2006.

NRG insisted that the forecast was appropriate and with the help of an aggressive advertising and marketing campaign, they were confident that the forecasted figure of 353 new residential customers was realistic. Given that NRG’s current penetration rate of 70% on its distribution system is relatively low compared to other utilities, NRG believes there are significant opportunities to grow volumes and customers.

Board staff also questioned NRG’s forecast that indicated a loss of 44 Rate 2 customers in 2006 as well as the methodology used to determine that forecast. NRG indicated that it drove by every farm that it had an account with to determine whether they had tobacco in their fields. The resulting number was validated against a 35% reduction in customers corresponding to the 35% reduction in quota. The numbers from the two methodologies were fairly close and the lower number of 77 was used in the application. For 2007, the 2006 number was simply reduced by 35% yielding a total of 50 customers.

With regard to the proposed ethanol plant, Board Staff sought clarification on the impact that the ethanol plant would have on NRG’s throughput and distribution system. NRG indicated that its throughput volume would triple due to the significant demand of natural gas the ethanol plant would require. NRG’s forecasted load for 2007 is 23.5 million cubic metres and this would increase to 70-80 million cubic metres with the inclusion of the ethanol plant. The existing system in not capable of handling this load for two reasons: (i) the volumes are significantly larger and require a separate feed from the Union Gas system, and (ii) the plant requires a higher delivery pressure than NRG can currently provide.

The panel questioned why NRG was cautious about gaining the ethanol plant as a customer. NRG indicated that the project requires a significant outlay of capital of approximately five million dollars. In addition, the costs that NRG pays to Union Gas under the M9 delivery contract would essentially double as the peak demand would double with the ethanol plant. Moreover, addition of the pipeline would increase NRG's rate base to more than ten million dollars, making NRG ineligible for the capital tax exemption. In addition, property taxes on 31 kilometres of a high-value pipeline would be substantial.

The Board also questioned NRG on how it would be impacted if the tobacco industry disappeared in its entirety in its service territory. NRG indicated that this would lead to $200,000 in costs that would need to be allocated to other rate classes. NRG did not have any contingency plans in place to address this possibility.

In the closing statement, Board staff reiterated their position that the residential customer addition forecast for 2006 and 2007 was too ambitious and this was also reflected in the volume forecast. NRG's reply argument stressed the aggressive advertising and marketing campaign and considered this program crucial to the company's efforts to mitigate the revenue loss from tobacco customers.

Board Findings

The Board accepts NRG's 2007 forecasted total throughput volume and operating revenue of 23,566,141 cubic meters and $4,570,085, respectively.

The Board notes the optimistic forecast with respect to residential customer additions in 2006 and 2007, but accepts NRG's explanation that an aggressive advertising and marketing program will help meet forecasts. The Board also accepts NRG's 2007 forecasted customer numbers of 6,872.

The Board is concerned about the significant reduction in the 2006 tobacco quota and its impact on NRG's tobacco curing customers. NRG has forecasted a further drop of 35% in the tobacco quota resulting in a loss of 27 customers in 2007. The Board acknowledges that the loss of 71 customers in 2006 and 2007 will lead to a significant erosion of this rate class. The Board is also concerned about the lack of data for the 2007 test year with respect to the tobacco quota. Recognising that there is a further risk to this rate class, the Board accepts NRG's forecasted Rate 2 volumes and numbers, but at the same time directs NRG to consider developing a contingency plan to address possible reduction in volumes as well as a potential loss of the entire rate class.

COST OF SERVICE

NRG's cost of service forecast for the 2007 test year totals $3,770,275. Operation and Maintenance costs total $2,149,572 or approximately 57.0% of the total cost of service. Depreciation and amortization totals $731,597 or 19.4% of the cost of service. Property, capital and income taxes account for $440,669 or 11.7% of the cost of service. Gas transportation costs account for the remaining $448,437 or 11.9% of the cost of service.

Net wages and benefits account for approximately 45% of the total Operating and Maintenance costs. A list of some of the important cost items together with a comparison to the 2005 level of costs appears below:

O & M Costs	2005[5]	2007[6]
Wages	801,900	911,623
Employee Benefits	120,800	132,997
Insurance	265,000	273,911
Advertising	22,000	74,861
Telephone	41,500	33,758
Repair & Maintenance	159,600	149,316
Automotive	54,500	99,551
Regulatory	108,500	193,700

Board staff examined a number of areas including unaccounted for gas, gas transportation costs, automotive expenses, regulatory costs, bad debt expenses, advertising costs and the cost of gas.

NRG has requested modification of the methodology used to account for unaccounted for gas. NRG's methodology uses a 3-2-1 weighting of the unaccounted for gas for the last three years. This is a Board-approved methodology and similar to the one used by Union Gas. The Company is seeking approval to use the same methodology but

5 Board Approved amounts (RP-2004-0167)
6 Updated Evidence, Exhibit D1/Tab3/Schedule2/Pg.1

subjecting it to a floor of zero percent. The current methodology does not have a floor limit.

Board staff argued that NRG has reported gas gains in two out of the three previous years, namely 2003 and 2005. NRG argued that a majority of the gas gain is due to NRG's fiscal year end being September when tobacco volumes are at their highest. This can result in significant swings in unbilled volumes as a result of a difference in billing cycle versus the calendar month. NRG also confirmed that it is more of a volumetric issue than an accounting one. NRG indicated that there is no adverse impact on customers. Even if the floor was set at a gas gain of 0.2%, the net impact after tax would be a negligible decrease of $223.

Board staff questioned NRG's proposed automotive expenses of $99,551 which included repair and maintenance costs of $18,735. There was no evidence why repair and maintenance costs were increasing when the company proposed to replace five vehicles in 2007. In response to an undertaking, NRG explained that part of the $18,735 includes expenses related to equipping the new vehicles with accessories such as racks and shelving.

NRG's pre-filed evidence indicated regulatory costs of $192,700 of which $131,700 relate to the 2007 cost of service hearing. In response to a Board staff IR, NRG indicated that it intended to file the next rates case in December 2007. This has since been changed to December 2006. Board staff questioned the rationale for this change considering that NRG submitted a report as per Board's direction in RP-2004-0167 supporting a multi-year rate filing. NRG was of the view that the proposed ethanol plant would result in a significant change in its rate base and operations warranting a cost of service application. However, NRG indicated that it did not wish to wait until the end of the year to file, in effect delaying the current application, for the simple reason that there was some uncertainty around the construction of the ethanol plant.

Board staff questioned NRG on the possibility of a rise in collection and bad debt related costs as a result of an expected loss of Rate 2 customers in 2006 and 2007. NRG indicated that it did not foresee a rise in collection related and bad debt expenses.

Board staff specifically focussed on the proposed advertising expenditures of NRG. The cash rebate program forms a major part of NRG's proposed advertising budget and is estimated to cost $198,250 in 2007. NRG planned to amortise the cost over an eight-year period. The program is intended for residential customers who convert an appliance from an alternative fuel to natural gas. These customers would receive a rebate for the natural gas equipment that they purchased or rented as an incentive to convert to natural gas. For example, a person converting to a natural gas furnace would receive a one-time rebate of $450.

During cross-examination, NRG confirmed that although the ancillary business sold furnaces, water heaters and appliances, none of the advertising expenditures were allocated to the non-regulated portion of the business. NRG argued that the goal of the rebate was to increase throughput and the rebate was distributed irrespective of where the customer purchased the gas fired appliance. However, NRG did agree that majority of the sales or rentals were going through them. Board staff maintained that the ancillary business should bear some of the advertising costs as they derive some benefit from the program. It is fair to assume that fewer people would purchase or rent appliances from NRG without the existence of this program.

The forecast of customer additions was also questioned. NRG forecasted the addition of 353 residential customers in 2006. To-date NRG has added approximately 200 customers and based on historical statistics is likely to add another 25 by the end of the fiscal year. Board staff expressed concern about the numbers and the likelihood of NRG adding another 150 customers by the end of September.

Board staff also questioned the rationale for selecting an eight-year amortization period for the cash rebate program. In reply NRG indicated that the eight year period represented the approximate time to recover the rebate amount in rates from the customer. The net benefit of the program was greater than one beyond eight years.

Another program that NRG planned to introduce was the lead pay program. This is an incentive tool for employees to encourage conversion to natural gas. During cross-examination, NRG explained that the $10 lead fee would be paid only if it resulted in the conversion of an appliance. This program is estimated to cost $6,000 in 2007.

Finally, Board staff examined the gas purchases from NRG Corp., a related company. Board staff was concerned that the contract price in 2006 was substantially higher than the forecasted average price for the year. NRG clarified that the contracted price was determined by calculating the one-year forward strip over the last ten business days of September 2005. Board staff presented an Exhibit “Canadian Natural Gas Focus (October 2005)” that showed the NYMEX 12-month forward price in September. This price was significantly different from the one NRG used in its contract. NRG presented its own evidence, a document titled, “The Source Report” from which NRG determined the price. Board staff expressed satisfaction with the source and the methodology to calculate the price so long as the source and the methodology used were consistent going forward.

In final argument Board staff expressed concern with the forecasted customer additions and the rationale for spending almost ten times the amount for marketing and advertising as compared to past periods. The second issue dealt with the allocation of these advertising expenses. Board staff did not agree with the allocation of 100% of advertising expenses to the regulated side of the business when the ancillary business derives additional sales and profits from this program. Citing the example of the water heater grants program that was allocated 100% to the ancillary business, Board staff questioned if the current program was radically different. Board staff recommended allocating some portion of the proposed advertising and marketing expenses to the ancillary portion of the business.

In its reply argument NRG stressed that all ratepayers across all rate classes would benefit from the marketing campaign as a result of additional throughput. Moreover, there are occasions when the ancillary business does not benefit from the rebate programs. Customers were eligible for rebates even if they purchased their equipment elsewhere. In other words, the ancillary business may not derive all the benefits that Board staff claimed. NRG also confirmed the success of their marketing programs to-date and expressed confidence in meeting their targets.

Board Findings

The Board approves NRG's request for setting the floor of 0.0% for the test year. NRG has recorded gas gains in only 4 of the last 24 years and as tobacco volumes fall, further swings in unbilled volumes are likely to decline.

The Board understands the challenges faced by NRG with respect to serving the ethanol plant and the significant impact this potential customer will have on its cost structure and rates. The Board supports NRG's rationale for filing a cost of service application in December. However, NRG needs to recognize the cost consequences of frequent regulatory filings on its small customer base.

The cash rebate program forms a significant portion of NRG's proposed advertising expenditures. The Board is concerned about NRG meeting its target with respect to customer additions and the overall benefit of this program. However, NRG is confident of meeting this target and the Board accepts this assurance.

It is evident that the cash rebate program will provide some benefit to the ancillary business. The ancillary business is making profits and according to testimony of NRG, the percentage of profit is similar to the regulated portion of the business. The Board directs NRG to allocate a portion of the advertising expenditures for programs that involve selling or renting gas appliances, namely the cash rebate program and the lead pay program, between the ancillary and regulated businesses according to revenues. Accordingly, 85% of program costs will be borne by the regulated business and the balance, 15%, by the ancillary business.

The evidence also discloses an inconsistency between the number of appliances that are likely to be sold or rented under the cash rebate program and the lead fee that will be paid to employees for a successful conversion. The evidence indicates that NRG is likely to convert 201 appliances from other fuel sources to natural gas. In addition to paying a cash rebate for each conversion as discussed previously, the company could also be paying sales people a $10 lead fee for every conversion secured through them. The cost estimate for this expense in the application is $6,000 which would suggest 600 leads. The inconsistency stems from the fact that all customers acquired as a result of leads would be made aware of the cash rebates available and therefore would not be able to exceed the numbers projected for the cash rebate program. Accordingly, it seems appropriate to adjust the cost of the lead pay program from $6,000 to $2,010 based on a maximum of 201 conversions. The Board accepts NRG's rationale for amortizing the costs of the cash rebate program over an eight-year period.

The Board accepts NRG's methodology to calculate natural gas prices associated with purchasing gas from the related company. However, the Board directs NRG to seek prior permission should it decide to change either the source from which prices are calculated or the methodology used to determine the contract price.

CAPITAL STRUCTURE AND COST OF CAPITAL

NRG's proposed capital structure and cost of capital for the 2007 Test Year is detailed below:

Capital Structure – Cost of Capital[7]
2007 Test Year

	Capital Structure ($'s)	Ratios (%)	Cost Rate (%)	Return Component (%)
Long-term debt	6,406,924	66.10%	8.45%	5.58%
Short-Term Debt				
Operating Loan	0	0.00%	6.00%	0.00%
Unfunded Debt	(106,288)	-1.10%	6.00%	-0.07%
Common Equity	3,392,650	35.00%	10.20%	3.57%
Total	9,693,286	100.00%		9.08%

The main differences between the 2005 Test Year Board-approved Capital Structure and Cost of Capital, and NRG's proposal for 2007 are as follows:

- Equity ratio decreases from 50% to 35%
- Return on equity increases from 9.57% to 10.2%
- Long term debt ratio increases from 31.43 to 66.1%
- Long term debt rate increases from 8% to 8.45%
- Short term debt ratio decreases from 17.3% to a 1.1% credit
- Short term debt rate increases from 5.5% to 6%

[7] Exhibit 6, Tab 1, Schedule 1, Updated Evidence

Mr. Bristoll testified as the Company's witness on NRG's proposed capital structure and return on equity. Ms. Kathleen McShane, of Foster Associates Inc., testified as the Company's expert witness. The purpose of Ms. McShane's testimony was to evaluate the reasonableness of NRG's proposed capital structure and to determine the risk premium for the utility. Ms. McShane's analysis and evaluation, Opinion on Capital Structure and Equity Risk Premium for Natural Resource Gas[8] concluded that for the 2007 Test Year, a 35% common equity ratio is reasonable and recommended that a 150 basis point premium be added to the return on equity amount as calculated using the Board's Guidelines on a Formula-Based Return on Common Equity for Regulated Utilities.

During cross examination Board staff explored three issues: (1) the possibility that a range of equity ratios could be appropriate, (2) the factors leading to changes to NRG's equity ratio that the Board considered in previous decisions, and (3) the role risk has in determining capital structure and rate of return.

Ms. McShane agreed that there is a range of acceptable equity ratios. A ratio within the range of 35% to 55% would be reasonable for a specific utility, given the appropriate common equity return for the utility. In the witness's opinion, the Board in previous decisions had approved increases in NRG's deemed equity ratio because the actual ratio had reached 50% and a 50% equity was reasonable for the level of business risk that NRG faced. With regard to the changed circumstances that would prompt a 35% equity ratio, Ms. McShane indicated that the company had re-financed and raised new debt, thereby establishing an actual common equity ratio of approximately 35%; and that 35% is appropriate to use because it is the actual ratio.

Mr Bristoll's rationale for the change was that NRG had been prevented from issuing dividends (due to the Imperial Life Loan covenants) and that, given the low interest rates, the time was right to go to market to re-finance. He indicated that NRG cannot go to market repeatedly and noted that the new structure was good for ratepayers since it reduced NRG's revenue deficiency.

[8] Exhibit E2, Tab 1, Schedule 1

Ms. McShane stated that NRG's risks, and those relative to other gas distributors, had not changed appreciably. The witness confirmed that if there had been a significant increase or decrease in business risk, then that should be reflected in a capital structure or equity return change. With respect to NRG's comparative risk with Enbridge Gas Distribution Inc. (EGDI), the witness concurred with the proposition that if the Board agrees that the business risk of NRG relative to EGDI has declined, then it would lead to a lower risk premium. The witness noted that, if NRG moves to a 35% equity ratio, there is no reason to believe that the overall cost of capital would be any different, assuming no material change in the business risk.

With respect to the proposed 150 basis point risk premium, Ms. McShane indicated that a 150 basis point risk premium was justified. Her conclusions were based on the consideration of three factors: the difference of cost of debt between the utilities, the impact of size on return (Ibbotson Study) and the equity return rate which under a different capital structure would result in an equivalent cost of capital, assuming no change in business risk.

Board staff questioned the witness's assumption that NRG's business and relative risk had not changed since the 1998 Test Year decision in which the Board approved a 50% equity capital structure and a rate of return on equity equivalent to Enbridge Gas Distribution Inc's.

The panel sought clarification regarding the witness's claims that (i) NRG's entire market and not just the agricultural sector, is riskier than Enbridge Gas Distribution Inc.'s, (ii) NRG's residential component is riskier because it is less diversified, more dependent on an agricultural base (iii) NRG doesn't have the diversity of employment that EGDI has, and (iv) the agricultural sector is more risky than industrial markets.

Ms. McShane acknowledged that she had not examined data supporting the conclusion that NRG's residential market is less diversified and also reiterated that her assessment of the market being more risky is based on the total market and not just the residential portion. The witness indicated that she didn't necessarily look at number of customers nor revenue to ascertain relative risk but rather looked at the gross margin attributable to the different customer classes and supported the proposition that the greater the proportion of revenue or gross margin, that comes from residential customers, the less risky the market. The witness did not disagree with the proposition that replacing tobacco load with residential load, and all things being equal, would reduce the overall business risk.

In this regard, the Company filed Exhibit K 2.4[9] which provided comparative customer and market related information for NRG, Union Gas Limited and Enbridge Gas Distribution as set out below.

	NRG	Enbridge	Union[10]
Residential Sector			
Percent of Customers	91	91	90.5
Percent of Volumes	46	37.5	19
Percent of Gross Margin	70	60	59
Commercial Sector			
Percent of Customers	6	8.6	9
Percent of Volumes	14	40	13
Percent of Gross Margin	13	32	26
Industrial Sector			
Percent of Customers	3	0.4	0.5
Percent of Volumes	40	22.5[11]	68[12]
Percent of Gross Margin	17	8	15[13]

Of these three breakdowns by customer class, the gross margin is the most indicative of the utilities' dependence on the industrial class. Note that the Union data are for in-franchise operations only. The industrial gross margin as a percent of the total, inclusive of storage and transportation revenues, is approximately 12%. Note also that the industrial data do not provide any insight into the diversification among industries.

Counsel for IGPC questioned Ms. McShane's reasoning for recommending a 150 basis point premium, despite the fact that in 1995 the Board had approved a 135 basis point premium, when in both cases the equity ratio is 35%, and NRG's risk has declined since that time. Ms. McShane responded that one could not make a direct comparison

[9] EXHIBIT K 2.4:
To Provide Figures for Revenue and Number of Customers for Residential as a Percentage of Total Revenue and Number of Customers for Enbridge Gas Distribution, Union Gas Limited and NRG; To Provide the Percentage of Gross Margin Coming from both Residential and Industrial Customers
[10] Excludes storage and transportation, which accounts for 20% of revenues
[11] Includes wholesale (Gazifere)
[12] Includes large commercial
[13] Includes large commercial

between the two situations and conclude definitively that it represented an increase in risk premium.

Board staff in its closing argument identified two issues for the Board's consideration. The first was whether the equity ratio should be reduced to 35% from its deemed 50%. The second was whether there should be an equity risk premium, and if so, what that premium should be.

Noting Ms. McShane's suggestion that the equity ratio can be between 35% and 55%, Board staff questioned whether deeming an equity ratio at the lower end of the range would impact NRG's ability to raise debt to finance the pipeline for the proposed ethanol plant.

Regarding the 150 basis point risk premium proposed by NRG, Board staff referred to expert witness testimony that small cap companies have greater risk than larger-cap ones and that business risk is related to size and diversity of market. Board staff noted that there is evidence indicating that NRG is similar to Union, on the basis of gross margin by rate class, and that NRG's exposure to the industrial class has declined form 17% to 11%. Board staff suggested that as residential load increases relative to the riskier industrial load, business risk should decline because the margin on residential load is twice that on industrial load.

Board staff also referred to previous decisions which could be of assistance to the Board. In RP-2002-0158[14] Union Gas Limited was granted a 15 basis points premium over EGDI and in EBRO 480[15] NRG was given a 50 basis point premium over Union. Board staff suggested that the appropriate premium for NRG should be around 65 basis points, the sum of 50 and 15.

Counsel for IGPC agreed with Board staff that a risk premium is warranted in the range of 60 to 75 basis points. Mr. Stoll indicated that the recent Bank of Nova Scotia loan and the growth in the number of residential customers suggested a stronger utility for which a

[14] RP-2002-0158, In The Matter of Applications by Union Gas Limited and Enbridge Gas Distribution Inc. For A Review of the Board's Guidelines for Establishing their Respective Return On Equity, Decision and Order, paragraph 45
[15] EBRO 480, NRG Ltd., Decision, Section 6.5.19 and Appendix I, pgs. 5 & 6

150 basis point premium was not warranted. With respect to capital structure, Mr Stoll supported a 35% equity ratio.

NRG addressed two issues in its closing submission: capital structure and return on equity.

The first concerned the new cost of equity calculation proposed by NRG which assumed that NRG's risk had not changed appreciably relative to that of EGDI. Mr King submitted that NRG's relative risk had not changed materially. Although NRG's riskiest customers are forecasted to leave the system, the risk is only reduced if the "leaving" customers are replaced by new customers. Mr King noted that NRG's gross margin from the industrial sector is declining and that, as pointed out by Ms. McShane, Enbridge's and Union's industrial sector is more diversified than NRG's, and consequently less risky.

The second issue raised by NRG was the appropriateness of NRG's proposal to decrease the equity component of its capital structure from 50% to 35%. To the concern raised by IGPC that a low equity ratio will hinder NRG's ability to fund or obtain funding for any capital investments required to attach the new ethanol plant, counsel for NRG pointed to Mr. Bristoll's testimony that the company remains strong, post-refinancing, and that financing particulars would be addressed by the Board when the project plans are firmed-up. On the matter of the dividend pay-out, NRG noted that had it paid a dividend over the past 12 years, it would be in the same position as it is in today in terms of dealing with any funding requirements related to the planned ethanol plant.

Board Findings

NRG in this application requested an equity ratio of 35%. The evidence shows that the actual equity ratio is 41.5%. This is the ratio that results after the Bank of Nova Scotia financing and the payment of $2,038,581 to shareholders.

It is not clear why NRG was proposing 35% equity ratio except that the company's expert witness appeared to believe that was the actual ratio. The Board agrees with the principle that the actual ratio should be used unless the ratio is considered to be unreasonable. In the past, the Board has used a deemed equity ratio for NRG, but that was on the basis that the actual equity ratio was unreasonable. In this case, the Board finds that the actual equity ratio of 42% is reasonable. It does reflect the fact that NRG is a more risky utility than Enbridge Gas Distribution and Union. However, the Board is convinced that the equity financing is a sound third-party financing and there is no basis for assuming that the actual ratio of 42% is unreasonable. Accordingly, the Board sets NRG's common equity ratio to 42% for the 2007 fiscal year.

With respect to the risk premium, NRG requested a 150 basis points equity risk premium over Enbridge Gas Distribution Inc. This Board in the past has allowed Union a 15 basis points risk premium[16] over Enbridge. The Board agrees that risk premiums are appropriate in certain cases. However, the Board does not see why NRG's risk premium should be ten times to what was approved for Union (15 basis points as compared to 150 basis points).

The position of Board staff and IGPC was that there should be some risk premium but that it should be in the range of 60 to 80 basis points.

It is important to note that if anything NRG's risk is declining. The Company's evidence indicates impressive growth figures. These include tripling the number of customers since 1991 and the forecast for 2007 indicates a strong growth in residential load. This is likely to replace in part the risky tobacco load which will reduce the risk that has dominated NRG's business in the past.

It is also significant that the Company has for the first time been able to secure arms length financing for all of its debt. And for the first time NRG has been able to obtain financing from a major financial institution, in this case the Bank of Nova Scotia. The amount of debt is almost twice the level of its previous long-term debt at an interest rate far lower than rates previously paid by NRG. This in itself goes a long way to reducing the risk of NRG as an operating utility.

For the reasons expressed above, the Board is of the view that a risk premium of 50 basis points over Enbridge Gas Distribution Inc. is justified. It should be noted that while

[16] Decision and Order RP-2002-0158, Para 45

the Board has rejected the requested 150 basis points risk premium, it has increased the equity component from 35 to 42 percent which offsets this in part.

FINANCING AND REDEPLOYMENTS COSTS

The Board has asked NRG in previous rate cases to refinance its long-term debt. In RP-2004-0167, the Board indicated that it will address recovery of breakage costs through rates if and when they are incurred. NRG has refinanced its debt and has incurred two types of costs; (1) financing costs with respect to obtaining the new loan from Bank of Nova Scotia and (2) prepayment penalties associated with the retirement of its previous debt instruments.

The financing cost is $47,793 and includes a commitment fee of $20,000, Bank legal fees of $20,000 and another $7,793 in legal fees of NRG. The redeployment costs total $219,116.85 including interest of $5,864.46. The prepayment penalties for the Imperial Life loan and Banco Securities Debenture are $192,970.59 and $20,281.80 respectively. NRG is requesting the recovery of all financing and redeployments costs.

NRG has proposed to recover the financing costs of $47,793 over the term of the new loan, which is over a period of five years, amounting to $9,559 per year. With respect to refinancing costs, NRG proposes to amortize the costs including accumulated interest, over the remaining life of the new loan beginning in the fiscal 2007 test year. The remaining life is forecast to be 53 months as of October 1, 2006.

During cross-examination NRG was asked to explain how the redeployment costs were calculated. The pre-payment penalties on the Imperial Life loan and the Junsen Debenture represents the difference between the July 2009 long-term rate (maturity of the loan) and the rate on the loan net present valued over the remaining period of the loan. This is in contrast to the Bank of Nova Scotia loan which has a three-month interest penalty for pre-payment.

Board staff argued that the Junsen Debenture was held by a related party and in a previous rate case the Board disallowed recovery of the Junsen penalty stating:

> "However, the Board has not factored the pre-payment penalties related to the Junsen Debenture into its determinations. The Board does not believe that NRG would have agreed to the insertion of such

> a clause into the debenture agreement in 1998 if it had been negotiating with an arms-length third party."[17]

NRG's reply was that it is not unusual for the lender to have some kind of a pre-payment penalty clause in order to protect their interest and even the Imperial Life loan and the Nova Scotia loan have pre-payment penalties.

Board staff further argued that the Board made those comments within the context of an impending refinancing and the acceptance of a penalty clause in those circumstances was imprudent and not the concept of a penalty clause in general. NRG's testimony indicated that since the financing did not occur at that time, the Board had not disallowed the penalty from being considered in subsequent cases. NRG considered these costs to be prudent and a common practise in lending arrangements.

In reply to an undertaking NRG provided three-month pre-payment penalties for all three loans, Imperial Life, Junsen Debenture and Bank of Nova Socita. The panel asked for this information in order to understand how onerous the Banco Debenture penalty was as compared to Imperial Life and Bank of Nova Scotia. The three-month penalty for Imperial Life works out to $41,446.57, Banco Debenture $6,263.14 and for Bank of Nova Scotia it is $121,867.29. However, NRG did add a caveat that all loans were at different points in time representing different financing needs and different abilities to borrow money.

The second issue that Board staff focused on was the one percent premium on interest rates that the Board approved in 2004 rates. This one percent premium works out to $31,698 inclusive of the impact of income taxes.

Board staff argued that it was evident in the Board Decision RP-2002-0147 that the one percent premium awarded to NRG on its debt was to cover some of the financing and transaction costs related to the refinancing of its debt. NRG's position was that it is not clear what the Board meant and the 9% represented the deemed rate for that year.

[17] RP-2002-0147/EB-2002-0446, Para 84

The last issue in this area dealt with the amortization period that NRG proposed for accounting refinancing costs. Board staff questioned NRG's motive for not charging a portion of the refinancing costs in 2006 when it was evident that lower interest rates on the Bank of Nova Scotia loan will provide some benefit to the company in 2006. NRG quoted the Board's previous decision that states that NRG should come before the Board for recovery of breakage costs in rates. NRG indicated that its application reflects the Board's policy of not implementing retroactive rate increases.

Board staff argued that NRG had benefited in the amount of $40,000 by refinancing at a lower rate of 7.52% as compared to paying a higher interest rate that was attached to their previous loans. Moreover, a portion of the proceeds from the current loan was being paid out as a special dividend to the shareholder and Board staff suggested that the shareholder should be responsible for a part of the breakage fee. NRG did not deny the benefit but did point out that if they wanted they could have refinanced in September or October, a period closer to NRG's fiscal year end. Moreover, the shareholder had not received any dividend since 1994 and if the financing mechanisms had allowed distribution of dividends, the shareholder would have received dividends during the loan period and this could have worked out to be the same as the one-time special dividend.

In closing arguments, Board staff recommended that the Board not allow the recovery of penalty costs associated with the Junsen Debentures, the 1% premium ($31,698) that the Company has already collected in rates in 2004 and an amount of $6,960 representing the interest rate differential between the deemed rate of 8.0% and the actual rate of 7.52% that the company would be paying in the last six months of 2006.

The Junsen Debenture was not an arms-length transaction and the additional penalty clause was entered into after the company was aware that the Board wanted them to refinance. And further there was no evidence whether the company even used the additional credit facility that was the prime motivator to enter into this agreement. Referring to the one percent premium, Board staff reiterated their position that had the Board not intended to give them monies to cover refinancing and transaction costs, they would have given 8% versus the 9% approved in RP-2002-0147. The fact that the refinancing was not undertaken is irrelevant to the fact that over $31,000 had been collected from ratepayers.

In its reply argument, NRG pointed to the Board Decision RP-2004-0167 that instructed the Company to bring forward all refinancing costs when incurred and that is exactly what NRG had done. Penalties related to the Junsen Debenture form part of the refinancing costs. NRG argued that including a breakage fee clause is common practice in lending agreements so as to protect lenders of fixed-rate loans from borrowers disappearing when rates are lowered. Referring to the one-percent premium, NRG reiterated its earlier position that it did not agree with the position of Board staff.

Board Findings

The Board appreciates NRG's efforts to refinance its debt. However, the Board notes that the Banco Securities Debenture was not a third party transaction and the prepayment penalty constitutes a significant portion of the total loan amount (4.28%). However, the Board is aware that most financial agreements do carry a prepayment penalty clause and a 3-month interest penalty is fairly common. The Board therefore approves a 3-month interest penalty for the Banco Securities Debenture. This amounts to $6,263.14 as indicated in Undertaking J1.6.

The Board does not agree with Staff's argument that the one percent premium awarded to NRG in Decision RP-2002-0147 was to recover refinancing and transaction costs. The decision does not explicitly state that the 9% deemed rate on the cost of debt includes a one percent premium to recover future financing costs irrespective of when NRG refinances its debt.

NRG proposes to amortize refinancing costs including interest over a period of 53 months starting October 1, 2006. NRG's intent is to align the amortization period with the term of the loan. The loan is for a period of five years or 60 months beginning in March 2006. NRG has applied for rates effective October 1, 2006. The Board believes that customers should get the same 60-month period and should not be asked to pay more every month in rates because NRG refinanced earlier in 2006. The Board orders NRG to amortise the refinancing costs over a 60-month period and not 53 months as proposed in the evidence.

The Board does not agree with the position of staff that NRG should be allowed to recover the actual cost of 7.52% for the second half of 2006 as opposed to the deemed rate of 8.0% because that would amount to retroactive rate making. A rate of 8.0% was approved in the previous decision and the company is allowed to recover that amount for the entire year.

The following refinancing costs are accordingly approved for recovery:

• Prepayment penalties for the Imperial Life Loan	-	$192,970.59
• Junsen Debenture	-	$ 6,263.14
• Interest costs	-	$ 5,478.93
Total refinancing costs approved	-	$204,712.66

The Board orders that the above costs be amortized over a 60-month period.

The Board approves a rate of 6.00% for short-term debt. This issue was not contested in the proceeding.

COST ALLOCATION

NRG proposed to modify the previously Board approved cost allocation study to reflect the 2007 revenue requirement, to incorporate the updated information and to reflect a number of changes to the functionalization, classification and allocation of costs.

The updates and changes to the cost allocation study fall into three categories. The first category consists of updates to the calculation of the coincident and non-coincident peak allocators and the calculation of the zero intercept study to reflect the most recent information available. The second category consists of changes to the functionalization, classification and allocation factors that are the result of updated information or circumstances. The third category of changes relate to the fully allocated cost study.

NRG did not propose a change to the methodology used in the Fully Allocated Costing Study that was approved in RP-2002-0147.

Board staff focused on the proposed advertising expenditures associated with the cash rebate and lead pay program, specifically in the context of the allocation of the costs of these programs. During cross-examination, NRG confirmed that while majority of the sales and rentals were through its ancillary business, none of the advertising expenditures were allocated to the non-regulated portion of the business.

Board Findings

The Board approves NRG's proposed updates to its previously approved cost allocation model.

With respect to the allocation of costs of the cash rebate program and the lead pay program, the Board notes that based on NRG's testimony the ancillary business is making a profit and the percentage of profit is similar to that of the regulated portion of the business.

The Board notes that since NRG's ancillary business derives some benefit from the sale and rental of natural gas equipment designed to increase the Company's throughput volumes, the Board directs NRG to allocate a portion of the advertising expenditures for programs that involve selling or renting gas applications, between the ancillary and regulated businesses according to revenues.

RATE DESIGN

In order to increase the fixed cost recovery through the monthly fixed charge, NRG proposed to increase the monthly fixed charge from $9.50 per month for Rate 1 customers to $11.50 per month and to decrease the first block delivery charge and increase the second block delivery charge. This proposal will result in an increase of approximately $4 (1%) to a typical residential customer's annual distribution charge. A typical Commercial customer will see no change while a Rate 1 Industrial customer will see an increase of $380 (11%) to the annual distribution charge.

NRG proposed a $2 increase to the monthly fixed charge for Rate 2 customers that would increase the fixed charge from $10.75 to $12.75 per month. In addition, a decrease to the delivery charge in the first block in the April through October period was proposed as was an increase to the delivery charge in the second and third blocks in the April through October period. No changes were proposed to delivery charges in the November through March period. A typical Rate 2 seasonal customer will see an increase of $504 (22%) to their annual distribution charge as a result of the proposed changes.

For the Rate 3 - Large Volume Contract Rate, NRG proposed to increase both the firm demand charge and the monthly fixed charge for these customers, in order to increase the recovery of fixed and demand costs. The monthly fixed charge for Rate 3 customers would increase to $150.00 from the current level of $100.00. The charge for Rate 3 combined customers would increase to $175.00 per month from the current level of $125.00. The firm delivery commodity charge will also be increased in the test year. No changes were proposed to the interruptible delivery commodity charge range in the 2007 test year. Rate 3 Firm customers will see an increase of $4,131 (9%) to their annual distribution charge.

For the Rate 4 – General Service Peaking rate class, NRG proposed to increase the monthly fixed charge by $2.00, from $10.75 to $12.75 per month with a decrease to the first block delivery charge and an increase to the second block delivery charge in the April through December period. The decrease in the first block rate helps to offset the impact of the higher monthly fixed charge. Rate 4 customers will see an increase of $306 (15%) to their annual distribution charge as a result of this change.

For the Rate 5 – Interruptible Peaking Contract Rate, NRG proposed to increase the monthly fixed charge from $100.00 to $150.00 and increase the interruptible delivery commodity charge. There was also a change proposed to the charge related to the minimum annual volume penalty rate. Rate 5 customers will see an increase of $1,096 (9%) to their annual distribution charge.

The table below summarizes the proposed changes to the monthly fixed charge across the different rate classes.

Rate Class	Current Fixed Charge	Proposed Fixed Charge	Difference
1	$9.50	$11.50	$2.00
2	$10.75	$12.75	$2.00
3	$100.00	$150.00	$50.00
Rate 3 Firm	$125.00	$175.00	$50.00
4	$10.75	$12.75	$2.00
5	$100.00	$150.00	$50.00

NRG also proposed a change to the System Gas Fee in Schedule A of its rate handbook, which provides the gas supply charges that are applicable to all system customers served under rates 1, 2, 3, 4 and 5. NRG proposed to increase the system gas fee from $0.001159 per m^3 to $0.001828 per m^3 to cover 100% of the associated allocated costs.

Board Staff sought an explanation from NRG as to what constitutes a “rate shock”, a concept that NRG intends avoiding as outlined in their guiding principles to rates and service terms. NRG could not provide specific criteria of what constituted a rate shock and considered the concept to be subjective. Board Staff specifically questioned NRG with respect to the increase in distribution charges for Rate 2 customers. The Company did agree that the impact on Rate 2 customers was approaching rate shock.

The Company indicated that it had taken steps to mitigate the impact on Rate 2 customers. Elaborating on this measure, the Company stated that the revenue-to-cost ratio of Rate 2 customers is lower than previously Board approved ratios.

Considering the expected decline in number of Rate 2 customers, Board staff questioned the possibility of merging Rate 2 customers with some other rate class. The Company argued that Rate 2 customers pay a much lower rate than some other rate classes and the problem was that they could neither be reclassified as contract customers due to insufficient volumes nor considered for interruptible services.

The Company also stated that the proposal to increase the monthly charge is revenue neutral in each rate class. NRG further added that it will continue to review the level of the fixed monthly charge consistent with the practice of other utilities such as Enbridge and Union.

Considering the impact of a project the size of the ethanol facility, IGPC wondered whether NRG would design a new rate class specifically for them. NRG in its reply confirmed the need for a separate rate.

Board Findings

The Board approves the rate design changes as proposed by the Company and agrees that the alignment of cost incurrence with cost recovery is in keeping with sound rate design principles.

DEFERRAL AND VARIANCE ACCOUNTS

NRG has the following five Board-authorized deferral accounts:

- Purchased Gas Commodity Variance Account (PGCVA)
- Purchased Gas Transportation Variance Account (PGTVA)
- Gas Purchase Rebalancing Account (GPRA)
- Gas Cost Difference Recovery Variance Account (GCDRVA)
- Regulatory Expenses Deferral Account (REDA)

Balances in the PGCVA and REDA have been determined in the same manner as in the past. The REDA is projected to have a debit balance of $147.96 at the end of fiscal 2005. NRG proposes that the REDA be continued into the 2007 test year and that it continue to record costs associated with participating in generic hearings and in Union Gas proceedings. The balance in the PGCVA as of September 30, 2005 was a debit of $104,565.91 including a debit of $1,944.76 in accumulated interest. NRG has proposed that the PGCVA be continued into the 2007 test year. The reference price will continue to be adjusted on a quarterly basis through the QRAM process.

The PGTVA reference price of $0.021848/m^3 approved as part of the RP-2004-0167 Decision with Reasons dated December 20, 2004 for fiscal 2005 rates remains in effect for fiscal 2006. NRG has proposed to dispose of the balances in this account on completion of fiscal 2006. As part of this proceeding, NRG has proposed to change the reference price used when calculating the balance recorded in the PGTVA to $0.019029/m^3 for fiscal 2007. This is the projected rate that is required to recover the forecast gas transportation costs payable to Union.

The GPRA is used to record increases or decreases in the value of gas inventory available for sale to sales service customers due to changes in NRG's PGCVA reference price. The monthly inventory balances used in calculation of the GPRA are based on a deemed level of unaccounted for gas (UFG) of the total throughput volume. NRG has proposed that the GPRA be continued in the 2007 test year, based on a deemed UFG of 0.0%.

The GCDRA was approved by the Board in the RP-2004-0167 Decision with Reasons dated December 20, 2004. It was established to track the variance between the amount collected from ratepayers ($531,794), as authorized by the Board in RP-2004-0167/EB-2004-0413, and $177,265 in each of three years. As part of this application, NRG has proposed that the GCDRA be continued for the 2007 test year. This will be the third and final year for the GCDRA. NRG has requested that the rate of $0.008230/m^3 be continued.

At the start of the hearing, NRG sought an approval from the Board to set up a Refinancing Cost Deferral Account (RCDA) to track breakage and penalty costs that it has incurred to refinance its debt. The updated evidence of NRG indicated a debit balance of $219,116.85 including a debit of $5864.46 in interest at the end of fiscal 2006. NRG has proposed to recover the balance related to the refinancing account by amortizing the costs, including interest, over the remaining life of the new loan beginning in the fiscal 2007 test year.

NRG has proposed to change the methodology used to calculate interest rates for deferral and variance accounts. It has proposed to use the Bank of Nova Scotia prime interest rate in effect at the time of each QRAM filing as the basis for the interest rate to be used in the subsequent quarter.

Board Findings

The Board approves changes to the reference price in the Purchased Gas Transportation Variance Account (PGTVA), from $0.021848/m^3 to $0.019029/m^3 for fiscal 2007.

The Board approves NRG's request to continue the Gas Purchase Rebalancing Account (GPRA) in the 2007 test year, based on a deemed unaccounted for gas of 0.0%.

The Board approves the setting up of the Refinancing Cost Deferral Account (RCDA) to track breakage fees and other related costs. However, the balance in the account will be as stated in this decision. NRG will include a total amount of $204,712.66 in this account, including $5,478.93 in accumulated interest at the end of fiscal 2006. NRG will recover this amount by amortizing it over a period of 60 months beginning in the fiscal 2007 test year.

The Board does not accept NRG's proposal to change the methodology to calculate interest rates for deferral and variance accounts. This is part of a separate generic proceeding (EB-2006-0117) and will be tabled before the Ontario Energy Board Rates Committee in October 2006. The Decision by the Rates Committee will determine the appropriate interest rates for use in variance and deferral accounts.

SUMMARY AND RATE ORDER

NRG claims a delivery-related revenue deficiency of $135,879 for fiscal 2007. This revenue deficiency/sufficiency is adjusted to reflect the following Board findings in this decision.

- Lower advertising expenses of $8,008 in fiscal 2007
- Reduction of replacement cost of one van ($38,000)
- Reduction of common equity ratio from 50% deemed to 42%
- An equity risk premium of 50 basis points over Enbridge Gas Distribution Inc.
- Reduction of $14,404.19 in refinancing costs including interest
- Amortization of refinancing costs over a 60-month period as compared to 53 months as proposed in the application

The Company is directed to submit a draft rate order, with appropriate documentation, containing the following:

- Financial schedules for the test year reflecting the Board's findings in this decision, i.e. Rate Base, Operation Revenue, Cost of Service, Capitalization/Cost of Capital, Determination of Revenue Sufficiency/Deficiency.
- Rate schedules for 2007 flowing from the above calculations and other Board findings in this decision.
- A list of deferral/variance accounts approved for the 2007 fiscal year.
- Notices to customers to accompany the first bills reflecting the new rates and bill adjustments.

DATED at Toronto, September 20, 2006

OEB, Report of the Board on Cost of Capital and 2nd Generation Incentive Regulation for Ontario's Electricity Distributors
December 2006

Ontario Energy Board

Report of the Board

on Cost of Capital and 2nd Generation Incentive Regulation for Ontario's Electricity Distributors

December 20, 2006

Table of Contents

1 Introduction

Purpose

In its Report on the 2006 Electricity Distribution Rate Handbook[1], the Board committed to conducting a review of the issues involved in establishing the cost of capital. In 2006, the Board also committed to implementing a multi-year rate plan for distributors (the "Rate Plan") which included an incentive mechanism to adjust rates over the period 2007 to 2009 and a commitment to develop a long-term rate setting framework by 2009. The incentive mechanism for rates over the period 2007 to 2009 is called the 2nd generation incentive regulation mechanism (2nd Generation IRM).

Board Staff have undertaken research, commissioned expert advice and consulted with stakeholders on the methods for setting the cost of capital and 2nd Generation IRM. These activities began in April 2006 and have culminated in this policy report of the Board.

This report sets out the Board's approach to cost of capital and the 2nd Generation IRM and presents guidelines for distributors to use in preparing their rate applications.

Organization of this Report

The report is organized as follows. The Board's policy for and analysis of cost of capital and 2nd Generation IRM are outlined in Section 2 and Section 3, respectively. Both sections provide brief descriptions of the matters being addressed, the Board's policies and rationale, and summaries of the issues and options raised in consultations. Section 1 outlines in more detail how and when the adjustments to distribution rates will be

[1] RP-2004-0188, May 11, 2005

implemented. Section 5 provides a summary. Guidelines associated with the policies set out in this report are contained in the Appendices.

2 Cost of Capital

The cost of capital for Ontario's electricity distributors is best understood in the context of their history. Up until 1999 the electricity distributors were mostly municipal organizations that were regulated by Ontario Hydro; from 1972 until 1998 the authority for this regulation was provided by the *Power Corporation Act*. In 1998, the passage of the *Energy Competition Act, 1998* gave the Board increased powers and a broader mandate, including responsibility for regulating the monopoly electricity transmission and distribution systems.

Since 1999, the cost of capital for distributors has been governed by the Board's Decision with Reasons in proceeding RP-1999-0034. This decision established a size-related capital structure for distributors and set the return on equity (ROE) at 9.88% based on the method used by the Board at that time to regulate natural gas utilities. This ROE method was a modified version of a method described in a report provided by Dr. William T. Cannon in 1998. That report was entitled "A Discussion Paper on the Determination of Return on Equity and Return on Rate Base for Electricity Distribution Utilities".

The subsequent phase-in of the Market Adjusted Revenue Requirement and the rate freeze imposed by Bill 210 in 2002 meant that further reviews of the cost of capital for electricity distributors were unnecessary. At about the same time, however, the Board did hold a review of ROE in response to applications from the gas distributors (RP-2002-0158). The Board found that there was no compelling reason to adopt a different cost of capital method for the natural gas distributors.

During the development of the 2006 Electricity Distribution Rate (EDR) Handbook the Board approved the continued use of the mechanistic update, consistent with the method used by Dr. Cannon in his 1998 paper, to set both allowed ROE and deemed debt rates for 2006 rate applications (the "current approach"). The updated ROE was determined by the Board for 2006 rates to be 9.00%. The stratification of debt/equity by distributor size, as a proxy for risk, was retained. The size-related deemed debt rates were updated in 2006 but the deemed capital structures were not changed.

Table 1 and Table 2 provide the allowed ROE, capital structure and deemed debt rates for distributors for the 2006 rate year, as described in the 2006 EDR Handbook.

Table 1: Allowed ROE

Average of 3- and 12-month *Consensus Forecasts* outlook for 10-year Government of Canada bond rates	4.75%
Average difference during April 2005 between 10- and 30-year Government of Canada bond yields (Source: Bank of Canada)	0.45%
Equity risk premium	3.80%
Allowed return on equity	**9.00%**

Table 2: 2006 Rates Capital Structure and Debt Rates

Rate Base	Deemed Capital Structure		Deemed Debt Rate (DR)
	Debt (D)	Equity (1-D)	
> $1.0 billion	65%	35%	5.8%
$250 million - $1.0 billion	60%	40%	5.9%
$100 million - $250 million	55%	45%	6.0%
< $100 million	50%	50%	6.25%

The Board's previous reviews of cost of capital reveal a general agreement that regulated distributors are less risky than the broader market on which the rating agencies primarily focus. Beyond that, however, there is a large potential range of risk and varied opinion on the best way of representing that risk in the current circumstances of Ontario's distribution companies. The Board is guided in this matter by the need to reflect appropriately risk in rates such that investors are provided a reasonable opportunity to earn a fair return and consumer interests are protected. The Board has looked to the advice of experts to assist in the development of an effective policy for setting the cost of capital for 2007 and beyond. In addition, the Board considered regulatory practice in several Canadian and United States jurisdictions.

2.1 Capital structure

Policy and Rationale

The Board will deem a single capital structure for all distributors for rate-making purposes. The Board has considered the concerns that have been expressed by distributors and certain members of the investment community that a reduction in equity thickness or return might result in a lower credit rating. As discussed below, the Board is not convinced these concerns warrant differentiated deemed capital structures. Therefore, **the Board has determined that a split of 60% debt, 40% equity is appropriate for all distributors.**

To date, the Board has used four size-related deemed capital structures for rate regulation of electricity distributors. As noted previously, this was based on the study conducted by Dr. Cannon for the development of the first Distribution Rate Handbook. In his study, Dr. Cannon noted that:

> Conceptually, [distributor] deemed capital structure ratios for rate-regulation purposes and/or their allowed returns on equity should vary to reflect the extent of the business risks to which each MEU is exposed. Higher relative business risks will imply less debt-carrying capacity and hence call for higher deemed common equity ratios (CERs). Furthermore, if the higher CER does not fully compensate for a MEU's relatively higher business risk, then the allowed return on equity (ROE) should also be adjusted upward to compensate MEU owners for the relatively higher total investment risk that their ownership stakes are exposed to.

However, Dr. Cannon recognized that it was not practical to review the capital structure for each distributor. He concluded that it was appropriate to stratify distributors into a limited number of groupings of similar risk. Further, he identified a number of characteristics that, in his view, affected the risk profile of a distributor:

(1) The size of the distributor's operations, assets, and revenue base;
(2) The nature and stability of the distributor's customer mix;
(3) Degree of competition from other fuels;

(4) The age and condition of the physical distribution system;
(5) Local climate peculiarities;
(6) The geographic size and isolation of the distributor's service area; and
(7) The availability of back-up self-generation capacity.

However, in his final analysis, Dr. Cannon settled on factors (1) and (6). Other criteria were rejected on the basis that the influence of each factor was generally small and/or “diversifiable”. Factors (1) and (6) were assessed to be recognizably correlated with each other, and, as a result, risk categorization based on size was believed to be warranted in 1998.

The electricity distribution sector has undergone significant change over the last eight years, and that change supports the move from size-related capital structures to a common capital structure. In particular, there has been considerable restructuring through mergers and acquisitions. While there were over 300 distributors in 1998, there are now less than 90. While there are some very small distributors in existence, the trend has been toward fewer and larger distributors. A recent Government announcement of a new two-year transfer tax exemption may spur further consolidation. This trend underscores the need to ensure that the Board does not create barriers to consolidation. In the Board’s view, one of those barriers is the differing capital structure of distributors.

Larger distributors generally supported the 60:40 structure as it means little or no change for them. However, smaller distributors expressed a number of concerns and disagreed with the proposal of a single capital structure.

Many distributors commented that size was an important measure of risk that must continue to be reflected in the cost of capital. Comments were made that small distributors face greater business risk than large distributors when a significant fraction of their load is from a single customer or when there is load concentration in a limited number of sectors (e.g. forestry, agriculture, etc.). According to this view, for a small distributor, a downturn in the sector may also result in consumers and local businesses (restaurants, stores, etc.) moving away, while larger distributors may operate in more diversified local economies and hence be better protected from a sector downturn.

The Board notes that load concentration risk, which was the primary focus of distributor concerns, is not necessarily related to distributor size. Horizon Utilities, Oakville Hydro and EnWin Powerlines are examples of mid-sized distributors with concentrated loads. As discussed previously, the four size-based categories have been in effect since industry restructuring and distribution rate unbundling. Based on changes to the sector over the last eight years and data from distributors’ operations since 1999 the Board concludes that size is not a key determinant of, or proxy for, risk.

This conclusion is corroborated by the Board’s examination of 2005 financial data filed by electricity distributors, which show that the distributors exhibit a variety of actual debt-equity structures. According to the data, about one quarter of the small distributors have leveraged themselves with debt to levels in excess of 50%. These distributors do not appear to be experiencing particular financing concerns as a result of this debt load.

A distributor, regardless of size, when planning and making decisions to manage its business risk, will organize its financing in line with its business needs.

The Board concludes that utility size no longer represents an accurate proxy for risk. As a result, there is no basis upon which ratepayers should be required to bear different costs, associated with different capital structures, on the basis of distributor size. The question the Board must ask is whether ratepayers of smaller distributors should pay higher rates than those of larger distributors because of a thicker equity component. For these reasons it is the Board’s view, that for ratemaking purposes, a single capital structure for all distributors is appropriate.

To avoid the unintended consequences of transition causing gross mismatch between actual and deemed capital structure, the Board has determined that a staged implementation will be used. This is discussed in sub-section 4.1, below. In addition, if the change in capital structure, and the increase in debt, leads to higher costs for new third-party debt, those higher costs will be reflected in rates. This is explained further in section 2.2.1.

The Board does recognize that some distributors may face materially different risks for the reasons identified by Dr. Cannon. However, it is incumbent upon the distributor to provide evidence of those risks. Whether the Board might address these risks through a different capital structure or a variance in the equity risk premium would depend on its consideration of the evidence provided. Distributors that believe they are in this category may raise this issue at rebasing. Distributors should also review the Board's letter of December 19, 2006 which deals with the timing of rebasing. Attached to that letter is a discussion paper on a screening methodology to establish a rebasing schedule for electricity distributors, including the option of self nomination.

Issues and Options Raised in Consultation

Most consumer groups support the single capital structure. During the technical conference, one stakeholder acknowledged that "small cap" firms do normally attract a risk premium in the market, but stated that information asymmetry is a major reason for this. This stakeholder further commented that information asymmetry occurs when an investor knows less about a small firm than would be the case with a large firm. However, in this context, information asymmetries are immaterial for regulated firms as they all report the same data to the regulator routinely, and publicly.

Some stakeholders expressed concern that during the transition to the new deemed structure distributors will restructure and take on more debt, possibly violating existing debt covenants or risking credit rating downgrades. However, the Board notes that a distributor's actual structure does not have to be the same as its deemed capital structure.

Larger distributors (primarily Hydro One Networks and members of the Coalition of Large Distributors (the CLD)) have not identified any concerns with the 60:40 structure. Smaller distributors argued in favour of the four size-based categories or, in the alternative, the two size-based categories recommended by staff's consultants, Dr. Lazar and Dr. Prisman. During the technical conference, Dr. Lazar and Dr. Prisman confirmed that their suggested two-category structure is "transitional" to a single structure. The Board is of the view that a single end-state structure with a method of transitioning towards it from the current four structures is more appropriate.

2.1.1 Debt Component

The 60% debt component is comprised of short-term and long-term debt. To date, short-term debt has not normally been factored into the setting of electricity distribution rates. However, it has been included in rate setting for natural gas distributors. In the gas sector, an amount referred to as "unfunded short-term debt" is calculated to balance total financing with rate base.

Policy and Rationale

The Board has determined that short-term debt should be factored into rate setting, and that a deemed amount should be included in the capital structures of electricity distributors. **The short-term debt amount will be fixed at 4% of rate base**.

Based on filings of distributors pursuant to the Board's Electricity RRR and in 2006 rate applications, it is clear that many distributors use short-term debt. The actual average for the industry is about 4%. Some distributors use it extensively as a substitute for long-term debt. This may be advantageous in a period characterized by low inflation and interest rates, but such a practice exposes the distributor – and its customers – to inordinate risk if rates climb. This risk may be reduced if the distributor prudently converts the short term debt to longer-term debt when rates start to rise.

Many distributors are using short-term debt to finance their operations. The Board believes that this should be reflected in rates. Short-term debt is generally less expensive than long-term debt and generally provides greater financing flexibility. Rates on short-term debt can be more volatile than rates on long-term debt and therefore the Board believes it is in the interests of distributors and ratepayers for the amount of short-term debt to be set at a deemed level.

Issues and Options Raised in Consultation

With respect to the short-term debt component of rate base, three other options were considered:

- No short-term debt (the status quo);
- Actual short-term debt component for each distributor; and
- Short-term debt set at 8% of the rate base.

No short-term debt

As a general principle for ratemaking purposes, the Board believes that the term of the debt should be assumed to be similar to the life of the assets that are to be acquired with that debt. This suggests that, in theory, for an industry with long-lived assets, the majority of debt should be long-term. However, in reality, some short-term debt is a suitable tool to help meet fluctuations in working capital levels. Therefore, exclusion of some consideration for short-term debt in the distributors' capital structures going forward would not be appropriate.

Actual short-term debt

While there was limited discussion of this approach, another option would be to use the actual short-term debt expressed as a percentage of the distributor's capital structure.

Although using a distributor's actual short term debt component may seem to be a more accurate approach, it may be problematic. Short-term debt is optimally used as an interim solution for managing a firm's financing requirements. It may fluctuate, although generally within a limited range. Using a firm's actual short-term debt component would be administratively challenging given the number of electricity distributors and the associated volume of data that would need to be reported and verified.

Short-term debt component set at 8%

In its July 25th discussion paper staff described an option of deeming short-term debt, needed to finance working capital, at 8% of rate base. The 8% figure was based on staff's review of Hydro One Distribution's lead-lag study filed in its 2006 EDR rate case.[2] In that study, Hydro One Networks showed that its working capital requirement was $288.5 million (cash of $265.6 million plus materials and supplies inventory of $22.9 million) out of a distribution rate base of $3,711.7 million, or about 8% of its distribution rate base. Staff explained this derivation during the technical conference.

There was confusion as to whether this proposal would also alter the working capital allowance (WCA) from the current formula (15% of the cost of power and (defined) controllable expenses). Staff explained that this was not the case. The Board committed, during the development of the 2006 EDR Handbook, to look at the determination of the WCA before 2008, and this is documented in the Board's Business Plan.

While a higher component of short-term debt would, all other things being equal, lower the cost of capital, it may be seen as financially constraining for distributors. Based on comments to this effect made by distributors, the Board believes that a smaller short-term debt component of rate base is appropriate.

[2] Table 1 on Hydro One's RP-2005-0020/EB-2005-0378, Exhibit D1, Tab 1, Schedule 1, Page 2 of 5.

2.1.2 Equity Component

Policy and Rationale

The Board has determined that distribution rates shall reflect 40% **common equity. There will be no adjustment for a preferred share component of equity in rates, although distributors can, if they choose to do so, use preferred shares within their financing structure**.

Issues and Options Raised in Consultations

One distributor suggested that preferred shares be treated as debt, so that the deemed capital structure would be 40% common equity, up to 4% preferred shares, and the remainder as long- and short-term debt. It was argued that common and preferred shares are different.

The Board is of the view that while common and preferred shares differ, preferred shares and debt also differ. The Board is not persuaded that preferred shares should be treated as debt in the deemed capital structure for ratemaking purposes. The fact that there is no requirement for the actual debt and equity structure of a distributor to match the deemed amount in rates means that distributors can use preferred shares at their discretion.

2.2 Debt Rates

2.2.1 Long-term debt

Long-term debt is a major component of a distributor’s capital structure. As noted previously, for ratemaking purposes the term of the debt should be assumed to be compatible with the life of the asset. With electricity distributors, the asset life can extend beyond 30 years. Typically, debt is incurred at the time when assets are put in service and the cost of that debt is at the prevailing market rate. This means that a distributor may be holding long-term debt at rates that differ according to when the debt was incurred. This is often called “embedded debt.”

In Ontario, distributors have two main sources of debt financing: affiliates (including owners); and third parties, such as commercial banks.

Policy and Rationale

For rate-making purposes, the Board considers it appropriate that further distinctions be made between affiliated debt and third party debt, and between new and existing debt.

The Board has determined that for embedded debt the rate approved in prior Board decisions shall be maintained for the life of each active instrument, unless a new rate is negotiated, in which case it will be treated as new debt.

The Board has determined that the rate for new debt that is held by a third party will be the prudently negotiated contracted rate. This would include recognition of premiums and discounts.

For new affiliated debt, the Board has determined that the allowed rate will be the lower of the contracted rate and the deemed long-term debt rate. This deemed long-term debt rate will be calculated as the Long Canada Bond Forecast plus an average spread with “A/BBB” rate corporate bond yields. The Long Canada Bond Forecast is comprised of the 10-year Government of Canada bond yield forecast (*Consensus Forecast*) plus the actual spread between 10-year and 30-year bond yields observed in Bank of Canada data. The average spread with “A/BBB” rate corporate bond yields is calculated from the observed spread between Government of Canada Bonds and “A/BBB” corporate bond yield data of the same term from Scotia Capital Inc., both available from the Bank of Canada.

For all variable-rate debt and for all affiliate debt that is callable on demand the Board will use the current deemed long-term debt rate. When setting distribution rates at rebasing these debt rates will be adjusted regardless of whether the applicant makes a request for the change.

The deemed long-term rate will be calculated using data available three full months in advance of the effective date of the distribution rate change. The method that the Board will use to update this rate is detailed in Appendix A.

The approach to setting the rate for embedded debt at its prior approved rate is based on the fact that those rates have already been reviewed in previous cases and been determined to be appropriate.

The approach to setting the rate for new debt differs as between third party and affiliate lenders, so as to recognize that in affiliate transactions there is an opportunity for terms to be negotiated at less than “arm’s length”, which could result in less favourable terms and conditions. When a distributor is financed by a third party, however, it is expected that the distributor will obtain commercial terms and conditions, including market rates.

Distribution rates will be adjusted for embedded debt only when the distributor is rebased and only up to the maximum allowed by the approved capital structure and at the weighted average cost of the embedded debt. During the incentive period, deemed debt rates will remain unchanged.

Issues and Options Raised in Consultations

Dr. Lazar and Dr. Prisman proposed that the deemed long-term debt rate be determined as the riskless rate plus the average spread between a sample of “A/BBB” rated corporate bonds of 5, 10 and 20 year maturities and the corresponding Government of Canada bonds. The riskless rate would be approximated by averaging estimates of the

5-, 10- and 15-year zero-coupon Government of Canada bond yields from publicly available data (e.g. from the Bank of Canada).

A concern was expressed that the 5- 10- and 15-year zero-coupon bond yields do not adequately match the life of the distribution assets. Stakeholders suggested that the bond yields should include longer terms up to 30 years. The Lazar/Prisman proposal and the method that the Board has adopted do include 30-year bond yields in the calculation of the deemed long-term debt rate.

The Board is of the view that while the Lazar/Prisman method has merit, the approach is materially more complicated and is also unfamiliar to stakeholders. In addition, the current method produces a similar result to that which arises from the Lazar/Prisman method. Maintaining the current method provides continuity and consistency for distributors, and the Board concludes that there is no compelling reason to change the method for setting the deemed long-term debt rate.

2.2.2 Short-term debt

“Short-term debt” normally denotes demand notes or debt that has a term of one year or less. On November 28, 2006, the Board issued a letter communicating its approved method for calculating interest rates for regulatory accounts. This provides a method to compute a short-term rate which is acceptable for short term debt.

Policy and Rationale

The Board has determined that the deemed short-term debt rate will be calculated as the average of the 3-month bankers’ acceptance rate plus a fixed spread of 25 basis points. This is consistent with the Board’s method for accounting interest rates (i.e. short-term carrying cost treatment) for variance and deferral accounts. The Board will use the 3-month bankers’ acceptance rate as published on the Bank of Canada’s website, for all business days of the same month as used for determining the deemed long-term debt rate and the ROE.

For the purposes of distribution rate-setting, the deemed short-term debt rate will be updated whenever a cost of service rate application is filed. The deemed short-term debt rate will be applied to the deemed short-term debt component of a distributor's rate base. Further, consistent with updating of the ROE and deemed long-term rate, the deemed short-term debt rate will be updated using data available three full months in advance of the effective date of the rates.

Issues and Options Raised in Consultations

The topic of short-term debt rates was subject to little comment due to the Board's separate process on interest rates to be applied to deferral and variance accounts. Any issues raised have been addressed as part of the Board's consideration of that issue.

2.3 Return on Equity

2.3.1 Return on Common Equity

The return on common equity compensates investors for the opportunity cost of providing share capital to a distribution business. The cost of that capital will vary with the perceived risk of the investment. In general, the rate of return to the investor should be appropriate to the risk of the distribution company compared to that in the market.

Policy and Rationale

The Board has determined that the current approach to setting ROE will be maintained. ROE will be determined based on the Long Canada Bond Forecast rate plus an equity risk premium (ERP). The method the Board will use to update ROE is detailed in Appendix B.

The Board's current approach has been in place for six years. In this consultation process several variations on the underlying inputs and assumptions to the current method were reviewed, and one alternative method was reviewed. The review of inputs and assumptions offered a range of ROE results between 8.37% and 11.5%. The alternative method produced ROE results ranging from 5.78% to 7.02%. This alternative method would have required more time and greater costs for its implementation. Given the issues and options raised in the consultation, the Board concludes that none of the approaches reviewed is better than the Board's current method.

The Board's method will continue to include an implicit premium of 50 basis points (0.5%) for floatation and transaction costs. This premium is included in, and not an addition to, the ERP. The Board notes that this has been the case ever since the Board first introduced the premium in the early 1990s, and that similar treatment is used by other Canadian regulators.

The Board will also clarify the starting point for the update. The update method was established in 1999 as part of a review of cost of capital. Therefore, it is appropriate to use the ROE calculated at that time as the starting point. This figure was 9.35% and was determined by the Board in Hydro One Network Inc.'s RP-1998-0001 Decision. The Board will use 9.35% ROE as the starting point for the update.

Issues and Options Raised in Consultations

Many stakeholders identified different ways to establish what they considered to be a more appropriate ROE; however, the majority of them indicated that if their own approach was not adopted by the Board, then the status quo was preferred.

An Alternative Approach to the Risk-Free Rate and ERP under CAPM

Dr. Lazar and Dr. Prisman recommended an alternative approach that would estimate ROE as the sum of a risk-free rate and an ERP estimated using the well-known Capital Asset Pricing Model (CAPM). They proposed estimating the ERP based on a proxy sample of firms that are similar to electricity distributors. They proposed to set the risk-free rate using forward rates based on zero-coupon bond yield estimates.

With regard to the risk-free rate, the recommended method would take advantage of new data which the Bank of Canada began to provide in 2004. These new data are estimates of the zero-coupon yield curves that may be inferred from the traded prices of Government of Canada bonds. Zero-coupon bonds are bonds that do not pay any yearly interest to the holders; they merely promise to repay the holders the face value of the bond at some future date.

As noted, Dr. Lazar and Dr. Prisman recommended an approach that relies solely on the use of the CAPM. While it was noted that CAPM has some deficiencies, Dr. Lazar and Dr. Prisman expressed their confidence that it is the soundest of the conventional methods (notwithstanding more recent and more complex methods based on Arbitrage Pricing Theory). They also noted that relying solely on CAPM would avoid the need for weighting of results, which is generally acknowledged as arbitrary. From their analysis, they estimated betas (a measure of the relative riskiness of the firm or sector against the market in general) of about 0.3 to 0.4.[3]

The proposed approach would result in a range of ROEs from 5.78% to 7.02% based on current data. With further analysis and some refinements to the proxy group of firms, staff calculated an ROE of 8.37% based on current data. A coalition of medium-sized distributors[4] retained Dr. Morin and Energy and Environmental Economics, Inc. who presented a study which used data from Dr. Lazar's and Dr. Prisman's report (and hence relied on CAPM), but used a different formulaic calculation of ROE. They calculated an ROE in the range of 9.8% to 10.4%.

Stakeholders criticized the Lazar/Prisman approach on the basis of a mistaken understanding that the riskless rate was estimated based on medium-term rates – the average of 5-, 10- and 15-year zero-coupon bond yields. Stakeholders suggested that this was inappropriate and that a longer term is appropriate to match the expected equity investment and asset life horizons for electricity infrastructure. In fact, the method recommended by Dr. Lazar and Dr. Prisman does incorporate data from 30 year bonds; their proposed method of averaging the 30-year zero-coupon yield curve focuses on the yields at 5, 10, and 15 years. There was also criticism of the short time series used in the analysis. While traditionally 60 year data is used, the consultants used one- to five-year data sets for the estimation of the CAPM beta and five and ten years for the market risk premium.

The sensitivity of the Lazar/Prisman approach to various assumptions and the lack of clearly comparable firms, have convinced the Board to maintain the current approach to setting ROE.

---

[3] A beta of 1 indicates equal riskiness with the market.

Traditional Approaches, Different ROE Estimates

Some distributors retained consultants that provided different ROE estimates using the traditional methods. Ms. Kathleen McShane of Foster Associates, Inc., the consultant for Hydro One Networks Inc., provided a cost of capital study that suggested an ROE of 10.5% is appropriate. The consultant for the Electricity Distributors Association, Mr. Robert J. Camfield of Christensen Associates Energy Consulting, tabled a study that suggested a range of ROEs of 10.2% to 11.5%. Both of these studies relied on the three standard methods of determining ROE: CAPM; the Discounted Cash Flow approach (DCF); and Comparable Earnings (CE). These studies relied on a longer time series of data. However, they also employed, to a lesser or greater extent, U.S. data in addition to Canadian data. Distributors have argued that they must compete for financing in global markets, and hence that use of U.S. data is justified on a "comparable earnings" basis. However, inclusion of U.S. data is a source of controversy, as allowed returns in the United States have typically been higher than those approved in many Canadian jurisdictions, and the market return is higher in the United States.

Some distributors argued that higher ROEs were needed because business risk for distributors has increased since 1999 – in large part due to governmental and regulatory policies which have hindered distributors' opportunities to earn a full rate of return. However, this was criticized by consumer groups on the basis that any business risk was particular to the early part of this decade, that distributors' revenue requirements have reflected a full market based rate of return since 2005, and that the multi-year rate plan should provide a predictable and stable regulatory environment under which distributors will be faced with "normal" risk.

Dr. Booth, a consultant retained by several consumer groups, supported a similar approach to that used by Dr. Lazar and Dr. Prisman, but expressed preference for the Board's current method because it better balances stakeholder and investor interests – and that this "balance" is relied upon in many Canadian jurisdictions. Dr. Booth commented that, notwithstanding his acceptance in the interim of an ROE calculated by Dr. Cannon's method, if he were to do the analysis directly he would end up with a result below 8%. At the technical conference, Dr. Booth observed that, in his view, it is just a matter of calculating using correct data. The fact that his result, and the results of Dr. Lazar and Dr. Prisman (as well as that of Professor Wilbur for Union Gas recently) are basically the same is merely a function of each doing what amounts to the same calculation, even if they come at it different ways.

While distributors supported the significantly higher ROE estimates of their consultants, many stakeholders – both distributors and consumer groups – recommended the retention of the Board's current approach rather than the adoption of Dr. Lazar's and Dr. Prisman's method. This suggests to the Board that the current approach results in a return sufficient for distributors to continue to attract capital. Therefore, the Board has determined that the current approach to setting ROE will be maintained.

2.3.2 Premium for Infrastructure Investment

The Board notes that staff's proposal to add a premium to the ROE for electricity distributors to provide an incentive for new infrastructure investment was not supported. While consumer groups generally rejected the need for an investment premium, distributors rejected the ROE premium on only new investment, but supported an overall increase in ROE to support new capital investment.

Some distributors did confirm that they are forecasting increased infrastructure investment for distribution system upgrades and expansion. The Board will be developing the criteria it should use to determine the Rate Plan groupings. The Board may consider, amongst other criteria, a measure of distributor capital investment to select distributors for rate rebasing in each of 2008, 2009, and 2010. Regardless, the Board is of the view that the extent and amount of capital upgrades required to ensure system reliability deserves further examination. This will be captured in a Board study undertaken in the 2007/08 fiscal year. Upon completion of this study, the Board may examine need for and appropriate form of any capital investment incentives. **The Board is not convinced that a premium is warranted at this time**.

Issues and Options Raised in Consultations

The issue of capital investment under incentive regulation is discussed in sub-section 3.6 below.

2.3.3 Implementation of Cost of Capital Policy

Changes to a distributor's cost of capital will be implemented beginning with applications for 2008 distribution rates.

A distributor's transition to the common deemed capital structure will start in 2008 regardless of whether the distributor rebases in that year or continues to be subject to 2nd Generation IRM. Further information on this transition is discussed in sub-section 4.1.

Other cost of capital parameters – updating of the ROE and long term debt rate, incorporating the deemed short-term debt rate, and implementing the short term debt component in the capital structure – will be implemented when a distributor files a cost-of-service rebasing application.

Having reviewed the cost of capital policy, the Board does not anticipate reviewing this issue again in the context of third generation incentive regulation.

3 Incentive Regulation

Incentive regulation is an alternative to traditional cost of service rate setting. Incentive regulation is intended to provide distributors with the opportunity to increase returns to shareholders through the implementation of efficiency initiatives. These efficiencies are also intended to benefit ratepayers by reducing costs.

This is the second time the Board has adopted an incentive rate setting mechanism for electricity distributors. The first was established in 2000 in the first electricity distribution rate handbook. The Board intends to review this 2nd Generation IRM in the future and determine how a long-term mechanism should be set.

The objective of the 2nd Generation IRM is to provide regulatory certainty to distributors during the Rate Plan as several rate-related studies are carried out. As such, 2nd Generation IRM is a transitional mechanism, and not an end-state in itself. The Board needs to put in place a formulaic rate adjustment method that will return distributors to incentive regulation, without creating any major hardships for them or for their ratepayers. As outlined below, the Board will rebase rates for each of the distributors over a period of three years.

3.1 Term and Starting Base

As indicated in the Board's April 27, 2006 letter announcing this project, the term (up to 3 years) and starting base (2006 rates) for the 2nd Generation IRM have already been established.

Further, **distributors' rates will not be rebased prior to implementing the incentive adjustment for new rates effective May 1, 2007**. The term of 3 years is not for all distributors. Some, whose rates will be rebased in 2008, will have this mechanism in place for one year. Others whose rates are rebased in 2009 will have this mechanism in place for two years, and the remaining distributors will have their rates rebased in 2010. **This mechanism, therefore, will be effective for at most, three years**. The Board is currently consulting with stakeholders on the criteria it should use to determine the Rate Plan groupings (i.e., which distributors will be rebased in which years).

Issues and Options Raised in Consultation

Some stakeholders commented that the 2006 rates were based on 2004 actual data and therefore the 2nd Generation IRM starting base should be adjusted in 2007 for three years (2004 to 2007) and not one year (2006 to 2007). The Board does not believe that it is appropriate to escalate the rates for the 2006 EDR historical year filers to a current test year. The 2006 test year rates were set based either on a historical test year or on a forward forecast year and were determined by the Board to be just and reasonable for 2006.

3.2 Form

The Board deliberated on different forms of incentive regulation extensively in its RP-1999-0034 proceeding which dealt with performance based regulation for electricity distributors, and in its RP-1999-0017 proceeding in response to Union Gas Limited's application for a performance based rate mechanism. Both proceedings resulted in Board adoption of price cap regulation.

Policy and Rationale

The Board will retain a price cap form of adjustment mechanism for electricity distributors. The price cap continues to be a simple approach that will, along with the implementation of mandatory service quality requirements as described below, provide balanced incentives for efficiency improvements and the maintenance of adequate service quality over the course of the 2nd Generation IRM.

With regard to alternative mechanisms, the Board concludes that a revenue cap approach is not appropriate, at this time. Revenue cap plans make distributors indifferent to gains and losses from demand fluctuations; however, they transfer to customers the risk of volume fluctuations, thus contributing to distribution rate uncertainty.

Benchmarking regulation uses information on industry, sub-industry, or peer group cost performance to establish a benchmark price (i.e., rate) for each firm in that group. Benchmarking will also not be applied at this time. The Board believes that the data and modeling requirements necessary to establish a price cap approach within a benchmarking framework are disproportionate to the objective for the transitional 2nd Generation IRM.

Issues and Options Raised in Consultation

There was no general concern raised about a price cap form. However, Dr. Yatchew, the consultant for the Coalition of Large Distributors, made an observation regarding the effectiveness of incentive regulation in general for government-owned utilities. Dr. Yatchew commented that for government-owned distributors it may be appropriate to take political risk into account when calibrating price cap rules and when determining appropriate rates of return. The Board observes that predicting political risk and its implications through economic regulation is challenging, and that more will be learned on the matter as experience is gained with 2nd Generation IRM. The Board continues to believe, as was stated in its RP-1999-0034 Decision with Reasons, that under incentive regulation, a distributor is responsible for making its investments based on prevailing business conditions, and the objectives of its shareholder within the confines of the price cap, and subject to the service quality standards set by the Board.

3.3 Price Escalator

Under cap mechanisms, changes in price indices such as macroeconomic or industry-specific indicators drive allowed changes in output prices for regulated services (i.e., these indices escalate the allowed prices).

Policy and Rationale

The Board will use the Canada Gross Domestic Product Implicit Price Index (GDP-IPI) for final domestic demand as the price escalator. For each year the GDP-IPI for final domestic demand (Series V3840594) will be taken from the Statistics Canada publication for the previous year. The adjustment in rates will be the difference between that number and the GDP-IPI for final domestic demand built into the previous year's rates. There will be no explicit adjustments in 2nd Generation IRM for ROE or debt costs.

Macroeconomic (e.g., national or provincial gross domestic or consumer product indices) or industry-specific indices can be used to proxy inflation in an incentive regulation formula. Staff's consultant, Dr. Lowry, prepared a report for the Board on incentive regulation entitled "Second-Generation Incentive Regulation for Ontario Power Distributors" (PEG Report). A table from that report is reproduced on the next page. The table summarizes a survey of formulas approved in other jurisdictions and shows that the macroeconomic GDP-IPI is the prevalent inflation proxy used by North American regulators for gas and electric utilities.

X FACTORS APPROVED BY NORTH AMERICAN REGULATORS FOR GAS AND ELECTRIC UTILITIES

Industry	Company	Term	Jurisdiction	Acknowledged Productivity Trend	Inflation Measure	Stretch Factor	X-Factor	Comments
Gas distribution	Boston Gas (I)	1997-2003	Massachusetts	0.40%	GDPPI	0.50%	0.50%	
Gas distribution	Boston Gas (II)	2004-2013	Massachusetts	0.58%	GDPPI	0.30%	0.41%	
Gas distribution	Berkshire Gas	2002-2011	Massachusetts	0.40%	GDPPI	1.0%	1.0%	Adopted the productivity study used by Boston Gas I
Gas distribution	Consumers Gas	2000-2002	Ontario	0.63%	CPI	0.50%	1.10%	O&M Productivity
Gas distribution	Union Gas	2001-2003	Ontario	0.9%	GDPPI	0.5%	2.5%	
Gas distribution	San Diego Gas and Electric	1999-2002	California	0.68%	Industry specific	0.55% (Average)	1.23% (Average	
Gas distribution	Southern California Gas	1997-2002	California	0.50%	Industry specific	0.80% (Average)	) 2.30% (Average)	Special 1% factor added to X to reflect declining rate base
Gas distribution	Bay State Gas	2006-2015	Massachusetts	0.58%	GDPPI	0.4%	0.51%	Adopted Boston Gas II
Bundled power service	Pacificorp	1994-1996	California	1.4%	Industry specific	NA	1.4%	Company specific productivity
Power distribution	San Diego Gas and Electric	1999-2002	California	0.92%	Industry specific	0.55% (Average)	1.47% (Average)	
Power distribution	Southern California Edison	1997-2002	California	NA	CPI	0.58% (Average)	1.48% (Average)	0.90% productivity trend estimated by Edison and Commission staff but not formally acknowledged by CPUC
Power distribution	All Ontario distributors	2000-2003	Ontario	0.86%	Industry specific	0.25%	1.5%	Productivity trend referenced is the 10 year average growth rate X factor is based on 5 and 10 year weighted average
Power distribution	Nstar	2006-2012	Massachusetts	NA	GDPPI	NA	0.63% (average)	
Bundled power service	Central Maine Power (I)	1995-1999	Maine	NA	GDPPI	NA	0.9% (average)	
Power distribution	Central Maine Power (II)	2001-2007	Maine	NA	GDPPI	NA	2.57% (average)	
All utilities	**Sample Average**			**0.70%**			**1.21%**	
All industry specific	**Sample Average**						**1.58%**	
All macro-economic	**Sample Average**						**1.01%**	

Source: PEG Report (Table 1, page 55)

The above summary includes the inflation measures used in those jurisdictions. Although a macroeconomic measure, the GDP-IPI is published by a trusted source, is readily available and is likely more easily understood by the public than an industry-specific measure would be.

With regard to use of the Consumer Price Index (CPI) rather than GDP-IPI, the Board agrees with Dr. Lowry that GDP-IPI is preferable to the CPI because it tracks a more relevant set of goods and services used as inputs for production by businesses, including electricity distributors. CPI tracks the prices of consumer goods and services, whereas GDP-IPI is a broader measure of inflation that covers other relevant sectors of the economy such as capital equipment. Therefore, the Board will use the GDP-IPI as the inflation proxy for the 2nd Generation IRM.

The Board employed an industry-specific index (IPI) approach in its first generation incentive mechanism for electricity distributors. As discussed in the PEG Report, an industry-specific input price index tracks industry input price fluctuations better than an economy-wide measure. Therefore, it may better mitigate significant gains and losses that might result from the failure of a macroeconomic index to track industry input price inflation. Both electricity transmission and distribution are capital intensive businesses and are therefore sensitive to changes in the cost of funds. This pattern of fluctuation can differ from that of an economy-wide measure for extended periods. However, the Board is of the view that the GDP-IPI approach is less controversial and easier to implement: only one index needs to be obtained and the only calculation necessary will be the annual change in the index.

Staff considered the following GDP-IPI indices available from Statistics Canada:

- Ontario GDP-IPI;
- Ontario GDP-IPI for final domestic demand;
- Canada GDP-IPI; and
- Canada GDP-IPI for final domestic demand.

Both Ontario indices are available only by late April. Distribution rate adjustments are typically scheduled to be in place May 1st. Therefore, the Ontario GDP-IPI data are not available in time for the Board's distribution rate adjustment process.

Both Canada indices are published for the previous year and 4th quarter by February 28th. This timing is suitable. Of the two national indices, the Board concludes that the Canada GDP-IPI should not be used because it includes consideration of inflation in the prices of crude oil and natural gas, among other price-volatile exports. These are important to Canada as a whole, but such exports are not inputs to "wires-only" electricity distributors in Ontario.

The Canada GDP-IPI for final domestic demand excludes these inputs. Therefore, the Board will use this index (Series V3840594). Further, the year-over-year change in the index will be used to calculate the price escalation. The Board is of the view that this index will result in a fair price adjustment because it better reflects the overall inflation experienced in the economy.

One stakeholder noted that, under staff's proposal, there would be no adjustments for ROE or for changes in distributors' debt costs during 2nd Generation IRM. They commented that while, in theory, GDP-IPI may track cost of capital changes, this would only occur over the long-term and may not be reflective of the electricity distribution industry, which is capital intensive. In response, one consumer group observed that the issue is not easily addressed within a "price-cap" incentive regulation mechanism:

- first, any adjustment to the IRM formula for changes in ROE would require distributor-specific calculations;
- second, it would also require obligating distributors to report any changes in debt costs so they, too, could be factored into the annual adjustment; and
- there would inevitably be some degree of double counting as the GDP-IPI formulation does include some consideration of changes in cost of capital.

However, two stakeholders commented that while the impact should not be material in the short term, this issue needs to be addressed in the longer-term. For 2nd Generation IRM, the Board is satisfied that during the term of the plan changes in GDP-IPI will implicitly recognize changes in the ROE and debt rates, and that therefore no further adjustment will be required.

Issues and Options Raised in Consultation

Some distributors commented that they would support the use of either CPI or GDP-IPI for the purposes of a price escalator in 2nd Generation IRM. However, they expressed concern over the exclusion of escalators related to crude oil and natural gas. Distributors commented that these factors affect many of their costs. In response to this concern, the Board notes that the GDP-IPI for final domestic demand does include these factors. It only excludes oil and gas for export.

One stakeholder supported use of an industry specific input price index and argued that it mitigates the significant gains and losses that result from the failure of a broad economy-wide index (e.g. GDP-IPI) to track changes in industry specific input prices better. However, another stakeholder noted that there is no “available” industry specific index even if the Board wanted to consider one. This stakeholder went on to say that, under the current Electricity RRR, distributors file statistics on performance based regulation related information annually. However, the Board believes that some of the required data may not be available to construct a credible industry specific index. Therefore, as a practical matter, the 2nd Generation IRM must rely on a macroeconomic index.

Staff originally proposed calculating the price escalator based on the change in the level of the GDP-IPI for final domestic demand on a 4th quarter over 4th quarter basis. This would factor year-end adjustments into the index. However, a number of stakeholders calculated that it would be better to base the change in the index on an annual over annual figure to reduce volatility inherent in using the quarter to quarter approach. The Board is persuaded that this is more appropriate.

3.4 X-factor

Under cap mechanisms, the allowed rates of change in the price of the regulated service are generally adjusted by offsets (often called an X-factor). The PEG Report detailed how X-factors based on indexing research typically include consideration of an *input price differential* (may be computed using Canadian input price trends), a *productivity differential* (may be the difference between a proxy for a total factor productivity (TFP) trend of Ontario's power distribution industry and the multi-factor productivity (MFP) trend of the Canadian economy), and a stretch factor.

Policy and Rationale

The Board has determined that distributors will be subject to a 1% X-factor for the duration of the 2nd Generation IRM. The X-factor precedents summarized in the PEG Report (reproduced in sub-section 3.3 above) suggest 1% as a reasonable reflection of relevant input price and acknowledged productivity trends. The Board believes that the Canada GDP-IPI for final domestic demand and 1% X-factor together should reasonably track industry unit costs, including efficiency gains, during 2nd Generation IRM. Therefore, the Board has determined that the value of the X-factor will remain fixed at 1% for the three-year term. Setting the X-factor at 1% over the term of the plan will provide price predictability and greater price stability. It also provides a sharing of the benefit of efficiency gains to ratepayers immediately.

Like the selection of the inflation measure, the selection of the X-factor is, for 2nd Generation IRM, a function of simplicity and transparency. Since 2nd Generation IRM is of a short duration, the Board will not develop an X-factor calibration that attempts to explicitly consider the productivity capabilities of each individual electricity distributor along with a stretch factor. Differentiated X-factors based on individual distributor circumstances would require an examination of distributor-specific evidence. In light of the spectrum of X-factor values put forward by distributors (as low as 0.7%) and consumer groups (as high as 1.2%) below, the Board believes that the 1% X-factor is reasonable for 2nd Generation IRM.

Issues and Options Raised in Consultation

Most distributors commented that 1% is too high and that the value should be based on individual distributor circumstances. They commented that distributors have been under rate freezes for an extended period of time and could not squeeze further efficiencies out of their businesses. Further, they commented that some distributors are experiencing a declining customer base – and suggested that a differential efficiency factor be determined based on growth rate. Some distributors proposed that the value of the X-factor should be 0.7%, stating a conservative approach was appropriate for 2nd Generation IRM – i.e., one without consideration of a stretch factor. The 0.7% was identified as reflective of acknowledged productivity trends without a stretch factor from the PEG Report. It was also argued that there is little reason to conclude that a distributor would be able to react to achieve efficiency savings under an IRM of such a transitional nature and short time period (some distributors will only be subject to it for one year). Therefore the X-factor simply becomes a somewhat subjective rollback of the inflation escalator. The Board does not agree that 1% is too high and that there is no opportunity for improvement in the industry over the next three years. While some distributors will only be subject to 2nd Generation IRM for one year, many will be subject to it for two and three years.

In contrast to distributors' comments that 1% is too high, consumer groups proposed that the value of the X-factor be increased. Skepticism was expressed that efficiency improvements will occur during 2nd Generation IRM given the variable term of the plan and the proposed X-factor of 1%. In one instance, it was argued that 1% is not adequate to bring about efficiency improvements. It was recommended that the X-factor be increased to 1.1% or 1.2% for 2nd Generation IRM. However, it was noted that this value is relatively modest in comparison to the values set by the Board in its previous plans (i.e., 1.5% for electricity distributors using IPI, and 2.5% for one of the gas distributors using GDP-IPI). It was also suggested that setting the X-factor for a longer term plan should include review of an input price differential (subject to the inflation factor used), historical productivity and a stretch factor (in lieu of an earnings sharing mechanism). In another instance, it was proposed that the X-factor value be determined relative to the distributor's current rates, similar to a benchmarking approach.

One stakeholder commented that although the proposed price cap rule does not recognize differential efficiencies across distributors and requires a common efficiency improvement of 1%, the stakeholder anticipated that future refinements would incorporate such differences. The stakeholder acknowledged that the proposed price cap rule comprises an important step in the process of improving regulation of Ontario distributors, describing it as simple and transparent, thereby easing regulatory burden for the regulator and the distributors.

While the Board has considered stakeholders' concerns, the Board is not convinced that for 2nd Generation IRM it is practical or necessary to set the value based on individual distributor circumstances. The 1% X-factor is low enough to recognize that distributors may be under some cost pressures and will be motivated to seek some operational savings over the term of the plan, and it is high enough to provide a benefit to consumers.

3.5 Z-factors

Under cap mechanisms (price or revenue), contingencies need to be built into the regulatory regime to provide the flexibility to recognize extraordinary events outside the control of distributor management. These are called Z-factors. Examples include changes in regulation, changes in accounting or tax rules, and natural disasters.

Policy and Rationale

For 2nd Generation IRM, the Board will limit reliance on Z-factors to well-defined and well-justified cases only – specifically, Z-factors will be limited to changes in tax rules and to natural disasters. The Board believes that for 2nd Generation IRM, Z-factors should be limited to events genuinely external to the regulatory regime and beyond the control of management and the Board – changes in Board policy should not be included. The Board can always assess the implications of such changes and make provision for them. Regardless, in order for amounts to be considered for recovery in a **Z-factor**, the **amounts must satisfy the eligibility criteria set out in Table 3**, below. The Board notes that changes in tax rules may result in positive or negative amounts.

Table 3: Z-Factor Amount Eligibility Criteria

Criteria	Description
Causation	Amounts should be directly related to the Z-factor event. The amount must be clearly outside of the base upon which rates were derived.
Materiality	The amounts must have a significant influence on the operation of the distributor; otherwise they should be expensed in the normal course and addressed through organizational productivity improvements.
Prudence	The amount must have been prudently incurred. This means that the distributor's decision to incur the amount must represent the most cost-effective option (not necessarily least initial cost) for ratepayers.

In addition, **the Board intends to maintain the materiality thresholds established in the 2006 EDR Handbook**: for expenses, the materiality threshold would be 0.2% of total distribution expenses before taxes; and for capital cost recovery, the materiality threshold would be 0.2% of net fixed assets. In both cases, the materiality threshold must be met on an individual event basis in order to be eligible for potential recovery.

Consistent with guidelines established for the first generation incentive mechanism, the Board has determined that when a distributor applies for disposition of these amounts, it will be required to submit evidence that the amounts which were incurred meet the three criteria outlined above. Appendix C outlines the detailed requirements for Z-factors, and has been adapted from the Board's 2000 Electricity Distribution Rate Handbook.[5] These requirements were established in consultation with stakeholders on the matter of performance-based regulation for electricity distributors (RP-1999-0034).

The Board may review and adjust the amounts claimed under Z-factor treatment during the term of the incentive regulation plan. This will allow the Board and any affected distributor the flexibility to address extraordinary events in a timely manner. The Board is of the view that the operational response to normal events, including winter storms, is within the planning control of management and that distributors are already adequately compensated for the risk of these types of events. Therefore, the Board will expect that any application for a Z-factor will be accompanied by a clear demonstration that the management of the distributor could not have been able to plan and budget for the event.

Issues and Options Raised in Consultation

Most stakeholders acknowledged the need for an IRM plan to provide for Z-factors.

Distributors were generally supportive of the proposed Z-factor requirements. However, some distributors expressed concern that the Board might attempt to exhaustively define when a factor would be available to a distributor, and commented that any list should be illustrative only.

Consumer groups commented that the tests for determining whether Z-factors are appropriate must be clear and set out prior to the commencement of the plan. Specifically that:

- the onus should be on the distributors to justify any Z-factor adjustments;
- the evidence provided in support of a Z-factor application must be thorough and subject to testing by the Board and intervenors prior to approval; and

[5] Revision 1.0, issued on November 3, 2000

- consistent with the 2006 EDR process there should be an onus on the distributors to bring forward Z-factors that may increase the revenue requirement or reduce it – the use of Z-factors must be symmetrical and should not be limited only to cost increases.

The last point was particularly a concern as staff did not recommend inclusion of an earnings sharing mechanism in the incentive regulation framework. Therefore, consumer groups were concerned that an unusual event that results in cost decreases or revenue increases must somehow be brought forward. The Board recognizes these concerns and is of the view that Z-factor adjustment for changes to tax rules should be symmetrical.

The Board has considered stakeholders' concerns and will limit the use and complexity of Z-factors because they undermine the basic principles of incentive regulation as opposed to traditional cost of service regulation. Therefore, only changes in tax rules and natural disasters will be considered.

3.6 Capital Investment under Incentive Regulation

Some distributors expressed concern over aging infrastructure and the need for increased investment in that infrastructure to maintain the appropriate levels of service which may be beyond the level supported by existing rates. They proposed that the incentive regulation formula should allow for the pass through of incremental capital expenditures in consideration for growing capital program costs. This could be done through an additional factor in the price cap formula.

Hydro One Networks Inc.'s consultant, Mr. Todd of Elenchus Research Associates, proposed a factor that would be an incremental percentage to the price cap index, contingent on a distributor filing an asset condition assessment in support of its proposal.

Typically, an incentive regulation mechanism is intended to encompass both capital and operating costs. This increases incentives for operating performance. In a capital intensive business such as electricity distribution, containing capital expenditures is a key to good cost management. The addition of a capital investment factor would mean that incentive under the price cap mechanism would be significantly reduced because the factor would address incremental capital spending separately and outside of the price cap. Further, it would unduly complicate the application, reporting, and monitoring requirements for 2nd Generation IRM because it would require special consideration to be implemented effectively.

The Board concludes that there is no need for a capital investment factor in this 2nd Generation IRM plan. Those distributors with an inordinate capital spending program can be accommodated through rebasing. Distributors should review the Board's letter of December 19, 2006 which deals with the timing of rebasing. Attached to that letter is a discussion paper on a screening methodology to establish a rebasing schedule for electricity distributors, including the option of self nomination.

3.7 Earnings sharing

The Board's policy, as expressed in the Natural Gas Forum Report[6], does not support earnings sharing mechanisms (ESMs). One of the reasons for that policy decision is that ESMs are thought to reduce the distributor's efficiency incentives. Another is that it may increase regulatory burden and retroactive review of a distributor's activities.

While consumer groups generally accepted the Board's policy position on ESMs, they expressed concern that over-earning be addressed in the Board's incentive regulation framework. Also, they commented that ratepayers will not have access to full information regarding a distributor's financial results and will not have the same ability

---

[6] *Natural Gas Regulation in Ontario: A Renewed Policy Framework*, March 30, 2005

as distributors to seek Z-factor relief. Accordingly, they argued that the use of an earnings sharing mechanism would provide a level of ratepayer protection during the plan. Others commented that in the absence of an ESM, the Board should require distributors that have excess earnings to rebase first. The Board is not convinced that an ESM is appropriate for 2nd Generation IRM. However, the Board may be informed by a comparison of a distributor's actual regulatory returns with Board-approved levels in the process of determining Rate Plan groupings for rebasing.

3.8 Service Quality

Service quality provisions are an important consideration in incentive regulation plan design. Definitions and reporting requirements of electricity distribution service quality indicators (SQIs) and the minimum standards set for them are laid out in Section 15, entitled Service Quality Regulation (SQR), of the 2006 EDR Handbook. For convenience, the list of the SQIs that distributors are required to measure and report on is provided in Table 4, below.

Table 4: Service Quality Indicators in the Handbook

Customer Service	Service Reliability
Connection of new services Underground cable locates Appointments Telephone accessibility Written response to enquiries Emergency response	System average interruption duration index System average interruption frequency index Customer average interruption duration index

Distributors have been reporting their performance on these indicators since 2000. Reporting is currently made annually of monthly and annual results under the Board's Electricity RRR. Some audits of service quality have been conducted and distributors' performance during the period 2002 to 2004 was reviewed as part of the 2006 EDR applications.

Policy and Rationale

The Board is resuming its SQR review to refine its SQR regime for electricity distributors. The Board is committed to ensuring an effective SQR regime as an integral element of incentive regulation.

In September 2003, the Board initiated a consultative process to review existing electricity SQIs. The process considered changes to these indicators and standards, new appropriate measures, and what, if any regulatory consequences there should be for persistent below-standard performance. While a working group of Board staff, distributors and other stakeholders met until February 2004, the process was not completed.

Issues and Options Raised in Consultations

Several stakeholders expressed concern that the Board's SQR regime be fully operational on commencement of 2^{nd} Generation IRM. It was commented that in any incentive regulation model it is essential to ensure that safety, reliability and quality of service are not degraded during the course of the plan.

Consumer groups urged the Board to make all SQR information publicly available, to more easily and transparently assess adherence to the requirements and allow for comparisons among all of the distributors. They commented that in the absence of full rate proceedings, the public reporting of SQIs is needed to ensure transparency and accountability for performance. Further, they noted that it would help to ensure that distributors do put forward the effort to meet and perhaps even exceed the standards.

One distributor commented that having mandatory and enforceable SQIs and performance requirements in and of itself will not result in improvements in distributors' performance as measured by the SQIs. The distributor argued that addressing this issue as a matter of compliance is contrary to the spirit of incentive regulation which it believes relies more on a cooperative approach that benefits all parties. The distributor suggested that due to the interim nature of 2nd Generation IRM and the fact that SQIs and performance requirements are evolving in response to experience and improvements in data quality and availability, perhaps the Board should focus on this issue as part of a longer-term plan when better data and more precise basis of arriving at differential performance targets can be established.

One stakeholder commented that given that distribution service safety, quality and reliability is what customers are paying for in their distribution rates, it is essential that interested parties have the opportunity to address a distributor's service performance relative to the distributor's proposed rates. Therefore, despite the codification of SQR, it was requested that the Board explicitly recognize the need for service performance to remain within scope in a distributor's rate proceeding.

In light of stakeholders' comments, the Board will resume its SQR review to refine its SQR regime for electricity distributors in consultation with stakeholders. This review will include consideration for public reporting of SQIs.

3.9 Rebasing

The timing of expenditures (i.e., operating, maintenance, replacement capital, etc) that are made periodically is an issue of mounting interest in incentive regulation schemes. Some timing issues may be revealed at rebasing.

The Board is working on details for the 2008, 2009, and 2010 rebasing reviews, as outlined in the Rate Plan. This work includes the following assumptions:

- the rebasing review will be based on a forward test-year cost of service filing;
- benchmarking evidence will be used as an input to the review;
- the benchmarking method may differ from the current comparators and cohorts approach; and

- benchmarking may be applied to the proposed costs in any forward test year as well as to costs in recent historical years.

The proposed requirements for the rebasing reviews are under development.

4 Implementation

4.1 Transition to Recommended Cost of Capital

The cost of capital will be implemented into a distributor's rates in two stages. First, as part of the rate rebasing process that begins in 2008, distributors will have their debt rates and ROEs adjusted in accordance with the policies described in section 2. Second, as part of rate adjustments between 2008 and 2010, distributors will have their capital structure adjusted in accordance with the policies described in section 2 and by the method described below.

Policy and Rationale

The Board will include an adjustment to rates in 2008, 2009, and 2010 as outlined below **to transition distributors from their existing capital structures to the single deemed capital structure**.

The adjustment for capital structure would begin with the 2008 rate year, on the 2006 approved rate base, unless a new rate base has been approved by the Board. As summarized in Table 5, below, the adjustment will be based on the following schedule:

- For distributors starting at equity of 35%, the equity component will move in equal increments over 2 years until it reached 40%;
- For distributors starting at equity of 45%, the equity component will move in equal increments over 2 years until it reached 40%; and
- For distributors starting at equity of 50%, the equity component will move in equal increments over 3 years until it reached 40%.

Table 5: Transition to Target Capital Structure

			Deemed Equity Component		
Current Deemed Equity	Variance from Target Equity of 40%	Transition Period (years)	2008	2009	2010
35%	5%	2.00	37.5%	40.0%	
45%	-5%	2.00	42.5%	40.0%	
50%	-10%	3.00	46.7%	43.3%	40.0%

4.2 How rate adjustments will be made using the incentive mechanism

Figure 1, below, summarizes what is in and what is not in electricity distribution rates based on 2006 rate orders. The block on the left shows what is in distribution rates and the right-side denotes items that are not.

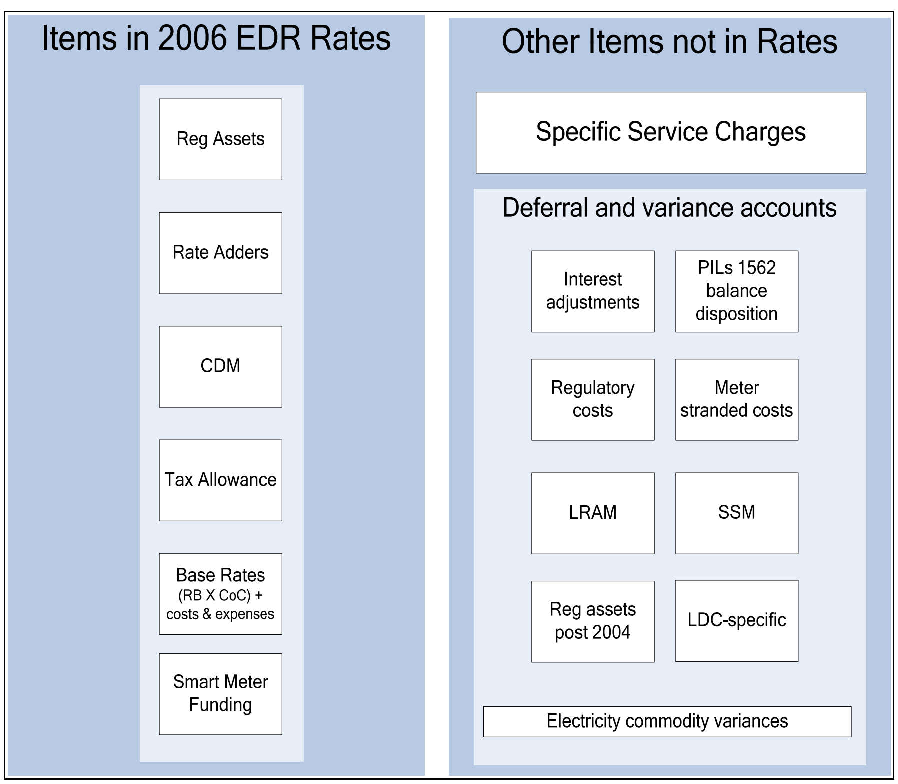

Figure 1: What's In and What's Outside of Electricity Distribution Rates

4.2.1 Allowance for Smart Meter Implementation

An amount was added in 2006 rates for smart meter implementation in order to provide "seed money" to distributors for their investment requirements and to help smooth rate shock to consumers.

Many parties expressed concern that further consideration be given to anticipated growth in smart meter costs to distributors. The Board has communicated separately to distributors that the process for approval of additional requirements for funds related to smart meters is under review, and will be dealt with shortly. The Board will advise parties of how changes will be implemented.

4.2.2 Conservation and Demand Management (CDM)

Recently, the Board issued a letter to distributors advising them that they may apply to the Board for incremental CDM funding through distribution rates. CDM-related costs which are to be recovered through distribution rates (i.e., any new spending on CDM, revenues from recovery of a lost revenue adjustment claim, or a shared savings claim) will be dealt with separately from the 2nd Generation IRM rate adjustment. Should the Board provide for a more comprehensive revenue stabilization mechanism for distributors, then it may consider how the reduced risk might be reflected in the Board's determination of an appropriate cost of capital.

4.2.3 Treatment of Taxes

A distributor's allowance for taxes (whether PILs or actual taxes) currently includes provision for income tax, Ontario capital tax, and large corporation tax.

The Board considered whether only the income tax portion of taxes should be subject to the price cap index. The large corporation tax was repealed retroactive to January 1, 2006; however, it remains in 2006 rates. The allowance for Ontario capital tax is relatively small compared to the allowance for income tax and therefore need not be shielded from the index.

The Board has determined that the large corporation tax, which was repealed with effect from January 1, 2006, will be removed from base rates in 2007. All other taxes will be adjusted under the price cap index.

4.2.4 Deferral and Variance Accounts

Deferral and variance account balances will be dealt with in accordance with the provisions of the *Ontario Energy Board Act, 1998*.

Consistent with its proposal on Z-factors, the Board has determined that, to the extent possible, it will limit reliance on creation of new deferral accounts during the term of the scheme to well-defined and well-justified cases only. Z-factor rules should govern need for, and treatment of deferral accounts.

4.2.5 Application of the Price Cap Index

The Board will apply the price cap index uniformly across all customer classes and to both the monthly service charge and volumetric rate, including taxes. Also, the adjustment for 2007 rates will be based on the approved 2006 information. This will require a standardized and simple application to be filed by distributors.

The index will not be applied to specific service charges as the Board recently completed a generic review of these charges.

There are a number of components to distribution rates to which the index will not be applied. This includes the current smart meter amount, regulatory assets amounts, rate adders, and CDM amounts. The current smart meter amount may be affected by the on-going review that the Board is engaged in to determine how smart meter funding should be provided.

This “de-construction” of 2006 rates is conceptually illustrated in Figure 2, below.

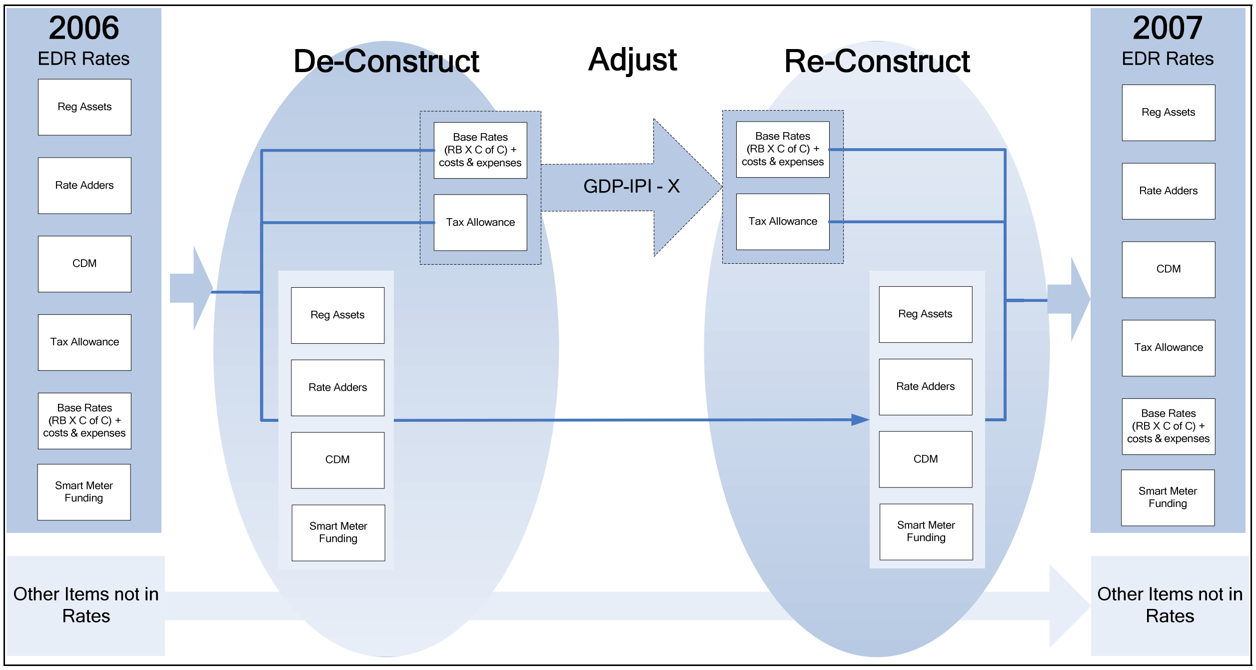

Figure 2: Conceptual Diagram of 2007 Rate Adjustments

The practical implementation of this approach using the 2006 rates as a point of departure may mean that some of this de-construction could occur at the base revenue requirement level. Regardless, the resultant monthly service charge and volumetric rate (both including taxes) for all customer classes will have been adjusted uniformly by the price cap index amount. That is, if the price cap index is 1%, then the index will be applied so that the rates, including taxes, will all be adjusted upwards by 1%.

After adjusting the base rates and taxes with the price cap index, rate elements would be “re-constructed” to derive 2007 rates.

As discussed above, the adjustment for capital structure would begin with the 2008 rate year.

4.3 Off-ramps

The Board expects distributors to use the incentive mechanism to file a rate application as required over the three-year period to effect rate adjustments in 2007, 2008, and 2009. As noted previously, there are limited adjustments available to distributors. If these adjustments are insufficient for specific cost pressures (e.g., additional capital investment) or the distributor is in the tranche to be rebased, then the Board would expect these distributors to file a comprehensive cost of service application and not to rely on the simplified filing requirements for the incentive mechanism.

5 Summary

The Board engaged many interested stakeholders in the discussion of an appropriate cost of capital and 2nd Generation IRM for electricity distributors. This consultation aided the Board in developing the policies detailed in this report. The Board has appreciated the input from all stakeholders in determining the approach it should take.

5.1 Cost of Capital

The cost of capital policy will remain in effect until it is reviewed and changed by the Board. The cost of capital elements are summarized in the following table.

Table 6: Components of the Board's Cost of Capital Policy

Capital structure	• One structure – 60% debt and 40% equity. • Move to this structure equally: 2 yr period for distributors closing a 5% gap; and a 3 yr period for those closing a 10% gap. Start in 2008, finish by 2010.
Debt structure	• One structure to include short-term debt and long-term debt: deemed short-term debt percentage of rate base based on average of distributors; and long-term debt is difference between 60% and short-term debt. Short-term debt amount is 4%. Long-term debt amount is 56%.
Equity structure	• One structure to include common equity of 40%.
Short-term debt rate	• Short-term rate is the average of the 3-month Bankers' acceptance rate over the weeks of the same month as is used for estimating long-term debt rates and the ROE, plus a spread of 25 basis points.
Long-term debt rate	• Existing debt that is either affiliate or third party will be unchanged from the Board approved values. • New third party debt – at the rate prudently negotiated by the distributor with the financing company. • New affiliate debt – lower of the contracted rate or the updated deemed debt rate. Updated deemed rate is consensus forecast plus the premium of A/BBB bonds. Premium is difference of average A/BBB Long-term Corporate Bond yield from long Canada Bond yield.
Common equity return	• No change to current ROE method – modified CAPM method which includes a consensus forecast rate plus an equity risk premium. This includes an implicit 50 basis points for transactional costs.

5.2 Price Cap Incentive Regulation

This 2nd Generation IRM policy will remain in effect until its final application in the 2009 rate year. The rate adjustments for the 2007 rate year will apply to all distributors. For the 2008 rate year the policy will apply to distributors that do not apply for rebasing. For the 2009 rate year it will apply to those remaining distributors that have not yet applied for, or been subject to, rebasing. The mechanism elements are summarized in the following table.

Table 7: Components of the Board's 2nd Generation Incentive Regulation Mechanism Policy

Price Escalator	• Canada GDP-IPI for final domestic demand – updated annually.
X factor	• Fixed at one percent per year for term of plan – all distributors subject to the same value.
Z-factors	• Will be limited to changes in tax rules and to natural disasters, and based on the three criteria of causation, materiality and prudence.

Appendix A: Method to Update the Deemed Long-term Debt Rate

The Board will use the Long Canada Bond Forecast plus an average spread with "A/BBB" rated corporate bond yields to determine the updated deemed debt rate.

The following approach is consistent with the ROE method. As per the approach adopted in the 2006 EDRH, the ROE and the long-term debt rates are based on the same risk-free rate forecast. Therefore, they differ only through the risk premiums that reflect their distinct natures and for which lenders/investors seek commensurate returns. This approach simplifies the calculations and aims to make it easier to understand the numbers. Specifically, the Long Canada Bond Forecast ($LCBF_t$) used will be the same as that used for updating the ROE. The average spread between "A/BBB" rated corporate bond yields and 30-year (long) Government of Canada Bond yields will be calculated as the average spread over the weeks of the month corresponding to the Consensus Forecasts.

The deemed Long-Term Debt Rate ($LTDR_t$) will be calculated as follows:

$$LTDR_t = LCBF_t + \frac{\sum_w (CorpBonds_{w,t} - {}_{30}CB_{w,t})}{n}$$

Where:

- $CorpBonds_{w,t}$ is the average long-term corporate bond yield from Scotia Capital Inc. for week w of period t [Series V121761];
- ${}_{30}CB_{w,t}$ is the 30-year (long) Government of Canada bond yield for week w of period t [Series V121791]; and
- n is the number of weeks in the month for which data are reported.

Appendix B: Method to Update ROE

ROE Update for any Period

Using March 1999 as the starting calculation and substituting for the initial ROE and Long Canada Bond Forecast approved by the Board in the Decision RP-1998-0001 the following is the adjustment formula for calculating the ROE at time *t*:

$$ROE_t = 9.35\% \; + 0.75 \times (LCBF_t - 5.50\%)$$

The ROE must be set in advance of the approved rates. The final ROE will be factored into rates using the Long Canada Bond Forecast based on *Consensus Forecasts* (as detailed below) and Bank of Canada data three months in advance of the effective date for the rate change. Therefore, for May 1 rate changes, the ROE will be based on January data – effectively *Consensus Forecasts* published during that month and Bank of Canada data for all business days during the month of January. The necessary data is available within the first or second business days after the end of the month and thus poses no delay for determining rates.

Long Canada Bond Forecast for any Period

For any period *t* the Long Canada Bond Forecast $LCBF_t$ can be expressed as:

$$LCBF_t = \left[\frac{{}_{10}CBF_{3,t} + {}_{10}CBF_{12,t}}{2}\right] + \frac{\sum_i ({}_{30}CB_{i,t} - {}_{10}CB_{i,t})}{I_t}$$

Where:

- ${}_{10}CBF_{3,t}$ is the 3-month forecast of the 10-year Government of Canada bond yield as published in *Consensus Forecasts* at time *t*;

- ${}_{10}CBF_{12,t}$ is the 12-month forecast of the 10-year Government of Canada bond yield as published in *Consensus Forecasts* at time *t*;
- ${}_{30}CB_{i,t}$ is the actual rate for the 30-year Government of Canada bond yield at the close of day *i* (as published by the Bank of Canada) [Series V39056] during the month (this is the previous month data, the same as used for updating the ROE for natural gas distribution) corresponding to time *t*;
- ${}_{10}CB_{i,t}$ is the actual rate for the 10-year Government of Canada bond yield at the close of day *i* (as published by the Bank of Canada) [Series V39055] during the month corresponding to time *t*; and
- I_t is the number of business days for which published 10- and 30- Government of Canada bond yields are published during the month corresponding to time *t*.

Appendix C: Z-Factors

A Z-factor has been incorporated into the incentive regulation mechanism for well-defined and well-justified cases only – specifically, Z-factors will be limited to changes in tax rules and to natural disasters. These events are generally not within management's control. However, options are sometimes available for how management responds, each with various tradeoffs between cost and effectiveness. The distributor will be required to supply the details of management's plans for addressing these events in support of the distributor's request for special cost recovery. The Board may limit the recovery of certain amounts associated with activities.

A distributor may record amounts which meet the eligibility criteria presented below for Z-factor events.

A distributor must follow the requirements listed below to be eligible to apply to the Board to claim any amounts into rates which the distributor has recorded.

Eligibility Criteria for Z-factor Amounts

In order for amounts to be considered for recovery in the Z-factor, the amounts must satisfy all three tests set out in the following table.

Table 8: Z-Factor Amount Eligibility Criteria

Criteria	Description
Causation	Amounts should be directly related to the Z-factor event. The amount must be clearly outside of the base upon which rates were derived.
Materiality	The amounts must have a significant influence on the operation of the distributor; otherwise they should be expensed in the normal course and addressed through organizational productivity improvements.
Prudence	The amount must have been prudently incurred. This means that the distributor's decision to incur the amount must represent the most cost-effective option (not necessarily least initial cost) for ratepayers.

The above three criteria will be applied to determine the eligibility of amounts for recovery through Z-factors, or any other approach deemed appropriate as a result of Board review. It should be noted that when an electricity distributor does apply for disposition of these amounts, it will be expected to submit evidence that the costs/revenues which were incurred/received meet the three standards outlined below in its annual application.

Causation

For Z-factor amounts, the revenue or expense must be clearly outside of the base upon which rates were derived.

Materiality

Recovery is reserved for amounts which have a significant influence on the operation of the distributor. As a guideline, an expense will be considered material if it involves 0.2% of total distribution expenses before taxes; and a capital cost will be considered material if it involves 0.2% of net fixed assets. Therefore, materiality will differ depending on the size of the distributor. Further, in both cases, the materiality threshold must be met on an individual event basis in order to be eligible for potential recovery.

Prudence

In supporting the prudence of the expense, the distributor will need to justify the reasonableness of the amount relative to other options that the distributor may have had. For example, if the distributor must incur costs to deal with a natural disaster the amount incurred must be justified.

Board Review

The Board may review and adjust the amounts claimed under Z-factor treatment at any time during the term of the incentive regulation plan.

Balancing Account

Those amounts that pass the three-part test outlined above should be included in account 1572, "Extraordinary Event Costs" of the Board's Uniform System of Accounts contained in the Accounting Procedures Handbook.

Interest on these deferral accounts shall be separately recorded within these accounts. The interest shall be calculated on the monthly opening balances in these accounts at the rate set in accordance with the Board-approved method for accounting interest rates (i.e. short-term carrying cost treatment) for variance and deferral accounts.

In support of a rate adjustment related to Z-factor amounts, the distributor must indicate the amounts booked to these accounts in the previous year and provide evidence that these amounts satisfy the three criteria listed above. Distributors must also propose a disposition amount for these accounts. The distributor must also provide the basis upon which the disposition amount should be allocated to each rate class, including a discussion of the merits of alternative allocations considered. The disposition amounts allocated to each rate class from the deferral account should then be tallied, and a rate class specific revenue requirement adjustment determined.

Disposition Account

The size of the prospective rate adjustment will not be subject to a predefined limit. The absence of a predefined disposition limit will give individual distributors the flexibility to propose the rate rider with due consideration to other rate-related customer impacts.

The Board may either, adjust the class-specific rate adjustments directly based on the information provided, or may seek additional information from the distributor and/or may request a review and report from the Board's Chief Regulatory Auditor on cost eligibility and the derivation of the rate rider.

Appendix D: Filing Requirements for 2007 Rate Adjustments

These filing requirements set out the Board's expectations only for filings by distributors that are applying for rates on the basis of the cost of capital and 2nd Generation IRM policies as set out in this report. Distributors that do not file on this basis will need to file on the basis of the Board's Filing Requirements for Transmission and Distribution Applications in relation to electricity transmission and distribution companies' cost of service rate applications, based on a forward test year.

The implementation of the cost of capital and 2nd generation incentive regulation mechanism policies will occur first with rate adjustments scheduled for May 1, 2007. The 2007 rate adjustments will include:

- the 2nd Generation IRM price cap index adjustment; and
- the removal of the Large Corporation Tax Allowance (for those distributors previously subject to this tax).

The price cap index adjustment will be applied to distribution rates (fixed and variable) net of the Smart Meter Funding increment, Large Corporation Tax Allowance, and incremental 2006 CDM funding. The adjustment will not apply to the regulatory assets rate rider or to Specific Service Charges. While the smart meter funding will continue unadjusted in rates, the Large Corporation Tax and the approved incremental 2006 CDM funding will be removed from rates.

A model (the "IRM Model") has been developed to be used by distributors in applying for rate adjustments. The IRM Model is based on the 2006 EDR Model and is available for downloading from the Board's website. Distributors will be required to make a number of data entries from their approved 2006 EDR Model, including the complete approved 2006 EDR tariff schedule. The steps are detailed below.

2006 EDR Tariff Sheet as Approved by the Board

All distributors must enter all approved 2006 rates. Distributors must also input the 2006 Smart Meter Funding increment that was added to their Monthly Service Charge.

Large Corporation Tax Allowance

For those distributors that had a Large Corporation Tax (LCT) allowance approved in their 2006 distribution rates, the model will reduce rates to reflect the removal of this allowance in 2007. These distributors must input their 2006 approved LCT allowance from their EDR models and 2006 base revenue requirement from the EDR model. The reduction in the allowance will be reflected through a percentage decrease in distribution rates calculated by the ratio of 2006 LCT allowance to the 2006 Base revenue requirement.

The LCT allowance will be removed from 2006 rates before the price cap adjustment is applied.

Incremental Approved 2006 CDM Funding

2006 CDM funding approved in rates for 2006 will be removed from rates before the price cap adjustment is applied. This adjustment does not apply to funds approved under the third tranche of the Market Adjusted Revenue Requirement approved in rates in 2005.

Price Cap Adjustment

Distribution rates are to be adjusted under the 2nd Generation IRM plan each year for two factors: a price escalator and an X factor. In addition, beginning in 2008, the price cap formula will also include an adjustment for the transition to the common deemed capital structure for rate-setting purposes.

The Board has determined that GDP-IPI – for final domestic demand is to be used as the price escalator for the 2nd Generation IRM. The Board expects applicants to use, as a proxy, the current value of 1.92% in their applications. The IRM Model will include this proxy as a reasonable estimate of the index result. When the final 2006 data are published by Statistics Canada in late February 2007, the Board will adjust the inflation index in each distributor's rate application model, to ensure this final published number is used to adjust rates for all distributors.

The X-Factor will then be applied to reduce the upward adjustment resulting from the GDP-IPI value.

The IRM Model will apply the price cap adjustment to fixed and variable distribution rates net of the 2006 smart meter funding increment, Large Corporation Tax allowance, incremental 2006 CDM funding. Further, the price cap will not apply to rate riders or Specific Service Charges.

The Smart Meter Adder

Smart Meter Funding is currently included in the Monthly Service Charge for Metered Customers in accordance with the Board's Decision RP-2005-0020/EB-2005-0529 and as approved in the Board's Decision and Rate Order for each distributor's distribution rate application. The current rate adder will be removed and then re-incorporated into the 2007 rate. The amount of the rate adder may change as a result of the Board's current review of smart meter funding. This will be communicated before the end of January, 2007.

When all adjustments are complete, the IRM Model will generate a new 2007 distribution tariff sheet for the utility that will accompany the Board's decision for each distributor.

Bill Impacts

The IRM Model will include a bill impact analysis, which will provide bill impacts of the distribution rate change only. This analysis is similar to that used in assessing rate applications in recent years.

The Board acknowledges that RPP prices could also change on May 1, 2007 and therefore the IRM Model will include an additional bill impact analysis that will be used when any RPP change is released, expected to be in mid-April 2007.

Manager's Summary

Each application should include a completed IRM Model and a brief Manager's Summary explaining all rate adjustments applied for.

Enbridge Gas Distribution Inc., 2007 Rates, Decision with Reasons – Phase 1, EB-2006-0034

Ontario Energy Board

Commission de l’énergie de l’Ontario

IN THE MATTER OF AN APPLICATION BY:

ENBRIDGE GAS DISTRIBUTION INC.

2007 RATES

DECISION WITH REASONS – PHASE 1

July 5, 2007

Summary of the Decision with Reasons[1]
(EB-2006-0034)

Application	Board Decision
• Degree Day Forecast Methodology	• Approved for each service region, as per amended proposal
• Average Use per Customer	• Approved, to be amended for approved degree day forecast
• General Service and Contract Sales	• Approved, to be amended for approved degree day forecast
• Fuel Switching program expenditures	• Expenditure levels to be managed by Enbridge but must meet Total Resource Cost test
• Energy Link program	• Not approved. Cease program • Recovery of costs incurred
• Gas Supply Risk Management program	• Not approved. Cease program • Recovery of $0.691 million
• 2007 Open Bill Access Deferral account • 2006 Electric Program Earnings Sharing Deferral Account • 2006 Unbundled Rate Implementation Cost Deferral Account • 2006 Alliance Vector Appeal Costs Deferral Account • 2005 and 2006 Gas Distribution Access Rule Deferral Accounts	• Approved as proposed • Approved as proposed • Approved as proposed • Approved as proposed • Approved as proposed
• 38% Equity Component of Capital Structure	• Increase equity component from 35% to 36%
• Revenue to Cost Ratios	• Approved as proposed
• Access to Bill envelope to include inserts by third parties	• Approved with changes
• Rate Implementation	• Recovery of approved revenue deficiency/new rates effective January 1, 2007

[1] This summary (i) excludes the particulars in the 2007 Settlement Proposal and (ii) does not form part of the Decision nor does it itemize all findings and is not to be relied on for the purpose of applying or interpreting the Decision.

DECISION WITH REASONS

JULY 5, 2007

INTRODUCTION

The Application

Enbridge Gas Distribution Inc. ("Enbridge", or "the Company") filed an application dated August 25, 2006 with the Ontario Energy Board (the "Board") under section 36 of the *Ontario Energy Board Act, 1998*; S.O. c.15, Schedule B, for an order or orders approving or fixing just and reasonable rates for the sale, distribution, transmission, and storage of gas for Enbridge's 2007 fiscal year commencing January 1, 2007 ("2007 test year" or "test year"). The Board assigned file number EB-2006-0034 to the Application.

Appendix A contains details regarding some of the procedural aspects of the rates Application, including a list of witnesses and a list of participants.

The Settlement Proposal

On January 24, 2007, a Settlement Proposal was filed with the Board. During the course of the oral hearing, the parties to the Proposal filed four appendices regarding supplemental completely or incompletely settled items, one regarding issue 6.3, and three regarding issues 7.1 through 7.5. They are included as Appendices C to F of the Settlement Proposal. Appendices C and D are dated February 12, 2007, Appendix E is dated February 20, 2006, and Appendix F is dated March 21, 2007.

A copy of the Settlement Proposal, including the addenda, is attached as Appendix B.

Of the 47 issues on the Issues List, the Settlement Proposal includes the complete settlement of 30 issues and indicated that parties would not address these issues at the hearing. There were 7 issues for which there was a partial settlement, and the parties were unable to reach agreement on the remaining 10 issues.

Below is a list of issues which are presented in the Settlement Proposal as having been completely settled. The Board accepts the cost consequences of the Settlement Proposal and will not review these issues in this Decision.

Issue 1.1	Appropriateness of the Proposed 2007 Rate Base Amounts
Issue 1.3	2007 Safety & Integrity Project Budget Amounts
Issue 1.4	Board Method of dealing with Leave to Construct Applications in Separate Proceedings
Issue 1.5	Meeting requirements of the Board for Independent Cost Benchmark Study for the EnVision Project

Issue 8.2	Actions necessary to appropriately reflect the impact of the Decisions of the DSM (EB-2006-0021) Proceeding
Issue 9.2	Setting of Interim Rates, effective January 1, 2007

This Decision with Reasons will address the non-settled issues under the following chapters:

- Forecast of Degree Days
- Average Use-Per-Customer
- Contract Gas Volume and Revenue Forecast
- General Service Volume and Revenue Forecast

- Fuel Switching
- EnergyLink Program
- Open Bill Access
- Risk Management Program
- Deferral and Variance Accounts
- Capital Structure and Cost of Capital
- Revenue to Cost Ratios
- Rate Implementation

On April 16, 2007, the Board issued Procedural Order No. 8, dealing with the settlement of Issue 3.6 (Regulatory Cost Allocation Methodology). Parties had indicated in the settlement that they were unable to reach a settlement on Issue 3.6. The Board ordered that Issue 3.6 will be considered as part of a separate phase (Phase 2), and consequently, Issue 3.6 is not addressed in this Decision. The ultimate resolution of this issue will not affect 2007 rates.

Interim Rate Order of March 26, 2007

The Settlement Proposal included the agreement from all parties that:

> … for rate implementation purposes only, the Company can adjust rates to recover an additional $26.0 million, effective as of January 1, 2007, and that this will be implemented at the same time as the Company's April 1, 2007 QRAM is implemented. GEC's and Pollution Probe's agreement in this regard is subject to any later adjustments to the Company's recovery of revenue deficiency that might be required as a result of Issue 3.2. Schools' agreement in this regard is subject to any later adjustments to the Company's recovery of revenue deficiency that might be required as a result of Issue 9.1. (Ex.N1 Tab1 Schedule 1 p9 /filed January 24, 2007)

An Interim Rate Order was issued on March 26, 2007 and is attached as Appendix C to this Decision.

Submissions and exhibits

Copies of the evidence, exhibits, arguments, and transcripts of the proceeding are available for review at the Board's offices.

The Board has summarized the record of the proceeding only to the extent necessary to provide context to its findings.

FORECAST OF DEGREE DAYS

The forecasting of degree days establishes the basis on which the Company can project its expected revenues and from that derive its projected sufficiency or deficiency.

Issue 2.3 reads "Is the forecast of degree days appropriate?"

The Company originally proposed to use the Central region degree day forecast of 3,617 degree days based on the 20-Year Trend method. In addition to the Central region application this forecasting methodology would apply to both Niagara and Eastern regions. The use of this forecast methodology would result in a revenue deficiency of $12.9 million, compared to the last Board-approved degree day forecast.

In its argument–in-chief, the Company amended its proposal by requesting approval of separate forecasting methodologies and forecasts for its Niagara and Eastern regions.

The nine methods evaluated by the Company are: the Naïve method, 10-Year moving average method, 20-Year moving average method, 30-Year moving average method, 50/50 method[2], de Bever method[3], de Bever with Trend method[4], 20-Year Trend method and the Energy Probe method[5]. The Company compared the actual degree days with the forecast degree days for each methodology for each year for the 1990 to 2005 period. The Company then ranked these methods using the following measures: Accuracy (as represented by Mean Absolute Percent Error and Root Mean Square Percent Error), Symmetry (as represented by Mean Percent Error and Percent Over-Forecast) and Stability (as represented by Standard Deviation).

[2] Also referred to as the Union method, is a weighted average of the 20-Year Trend method and the 30 Year Average.
[3] "The de Bever [method] is a regression model and features a long-term and short-term component. The former takes the form of a constant, while the latter is accomplished via a five-year weighted average of degree days (lagged two years). The model is estimated over a period equal to the estimated periodicity of the weather cycle". C2/T4/S1
[4] "The de Bever with Trend [method], as the name implies, adds a trend variable to the previously approved de Bever method". C2/T4/S1
[5] "Energy Probe [method] adds both a trend and a five-year simple moving average to the basic de Bever model". C2/T4/S1

Based on its review, the Company now proposes to use a mix of degree day forecast methodologies. The Company argues that its analysis indicates that it is appropriate to move away from using the de Bever methodology and in its place the Board should adopt the method that is best suited to each of its three regions. Accordingly, the Company is requesting approval for the 20-Year Trend method (and forecast of 3,617 degree days in the Central region), the Energy Probe method (and forecast of 4,410 degree days) in the Eastern region and the 50/50 method (and forecast of 3,546 degree days) in the Niagara region. This new proposal reduces the revenue deficiency related to weather from $12.9 million to $11.7 million.

While intervenors and Board Staff have raised a number of issues with the Company's proposal, the majority of the discussion has focused on the proposed use of the 20-Year Trend method in the Central region.

The Company argues that the current Board-approved method, which was approved in 1990, is no longer appropriate to accurately predict an increasingly volatile and downward trend in heating season degree days.

The Company presented evidence to support its claim that, in recent years, weather has become increasingly volatile and exhibits a warming trend. The Company also presented detailed empirical evidence based on its examination of the different methods. Its analysis, the Company argued, clearly indicates that the 20-Year Trend method produces better forecasts than any of the other methods for the Central region.

Schools and CCC argued that the Company has not made a case sufficient for the Board to adopt a new methodology, particularly a complex mix of various approaches. While Schools accepted the use of a linear trend to forecast degree days, it raised a number of issues with respect to the methods tested, the design of the ranking system, and the length of the test period. Schools also argued that the Board should adopt an interim solution and the issues of weather risk and degree day forecasts should be addressed in a generic proceeding.

CCC submitted that Enbridge has not demonstrated that the 20-year trend is a sufficiently robust and flexible model and that the Board should continue with the de Bever methodology, or set the 2007 degree day forecast using the methodology approved by the Board for Union Gas.

IGUA argued that the Company should not be allowed to change its degree day methodology before the results of the Board's pending weather normalization review are known. IGUA argued that Enbridge's forecast should be determined based on the methodology currently embedded in its rates. IGUA characterized this methodology as the "adjusted" de Bever methodology and it consists of reducing the forecast produced by an application of the Board approved de Bever methodology by 43 degree-days. Accordingly, IGUA argued the 2007 degree day forecast should be 3,805 degree days.

Board Staff identified certain concerns with the Company's proposed methodology, but did not advocate the use of any one particular method.

Energy Probe supported the Company's proposal to use the best performing method in the three regions. However, it argued that the analysis used to assess the performance of the different methodologies, is flawed. Energy Probe submitted that the Board should approve the Energy Probe methodology for the Central and Eastern regions and the 10-year moving average methodology for the Niagara region.

Board Findings

The Board considers the following to be the two issues to be considered with respect to the proposed change in methodology: Has the Company made a sufficient case to alter the currently used methodology? If it has, then what is the appropriate degree-day forecasting methodology (or methodologies) for setting test year rates? The Board deals with each question below.

Has the Company made a sufficient case to alter the currently used methodology?

CCC submits that Enbridge has not made a case sufficient for the Board to adopt a new methodology, particularly a complex mix of various approaches. Schools argues that the Board has an approved degree day forecasting method for Enbridge which was established after a thorough debate with expert evidence and that, from a strict legal point of view, the de Bever method is the default method; since the Company has not met the onus to supplant it, the de Bever method should be used. IGUA, supported by VECC, argues that pending the results of the weather normalization review, Enbridge's forecast should be determined based on the methodology currently embedded in its rates.

The Company argues that it has presented detailed evidence to indicate that the current method is no longer appropriate and notes that those are sufficient grounds to warrant a change in methodology. In response to IGUA's arguments, the Company argues that no such methodology has ever been presented or approved by the Board. The Company further argues that in the years since 2003 the degree day forecasts have been settled and are not premised in any degree day forecasting methodology.

The Board notes that the settlement agreement in the last rates case for the Company (EB-2005-0001) does not make any specific characterization nor does it explain the basis for the degree day adjustment agreed to by the parties from the level proposed by the Company. It merely notes that the parties have agreed to reduce the degree day forecast by 43 degree days. The Board considers the adjustment to be the result of a negotiated settlement rather than being underpinned by any scientific or statistical reasons.

The Board believes that given that the sole purpose of a forecasting methodology is to accurately forecast weather it is simply appropriate to select a method based on the empirical findings.

In the Boards view, the aforementioned evaluation of nine various methodologies presented by the Company reasonably demonstrates that the de Bever method has not produced the most accurate forecasts compared to other methods.

What is the appropriate degree-day forecasting methodology (or methodologies) for setting test year rates?

Having found that the utility has made a compelling case to consider a change in methodology, the Board then must make a determination on an appropriate degree day forecasting methodology.

The Company has presented historical weather data and argues that this data reveals that weather is increasingly volatile and displays a warming trend, especially in the Central region. The Central region is particularly relevant in this context, because it accounts for over 80% of the Company's volumes.

The Board is satisfied that the historical weather data presented by the Company can be interpreted to support the premise that an underlying warming trend and increasing volatility in weather does exist. However, the Board does not find this to be determinative in the selection of the most appropriate model. The Company has presented various methods. Some of these are based on simple moving averages, while others are more sophisticated.

Based on the evidence and arguments, the Board concludes that a linear trend method is an appropriate method to be used. The moving average methods, while they do capture the trend, exhibit a considerable lag, thus making it an inferior method to the linear method. While the Naïve method captures the randomness in the data, it can result in an abrupt and substantial change, which could lead to rate shock. The de Bever method, as noted earlier also has its limitations.

The selection of the trend is a critical factor in the determination of an appropriate forecast. The evidence the Company has presented indicates that a linear regression trend based on 20 years of data, compared to the other eight commonly used methods, generates forecasts that display greater accuracy. for the Central Region having accepted the analysis presented by the Company as part of its review of the nine comparable methodologies, the Board accepts the Company's amended proposal to apply the 20-Year Trend method in the Central region, the Energy Probe method in the Eastern region and the 50/50 method in the Niagara region.

AVERAGE USE-PER-CUSTOMER

This section addresses Issue 2.4, namely, Are the average use-per-customer forecasts for Rate class 1 and Rate class 6 appropriate?

A key element in the Company's forecast of its General Service sales volumes for the 2007 test year is the forecasted average use for Rate 1 and Rate 6 customers. The Company indicated that the models it employs to forecast average use have been in use since 2001 and that, during that period, parties and the Board have accepted these models through the Board-approved Settlement Proposals. Excepting the years 2001 and 2005, in which there were high and volatile gas prices, the average error variances between normalized actual use and Board-approved was less than 1%, indicative of the model's accuracy and validity.

The Company's 2007 forecast of volumes for general service customers was prepared in the spring of 2006, incorporating the most up to date information available when the filing was prepared. At that time, the Company used the PIRA Energy Group's price forecast for Henry Hub Spot which was published in January 2006. This was the most recent information available when the Company put together its volume forecast budget in April 2006.

The Company's evidence forecast a continuing decline in average use.

The Company noted that its 2007 General Service sales volumes forecast reflects a decrease of 99 million cubic metres, as compared to the 2006 estimate, due to declining average use per customer.

Efficiency of gas appliances and relatively high and volatile gas prices were identified by the Company as key reasons for the decline in average use.

The Company's evidence indicated that gas prices accounted for 62% of the decrease in Residential gas consumption and for 19.9% of the decrease in apartment /commercial/ industrial gas consumption.

Positions of the Parties

While no intervenors disputed the integrity of the average use model the Company used to generate its average use forecast, VECC and Energy Probe questioned the timeliness and source of the gas price forecast which was reflected in the model utilized to forecast average use. Their submissions received the support of IGUA, Schools and CCC.

VECC expressed concern with the forecasted decline in normalized average use and volumes in the residential and apartment sectors, and highlighted the projected increase in natural gas prices as the dominant factor driving the forecasted decrease in general service volumes. In this regard VECC submitted that Enbridge made two material errors when forecasting the normalized average use for residential (Rate 1) customers by i) relying on the PIRA Energy Group forecast as opposed to the Board approved QRAM price forecasts, and ii) relying on forecasts from Q1, 2006 when materially different actual and forecasted natural gas prices for 2006 and 2007 are available.

Energy Probe submitted that the real energy price forecast, a key input into the regression models for both the Rate 1 and Rate 6 average use equations, should be updated to reflect the most recent information available on the basis that it has a material impact. Energy Probe expressed concerned with the timing of the information used to prepare the 2007 test year average use per customer forecast. Although accepting the view held by Enbridge's witnesses that it is not possible to update the entire rate filing, Energy Probe argued that it is appropriate to update for significant changes that have taken place since April of 2006.

The Company disagreed with the intervenors' assertion that the gas price forecasts should be updated to reflect more recent information. The Company noted that the nature of forward test year cost of service regulation is that all of the Company's budgets are set on a forecast basis and then submitted to the Board for approval. Selective updating, while less cumbersome and time-consuming than full blown update, could present a misleading or inconsistent picture and would encourage opportunistic behaviour by intervenors. In the Company's view, the fair approach in this case is to reject the intervenors call for selective updates and instead rely on the consistent information that was available at the time that the Company prepared its application.

Board Findings

The Board notes that no intervenor challenged the accuracy of the volumes put forward by the Company or the assumptions imbedded in the average use model. Nor does the Company question the accuracy of the volumes put forward by VECC and Energy Probe in the respective proposals. The differences in the proposals are in the source of the reference price and the timing of obtaining the reference.

The question before the Board is one of fundamental importance as it deals with the basic principles associated with the filing of an application and the interrelation and interdependencies of various application components.

In establishing fair and reasonable rates the Board considers many factors and weighs many pros and cons. One of these balancing exercises is the valuing of the use of the most recent and therefore most accurate data against the value of being able to complete application processes in a timely manner and with a degree of certainty by all involved that the original application will be heard as filed, except for pre-determined or exceptional circumstances.

In this particular case the intervenors representing consumer groups support the insertion of fresh information into the application which would result in higher projected usage and therefore a lower projected revenue requirement for the Company. One can easily imagine the Company putting forward the same type of proposition if during the proceeding it became clear that the starting assumption on gas forecast prices was a less favourable input than a current reference price indicated. In essence, the application in such a paradigm would remain a dynamic document until the record would be considered closed. Although such dynamism may be appropriate in certain circumstances, it is impractical in this context.

The Board accepts that the most recent data should be used in the preparation of an application in the establishing of rates. The Board does not consider the data updating propositions of Energy Probe and VECC to be practical. The Board accepts the Company's position that there are too many interrelated matters and assumptions that must be taken into account if it were to update the particular elements argued for in its rates application.

The Board accepts the Company's average use-per-customer forecasts.

CONTRACT GAS VOLUME AND REVENUE FORECAST

This section deals with Issue 2.5, namely, Is the proposed 2007 contract gas volume and revenue forecast appropriate?

Contract customers are customers with annual consumption of 340,000 m^3 or greater who enter into a service contract with the Company and are in the 100, 200 and 300 series of rates. The volume forecast was prepared in March 2006, and incorporated the most up to date information available at the time when the filing was prepared.

In its pre-filed evidence, the Company sought approval of its contract gas volume forecast 4,131.7 10^6m^3 for the 2007 test year. Subsequently, in its argument-in-chief, the Company increased the forecast to 4,134.3 10^6m^3 to reflect the Company's amended degree days forecast proposals.

The Company characterised the development of the volume forecast for the contract market as a grass roots approach; it is prepared by aggregating the information collected by its account executives in consultation with all contract customers. The aggregate contract gas volume budget that results is then adjusted to take account of the degree day forecast on the weather-sensitive portion of the customers' forecast volumes to form the total contract volumes forecast for the test year.

IGUA submitted that it had no quarrel with Company's 2007 contract gas volume forecast apart from the weather projection methodology used to derive a forecast of 3,805 degree days for the weather sensitive portion. No other intervenors made submissions.

The Board accepts the non-weather sensitive component of the 2007 contract gas volumes forecast as filed. The Board directs the Company to reflect the 2007 test year contract sales volume forecast consistent with the Board's findings in the Forecast of

Degree Days chapter of this Decision pertaining to the degree day methodology the Company is to use to forecast weather sensitive volumes.

GENERAL SERVICE VOLUME AND REVENUE FORECAST

This section deals with Issue 2.6, namely, Is the proposed 2007 General Service gas volume and revenue forecast appropriate?

The Company in its pre-filed evidence sought approval of its General Service volume forecast of 7,625.8 10^6m^3 for the 2007 test year. Subsequently, in its argument-in-chief, the Company increased it to 7642.0 10^6m^3 to reflects the Company's amended degree days forecast proposals.

The Company indicated that the forecast was derived using regression models (average use) for Rates 1 and 6 and a forecast for Rate 9 consistent with past practices.

Intervenor and Company submissions focused on the Degree Day forecast and average use forecast, both of which are major inputs into the General Service forecast.

General Service volume forecast relates to degree day methodology and the derivation of use per customer amounts for the 2007 test year. The Board's findings in this regard are found in the Forecast of Degree Days and Average Use-Per-Customer chapters of this Decision. No submissions were made regarding other aspects of the General Service forecast.

The Board directs the Company to update the 2007 test year General Service forecast commensurate with this Decision as it pertains to degree day methodology and use per customer amounts.

FUEL SWITCHING

The settlement proposal approved by all parties other than GEC and Pollution Probe reduced the Company's proposed "Other O & M Budget" for the 2007 test year from $200.8 million to $181.5 million. Parties other than GEC and Pollution Probe agreed that they would not take any position as to how the Company should allocate this $181.5 million. Out of the $181.5 million approximately $3 million relates to fuel switching.

At the oral hearing Enbridge indicated that it will have to consider how it will allocate the $181.5 million amongst its different departments as a result of the Settlement Agreement. Consequently, the Opportunity Development budget, which subsumes fuel switching, would be allocated an amount lower than the $30.8 million budgeted in the pre-filed evidence.

Positions of the Parties

All parties with the exception of GEC and Pollution Probe agreed that Enbridge should have the required flexibility to allocate the envelope amount of $181.5 million.

GEC and Pollution Probe argued that the Board should approve Enbridge's fuel switching budget as filed and earmark an additional $11.5 million for incremental fuel switching expenditures as part of a joint Enbridge/OPA fuel switching program. Pollution Probe cited several benefits of fuel switching including reducing greenhouse gas emissions by reducing the demand for electricity, lowering natural gas distribution rates and reducing the need for new high-cost natural gas-fired power plants. Accordingly, GEC and Pollution Probe argued:

1. The Board should approve Enbridge's fuel switching budget as initially filed minus the costs associated with those programs that fail the Total

Resource Cost (TRC) test. This includes outdoor barbeques, garage heaters, pool heaters and gas fireplaces.

2. The Board should approve an additional $11.5 million of fuel switching expenditures.

3. The Board should establish a variance account with respect to Enbridge's fuel switching budget that returns any of the unspent dollars to ratepayers, and

4. The Board should direct Enbridge to evaluate the actual TRC net benefits of its fuel switching programs at the end of fiscal 2007. Enbridge should also be subjected to the evaluation and auditing process similar to a Demand Side Management ("DSM") program.

VECC was a signatory to the Settlement Agreement on Other O&M but kept its options open to advance arguments that the Company allocate the budgeted amount of $925,000 for Low-Income fuel switching initiatives. VECC argued that according to the settlement reached in the generic DSM proceeding, Enbridge was committed to budget a minimum of $1.3 million, or 14% of its residential DSM program budget, whichever is greater, for low-income customer programs. Accordingly, Enbridge should commit to spend the budgeted amount of $925,000 on Low-Income fuel switching initiatives as stated in the pre-filed evidence. VECC submitted that in order to ensure success of Low-Income fuel switching programs, a minimum amount needs to be spent so as to reach a critical mass of customers. According to VECC this amount is much higher than 14 percent of the residential program budget that Enbridge committed to spending at the oral hearing. VECC argued that this proportion should be close to 30%.

The Company in its Argument-in-Chief maintained that it required flexibility to allocate its budgets within the Other O&M envelope. Enbridge argued that its managers must have the flexibility to respond to changing market conditions and ensure a reliable and safe natural gas system. Enbridge rejected suggestions of GEC and Pollution Probe of setting up a variance account to track the money spent on fuel switching activities citing that the Company should not be locked in terms of spending on a particular area.

The Company further maintained that the Board should not micro-manage Enbridge's budget on a program-by-program basis. It also rejected suggestions of spending additional expenditures on fuel switching activities. The Company indicated that the Other O&M envelope of $181.5 million is the level of spending that ratepayer groups are prepared to accept and the Company has to work within this envelope in determining its budget priorities. Spending additional amounts will lead to short term rate impacts that the ratepayer groups are not prepared to accept.

The Company also rejected the recommendation of some intervenors that Enbridge should not pursue load growth or fuel switching programs that generate a negative net TRC. According to the Company, the TRC analysis does not work with respect to many load growth programs and therefore does not assist in the determination of whether the program should be continued or not. One example that the Company cited in its Argument-in-Chief was the proposed residential fireplace program. Although the program has a favourable Net Present Value (NPV), it does not pass the TRC test. The Company has argued that if the TRC measure is used as the determining factor then the Company would have to discontinue all its activities with respect to natural gas fireplaces. The Company maintained that if it is prohibited from implementing all programs that generate a negative TRC, then it would have to discontinue the electronically commutated motor program ("ECM") which increases the efficiency of the motor on a furnace saving electric load, while incrementally adding additional gas consumption. The Company further added that this program has been strongly supported by intervenors in the past.

The Company also referenced the California Standard Practice Manual: Economic Analysis of Demand Side Programs and Projects that points to the weaknesses of the TRC test in evaluating load growth initiatives. The Company indicated that it puts greater emphasis on NPV as an appropriate measure for load growth and fuel switching initiatives as it provides a better basis to assess whether the program will not be a financial burden on ratepayers. Based on the above argument, the Company asked the Board to reject any suggestions that it be prohibited from undertaking programs that support the lawful use of natural gas appliances by its customers.

Board Findings

In the 2006 Rate Case (EB-2005-0001), the Board did not look at individual departmental budgets to determine its findings on Enbridge's Other O&M. Rather it looked at cost per customer. The Board noted on Page 97 of the Decision:

> The Board expects that productivity improvements, or budget prioritization, will allow Enbridge to manage cost pressure within this envelope.

The Board did not allocate specific amounts to different departments and relied on Enbridge to decide on how best to manage its operations within a specific envelope. In the current proceeding, Enbridge and other parties have agreed to an envelope amount of $181.5 million to meet the Company's Other O&M requirements. The Board does not see any reason for micro-managing Enbridge's budget. Enbridge has been allocated an envelope amount and requires sufficient flexibility to meet its operational priorities. The Board will therefore not make any determination on the amount that Enbridge should spend on fuel switching initiatives and will neither ask Enbridge to set up a variance account to track expenses on such initiatives.

In making this finding, the Board rejected GEC and Pollution Probe's recommendation that Enbridge should be asked to significantly ramp up its spending on fuel switching initiatives and spend an additional $11.5 million on such initiatives. Although such initiatives can provide additional benefits, there is no evidence to suggest that Enbridge can spend more money in a cost-effective way on fuel switching in the interests of ratepayers.

GEC and Pollution Probe's recommendation that Enbridge should not be allowed to promote fuel switching and load growth initiatives with appliances that fail the TRC test has merit. Promoting appliances with a negative TRC seems inconsistent with the Government of Ontario's goal of creating a culture of conservation and carries negative societal benefits in terms of increasing emission of greenhouse gases. Accordingly, the Board directs Enbridge to pursue only those initiatives that meet the TRC test.

Enbridge's claim that if it is prohibited from implementing all programs that generate a negative TRC, then it would have to discontinue the electronically commutated motor program ("ECM") is not correct. Although the TRC may be negative in the case of the ECM program, this initiative is not evaluated separately from the furnace. Consequently, the high-efficiency furnace that uses an ECM has a positive TRC. This is not the case for a natural gas fireplace, barbecue, outdoor heater or a pool heater.

The Board does not see any need to evaluate the actual TRC net benefits of Enbridge's fuel switching programs at the end of fiscal 2007. The Board has recently approved a three-year DSM framework for Enbridge and Union. One of the key reasons for implementing a three-year framework was to avoid detailed ongoing scrutiny of the utility's DSM programs. It would be inappropriate to move backward and subject Enbridge's fuel switching initiatives to the prior level of scrutiny afforded to DSM.

The final matter to be addressed in this section of the Decision concerns the VECC argument regarding the minimum amount that the Company should be spending on fuel switching for low income groups. VECC essentially argues that the reduction in the O & M budget agreed to in the Settlement Proposal should not be applied to this segment and suggests that the minimum amount should be closer to $925,000 which is close to 30% of the total amount. The Board does not accept this submission but does accept the submission that the amount of fuel switching expenditure on low income groups should be not less than 14% approved by the Board in the generic DSM Decision pertaining to DSM programs. In making this finding, the Board is not making a nexus between DSM and fuel switching other than the 14% level also being an appropriate allocation of expenditures geared to lower income groups.

ENERGYLINK PROGRAM

EnergyLink is a channel partnership with HVAC contractors intended to assist Enbridge customers find natural gas solutions using a referral system that can be accessed either through the Internet or the Company's call centre. Customers are given a choice of three service providers who meet their requirements.

The Company initiated a phased roll-out of EnergyLink. The first phase which included customer referrals for natural gas furnaces, boilers, fireplaces and water heaters, as well as referrals for installation of natural gas appliances was launched in December of 2006. In the second phase, the Company will create a retailer locator that will help customers find retailers of natural gas appliances.

Enbridge has budgeted an amount of $1.3 million in O&M spending on EnergyLink and a further $2.75 million in capital expenditures. A partial settlement was reached for the 2007 capital budget and the overall level of "Other O&M". However, capital and O&M spending on the EnergyLink program remained unsettled items other than the agreement that the Board's decision in this matter would not impact the overall test year capital or O&M budget.

With the exception of GEC and Pollution Probe, intervenors did not support the EnergyLink program. The main issues are as follows:

1. Whether the Board approved the program in its Decision in EB-2005-0001 or otherwise?

2. If the Board has not approved the EnergyLink program, should the Board now approve this program?

3. If the Board does not approve the EnergyLink program, should the costs incurred be recovered from the ratepayers?

Positions of the Parties

CCC disagreed with the Company that the Board has approved the EnergyLink program. According to CCC, Enbridge did not provide detailed evidence in the 2006 rate case of what the EnergyLink program consisted of so that the implications of approving the program could be fully examined. In Union Energy's view, Enbridge cannot pursue EnergyLink without prior Board approval and in the event that Enbridge seeks Board approval, it should not be permitted to allocate funds from either the 2007 Capital Budget or the Other O&M Budget to EnergyLink. VECC, based on its calculations of unit costs of $60 per call or $20 per contractor referral, argued that these unit costs appeared to be high and it was not clear that EnergyLink was a cost-effective service for ratepayers.

CCC, HVAC, and IGUA are concerned about the risk of an anti-competitive impact from this program. They argued that the customers would associate the EnergyLink program with Enbridge and think that it is the primary source of service for gas-fired equipment.

HVAC specifically argued that companies who promote their own brand name face a new hurdle, namely one of having to compete with the powerful Enbridge/EnergyLink brand. HVAC companies will have to make a decision whether to market under the EnergyLink brand or their own brand, with the latter option being significantly more expensive. In addition, Enbridge will restrict competitors' efforts to compete with the Enbridge/EnergyLink brand and will restrict advertising by third parties in Enbridge's envelope by preventing companies from mentioning EnergyLink.

Direct Energy argued that Enbridge should have continued to work with the contractor community and focused its efforts on marketing and promoting the benefits of natural gas, rather than developing a branded referral service that would compete against established marketing channels and existing referral services. Direct Energy stated that, like many other service providers, it felt compelled to join the EnergyLink program, given the potential for negative customer perception from not being accepted as a qualified contractor by Enbridge. However, having the benefit of full disclosure of the intent and scope of the program, Direct Energy submitted that it strongly opposes the continuation of EnergyLink and recommended that the Board disallow the further use of ratepayer dollars.

HVAC asked that the Board order the Company to terminate the EnergyLink program immediately and CCC submitted that the Board should not approve the EnergyLink program in view of its possible adverse impact on the competitive market.

Union Energy, HVAC and IGUA submitted that one of the major reasons for developing this program is to provide a platform for Enbridge Financial Services Inc.'s financing program and provide benefits to the unregulated affiliates of the utility. CCC argued that the returns to Enbridge's parent from the financing program of EnergyLink would be very substantial according to a presentation attached to an exhibit by the Company and that no part of the cost of the EnergyLink program should be recovered from ratepayers.

Union Energy and HVAC also questioned the projected success of the program. In reply to an Undertaking (J10.7), the Company indicated that it expects 1,200 customers to switch to a natural gas furnace from an electric or oil furnace as a result of the EnergyLink program. HVAC submitted that this forecast is unrealistic. The Company forecasts replacement of 36,191 furnaces from electric/oil to natural gas. Considering that 90% of Enbridge's households in their franchise area have a natural gas furnace, this would imply a replacement rate of over 20%. Since the life of an electric or oil furnace is 15 to 20 years, this indicates that switching is three to four times the normal replacement rate. HVAC and Union Energy submitted that Enbridge had not provided credible evidence as to how EnergyLink is going to cause these new sales.

HVAC also questioned the Company's forecast with respect to water heaters. The Company has two types of water heater programs, those in which an electric water heater is switched to gas and those under which a new water heater is installed, usually in new construction. The Company's direct programs forecast 1,518 participants and this program show a negative NPV (Exhibit J9.2). The reason for the negative NPV is the amount paid to participants as incentives. However, when the same program is being promoted through EnergyLink, the Company is projecting 2,500 participants (Exhibit J10.7). Since this program has a positive NPV, it indicates no incentives. HVAC argued that it is difficult to believe that a program that gives an incentive cheque to a customer will be significantly less successful than the EnergyLink program.

On the other hand, GEC and Pollution Probe submitted that they support the EnergyLink proposal as a means to facilitate DSM and fuel switching, and according to GEC, so long as the mechanism is not used to encourage inefficient end uses. Pollution Probe submitted that the Board’s approval of the EnergyLink program budget should be conditional on Enbridge issuing a RFP to obtain competitive bids from financial institutions for low interest financing. GEC commented that the parties who are opposed to the EnergyLink program on the basis that it was a platform to channel financing opportunities to Energy Financial Solutions Inc. were signatories to a settlement allowing the on-bill financing proposal to proceed, presumably believing that any possible abuse of affiliate relationship and any corrosion of the competitive market due to bill-financing is protected against in that agreement. Accordingly, GEC submitted that it was puzzled by the suggestion of some parties that the EnergyLink program is a tool to destroy competition.

VECC stated that of the purposes for the EnergyLink identified by Enbridge, the provision of an easy connection for customers with service providers was the only goal which VECC accepted and that it does not disagree that an enhanced referral system located in the utility could be of benefit to customers, to the extent that it provides the 25,000 unsolicited calls from customers with referrals to qualified service/installation contractors.

IGUA and Union Energy argued that activities such as the rental of gas-fired equipment, the provision of a contract referral service, are not within the scope of business activities in which Enbridge can engage as a Board regulated natural gas transmission, distribution and storage utility, quoting the undertakings Enbridge gave the Lieutenant Governor in Council which were approved by Order in Council on December 9, 1998:

"….shall not, except through an affiliate, carry on any business activity other than the transmission, distribution or storage of gas, without the prior approval of the Board." Furthermore, IGUA, with respect to business activities pertaining to the rental of gas-fired equipment, quoted paragraph 3.2.5 from the Board's March 31, 1999 Decision with Reasons in E.B.O. 179-14/15: "The Board's finding with respect to retention of the rental program in the core utility is supported by its view of current regulatory policy, which encourages the development of a "pure utility", stripped of non-monopoly services……..Retaining the Company's rental program in the core utility does not allow appropriate costing principles to prevail." And according to paragraph 3.2.6 "The Board would accept the program, for the time being, on a non-utility basis within the Company, with elimination of the program's costs on a fully allocated basis." Union Energy submitted that the subsidy burden that EnergyLink imposes on ratepayers should be evaluated on a fully allocated cost basis and eliminated in its entirety from Enbridge's revenue requirement. IGUA argued that since the EnergyLink program is incompatible with the "pure utility" policy reflected in the Company's current undertakings, the utility is prohibited from carrying on any of the EnergyLink program activities without prior Board approval. VECC submitted that the Board should not approve the cost consequences of EnergyLink for 2007 since it is not a core distribution utility service.

The Company argued that it has already received approval for EnergyLink in the 2006 rate case. The Company did indicate then that it planned to introduce a channel strategy to facilitate natural gas solutions for customers. The Company did not however specifically mention the EnergyLink program. Before EnergyLink was launched by the Company, Mr. Hewson the Board's Chief Compliance Officer received a letter from the HVAC Coalition expressing concern about the program. Mr. Hewson indicated that it did not appear that EnergyLink was outside the requirement of the Gas Distribution Access Rule ("GDAR") or any other regulatory parameters within which Enbridge is permitted to distribute natural gas in Ontario.

With respect to the arguments by certain intervenors that based on the undertakings that the Company has given to the Lieutenant Governor in Council Enbridge cannot engage in a business activity other than the transmission, distribution or storage of gas unless it has prior Board approval, the Company indicated that there are a wide range of activities that the Company undertakes on a daily basis that support the core activities of the Company such as maintaining a fleet of vehicles or conducting financial studies. The Company submitted that EnergyLink falls precisely into the same category.

The Company reiterated that it is confronting a situation of market stagnation. Average use per customer has been declining and this is expected to continue due to the impact of conservation, updated codes and standards and higher and more volatile natural gas prices. This market stagnation has resulted in negative pressure on Enbridge's market share and throughput. To support its argument, the Company cited the decreasing penetration of gas water heaters in the customer replacement market and the increasing market share of electric fireplaces. EnergyLink would address these issues by increasing throughput and penetration of natural gas-fired appliances.

Another factor according to the Company that underlies the EnergyLink program is customer confusion about who to call for information regarding natural gas equipment and appliances. The Company indicated that customers see Enbridge as an unbiased party and a reliable provider of information[6]. Thus, it is no surprise that customers contact the gas utility for information on natural gas appliances. The Company has estimated that it receives 25,000 calls per year of this nature. EnergyLink would satisfy these customers by providing referrals to qualified contractors. More importantly, customers do not pay any fees for referrals and there is no charge to contractors to participate in the program.

The Company stressed the benefits of EnergyLink that it provides to ratepayers by increasing throughput. The program has a net present value of $4.1 million. The program provides a valuable service to customers and might assist customers in selecting a natural gas solution over an electric one. The Company also cited benefits to members in the form of free leads, free access to the EnergyLink brand, exclusive

[6] According to a survey done by Enbridge and filed in evidence, 75% of the Company's customers would trust Enbridge to provide reliable and credible information about contractors/retailers: Exhibit I-26-17, Attachment 3, page 8 of 19

sales campaigns, co-op advertising, access to training opportunities and other sales tools.

One issue specifically scrutinized by the intervenors was a proposal to offer a financing program whereby customers could finance their equipment purchase through the Enbridge bill. The Company indicated that Enbridge Solutions has still not made a decision about whether it intends offering a financing program and that EnergyLink is not a platform to launch an affiliate's financing program.

The Company argued that the issues raised by other parties have not demonstrated that the program is fundamentally flawed but rather the issues have merely created suspicions around EnergyLink. In that regard, in its reply argument, Enbridge made six commitments to the Board to address certain issues around this program:

1. Enbridge will send out an immediate communication to all EnergyLink contractors making it clear that they do not have to belong to EnergyLink to access the bill.

2. Enbridge will seek opportunities to encourage low interest financing for energy efficiency products or measures to be part of its market development activities and it will seek to include as many interested financing entities as possible.

3. Enbridge will investigate working with the TSSA in connection with independently qualifying these EnergyLink contractors.

4. Enbridge will establish an EnergyLink advisory group. This group will not be funded by ratepayers, but will be comprised of individual EnergyLink contractors to provide guidance and feedback and suggest continuous improvements to the program.

5. Enbridge will report to the Board in an appropriate time and fashion the following information: prior to launch, its plans regarding Phase II of EnergyLink with respect to retail options for natural gas white goods and

after completion of 2007, performance reporting including number of customers, number of referrals, customer satisfaction results, level of influence of EnergyLink, added load and DSM, and results of a contractor survey.

6. In full compliance with the Affiliate Relationship Code, Enbridge will continue to ensure that no non-public information about EnergyLink is communicated to any unregulated affiliate.

In response some intervenors submitted that the so-called “commitments” were materially new and untested. They were not introduced as evidence and should not be considered in this proceeding as they are inadmissible. The HVAC Coalition submitted that the commitments failed to address the fundamental problems with the EnergyLink program and its harmful impacts on the competitive marketplace and the Company’s ratepayers.

Board Findings

Enbridge is a leader in conservation initiatives in the Province and a considerable amount of consumer dollars are invested in this activity. The EnergyLink Program is designed to do exactly the opposite, namely to use consumer dollars to fund programs to increase the use of gas. In some cases, these projects would not meet the TRC standards that are used to evaluate their conservation initiatives. The result is that consumers would be receiving confusing messages and funding competing programs.

The other concern is the potential anti-competitive aspect of the EnergyLink Program. Much of this hearing centered on this issue. While the six commitments made by Enbridge in its reply argument attempt to address the anti-competitive concerns, these concerns continue to exist. There is no question that leads and inquiries go to the gas company and without a referral program many of these leads may be wasted. On the other hand, the evidence before the Board is that there is a growing and substantial industry capable of meeting market requirements. The unintended result of the Enbridge program might be to dampen this competitive development.

The Board finds that there is no clear evidence of market failure that requires the intervention of Enbridge through this Program. The Board is not convinced that the cost of the Program justify the benefits. The concern with declining average use remains of course. It should be addressed, in the Board's view in a more fundamental fashion as has been done in a number of jurisdictions that dealt with the issue of declining use.

Enbridge argues that the Board has accepted and approved the EnergLink Program in its previous rate case. The intervenors disagree. The evidence provided by the Company in that proceeding was limited. It is difficult to conceive that the Board intended to approve or approved a Program of the nature described in this hearing with its attendant costs based on the evidence, or lack of, that was before it. The Board will allow the Company however to recover the costs incurred to date but finds that no further costs should be recoverable from the ratepayers.

The Company indicated that it had budgeted $1.3 million in Operating and Maintenance expenses and $2.7 million in Capital expenditures for 2007 and that it estimates to have spent $3.3 million in capital in 2006. The Board finds that for ratemaking purposes the Company's 2007 Other Operating and Maintenance Budget shall be reduced by $1.3 million to $180.2 million. The 2007 rate base shall be updated to reflect the removal of any EnergyLink related capital expenditures. The Board understands that the Company in good faith has incurred actual costs in operating and maintenance expenses and capital expenditures related to the EnergyLink program and it would be unfair to the company to have to absorb these costs. The Board approves the recovery of the 2007 Operating and Maintenance expenses incurred as of the date of this decision, but no more than $1.3 million. The Board approves the recovery of capital expenditures, but no more than the 2006 estimated and 2007 budgeted amounts spent to the date of this decision. The balances will be amortized evenly over three years starting in 2007. The Company therefore shall include a rate rider as part of its draft 2007 rate order, with appropriate supporting documentation as to the calculation of the specific amounts.

OPEN BILL ACCESS

This section addresses the “non-settled” aspect of Issue 7.5. Issue 7.5, “Is the Applicant’s proposal of open bill access appropriate and consistent with the direction in EB-2005-0001” has two aspects, (i) third party billing information included on the Enbridge bill (“billing services”) and (ii) the inclusion of third party inserts in the Enbridge envelope (“inserts”). “Billing services” was completely resolved in the 2007 Settlement Proposal. “Inserts” was not.

Certain parties (Enbridge, Direct Energy, OESLP and Union Energy) agreed to settle the billing insert component on the basis that the Company can proceed with the Insert Service subject terms listed in Appendix D page 1 of the Settlement Proposal. HVAC, VECC and Schools did not agree with the proposed settlement and CCC opposed the settlement in order that it may be permitted to pursue cross examination on the issue. GEC and Pollution Probe reserved the right to pursue in the hearing whether the Board should order that third parties not be allowed to use the billing services for the billing of specific products on the basis of their environmental attributes. Superior opposed the proposed settlement on the principle that it is not supportive of a settlement position that would allow for the Company to promote system gas through billing inserts.

Open Bill Access was an issue in the 2006 test year proceeding (EB-2005-0001/EB-2005-0437). In that Decision, the Board indicated that although that there may be merit in sharing the bill with service providers, Enbridge had to make a more thorough case. The Board noted that concerns, including ratepayer benefits, impact on the public interest, the potential for customer confusion, non-discriminatory access, and interim versus comprehensive solutions needed to be addressed.

Positions of the Parties

The Company's basic justification for the program is to increase the use of natural gas to offset a declining rate of usage on a per customer basis through the promotion of sales of goods which utilize natural gas. According to the Company, the program will also fulfill the expectations of customers that Enbridge will provide them with information about natural gas products and services while providing them with the option of opting out from receiving such information. In addition, the Company asserts that the program will provide an additional ratepayer benefit through earnings sharing and lower cost of service, provide additional opportunities for DSM and enhance customer convenience and improve customer satisfaction.

Parties supporting the program submitted that the program would provide equal and fair access to both big and small vendors to the envelope and would be in the public interest given ratepayer financial benefits and customer communications.

GEC and Pollution Probe supported the program on condition that it not be used to promote inefficient products and services. The results should be TRC positive and consistent with DSM purposes.

Parties disagreeing with the program noted that the presence of third party inserts will obscure and dilute the impact of safety and regulatory inserts, will cause customer confusion, that survey data supporting customer interest in receiving the inserts is ambiguous and that the 50/50 income sharing arrangements are inadequate.

HVAC, as a potential user of the service, submitted that the Board direct the Company not to proceed with a bill insert service at this time because risks and inconveniences to ratepayers exceed any benefits, the program does not comply with the Board's direction in providing open access, the bidding process does not meet the test of being non-discriminatory, and the Company still has to demonstrate a bidding structure that accomplishes the goals of open access and revenue maximization. HVAC also raised the question of whether, in the first instance, it is appropriate for a utility to use its envelope to sell the services of private companies.

Board Findings

There are a number of criticisms of the procedures the Company developed for bill insert service.

There is no question that granting access to the bill for bill insert service can improve the competitive framework. That explains the reason the Program is supported by intervenors such as Direct Energy. There are complaints however by HVAC that the bidding structure for mid-size companies is not satisfactory. The Board believes that these concerns should be carefully investigated by Enbridge with a view to meeting the concerns of HVAC consortium in a revised bidding structure. Nonetheless, the Board believes that the Program is in the public interest subject to certain conditions expressed below.

First, there is a concern that crowding the bill with inserts tends to weaken the message for all participants and as a result a portion of the readers actually do not pay any attention to the inserts at all. The Board believes that the suggestion made by CCC has some merit and where a safety notice or rate increase is being publicized through a bill insert, no other material should be included in the bill for that particular mailing.

The Board also has some sympathy with the submissions made by GEC and Pollution Probe and agrees that access to Enbridge's billing envelope should be consistent with the Company's DSM Program and restricted to appliances so that they meet existing TRC tests. However, the Board concludes this would burden the initiative with an undue administrative oversight requirement and instead relies on the Company's exercise of discretion on this matter.

The last matter at issue is the income-sharing aspect. Enbridge proposes a 50/50 split in income received from the bill insert service. The infrastructure costs of this service are paid for by the ratepayers while the incremental costs are paid for by the companies seeking access to the bill. The Company forecasts the maximum ratepayer benefit in the order of $2.5 million. The question is how are the profits to be shared. This is admittedly a matter of judgment but in the circumstances the Board accepts the Company's proposed 50/50 split.

Accordingly, the Board accepts the proposed program, subject to the aforementioned provisions, as described in Appendix D of the 2007 Settlement Proposal.

RISK MANAGEMENT PROGRAM

In the Company's last year's proceeding (EB 2005-0001), the Board stated in its decision as follows:

> The question that remains is the extent to which Enbridge's risk management program is redundant or represents a useful and cost effective tool to reduce consumer price volatility in a fair and reasonable way.
>
> …
>
> No evidence has been provided that demonstrates whether the hedging activity had a material effect on the volatility experienced by customers, given the effects of QRAM, the PGVA, and equal billing programs over the same period.

and directed:

…. Enbridge to prepare for consideration in its next rates case evidence which demonstrates the extent to which the Company's hedging activities in 2003, 2004, and 2005 would have resulted in reductions in volatility for its customers, had it applied the proposed $75 action level.

Issue 3.10 in this proceeding asks: "Is the continuation of the Risk Management Program appropriate in the context of the Board's 2006 Decision directives?" Issue 3.13 deals with the disposition of existing deferral and variance accounts, including the Gas Supply Risk Management Program Deferral Account.

In response to these issues, the Company is seeking approval for two things:

(a) the continuation of its Risk Management Program; and

(b) closing to rate base of the expenditures incurred upgrading from an Excel spreadsheet to a database format which have been recorded in the Gas Supply Risk Management Program Deferral Account.

While the risk management program affects all customers that are on system gas who may be served under Rates 1, 6 or 10, the Company acknowledged that the objectives of the program are aimed at residential and small volume general service customers. The Company also acknowledged that it is the customers that are not on direct purchase and the customers that are not on budget billing that are most affected by the program.

The Company has an optional budget billing plan where the customer, whether direct purchase or system gas, can smooth rate fluctuations by making payments of equal amounts. The Company also has a Board-approved QRAM mechanism where commodity prices are updated quarterly to reflect more recent forecasts. The updated forecasts also form the new base for the PGVA, a mechanism for capturing the differences between forecast and actual commodity costs to the Company. Under the budget billing plan, the customer's forecast payments for a twelve month period starting in September are equalised with July being the true-up month. For August, actual use is being billed. A customer's bill is reviewed every three months and revisions to the amounts may be required to reflect the customer's natural gas usage or if there is a significant change in the reference price or both.

The Company acknowledged that if it terminated its risk management program, it would not affect its gas supply as the program is done through financial instruments only. The Company also indicated that even if it had a more frequent rate adjustment mechanism than quarterly, this may not have any impact on the price volatility that is happening in the physical market. The Company explained that any frequency of rate adjustment will have the potential to change the magnitude of the PGVA but the PGVA is driven mainly by the volatility in the forward 12-months prices.

The Company's evidence showed the impact of its Risk Management activities on the PGVA reference price from January 1, 2002 through to October 1, 2006. The

Company's evidence displays the actual PGVA reference price and what that price would have been without Risk Management activity built into it and the quarter-over-quarter change of the PGVA reference price for both the risk-managed and non risk-managed pricing scenarios. The variance of the risk-managed versus non risk-managed scenarios is calculated in absolute dollar terms per 10^3m^3. The evidence shows that, in general, risk management results in less volatility in the PGVA reference price. The quarter-over-quarter swings are muted by risk management. The largest variance is negative \$6.07 per 10^3 m^3. Generally, the volatility reduction over the period was in the \$1 to \$2 per 10^3 m^3 range.

The Company acknowledged that it did not provide the information or calculations sought by the Board in the previous decision to demonstrate whether the hedging activity had a material effect on the volatility experienced by consumers given the effect of QRAM, the PGVA and the budget billing plan. The Company explained that it would be very difficult to recreate that history given how the hedging program works with the trigger points and hedging instruments. It would be largely a theoretical exercise and the results would not be reliable.

In responding to questions whether the risk management program should be addressed as part of a pending review of the QRAM process, the Company indicated that this review is aimed at reviewing cost allocation issues to system gas and standardization of QRAM for Enbridge and Union Gas, and that the risk management issue can be assessed independently of this review.

The Company has recorded the sum of $691,500 in the 2006 Gas Supply Risk Management Program Deferral Account ("GSRMPDA"). These amounts were incurred by the Company converting from Excel spreadsheets to a database format, as recommended by RiskAdvisory in the RP-2003-0203 proceeding. In the last main rates case, the Board chose not to close the IT capital costs in rate base as requested by the Company and, instead, found that the balance should be disposed of according to the Board's decision in this case. The Company proposed that, even if the Board directed discontinuance of the risk management program, the capital costs should be recovered from ratepayers as these costs were prudently incurred. The Company noted that RiskAdvisory's recommendations to convert the format were at no time challenged by any party and that at the time the Company began incurring these costs, it had recently been told by the Board that risk management was of value to ratepayers and would be continued.

Tom Adams, on behalf of Energy Probe, calculated the impact of the program on customer bills to be no more than one percent. His evidence also noted the $107 million losses incurred by the program in the last five years and expressed concern of the intergenerational inequities that arise from those losses. He concluded that the Company's risk management program is redundant and is therefore neither a useful nor an effective tool for reducing volatility for the residential consumer.

The Company noted that Mr. Adams' evidence only shows the impact of the risk management program on the commodity price at points in time; not the difference in the volatility the customer experiences over the quarter-over-quarter change, which in the Company's view was the Board's direction in the previous rate case. When prices are compared at the same point in time, the Company argued, it is not going to give an indication of the volatility or the extent of the price change that a customer experiences. On the other hand, the Company's evidence shows exactly that.

Positions of the Parties

The Company noted that risk management is an activity common to utilities across North America and that the Board itself noted in its Decision with Reasons in the RP-2003-0203 proceeding that only one major Canadian gas utility does not have a risk management plan. The Company's risk management activities have been the subject of two customer surveys, regular reviews by the Board and a detailed examination by a recognized expert in risk management activities, RiskAdvisory, only several years ago. The purpose of such activities and the benefits to ratepayers have not changed, and while the Company has been undertaking risk management activities for many years, the evidence in support of it is very current, beginning with the 2003 Rates Case (RP-

2002-0133). In its Decision with Reasons, the Board found that risk management activities are of value to ratepayers.

Ratepayers should not conclude they have either benefited or lost because of the risk management activities in any specific year, because when one views the net impact of such activities over time, the net impact will change from positive to negative, or vice versa, from year to year. While there will be gains and losses in each year in which risk management activities are undertaken, the net effect over time will be close to zero.

As demonstrated by the Ipsos-Reid Survey filed in the proceeding, a significant majority of ratepayers favour the Company undertaking steps to mute price volatility. The fact that the Company is regulated does not and should not reduce the need to exhibit good business practices by responding favourably to reasonable service requests by customers.

When one examines the results of risk management activities over time by looking at the percentage reduction in quarterly price changes on a quarter over quarter basis, the results are material and of value to ratepayers. The estimated $170,000 annual O&M cost associated with risk management amounts to little cost on a per customer basis. For the same reasons that industrial customers undertake similar activities to moderate commodity price volatility, so too should residential and commercial customers on system gas similarly benefit from risk management activities undertaken on their behalf collectively.

The Company cautioned that the value of risk management activities to ratepayers not be confused with the impact on the monthly amounts payable by customers that subscribe to the budget billing plan, which is simply a budgeting tool for ratepayers - it does not have any impact on the commodity price otherwise payable. Customers on the budget plan can be subject to large increases and decreases in the monthly amount payable to reflect price and consumption changes. The direct purchase customers have already eliminated commodity price volatility by agreeing to a fixed commodity price. The reason why such customers opt for the plan is not to address commodity price volatility, but for budgeting and/or the smoothing of invoice amounts over the better part of a year.

Enbridge argued that Energy Probe fails to look at volatility from one quarter to the next, and instead expresses the results of risk management as simply a percentage of the commodity price at a particular point in time.

CCC supported the continuation of Enbridge's risk management program and proposed that a broad review of system gas pricing is the most appropriate forum to consider how best to weigh the objectives of providing meaningful pricing signals but at the same time minimizing volatility.

VECC also supported the continuation of the program and the clearing of the $691,000 deferral account as proposed by the Company and stated that any concerns about the program should be addresses in the Cost Allocation of System Gas and QRAM process generic review.

Energy Probe argued that the Company has not been able to demonstrate that its risk management program had a material effect on the price volatility experienced by customers. While the operating costs of the program are not substantial, large losses have been incurred and there is no indication that these large losses will not become even larger, giving heightened concerns for inter-generational inequities and non-price transparency. Energy Probe submitted that the program should be terminated, in an orderly fashion but noted that it is not opposed to the $691,000 expended amount to be closed to rate base.

IGUA submitted that the Board should focus on the program's incremental value to that of the combined effects of QRAM, the PGVA, and the budget billing program. In IGUA's view, neither the Enbridge nor Energy Probe's evidence completely addresses the issue of incremental value. IGUA argued that the Company's risk management program does nothing to reduce the volatility that remains inherent in the QRAM regime. IGUA noted that Enbridge's cumulative losses because of the risk management program should prompt the Board to seriously consider directing Enbridge to cease the program.

Should the Board be reluctant to treat Enbridge differently than Union Gas, then the programs for both utilities should be reviewed on the basis of their incremental value over and above the smoothing already produced by the QRAM, the PGVA and budget billing programs in the generic QRAM proceeding contemplated in the Board's 2007-08 business plan. As for the $691,000 expended amount, IGUA argued that it should not be recovered from ratepayers since Enbridge has failed to satisfy the Board's condition that the program has value.

Schools argued that it would be in the public interest to phase out the Company's risk management program as soon as reasonably possible as it has not delivered benefits over the costs. The program has had only a limited impact on reducing volatility and there are other less costly methods of reducing volatility, such as the budget billing plan. To the extent that the program does have any impact on reducing price volatility, it mutes price signals and thus it runs counter to promoting conservation and encouraging market choices.

Board Findings

The Company and others have placed much emphasis on what they perceive is being revealed by customer surveys on the Company's risk management activities. Results of customer surveys cannot and should not be determinative of disposing of a matter. The Board's mandate is to set just and reasonable rates, which involves a balancing of many considerations. A prime consideration is cost effectiveness. It is clear that the previous Board panel decided the way that it did with the benefit of the Ipsos-Reid survey. The Board panel in that case made the decision that it did, which was to enunciate certain tests under which the Company's program should be scrutinized.

The previous Board panel concluded that no evidence had been provided that demonstrated whether the hedging activity had a material effect on the volatility experienced by customers, given the effects of QRAM, the PGVA, and equal billing programs.

The Company explained that it was not feasible to do so in this case, given the way its hedging program operates, the change in threshold levels, the complexities in attempting to reconstruct history and the questionable reliability of the ultimate results. The Board accepts this.

This leaves the other finding of the previous Board panel. Namely, the extent to which Enbridge's risk management program is redundant or represents a useful and cost effective tool to reduce consumer price volatility in a fair and reasonable way.

The Board notes the Company's concerns that the value of risk management not be confused with the impact of the budget billing plan on the monthly amounts payable by customers that subscribe to the plan. But the conclusion cannot be any other than there is little if any value for customers on the budget plan. There is no offset to bill volatility for these customers. These customers make equal payments for ten months of the year, and they eventually pay the actual costs. Adjustments prior to true-up may be required from time to time but these can also be because of factors other than commodity price changes. The existence of a risk management program is not really that relevant or of value for those customers.

This leaves the system customers who are not on budget billing. The volatility reduction over the last five years was in the \$1 to \$2 per 10^3m^3 range, which is fairly small relative to the prevailing PGVA reference price. The impact on the total customer bill impact in percentage terms is very marginal. The Company's argument that the annual costs associated with the program are small is not persuasive. This can be said about many other program and activities costs. The relative small size of costs involved in a program should be only one consideration. Other considerations are also important.

The Board notes from the evidence that for the period January 2002 to October 2006, the impact of the program was an accumulated net loss of \$107.3 million. In 2006, the loss was \$110.5 million. For 2007, at the time of the hearing the position of the account was a loss of about \$16 million. Clearly, in the most recent five years at least, the program was not an effective enterprise. It came at a high cost to the consumer. It is possible that the losses may be reversed in the future. It is however questionable whether this is necessarily a zero-sum game. To have a zero-sum result from the current position as a starting point, gas prices going forward have to be assumed as trending upward, not just gyrating around their current level, and that there is no cost in engaging in hedging.

Further, losses or gains as a result of the program do have intergenerational impacts. These impacts can be significant at times. The $110 million loss in 2006 for example is a cost that will need to be recovered by customers who may not have been customers during the time the loss had occurred. Although inter-generational impacts cannot be avoided in every circumstance, they should be mitigated or avoided when it is possible and reasonable to do so.

The Company's and Energy Probe's evidence have satisfied the Board that the rate smoothing attributable to the Company's risk management program for the remaining system customers not on equal billing is marginal at best. While the annual costs of operating the program are of lesser concern to the Board, the inter-generational impacts in light of the substantial losses are of significant concern.

Given the program's minimal impact on the other system customers not currently on equal billing, the impact will likely be unnoticed by these customers. For these customers, the option is still available to take advantage of the Company's equal billing plan if they so choose.

For all of the above reasons, the Board directs the Company to cease its risk management program as soon as practical.

In reaching this conclusion, the Board has considered the arguments that Union has an approved risk management program. This panel of the Board is mindful that, to the extent possible and practical, Board regulatory policy should be consistent. However, it would not be appropriate on the basis of the evidence adduced in this proceeding for the Board to allow continuation of Enbridge's risk management program. It would similarly not be appropriate to defer this matter to the future Cost Allocation of System Gas and QRAM process generic review without ruling on the matter on the evidence adduced in this proceeding. In that this decision may have implications for Union in a future rates case, it would be up to parties to raise the issue in a future Union proceeding.

With respect to the $691,500 recorded in the 2006 Gas Supply Risk Management Program Deferral Account (“GSRMPDA”), the Board is mindful of the Company’s concern of the longer term problems for decision making, on IT projects specifically, if the test is something other than the prudence of undertaking these projects based on the information available to the Company at that time. Given the history of endorsement of the Company’s risk management program by intervenors and the Board, the Company’s decision to proceed with the implementation of the recommendation by its consultant is certainly understandable. In these circumstances, the Board will allow recovery of the costs recorded in the 2006 GSRMPDA. The 2007 draft rate order is to include the full disposition of this account in 2007 and Enbridge is to ensure there are no Risk Management related costs included in 2007 rate base. The Board considers appropriate that this amount will be recovered from system gas customers.

DEFERRAL AND VARIANCE ACCOUNTS

Issue 3.12 deals with the establishment of 2007 deferral and variance accounts. All except one of requested deferral and variance accounts were the subject of the Settlement Proposal accepted by the Board. With respect to Company's proposals regarding Customer Care and Open Bill Access related deferral accounts, the parties indicated that these would be addressed under Issues 7.2-7.4 and 7.5 respectively. In this regard, the establishment of a 2007 Open Bill Access Services Deferral Account remained unsettled as part of the larger Open Bill Access-Inserts issue and is addressed in the Open Bill Access Chapter of this Decision.

In the EB-2006-0021 Natural Gas Demand Side Management Generic Decision with Reasons, issued August 25, 2006, the Board ordered the creation of a deferral account to record any carbon dioxide offset credits that the Company might earn. The Company included this deferral account (the 2007 Carbon Dioxide Offset Credit Deferral Account) in this proceeding, which was not an issue but was filed for completeness.

Disposition of Existing Accounts

Issue 3.13 relates to the disposition of existing deferral and variance accounts. In the Settlement Proposal, there was an agreement to settle a number of existing deferral and variance accounts and to defer consideration of the clearance of others to a future date. The Company proposes to clear the balance of all settled accounts, adjusted to reflect the Board's decision in respect of accounts reviewed and tested during the hearing, together with the outstanding balance in the 2006 PGVA.

There was no agreement reached with respect to the disposition of six deferral accounts. One of these accounts, the 2006 Gas Supply Risk Management Program Deferral Account, was dealt with earlier in this Decision under Issue 3.10 "Risk Management Program". The following five deferral accounts will be discussed below:

2006 Electric Program Earnings Sharing Deferral Account (2006 EPESDA)

2006 Unbundled Rate Implementation Cost Deferral Account (2006 URICDA)

2006 Alliance Vector Appeal Cost Deferral Account (2006 AVACDA)

2005 and 2006 Gas Distribution Access Rule Costs Deferral Accounts (GDARCDA)

2006 Electric Program Earnings Sharing Deferral Account (EPESDA)

The Company proposes the disposition of $175,100 which amount has been recorded in this account as a credit to ratepayers. This represents 50% of the net revenue of the Electric Program earnings after deducting program costs. This account and the 50/50 sharing were approved by the Board in the EB-2005-0001 proceeding in its Partial Decision with Reasons, dated December 22, 2005.

CCC expressed concern with the "lack of evidence" provided in this case to support the calculation of the $1.45 million in gross revenue and the costs in material, service costs, and internal costs. CCC stated that while it accepts the clearance of this account as proposed, in the future the Company should provide detailed evidence in support of the calculation of net revenue and should be required to determine net revenue on a fully allocated cost basis. IGUA stated that it supports CCC's position with respect to this matter.

The Board notes that no party opposed the clearance of the balance on this account as proposed by the Company. The Board also notes that the DSM Generic Decision (EB-2006-0021) directed that, from 2007 onward, the gas utilities shall allocate their internal costs on a fully costed basis. The balance the Company seeks to dispose of relates to 2006. In any event, the Board accepts the Company's submission that, as this activity is new for the Company, the internal costs for 2007 will be minimal. The Board approves the clearance of the balance recorded in this account as proposed by the Company.

2006 Unbundled Rate Implementation Cost Deferral Account (URICDA)

The Company developed unbundled rates and services for power generation and large volume customers as part of the NGEIR proceeding, which concluded in August 2006. In that proceeding, all parties agreed that the Company should be kept whole with respect to the implementation and introduction of unbundled rates and services. Parties to the NGEIR Settlement Proposal agreed to support the establishment of the 2006 URICDA and to support the recovery by the Company of prudently incurred costs recorded in the account.

The amount recorded in this account which the Company proposes to be cleared to rates is $480,500. This is the cost to implement the new unbundled rates and services, including design, development and implementation of a manual tracking tool, training, communication, and customer education costs, as well as legal and staffing costs.

As part of the NGEIR proceeding, the Board was asked to consider a threshold issue about which customers should be responsible for the unbundled rates implementation of costs. In an oral decision delivered July 14, 2006, the Board found that these costs should be recovered from large volume customers. Accordingly, the Company proposed to recover these costs from all large volume customers, bundled or unbundled, based on customer numbers.

IGUA stated that it supports the Company's proposal to allocate the amount to the large volume rate classes using customer numbers as the allocator. However, IGUA noted that it reserves its rights with respect to the manner in which any credit balance accumulated in this account is cleared to rate classes in the future and reserves its right to seek a re-balancing of Rate 115 and the baseline from which this account will operate, in the event that Transalta continues to take service on Rate 115.

The Board notes that no party objected to the clearance of the balance in this account as proposed by the Company. The Board also finds the Company's proposal reasonable and approves it.

2006 Alliance Vector Appeal Cost Deferral Account (AVACDA)

In RP 2002-0032, the Board ruled that Enbridge could not recover some $11 million in costs arising from a contract to transport gas on the Alliance/Vector pipeline system. Enbridge appealed that ruling to the Divisional Court, which found that the Board had erred. The Board sought and was granted leave to appeal the decision by the Divisional Court to the Ontario Court of Appeal, which found that the Divisional Court had erred. Enbridge sought but was denied leave to appeal to the Supreme Court of Canada.

The Company has recorded costs of $529,000 plus interest in this Board-approved account. All of the costs, according to the Company, are external legal fees and disbursements associated with the Company's actions on the Board's application for leave to appeal to the Court of Appeal and the Company's application for leave to appeal to the Supreme Court, and none of the claimed costs are related to its own appeal to the Divisional Court.

During the 2006 rate case, the Company had planned to record relevant costs and seek approval for clearing these costs to rates by means of the Ontario Hearing Costs Variance Account. The Board, however, in its 2006 Decision, directed the Company to apply for a new deferral account specifically to capture the costs associated with the Alliance Vector appeal. The Company subsequently requested and received approval, under docket EB-2006-0144, to establish the account. The Board in its 2006 rates decision (EB-2005-0001) commented about some of the considerations that should apply when it is asked to consider disposition of costs relating to an appeal of a Board decision. Specifically, the Board stated:

> The rate structure in Ontario is predicated on a just and reasonable standard. Where a utility acting in good faith regards a Board decision to be unsound, it should be open to bring a Judicial

> Review action, and to have prospect of recovery of the associated costs.

In addition, the Board also had the following to say in that decision about determining the prudence of expenditures for appeals:

> In our view, the question of the prudence of the expenditure is not dependent on the success or failure of the review pursued by the Company; nor is the primary consideration whether the aspect appealed from inures to the benefit of the shareholder or the ratepayer. The determination of the prudence of the expenditure will turn on the reasonableness of the grounds for the review, the reasonableness of the costs incurred, including the relationship of the costs incurred to the likely outcome (which includes such intangibles as precedent, clarification of the law and corporate reputation), and the extent to which the Company can show that it prosecuted its case diligently and efficiently.

The Company submits that it clearly meets all tests which the Board stated are appropriate during its consideration of costs incurred by the Company on an appeal of a Board decision.

First, in respect of the Alliance Vector Pipeline disallowance by the Board, the amount was significant, being approximately $11 million. The appeal did not involve a frivolous amount.

Second, the Company was successful on its appeal to the Divisional Court and that this is clear evidence of the reasonableness of it undertaking the appeal. It also confirms that the Company acted in good faith launching the appeal. While the Company agrees with the Board that the prudence of appeal expenditures is not dependent on the success or failure of the review, the fact that an independent judicial body agreed with the Company, is irrefutable proof of the reasonableness of the grounds for the review and hence the appropriateness of it launching the appeal.

Third, as to whether the costs incurred were reasonable, the Company is not seeking to recover any of the costs it incurred associated with the original appeal to the Divisional Court.

Fourth, there can be no question about the appropriateness of the Company recording the costs which it did in this deferral account. In its EB-2005-0001 Decision with Reasons, the Board specifically stated that the Company should apply for a new deferral account to capture the costs associated with the Judicial Review process at Divisional Court and any appeal proceedings thereafter.

Fifth, all of the amounts recorded in this account relate to legal fees and disbursements invoiced by the Company's counsel on the appeal, Fraser Milner Casgrain, who were also counsel on the original Divisional Court appeal. Accordingly, there were no costs incurred which would be associated with retaining and educating new counsel.

Sixth, all of the legal bills that were received would have been directed through the Company's Associate General Counsel, and then they were subsequently reviewed to determine that the hours and dates spent were sufficient in the context of the proceedings. Counsel on the appeal, Fraser Milner Casgrain, were in fact the same counsel that acted for the Company in the proceedings before the Board where the Alliance Vector costs were disallowed. None of the costs associated with Fraser Milner Casgain's representation of the Company at that Board proceeding were disallowed.

Seventh, the OEB's costs for its leave to appeal the Divisional Court decision and the subsequent appeal of the Divisional Court decision are being recovered from Ontario ratepayers through the OEB's assessment authority. It only seems fair and reasonable that the Company also recover its costs from ratepayers for responding to the proceedings initiated by the Board.

CCC argued that the Company should not be allowed to recover any of the $529,000 amount claimed. In the alternative, it should recover no more than $30,000. In support of this alternative amount, CCC noted that the Board's principles were enunciated before Enbridge's application for leave to the Supreme Court and therefore these principles do not apply. Rather, section 40 of the *Supreme Court Act* specifies the criteria that the Supreme Court of Canada applies whether leave will be granted and Enbridge did not meet the Court's criteria. The Board must decide on the reasonableness of Enbridge's costs with that in mind, especially since Enbridge did not file any evidence so that the Board would be able to judge the merits of that application. Moreover, the $82,000 in costs associated with that application for appeal “seems grossly disproportionate”. With respect to the $445,000 in claimed costs for responding to the Board’s application for leave to appeal to the Ontario Court of Appeal and the appeal itself, CCC termed the claim “grotesque”.

IGUA and VECC noted that they support CCC’s position with respect to this matter.

Schools submitted that the Company’s evidence is insufficient to demonstrate the reasonableness of the costs claimed, which the Company was required to do. Even allowing for preparation time, $529,000 (before interest) for a matter that took one day of argument at the Court of Appeal is excessive.

The Board does not question the Company’s proposal to recover costs associated with its participation to the Ontario Court of Appeal and its application to the Supreme Court of Canada. Neither does the Board question the existence of records to support this claim. It is not expected that the Company file such detail as part of its pre-filed evidence. While the onus is on the utility to prove its case, it was open to the parties to ask for supplementary information through the interrogatory process or during the hearing when the issue was canvassed. Parties did not develop that additional record. It is not reasonable to now fault the Company for an “insufficient” record. On the record before it, the Board finds it appropriate that the recorded balance in this account should be recovered by the Company, as proposed.

2005 and 2006 Gas Distribution Access Rule Costs Deferral Accounts (GDARCDA)

The amounts recorded for the 2005 and 2006 GDARCDA are $435,200 and $7,985,400, respectively. These amounts are to be capitalized. The amounts recorded in these accounts relate to the costs incurred by the Company to ensure that it is GDAR compliant.

The Board and all participating parties have been aware over the years that the Company would incur significant costs to meet the requirements of GDAR. It has only been over the course of the last year where enough detail has been driven out to the point where the Company could start to look at how it would have to re-engineer its business processes and modify its computer systems to accommodate the rule.

The project has been governed by a Steering Committee, in addition to an external risk manager, and a senior representative from both the Company's IT and Regulatory groups.

There has been a Project Manager in place throughout who reports to the Steering Committee and who also manages external resources working on the project. The Company has had a detailed project plan in place, which includes work plans and project milestones which form the basis of the project's budget.

The costs recorded in the 2006 deferral account plus the costs that the Company will incur in 2007 to be compliant by June 1st, in total will be about $1.7 million lower than the initial estimates provided.

CCC supported the clearance of the accounts, on the assumption that the costs are entirely related to Service Transaction Requests, but noted that this support is in no way an acceptance of the reasonableness of the GDAR costs that will be incurred in the future.

IGUA noted that it supports CCC's position with respect to this matter.

VECC stated that it has no reason to dispute the prudence of the costs incurred in this account. VECC requested that the Board require the inclusion of a representative of small volume customers in the remaining GDAR implementation stages as the small volume customers were not directly engaged in the process, though they will bear the cost consequences.

On the basis of the evidence, the Board has no reason to doubt that the reported balances are not related to Service Transaction Requests and that they are not reasonable. The Board accepts the disposition of the reported balances as proposed by the Company.

With respect to VECC's request for inclusion of a representative of small volume customers in the remaining GDAR process, the Board notes that GDAR is an independent initiative from this proceeding and VECC may make this request in that process.

CAPITAL STRUCTURE AND COST OF CAPITAL

Issue 4.2 was whether the Company's proposed costs for its debt and preference share components of its capital structure appropriate. No party took issue with the Company's evidence, nor does the Board.

This section therefore addresses the remaining issue related to capital. Specifically, Issue 4.3 read "Is the proposal to change the equity component of the deemed capital structure from 35% to 38% appropriate?" There was no settlement of this issue.

The Company' evidence is that it has suffered a dramatic decline in its financial strength. As a result, Enbridge's ability to raise new long term debt has been constrained and there is a real risk of a further downgrade in the Company's credit rating. An increase in its common equity ratio from 35% to 38% is necessary to restore the Company's financial integrity to a level that will allow it to sustain access to long term capital on reasonable terms. An increase in the equity thickness to 38% is also warranted by reason of higher business risks now faced by Enbridge. This latter evidence was given on behalf of Enbridge by Paul Carpenter of the Brattle Group.

Enbridge attributed the erosion in its financial strength to a steady decline in the allowed ROE that has outpaced the effect of declining interest rates on the Company's financing costs. Long term debt is issued at fixed rates for fixed terms and the rates payable on this embedded debt do not change as interest rates decline and the ROE goes down. As ROE declines, and the cost of long term debt remains fixed until debt maturities occur, the Company's ability to cover the interest on the debt is limited.

A measure of a company's financial strength is the Earnings Before Interest and Taxes (EBIT) interest coverage the ratio which is the quotient of the company's earnings divided by its interest expense. Enbridge noted that lower interest rates lower the ROE immediately but it takes time for the interest expense element of the Company's interest coverage ratio to decrease as interest rates decline, because Enbridge cannot refinance all of its long term debt in every year. The result is a lower EBIT coverage ratio which diminishes the Company's ability to issue new debt.

According to the Company, its weather-normalized EBIT interest coverage declined from a ratio of 2.38 in 1993 to 2.10 in 2006. Enbridge's margin above 2.0 times coverage for each of the years from 1993 to 2006 declined from $48.0 million in 1993 to $16.8 million in 2006.

Specifically, the Company noted that its existing trust indenture prohibits the issuance of new term debt if Enbridge's actual legal entity EBIT interest coverage ratio for any consecutive 12 month period out of the last 23 months does not exceed 2.0 times. In order for Enbridge to stay in compliance with the financial covenants in the trust indenture, the margins above normalized utility EBIT 2.0 times coverage must allow room to accommodate the effect on the Company's financial results of unexpected swings in the weather. EBIT margin above 2.0 times interest coverage had declined to $16.8 million by 2006. During the period since 1993, the average annual impact of weather on the utility's EBIT has been $35.0 million. The margin above 2.0 times interest coverage of $16.8 million is significantly less than what the Company needs to accommodate an average swing in the weather.

Enbridge testified that it must maintain a normalized allowed utility EBIT interest coverage ratio of at least 2.2. The requested equity ratio of 38.0% marginally achieves this minimum target. Given the magnitude of volatility in its earnings, the Company noted that even with 38% equity thickness and the minimum coverage at 2.2 on a weather-normalized basis, there is no assurance that Enbridge will always meet the new debt issuance test.

The Company indicated that, because of the considerably warmer than normal weather it experienced in 2006, it would not be able to meet the interest coverage test for any 12 month period that includes the period January-March 2006 to enable it to issue new debt. Actual weather in the first quarter of 2006 was considerably warmer than forecast. The warmer weather in the first quarter of 2006 alone reduced Enbridge's EBIT by

$33.3 million and the negative impact on its earnings because of weather was $57.7 million in impact for the full 2006 year.

The impact of a lower ROE in 2006 combined with actual results for January 2006 to March 2006 caused a significant decline in the actual interest coverage ratio, such that, as of January 2007, the ratio is about 1.85 times to 1.95 times depending on the 12 month period chosen from the previous 23 months. The Company noted that its ability to meet the new debt issuance test through 2007 and beyond will depend on the equity thickness allowed by the Board in this case and actual operating results for 2007, including any weather variances.

It is Enbridge's judgment that the ultimate costs to the ratepayer will almost certainly be higher if the Company's credit quality is allowed to decline further. Costs will rise due to constraints on accessing the long term debt as there is a risk for credit rating downgrades leading to suboptimal financing options.

Enbridge's evidence was supplemented by the evidence of Paul Carpenter of the Brattle Group. Dr. Carpenter provided evidence about changes in business risk that have occurred since 1993, when the appropriate level of equity thickness for Enbridge was last considered by the Board. Dr. Carpenter contends that equity investors would consider investment in Enbridge to be more risky than it was in 1993 because of a) changes in the commodity market for natural gas, b) increased risk of bypass, c) new gas-fired generation, and d) uncertainty as to the future rate regulation framework. Dr. Carpenter's remedy is also an increase in the common equity thickness but from the Company's business risk perspective, independent from the credit quality considerations advanced by the Company.

Dr. Booth, on behalf of CCC, IGUA and VECC, testified that Enbridge's current 35% allowed common equity is reasonable, if not generous. In support of that conclusion, Dr. Booth testified that Enbridge's short-term business risk is low and lower than that of Union Gas whose common equity thickness was negotiated at 36%. Furthermore, Enbridge's credit ratings have been quite stable, placing the Company among the premium group of regulated utilities in Canada.

Enbridge provided comparisons of its currently approved equity level to the equity levels in other Canadian jurisdictions and noted that it is apparent that Enbridge's equity ratio has fallen out of line during a period of years when the appropriate level of equity for the Company has not been considered by this Board, but equity levels for other Canadian utilities have been increasing.

Enbridge noted that Professor Booth's view of appropriate equity levels is not shared by Canadian regulators and is not reflective of what actually happens in the Canadian capital markets. According to Enbridge, there is clear trend in regulatory decisions towards higher levels of equity for Canadian regulated utilities. Professor Booth's views about debt/equity ratios of Canadian regulated utilities run counter to this trend and his recommendations are not aligned with what is actually happening in Canadian capital markets.

Positions of the Parties

Board Staff noted the testimony by the Company's witness that Enbridge's business risk is "pretty similar" to that of Union Gas' and that Union Gas' common equity was settled at 36%. On this basis, and on the basis that the Board has decided that a consistent debt-equity capital structure be implemented among electricity distributors, Board Staff stated that a common approach may be merited for the gas utilities and that a 36% common equity for Enbridge may be warranted.

Union Gas submitted that the OEB must consider capital structure in the context of well settled principles governing return on investment to equity holders. This includes a consideration of comparable risk, ensuring financial integrity and the attraction of capital on reasonable terms. Business risks have increased for utilities in Canada and interest coverage ratios are barring Ontario utilities from access to capital markets at a time when infrastructure investment is as important as it has ever been. Union Gas also noted that there has been a trend to increased equity thickness awarded to energy utilities across Canada.

CCC submitted that Enbridge has not demonstrated that it requires an equity component of 38%. CCC argued that Enbridge has not demonstrated that either its business risk or its regulatory risk has increased. CCC noted Dr. Booth's evidence that Enbridge's inability to access debt in the form of unsecured Medium Term Notes (MTN), is only temporary. It has been the result of the combination of warmer weather and decline in interest rates which affect return on equity pursuant to the Board's adjustment formula. As existing debt issues mature and are replaced with new ones at current interest rates, Enbridge's interest coverage ratio will naturally increase. It would not make sense to implement a longer term costly solution to address a temporary problem. CCC submitted that Enbridge has not demonstrated that its credit ratings are in jeopardy. CCC also submitted that Enbridge has effectively put itself into this temporary situation by flowing amounts to its parent during 2006 beyond what was approved by the Board. CCC noted that Union Gas has an equity level of 36% and that Enbridge's own witness, Dr. Carpenter, acknowledged that Union Gas is riskier than Enbridge. CCC noted that while it is acceptable for the Board to consider whether or not Ontario distributors should be subject to weather risk, this was not on the issues list in this proceeding. Had this been the case, parties, including Union Gas, may have filed evidence. It would be premature for the Board to make this determination in this case without the benefit of an appropriate forum for this issue to be aired.

IGUA argued that Enbridge's business risks have always been and remain low. Any recent changes in business risks facing Enbridge are immaterial and do not justify an equity ratio greater than 35%. IGUA argued that an equity ratio greater than 35% cannot be justified by comparing Enbridge to other utilities. Regulatory decisions of other tribunals do not assist Enbridge in satisfying the threshold requirement of objective and independent evidence that a material change in risk has occurred. Existence of weather risk cannot prompt an increase in Enbridge's equity ratio. The regulatory tools which should be used to respond to the weather risks Enbridge faces are the rate design measures and/or the removal of the weather risk from the Company through a deferral account as it is done by the British Columbia Public Utilities Commission. However, any consideration by the Board of a weather adjustment mechanism should take place in the context of a generic proceeding. With respect to

Enbridge's claims regarding the challenges in interest coverage and access to debt capital, IGUA argued that this is only temporary and will disappear as the Company's long term debt issues mature. IGUA termed Enbridge's proposal as a "base year stuffing" measure before the long-term incentive regulation is implemented. IGUA argued that Enbridge's actual normalized EBIT interest coverage ratio for the "stand alone" utility is more than adequate. IGUA particularly noted that the exclusion from normalized actual earnings of the sums paid by Enbridge to its parent and affiliates in excess of Board-approved amounts.

Energy Probe supported IGUA's arguments. It further noted that the Company is far from facing a crisis. The Company's proposal is in effect a request for costly insurance, to the tune of $9.5 million annually, which does not represent the least overall cost solution.

VECC submitted that Enbridge's problem of access to the MTN market is temporary and should be addressed by short-term solutions that provide access to needed capital until existing debt is retired. The best and least cost solutions according to VECC are either using commercial paper swapped into medium term debt or a medium term preferred share issue. Either one of these solutions would allow Enbridge to access capital on reasonable terms until its high coupon debt gets refunded over the next few years. Since 2008 is likely to be the first year of incentive regulation, establishment of a deferral account would allow Enbridge the opportunity to recover any prudently incurred incremental costs of maintaining access to the MTN market. In VECC's view, Board Staff's regulatory symmetry with Union Gas is not appropriate, since it does not take into account the fact that Enbridge has lower business risk than Union Gas, or that Union Gas' equity was the result of a negotiated settlement.

Board Findings

The Company's proposal for a thicker common equity in the deemed capital structure is grounded on business and financial risk considerations as well as its deemed common equity has fallen out of line with other Canadian utilities.

While the Board is of the view that Enbridge has presented credible evidence of a trend among Canadian regulators in finding thicker common equity for utilities, the Board does not generally find a comparison of Enbridge's common equity ratio with those in other jurisdictions to be necessarily determinative of the issue. An applicant must still satisfy the threshold requirement of independent evidence that material changes have occurred to justify a thicker common equity. Moreover, the hazard in doing so is that it engages issues of oversimplification and circularity, which downgrade the specificity that is required to make decisions pertaining to a particular utility. With those caveats, the Board nevertheless is mindful of the increasing trend and has factored this in its deliberations.

There is some value in considering evidence on the relative risk profile of the two large Ontario gas utilities. While Union's current 36% common equity was the result of a negotiated settlement, Enbridge's proposal for a 38% common equity level is materially higher than Union's, which is not consistent with the relative business risk profile of the two utilities. In fact, there was no dispute that Enbridge is a lower risk utility than Union Gas.

The Company claims that its business risk has increased over the last 10 to 15 years on several fronts. These are addressed below.

The Board agrees with parties who argued that the regulatory and legislative risks which Enbridge currently faces are not greater than they were last year or in prior years, at least not materially greater.

With respect to the risk of bypass noted by the Company, the Board is of the view that the Company has under-estimated the risk mitigation through the development and approval for rate options to specifically address the need of gas fired generators and mitigate any potential for bypass risk.

With respect to the claim by Enbridge that incentive regulation could lead to increased regulatory risk, Enbridge has operated under a performance based mechanism before. Moreover, the tenet behind an incentive regime is that the utility can reap the benefits of newly found efficiencies and it is only upon rebasing that these efficiencies will be shared with or passed on to ratepayers. From these perspectives, an incentive rate reqime is not necessarily an arrangement that negatively affects the risk of the utility.

From the market reports that were filed in the proceeding, there is no evidence on balance that Enbridge no longer enjoys a reasonably stable legislative and regulatory environment.

Even if there was some recognition of increased business risk in the totality of the Company's arguments, this must be weighed against other positive considerations. For example, the Company's evidence indicates that customer growth continues to be strong and natural gas remains the predominant fuel of choice in Enbridge's franchise area. Enbridge's customer base is consistently growing year after year. The Board does not see this as indicative of increased business risk.

In the result, the Board finds that the evidence presented by Enbridge does not warrant an increase in the common equity thickness to 38% on account of increased business risk, but the evidence on the trend of common equity thickness suggests that the 35% level in existence since 1993 should be considered as a floor.

This leaves the Company's proposal to also be evaluated on the basis of its claimed inability to raise capital, at least on reasonable terms.

The Board accepts that decreases in interest rates in 2006 have impacted the Company's EBIT adversely as there is a lag between the reduction in ROE and reductions in the total debt interest liability. The warmer than normal weather in 2006 contributed to the impact on EBIT. To worsen matters, the Company has paid out considerably more to its affiliates than what was reflected in the Board's 2006 revenue requirement decision. Whether or not the Company will be able to raise long term debt in the 2007 test year will very much depend on weather and its overall performance going forward.

The Board accepts that there may not be a practical way to circumvent the interest rate covenants in the current trust indenture. To alter these covenants would require agreement by current debt holders and this will likely come at a cost. To be clear, the Company is not suggesting that this would be a reasonable remedy. It is unfortunate that these covenants pose such a high restriction. The Board notes that the Company is considering ways by which the existing covenants may be replaced in the longer run. The Board encourages the Company to pursue this initiative.

The Board agrees with the many intervenors who argued that the problem is or may be temporary. On the assumption of a continuing low interest rate environment, as debt matures and is replaced the lower interest charges would provide some relief. If interest rates increase, the relief may be quicker. Relief may well even come from weather.

In any event, like many intervenors the Board is not convinced that the Company's proposed remedy to what is or may be a temporary problem represents the least cost solution. The common equity component of Enbridge's capital structure is and should be a matter that is reviewed infrequently. The Company's proposal to increase the common equity thickness from 35% to 38% carries an annual cost of about $10 million to ratepayers. In view of that substantial cost, the Board must consider other remedies.

In consideration of all of the above, and on balance, the Board finds an increase in the common equity thickness from 35% to 36% to be reasonable. While this finding should alleviate somewhat the financial pressure currently experienced by the Company, it alone might not fully address the immediacy of the problem, if the problem continues indeed to exist. The Company therefore might need to engage in financing alternatives other than issuing of long term debt in the shorter term. This may involve a number of market instruments that are available to the Company, if indeed the Company cannot issue long term debt when it needs it. The Company must also be more wary of the impact of excessive payments to its affiliates on EBIT.

The Company's evidence was that, in the period 1993 to 2006, the Company lost $107 million in EBIT due to warmer-than-forecast weather and that the average impact of weather in either direction on EBIT was $35 million, which is two times more than the $16.8 million currently reflected in rates according to the Company's evidence. The

Board is of the view that, given the large influence of weather on EBIT, this risk may need to be removed from the utility.

The Board recognizes that a move to removing weather risk from the Company is a decision that has implications for all regulated gas utilities regulated by the Board, and perhaps for electricity utilities as well. The Board considers this to be worthy of evaluation in the near future.

REVENUE TO COST RATIOS

The revenue to cost ratio compares the forecast recovery of revenues from each rate class, derived through the rate design process, to the allocation of forecast costs for each rate class, arrived at through the cost allocation process. A revenue to cost ratio for a rate class of unity means that the rate class is forecast to recover all of the allocated costs to that class.

The Company's pre-filed evidence set out the manner in which it initially proposed to allocate the proposed revenue requirement among customer classes. Issue 6.2 reads:

> Is the proposal to allocate revenue requirement between the customer classes and annually adjust the monthly customer charges and variable charges to recover the revenue deficiency reasonable?

Parties agreed on matters pertaining to the adjustments to the monthly customer charges and variable charges. The unresolved aspect of Issue 6.2 is described in the Settlement Proposal as follows:

> There is no agreement about the Company's proposal to allocate revenue requirement between customer classes. Some parties are concerned that the allocation of the 2007 revenue deficiency as proposed in the Company's evidence results in the collection of revenues greater than allocated costs from Rate 1 and Rate 6 customers based on the Company's filed Revenue to Cost ratios of 1.02 and 1.01 for these rate classes. These parties wish to explore the proposed 2007 revenue requirement allocation in light of the evidence and interrogatory responses on this issue. Other parties support the Company's revenue deficiency allocation and will oppose changes to it.

Appendix B to the Settlement Proposal sets out the Company's proposal for the recovery of the test year revenue requirement with assumed revenue deficiencies of $26 million and $82 million, which reflect the minimum and maximum revenue deficiencies that could result from the final Board decision in this case. Appendix B also sets out the revenue to cost ratios that would result for each rate class. In both scenarios, the revenue to cost ratios proposed by the Company for Rate 1 will be 1.01, which is the same as the Board approved in 2006. The revenue to cost ratios proposed for all other rates are 1.01 or less.

Appendix B also sets out the dollar amount of any over or under contribution by each rate class, relative to the costs allocated to that rate class. A portion of the over and under contribution for most rate classes relates to the phase-in of the allocation of upstream transportation costs on a volumetric basis (referred to as the phase-in of TCPL tolls). This phase-in, which was approved in the Company's 2005 rate case (EB-2003-0203), was to be completed over four years, so that the rate increase impact on large volume customers would not be too large in any one year. A corresponding impact of the phase-in is that associated over-contributions from Rates 1 and 6 have remained in place, at least in part, for four years while the under-contributions from large volume customers were phased out. The phase-in will be completed as of October 1, 2007. From and after that time, the actual amount of over or under-contribution for each rate class will no longer include any adjustment. All things being equal, the forecast revenue to cost ratios for Rates 1 and 6 will have decreased as the impact of the upstream transportation cost allocation adjustment is fully phased in.

The Company provided an illustrative example of how other rate classes would be impacted in the test year if $5 million of revenue requirement were shifted away from Rate 1 and recovered instead from the large volume rate classes. The effect of such a shift would be that, on a prospective basis from October 1, 2007, the rate increase for Rate 100 would move from 1.9% to 3.6%, the rate increase for Rate 145 would move from 1.6% to 8.0% and the rate increase for Rate 170 would move from 1.8% to 8.0%.

Whatever the ultimate revenue deficiency that the Board determines in this case, the Company has indicated that it will maintain revenue to cost ratios, and over/under contribution amounts by rate class, at approximately the same level as set out in Appendix B to the Settlement Proposal. The Company has also indicated that it will file, along with the draft final rate order in this case, a narrative explanation of the steps taken and adjustments made to arrive at final rates, and corresponding revenue to cost ratios.

Positions of the Parties

The Company asserts that its proposal is a fair and appropriate approach to the recovery of the revenue requirement from all rate classes. The approach is consistent with that taken and approved by the Board in previous years, where the revenue to cost ratio for Rate 1 has also been 1.01.

While the Company attempts to set revenue to cost ratios as close to 1 as possible, it also must take account of other rate design objectives. These objectives include rate stability, market conditions, maintaining competitive position, market acceptance, rate class characteristics and rate impacts on other rate classes. The Company also takes account of the revenue to cost ratios for each rate class from previous years and seeks to maintain similar ratios, on the assumption that the Board approved those ratios in previous years, and in order to avoid large rate swings in some rate classes which have corresponding impacts on others. While the Company seeks to keep revenue to cost ratios close to 1, the actual ratios are typically slightly different from 1, but within a reasonable band of tolerance so that there is no undue over or under collection from any particular rate class. The Company believes that it is important to retain some degree of flexibility with respect to revenue to cost ratios, so that the variety of applicable rate design objectives can be addressed. If the Company were required to maintain prescribed revenue to cost ratios, this flexibility would be lost. Moreover, a requirement to meet specified revenue to cost ratios could be very difficult to implement and maintain over time and, in some cases, may not be feasible.

If $5 million was shifted away from Rate 1, the level of rate increase to some rate classes would be less appropriate than the approach the Company advocates, particularly in the case for customers on interruptible Rates 145 and 170 who have dual fuel capability. In the event of large increases to those rates, affected customers may switch away from gas altogether, leaving other customers worse off as a result.

IGUA, Transalta and OAPPA supported the Company's proposed revenue to cost ratios as reasonable and falling within tolerable limits.

CCC noted Enbridge's testimony that it will be more explicit that it has been in the past regarding the determination of final rates as part of the Rate Order and in CCC's view this would be helpful.

VECC expressed concern with the proposal to maintain a revenue–to-cost ratio greater than one for Rate 1 customers in the test year. If the proposal is accepted and not corrected prior to setting base rates for a multi-year incentive regulation program, this over-contribution would be embedded for the duration of such scheme.

Board Findings

The Board notes that the proposed revenue to cost ratio for Rate 1 is actually 1.006, which has been rounded to 1.01. The Board considers this to be within a reasonable band of tolerance given the many other considerations and factors that enter into striking rates for each class, which they were enumerated by the Company. Requiring the Company to maintain strict 1.0 revenue to cost ratios for each class will remove the flexibility that may be needed to accommodate those other considerations and factors.

VECC's concern is that the settled revenue to cost ratio for Rate 1 in this proceeding will be fixed for the next six years under planned incentive regulation. The Board agrees with the Company that the cost drivers that will play into revenue to cost ratios over the next six years cannot be known now and that there is a pending rate proceeding to deal with rate-setting issues under incentive regulation.

The Board therefore accepts the Company's proposed revenue to cost ratios, and these shall be used to calculate proposed rates reflecting the final revenue requirement reflecting the Board's findings in this proceeding.

The Board notes the Company's commitment, as stated in its argument-in-chief , that it will file, along with the draft final rate order in this case, a narrative explanation of the steps taken and adjustments made to arrive at final rates, and corresponding revenue to cost ratios.

RATE IMPLEMENTATION

In regard to Issue 9.1 (How should the Board deal with any revenue deficiency applicable from January 1, 2007 to the date that the Board's decision is implemented?), the Company is seeking approval for the full recovery in rates during the 2007 test year of the full amount of revenue deficiency awarded by the Board in its final decision in this case. The Settlement Proposal in respect to this issue provided that:

> All parties agree that for rate implementation purposes only, the Company can adjust rates to recover an additional $26.0 million, effective as of January 1, 2007, and that this will be implemented at the same time as the Company's April 1, 2007 QRAM is implemented. GEC's and Pollution Probe's agreement in this regard is subject to any later adjustments to the Company's recovery of revenue deficiency that might be required as a result Issue 3.2. Schools' agreement in this regard is subject to any later adjustments to the Company's recovery of revenue deficiency that might be required as a result of Issue 9.1.

and parties, except for Schools, agreed that:

> …..the Company can adjust rates to recover an additional $26.0 million, effective as of January 1, 2007, and that this will be implemented at the same time as the Company's April 1, 2007 QRAM is implemented. Parties agree with and support the Company's proposal to recover the full $26.0 million through (i) increased annualized rates for the remainder of the test year; and (ii) the use of a rate rider over the nine remaining months of the test year to recover the remaining balance of the $26.0 million. Intervenors agree that no issue or objection will be raised around whether any part of this $26.0 million is unrecoverable because it relates to the time period between January 1, 2007 and April 1, 2007.

> There is no agreement as to whether or how the Company can recover any revenue deficiency in excess of $26.0 million.

The Board issued an interim rate order on March 26, 2007 which allowed for the recovery of $26 million in revenue deficiency by way of interim rates effective January 1, 2007 and implemented April 1, 2007, along with a rate rider to apply from April 1 to December 31, 2007. The amended rates will recover approximately $21 million in deficiency over the period April 1, 2007 to December 31, 2007, and the rate rider will recover an additional $5 million.

The Company proposes to recover any incremental revenue deficiency (that is any amount that is more than $26 million) through amended base rates and an additional rate rider to apply to the end of the test year. In the event that the Board's final decision results in a total revenue deficiency that is less than $26 million, the Company will adjust its rates accordingly.

The Company also proposes to clear all approved deferral and variance account balances on a one-time basis to rates. As set out at Issue 3.13 of the Settlement Proposal, the impact of this clearance for accounts, other than the 2006 Purchased Gas Variance Account (2006 PGVA) be a credit of approximately $23 million in favour of ratepayers, with the final amount adjusted to reflect the Board's decision in respect of the deferral and variance accounts that were reviewed and tested during the hearing. At the same time, the Company would also clear the outstanding balance in the 2006 PGVA as a one time adjustment, which will result in an offsetting debit of approximately $20 million.

As the Company's test year commenced January 1, 2007, the only implementation issue was the effective date of the new rates.

Positions of the Parties

The Company argued that circumstances outside its control prevented a timely filing of its application, including extenuating factors associated with the date of the 2006 test year Board decision and the complicated and lengthy consultative processes which were supported by all intervenors and led to positive results.

CCC stated that although there were avoidable delays caused by Enbridge, the timing of the hearing was not solely related to these delays. A number of consultatives were ongoing and there were Board scheduling issues. The Board should allow full recovery of the found revenue requirement in this case but should state as a matter of policy that may be financial consequences in the future if the delays are caused by the Company.

IGUA stated that although the Company did not initiate its application as promptly as it might have, given some extenuating circumstances in this particular case, including the consultatives, the Company should not be deprived of that portion of the agreed upon deficiency of $26 million which normally would have been recovered between January 1, 2007, and April 1, 2007. IGUA also stated that it accepts that any revenue deficiency over the agreed upon $26 million should be recovered through a rate rider to December 31, 2007, but only if in its view the impacts on large volume customers were reasonable following the Board’s Decision. Otherwise, IGUA stated that it reserves the right to argue for a lower rate rider that would extend beyond December 31, 2007.

VECC supported recovery of the remaining revenue deficiency on a prospective basis but, consistent with its earlier argument, the recovery from customers should correct for the over-contribution from Rate 1 customers.

Schools referred extensively to Enbridge’s testimony and argued that the Company could have filed its application earlier, therefore it should be responsible for causing the retroactivity. Schools suggested that the $5 million of the $26 million agreed upon deficiency could have been recovered from January 1, 2007 to March 31, 2007, and therefore should not now be recovered. With respect to any additional revenue deficiency to be found, the portion of such additional deficiency that would have been recovered from January 1, 2007 to the date of implementation of the new rates should not be recovered from ratepayers.

Board Findings

The prospect of retroactivity is always problematic for the Board. To be clear, having declared the Company's interim effective January 1, 2007, the effective date for the new rates in not a legal issue in this case. The Company can in this case request and the Board can grant an effective date of January 1, 2007. Rather, the issue of retroactivity is one of rate impacts and customer acceptability. The Board has stated numerous times that it does not endorse retroactivity, regardless of how the monies are recovered. The Board has attempted to work with the utilities and other parties so that retroactivity can be avoided. Some progress was made in recent years but now that progress appears to have been stalled.

The Board accepts, as many parties do, that there were extenuating circumstances in the past year which contributed to the Company's late filing. The Company had to comply with new minimum filing requirements, its evidence had to be in new formats, and the Company was engaged on a number of other important files before the Board. Also, there were a number of financially significant and complex items that were the subjects of several consultatives. However, while the use of the consultatives bore fruit on certain issues, their conclusions were not timely. Some of the consultatives did not complete their deliberations in time for the commencement of the hearing with the result that the hearing was postponed a number of times. The responsibility for that should not rest only with the Company. In the future, the Board expects parties to conclude any consultatives in adequate time for the hearing to commence when scheduled.

Recognizing these unique circumstances, the Board will not penalize the Company for the lateness of its filing, the commencement of the hearing and the resultant retroactivity. The Board expects the Company to endeavour to bring its filing cycle so that retroactivity can be avoided in the future. The Board expects all parties to act in a positive fashion to avoid retroactive ratemaking in the future.

The Board accepts the Company's proposals to implement recovery of the full revenue deficiency for the 2007 test year arising from this decision.

The Board also accepts the clearance of the balances in the deferral and variance accounts as proposed by the Company except in circumstances where the Board had made different findings in this decision.

Also, the Company in its Argument-in-Chief proposes that the Board include clearance of the 2006 PGVA balance in its decision regarding the disposition of deferral accounts tested during the hearing. The Board notes that the 2007 Settlement Proposal (p.32 of 47) indicates that parties agreed that Enbridge is not seeking to clear in the test year, certain balances, of which one was the 2006 PGVA, and these would be addressed by the Board in the future. The Board anticipates that the next QRAM application may be an opportune time for the Board to consider this matter.

The Board directs the Company to file a draft rate order reflecting the Board's findings, with an implementation date that in the Company's view would be more appropriate. Intervenors wishing to comment on the draft rate order shall file their submissions within 7 days from the Company's filing.

The Company shall include in that filing appropriate documentation in support of its draft rate order, including updates to the "N1, Tab2" series of exhibits.

COST AWARDS

On day 16 of the oral hearing the panel directed eligible parties to file their costs claims, for all costs up to and including April 13, 2007, by May 4, 2007.

Parties who intend to claim cost awards for activity subsequent to April 13, 2007, shall submit their cost claims by July 26, 2007. A copy of the cost claim must be filed with the Board and one copy is to be served on Enbridge. The cost claims must be done in accordance with section 10 of the Board's Practice Direction on Cost Awards.

Enbridge will have until August 9, 2007 to object to any aspects of the costs claimed. A copy of the objection must be filed with the Board and one copy must be served on the party against whose claim the objection is being made.

The party whose cost claim was objected to will have until August 16, 2007 to make a reply submission. Again a copy of the submission must be filed with the Board and one copy is to be served on Enbridge.

DATED at Toronto, July 5, 2007.

APPENDIX A

ENBRIDGE GAS DISTRIBUTION INC.

2007 TEST YEAR

DECISION WITH REASONS

BOARD FILE NO. EB-2006-0034

PROCEDURAL DETAILS INCLUDING LISTS OF PARTIES AND WITNESSES

JULY 5, 2007

PROCEDURAL DETAILS INCLUDING LISTS OF PARTIES AND WITNESSES

THE PROCEEDING

On September 7, 2006, the Board issued a Notice of Application which was published and served in accordance with the Board's direction.

The Board issued Procedural Order No.1 on October 4, 2006, establishing the procedural schedule for all events prior to the oral hearing, as well as the Issues List for the proceedings. These scheduled events included:

- Issues conference on October 10, 2006;
- Issues Day on October 12, 2006;
- Written interrogatories to the Applicant by October 23, 2006;
- Written interrogatory responses from the Applicant by November 9, 2006;
- Intervenor evidence filed by November 14, 2006;
- Written interrogatories on Intervenor evidence by November 21, 2006;
- Responses to written interrogatories on Intervenor evidence by December 5, 2006;
- Intervenor Conference on December 7, 2006;
- Settlement Conference beginning December 11, 2006;
- Settlement Proposal by January 4, 2006;

- Board review of Settlement Proposal on January 9, 2006.
- Oral Hearing beginning on January 11, 2007

On Issues day, the Board heard submissions from Enbridge Gas Distribution Inc. (“Enbridge”), Pollution Probe Foundation (“Pollution Probe”), Industrial Gas Users Association (“IGUA”), Union Energy LP, the Consumers Council of Canada (the “Council”), Direct Energy Marketing Limited (“Direct Energy”), Superior Energy Management (“SEM”), TransAlta Energy Corp (“TransAlta”), Coral Energy, Green Energy Coalition (“GEC”), Heating, Ventilation and Air-Conditioning Coalition Inc. (“HVAC”), Energy Probe Research Foundation (“Energy Probe”), School Energy Coalition (“Schools”), the Vulnerable Energy Consumers Coalition (“VECC”), and the Low-Income Energy Network (“LIEN”).

On October 20, 2006, the Board issued Decision and Procedural Order No. 2, dealing with the status of three parties as intervenors and eligibility for costs, the question of the Board’s jurisdiction regarding rate affordability programs, and the approved Issues List.

Procedural Order No. 3, issued November 6, 2006, involved a Motion brought forward by LIEN for orders to:

- Extend the dates to serve and file interrogatories on the Applicant, and to file its Intervenor evidence, by 30 and 60 days respectively from the date of Board decision on their Motion;
- Confirm LIEN’s eligibility for full cost awards, including newly raised issues

The Board heard LIEN’s Motion on November 17, 2006.

Procedural Order No. 4, issued November 29, 2006, made the following schedule changes:

- Written interrogatories on Intervenor evidence by November 24, 2006;

- Responses to written interrogatories on Intervenor evidence by December 8, 2006;

- Oral hearing to commence January 22, 2007;

- A provision for the treatment of certain interrogatory responses as "Proposed Confidential Undertakings" with objections to such course to be filed by December 4, 2006; EGD required to file any reply submissions by December 6, 2006;

- Settlement Proposals arising from the Settlement Conference to be filed with the Board no later than January 12, 2007

On December 20, 2006, the Board issued Decision and Procedural Order No. 5, which indicated that the rate affordability issue brought forward by LIEN would not be heard in the EB-2006-0034 proceeding, and declared rates, as approved in EB-2006-0288, interim effective January 1, 2007. The Board's decision was issued on April 26, 2007 where the majority of the panel found that the Board does not have jurisdiction to hear the rate affordability issue brought forward by LIEN.

On December 27, 2006, the Board issued Procedural Order No. 6, which set dates for a technical conference regarding Open Bill Access, involving Board Staff, Intervenors and Enbridge Gas Distribution Inc. The technical conference was held on January 10, 2007.

Decision and Procedural Order No. 7, issued January 12, 2007, provided the Board's finding regarding confidential treatment of certain responses to interrogatories.

On April 16, 2007, the Board issued Procedural Order No. 8, regarding the status of Issue 3.6, (Corporate Cost Allocation Methodology) given the filing of new evidence on February 14, 2007. The Order set Issue 3.6 to a separate phase in this proceeding.

The following parties filed written evidence with the Board:

- Eric Hoaken on behalf of Direct Energy;
- David MacIntosh on behalf of Energy Probe;
- John DeVellis on behalf of HVAC;
- Paul Manning on behalf of LIEN;
- Michael Buonaguro on behalf of VECC, the Council, and IGUA

PARTICIPANTS AND REPRESENTATIVES

Below is a list of participants and their representatives that were active either at the oral hearing or at another stage of the proceeding. A complete list of intervenors is available at the Board's offices.

Board Counsel and Staff	Michael Millar Richard Battista Edik Zwarenstein Colin Schuch Rudra Mukherji Khalil Viraney
Enbridge Gas Distribution Inc.	Fred Cass Patrick Hoey David Stevens Dennis O'Leary Robert Bourke
Pollution Probe	Murray Klippenstein Jack Gibbons Basil Alexander
Union Energy Limited Partnership ("Union Energy LP")	Kirsten Crain
Union Gas Limited ("Union")	Patrick McMahon Michael Penny

Industrial Gas Users Association ("IGUA")	Peter Thompson Vince DeRose
Consumers Council of Canada ("the Council")	Robert Warren Julie Girvan
Direct Energy Marketing Limited	Dave Matthews Eric Hoaken
Superior Energy Management ("SEM")	Elizabeth DeMarco
TransAlta Cogeneration LP, TransAlta Energy Corp ("TransAlta")	Elizabeth DeMarco
Ontario Energy Savings Corp	Nola Ruzycki
Green Energy Coalition	David Poch Kai Millyard
Heating, Ventilation and Air-Conditioning Coalition Inc. ("HVAC")	John De Vellis
Ontario Association of Physical Plant Administrators ("OAPPA")	Valerie Young
TransCanada Pipelines	Murray Ross Jennifer R. Scott Bernard Pelletier
Energy Probe Research Foundation ("Energy Probe")	David Macintosh Tom Adams Randy Aiken
School Energy Coalition ("Schools")	Jay Shepherd Bob Williams
Natural Gas Specialist	Jason F. Stacey
Accenture Business Services for Utilities Inc. ("ASBU")	Robert Howe
Low-Income Energy Network ("LIEN")	Paul Manning
Coral Energy Canada Inc. ("Coral")	Elisabeth DeMarco

CustomerWorks LP (“CWLP”)	Margaret Sims Hilary Clark
Vulnerable Energy Consumer’s Coalition (“VECC”)	Michael Buonaguro Michael Janigan Roger Higgin

WITNESSES

There were 51 company employees listed as witnesses by Enbridge Gas Distribution Inc. as part of their filed application. The following is a list of these participants:

Linda Au	Capital Budget Supervisor
John W. Bayko	Director, Operations Services
Glenn W. Beaumont	Vice President, Engineering & Information Technology
Mark Bergman	Senior Analyst, Economic & Market Analysis
Robert Bourke	Manager, Regulatory Proceedings
Bradley Boyle	Treasury Project Leader
Michael Brophy	Manager, DSM & Portfolio Strategy
Irene Chan	Manager, Volumetric Analysis and Budgets
David B. Charleson	Director, Energy Policy and Analysis
Susan Clinesmith	Manager, Business Markets
Jackie Collier	Manager, Rate Design
Anne Creery	Manager, Customer Care Operations
Kevin Culbert	Manager, Regulatory Accounting
Joel Denomy	Supervisor, Economic and Market Analysis
Jackie Eliason	Manager, Finance

Robert Fox	Chief Engineer, Engineering
Tanya M. Ferguson	Manager, Customer Care Financial Administration
Malini Giridhar	Manager, Rate Research and Design
Barry Goulah	Manager, System Measurement
Paul Green	Director, Market Development
Jane Haberbusch	Director, Human Resources
Patrick J. Hoey	Director, Regulatory Affairs
John Jozsa	Manager, Tax Services
Anton Kacicnik	Manager, Cost Allocation
Sagar Kancharla	Manager, Financial and Economic Assessment
D. A. Kelly	Manager, Operational and Capital Budgets
Narin Kishinchandani	Chief Accountant
Vivian Krauchek	Manager, Gas Supply
Thomas J Ladanyi	Manager, Budgets and Planning
Kerry Lakatos-Hayward	Manager, Business Development & Strategy
Douglas Lapp	Chief Safety Officer
Lee Liauw	Manager, Scorecard & Capital Appropriation
Gerry MacDonald	Director, NGV Business Development
Andrew Mandyam	Manager, CIS Program Operations
Catherine McCowan	Manager, Operations Service
Steve McGill	Manager, Strategic Projects & market Analysis
Michael Mees	Director, Customer Care
W. Robert Milne	Manager, Distribution Planning

Stuart Murray	Manager, Financial Assessment
Byron Neiles	Vice President, Legal Regulator & Public Affairs
Barry Remington	Manager, Property Taxes
Norman Ryckman	Group Manager Business Intelligence and Support
Jody Sarnovsky	Manager, Strategic & Key Accounts
Donald Small	Manager, Gas Cost Knowledge Centre
Patricia Squires	Manager, Mass Market and New Construction Market Development
Liz Stokes-Bajcar	Manager, Human Resources Service Centre & Compensation
Michael Tremayne	Manager, Infrastructure & Marketing, NGV
Trevor Tuck	Manager, Engineering Special Projects
Annette Urquhart	Manager, Corporate Budgets & Planning
Marc Weil	Director, Information Technology
Henry Wong	Manager, Business Applications

In addition, the Company called the following witnesses:

P. Carpenter	Brattle Group

Intervenor Witnesses:

Lee Rose	Senior Vice-President, Home Services Canada, Direct Energy
Michael Shulist	The Shulist Group Inc.
Martin Luymes	Senior Director, HRAC Services and Relations, Heating, Refrigeration and Air-Conditioning Institute of Canada (HRAI)
Nancy McKeraghan	President, Canco Climate Care Inc.
Michael Latreille	Vice-President, Holmes Heating Inc.

Glen Leis	General Manager, OZZ Comfort Solutions
Roger Grochmal	President, Atlas Air ClimateCare
Paul Messenger	President, A1 Heating and Air Conditioning
Steve Kinsey	Private Investigator, Corporate Investigation Services
Laurence D. Booth	CIT Chair in Structured Finance, Rotman School of Business
David Kincaid	President and CEO, Level 5 Strategic Brand Advisors

APPENDIX B

ENBRIDGE GAS DISTRIBUTION INC.

2007 TEST YEAR

DECISION WITH REASONS

BOARD FILE NO. EB-2006-0034

SETTLEMENT PROPOSAL

JULY 5, 2007

SETTLEMENT PROPOSAL

JANUARY 24, 2007

TABLE OF CONTENTS

ISSUE	**DESCRIPTION (& EVIDENTIARY REFERENCE)**
2.3	Is the forecast of degree days appropriate? (C2-4-1)
2.4	Are the average use-per-customer forecasts for rate class 1 and rate class 6 appropriate? (C1-3-1 and C2-3-1)
2.5	Is the proposed 2007 contract gas volume and revenue forecast appropriate? (C1-3-1)
2.6	Is the proposed 2007 General Service gas volume and revenue forecast appropriate? (C1-3-1)
3	**OPERATING COST (Exhibit D)**
3.1	Is the proposed 2007 gas cost forecast including the calculation of the PGVA Reference Price appropriate? (D1-4-1, D1-4-2)
3.2	Is the overall level of the 2007 Operation and Maintenance Budget appropriate? (D1-2-1)
3.3	Is the Company's proposed fuel switching program appropriate?
3.4	Is the Company's proposed Energy Link Program appropriate?
3.5	Is the budget for Human Resources related costs appropriate? (D1-4-1)
3.6	Do the revisions to the Regulatory Cost Allocation Methodology (RCAM) meet the Board's directives in the 2006 decision?
3.7	Is the proposed level of corporate cost allocation for 2007 appropriate?
3.8	Is Company's forecast level of Regulatory and OEB related costs for 2007 appropriate?
3.9	Is Enbridge's decision to change to a December 31 taxation year-end , in 2007, appropriate? (D1-5-1)
3.10	Is the continuation of the Risk Management Program appropriate in the context of the Board's 2006 Decision directives? (D1-4-3)
3.11	Is the proposal to change depreciation rates for 2007, as proposed in the depreciation study, and the impact on 2007 customer rates,

<u>ISSUE</u> **<u>DESCRIPTION (& EVIDENTIARY REFERENCE)</u>**

appropriate? (D1-13-1, D2-2-1)

3.12 Is the proposal for the establishment of 2007 Deferral and Variance Accounts appropriate? (D1-7-1)

3.13 Is the proposal for the disposition of existing Deferral and Variance Accounts appropriate? (D1-7-2)

3.14 Are the amounts proposed to be included in rates for capital and property taxes appropriate?

3.15 Is the amount proposed to be included in rates for income taxes, including the methodology, appropriate?

4 COST OF CAPITAL (Exhibit E)

4.1 What is the Return on Equity (ROE) for EGDI for the 2007 test year as calculated pursuant to the ROE Guidelines?

4.2 Are Enbridge's proposed costs for its debt and preference share components of its capital structure appropriate? (E1-2-1)

4.3 Is the proposal to change the equity component of the deemed capital structure from 35% to 38% appropriate? (E2-2-1)

5 COST ALLOCATION (Exhibit G)

5.1 Is the Applicant's cost allocation appropriate and is it based in its 2006 Board approved methodology? (G2-T1-S1)

5.2 Is the proposal to recover Demand Side Management costs in delivery charges, as opposed to load balancing charges, appropriate? (from G2-3-1 to G2-3-4)

6 RATE DESIGN (Exhibit H)

6.1 Is the proposal to introduce delivery demand charges for Rates 100 and 145 reasonable? (H1-1-1)

6.2 Is the proposal to allocate revenue requirement between the customer classes and annually adjust the monthly customer charges and variable charges to recover the revenue deficiency reasonable? (H1-1-1)

ISSUE DESCRIPTION (& EVIDENTIARY REFERENCE)

6.3 Should the Board approve the contents of the Applicant's Rate Handbook? (H1-1-1, H2-6-1; A1-14-2)

6.4 Is the proposed treatment of bundled transportation charges and T-service credit appropriate in light of the Board's Decision in RP-2003-0203 and the settlement agreement? (H1-1-1)

7 CUSTOMER CARE SUPPORT, CUSTOMER CARE SYSTEM, AND OPEN BILL ACCESS

7.1 Has Enbridge complied with the direction, in the EB-2005-0001 Decision, to file in evidence the following Customer Care Support Cost information: all agreements between Enbridge and CWLP, ECSI or any other EI-related entity related to the provision of customer care or CIS; the Program Agreement between CWLP and Accenture, including any amendments or revisions; financial statements for ECSI and CWLP (historical, bridge and test year); the return analyses described in the decision? (D1-12-3)

7.2 What actions or decisions are required by the Board regarding items in the 2006 and 2007 capital budgets which might be duplicated in the upcoming application for a Regulatory Asset Account? (D1-10-1, p. 2/AppA)

7.3 Are the forecast costs of the new CIS system appropriate? (B1-5-1, p. 3)

7.4 What are the appropriate costs for CIS and Customer Care for 2007, including internal and transition costs? (D1-12-1, p. 2 and D3-2-1, p. 1)

7.5 Is the Applicant's proposal of open bill access appropriate and consistent with the Board's direction in RP 2005-0001? (D1-11-1 to 5)

8 OTHER ISSUES

8.1 What are the actions or decisions necessary for the Board to be assured that the Board's decisions, including settlements, in the NGEIR (EB-2005-0551) proceeding will be appropriately captured and reflected in this proceeding?

8.2 What are the actions or decisions necessary for the Board to be assured that the Board's decisions, including settlements, in the DSM

ISSUE DESCRIPTION (& EVIDENTIARY REFERENCE)

(EB-2006-0021) proceeding will be appropriately captured and reflected in this proceeding?

9 RATE IMPLEMENTATION

9.1 How should the Board deal with any revenue deficiency applicable from January 1, 2007 to the date that the Board's decision is implemented?

9.2 Should the Board set interim rates, effective January 1, 2007, to allow Enbridge to begin to recover its prospective revenue deficiency?

ATTACHMENTS

Appendix A- Deferral and Variance Accounts Balances

Appendix B- Approximations of rate impacts of the Settlement Proposal

PREAMBLE

This Settlement Proposal is filed with the Ontario Energy Board ("OEB" or "Board") in connection with the application of Enbridge Gas Distribution Inc. ("Enbridge Gas Distribution" or the "Company"), for an order or orders approving or fixing rates for the sale, distribution, transmission, and storage of gas for its 2007 fiscal year (the "Test Year").[1] A Settlement Conference was held between December 11, 2006 and January 5, 2007 in accordance with the *Ontario Energy Board Rules of Practice and Procedure* (the "Rules") and the Board's *Settlement Conference Guidelines* ("Settlement Guidelines"). Ken Rosenberg acted as facilitator for the Settlement Conference. Settlement discussions between parties continued after that time. This Settlement Proposal arises from the Settlement Conference and subsequent discussions.

Enbridge Gas Distribution and the following intervenors (collectively, the "parties"), as well as Ontario Energy Board technical staff ("Board Staff"), participated in the Settlement Conference:

CONSUMERS COUNCIL OF CANADA (CCC)
DIRECT ENERGY MARKETING LIMITED (Direct Energy)
ENERGY PROBE RESEARCH FOUNDATION (Energy Probe)
GREEN ENERGY COALITION (GEC)
HVAC COALITION INC. (HVAC)
INDUSTRIAL GAS USERS ASSOCIATION (IGUA)
ONTARIO ASSOCIATION OF PHYSICAL PLANT ADMINISTRATORS (OAPPA)
ONTARIO ENERGY SAVINGS L.P. (OESLP)
POLLUTION PROBE
SCHOOL ENERGY COALITION (Schools)
SUPERIOR ENERGY MANAGEMENT (a division of Superior Plus Inc.) (Superior)
TRANSALTA COGENERATION L.P. AND TRANSALTA ENERGY CORP. (TransAlta)
TRANSCANADA PIPELINES LIMITED (TransCanada)
UNION ENERGY LIMITED PARTNERSHIP (Union Energy)
UNION GAS LIMITED (Union)
VULNERABLE ENERGY CONSUMERS COALITION (VECC)

The Settlement Proposal deals with all of the issues listed at Appendix "A" to the Board's Procedural Order #2, dated October 20, 2006 (the "Issues List"). The numbers ascribed to each of the issues correlate to the section numbers in the Settlement Proposal and each issue falls within one of the following three categories:

1. ***complete settlement –*** if the Settlement Proposal is accepted by the Board, the issue will not be addressed at the hearing because Enbridge

---
[1] In this Settlement Proposal, the terms "2007 fiscal year", "fiscal 2007" and "Test Year" each refer to the twelve-month period commencing January 1, 2007 and ending December 31, 2007.

Gas Distribution and all other parties who take any position on the issue agree to the proposed settlement;

2. ***incomplete settlement –*** if the Settlement Proposal is accepted by the Board, portions of the issue will be addressed at the hearing because parties are only able to agree on some, but not all, aspects of the issue; and,

3. ***no settlement –*** the issue will be addressed at the hearing because the parties who participated in the negotiation of the issue are unable to reach a settlement on the issue.

More particularly, the Settlement Proposal depicts the 47 issues enumerated on the Issues List as follows:

Complete Settlement Parties will not address the issue at the hearing	**Incomplete Settlement** Parties will address one or more parts of the issue at the hearing	**No Settlement** Parties will address the issue at the hearing
25 issues completely settled Issues 1.1, 1.3 to 1.8, 2.1, 2.2, 3.1, 3.5, 3.7 to 3.9, 3.11, 3.14, 3.15, 4.1, 5.1, 5.2, 6.1, 6.4, 8.1, 8.2 and 9.2	7 issues partly settled Issues 1.2, 3.2, 3.12, 3.13, 6.2, 6.3 and 9.1	15 issues not settled Issues 2.3 to 2.6, 3.3, 3.4, 3.6, 3.10, 4.2, 4.3 and 7.1 to 7.5

Issue 3.2, which relates to the Company's O&M Budget for the Test Year is an incomplete settlement, however, it should be noted that GEC and Pollution Probe object to the settled portions of this issue. Issue 9.1, which relates to rate implementation, is an incomplete settlement, however, it should be noted that Schools objects to the settled portions of this issue.

The description of each issue assumes that all parties participated in the negotiation of the issue, unless specifically noted otherwise. Any parties that are identified as not having participated in the negotiations of the issue also take no position on any settlement or other wording pertaining to the issue. Board Staff participated in the Settlement Conference, and has advised the parties that it does not oppose the proposed settlement on any of the completely settled or partly settled issues. However, in accordance with the Rules and the Settlement Guidelines, Board Staff takes no position on any issue and, as a result, is not a party to the Settlement Proposal.

The Settlement Proposal describes the agreements reached on the completely settled and partially settled issues. The Settlement Proposal identifies the parties who agree and who disagree with each settlement, or alternatively who take no position on the issue. Finally, the Settlement Proposal provides a direct link between each settled issue and the supporting evidence in the record to date. In this regard, the parties who agree with the individual settlements are of the view that the evidence provided is sufficient to support the Settlement Proposal in relation to the settled issues and, moreover, that the quality and detail of the supporting evidence, together with the corresponding rationale, will allow the Board to make findings agreeing with the proposed resolution of the settled issues. In the event that the Board does not accept the proposed settlement of any issue, further evidence may be required on the issue for the Board to consider it fully.

Best efforts have been made to identify all of the evidence that relates to each settled issue. The supporting evidence for each settled issue is identified individually by reference to its exhibit number in an abbreviated format; for example, Exhibit A1, Tab 8, Schedule 1 is referred to as A1-8-1. A concise description of the content of each exhibit is also provided. In this regard, Enbridge Gas Distribution's response to an interrogatory is described by citing the name of the party and the number of the interrogatory (e.g., Board Staff Interrogatory #1). The identification and listing of the evidence that relates to each settled issue is provided to assist the Board. The identification and listing of the evidence that relates to each settled issue is not intended to limit any party who wishes to assert that other evidence is relevant to a particular settled issue.

The parties agree that all positions, information, documents, negotiations and discussion of any kind whatsoever which took place or were exchanged during the Settlement Conference are strictly confidential and without prejudice, and inadmissible unless relevant to the resolution of any ambiguity that subsequently arises with respect to the interpretation of any provision of this Settlement Proposal.

According to the Settlement Guidelines (p. 3), the parties must consider whether a settlement proposal should include an appropriate adjustment mechanism for any settled issue that may be affected by external factors. Enbridge Gas Distribution and the other parties who participated in the Settlement Conference consider that no settled issue requires an adjustment mechanism other than those expressly set forth herein.

Issues 1.1 to 1.8, 2.1, 2.2, 3.2, 3.5, 3.7 to 3.9, 3.11 to 3.15 and 9.1 have been settled by parties as a package (the “package”), subject to the objections of GEC, Pollution Probe and Schools, as noted earlier, and none of the parts of this package are severable. All parties agree that, for rate implementation purposes only, the Company can adjust rates to recover an additional $26.0 million, effective as of January 1, 2007, and that this will be implemented at the same time as the Company’s April 1, 2007 QRAM is implemented. GEC’s and Pollution Probe’s agreement in this regard is subject to any later adjustments to the Company’s recovery of revenue deficiency that might be required as a result of

Issue 3.2. Schools' agreement in this regard is subject to any later adjustments to the Company's recovery of revenue deficiency that might be required as a result of Issue 9.1. Subject to considering the objections of GEC, Pollution Probe and Schools during the hearing, if the Board does not, prior to the commencement of the hearing of the evidence in EB-2006-0034, accept the package in its entirety, then there is no Settlement Proposal (unless the parties agree that any portion of the package that the Board does accept may continue as part of a valid Settlement Proposal). None of the parties can withdraw from the Settlement Proposal except in accordance with Rule 32 of the Rules. Finally, unless stated otherwise, the settlement of any particular issue in this proceeding is without prejudice to the rights of parties to raise the same issue in any future proceeding.

OVERVIEW

In order to address certain issues that have continued to be the subject of debate and discussion over a number of years, and in order to satisfy Board directions from the Decision with Reasons in the EB-2005-0001 case (the 2006 rate case), during the past year the Company has entered into a number of consultative processes with stakeholders. These consultatives were convened in respect of EnVision (issues 1.5 and 1.6), Corporate Cost Allocation (issues 3.6 and 3.7), customer care and CIS (issues 3.2 and 7.1 to 7.4) and open bill access (issue 7.5). These consultative processes have contributed greatly to the ability of all parties to come to settlements on many of these issues, as set out below. Several of the consultative processes are ongoing and may lead to settlement of additional issues. If additional issues are partly or completely settled, parties propose to file a supplementary settlement agreement that would explain the settlements, and the incremental financial impacts of such settlements.

Parties have been able to agree upon the package, which includes settlement of many of the issues raised in this proceeding. While some issues remain outstanding and unresolved, the impact of this Settlement Proposal, if accepted, is that the scope and length of the proceeding will be substantially reduced.

The Company's Application sought recovery of a revenue deficiency of $167.8 million. This figure was updated to $158.7 million in Impact Statement No. 1, to account for, among other things, the ROE for the Test Year of 8.39%.

Parties have agreed upon the settlement package of issues that, if accepted, would reduce the revenue deficiency by $76.7 million. This would result in a remaining revenue /c
deficiency of $82.0 million. /c

The implementation of the settlement package of issues will result in a revenue deficiency of $29.9 million, based on the Company's filing which expresses the revenue deficiency /c
as being relative to the Board-approved rates for F2006, and all of the items that make up

and contribute to those rates including, for example, the agreed-upon level of degree days for F2006.

The issues that are not settled by the Settlement Proposal represent an additional revenue deficiency amount of $52.1 million, based on the Company's filing, which will /c require determination by the Board in the hearing. Based on positions that may be taken by parties in the hearing, the potential outcomes arising from the determination of these unsettled issues by the Board range from an incremental revenue sufficiency of approximately $5 million to an incremental revenue deficiency of $52.1 million. /c

Some intervenors assert that, if they are successful on outstanding issues (in particular issues related to Issue 2.2 regarding degree days), then there could be a revenue sufficiency in respect of those issues. Parties are able to agree, however, that for rate implementation purposes only, the Company can adjust rates to recover an additional $26.0 million, effective as of January 1, 2007, and that this will be implemented at the same time as the Company's April 1, 2007 QRAM is implemented. This amount of $26.0 million will be subtracted from the total revenue deficiency resulting from the Board's final decision in this proceeding (which will include all impacts of this Settlement Proposal). The resulting revenue deficiency (or sufficiency) will be reflected and recovered in rates by the Company, subject to the outcome of Issue 9.1.

When implemented, the recovery of an additional $26.0 million will result in average increases, on an annual basis, of approximately 2% for Rate 1 customers, 1% for Rate 6 customers and between 0% and 2% increases for other rate classes. These average rate increases are relative to the July 1, 2006 QRAM rate and are calculated for a T-service customer, excluding commodity costs, and do not include impacts from the phase-in of cost allocation changes on October 1, 2006 and October 1, 2007. When these rate impacts are compared to the January 1, 2007 QRAM rate, the results are virtually identical as shown in Appendix B. The phase-in of cost allocation changes on October 1, 2007 will reduce the amounts recovered from Rate 1 and Rate 6 by approximately $5.01 million and $4.8 million respectively, and increase the amounts recovered from Rate 115, Rate 135 and Rate 170 by about $5.97 million, $0.6 million and $3.2 million respectively, as shown in Appendix B. The determination by the Board of the issues that are not settled will have additional rate impacts.

Attached as Appendix B is an approximation of the annual T-service rate increases that would result from the recovery of additional amounts of $26.0 million (the immediate additional amount to be recovered if the Settlement Proposal is accepted) and $82.0 /c million (the maximum recoverable revenue deficiency if the Settlement Proposal is accepted and the Board decides the unsettled issues by adopting the Company's position on these issues). These approximations do not take account of the clearance of deferral and variance accounts, the phase-in of cost allocation changes or any allocation changes that might result from the resolution of Issue 6.2. These average annual T-service rate impact estimates are not indicative of the percentage T-service rate increase that will occur on April 1, 2007, compared to T-service rates in force on March 31, 2007. T-service rate increases effective April 1, 2007 will include the rate increase associated with the nine month Rate Rider described in Issue 9.1. The Company believes, based on the analysis that it has undertaken, that these approximations of average annual T-service rate impacts, which are expressed relative to the July 1, 2006 QRAM rates and the January 1, 2007 QRAM rates, and are calculated for a T-service customer excluding commodity costs, are correct within +/- 0.5%.

1 RATE BASE (Exhibit B)

1.1 Are the amounts proposed for the 2007 Rate Base appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

Parties have reached a global settlement of all 2007 Rate Base issues, except for issues related to the capital budget for the new CIS system. Issues related to the new CIS system are discussed below at Issues 7.2 to 7.4. The capital spending for the new CIS system will have no rate base impact in 2007. Parties agree that the Company will reduce the revenue deficiency associated with 2007 Rate Base issues by a total of $8 million, as compared to the Company's filed evidence. This will result in a 2007 capital budget of approximately $300 million, plus the cost of the Portlands Energy Centre Leave to Construct project, which is estimated at $18 million during the Test Year. The Portlands Energy Centre project, if approved in the leave to construct application, will not affect rates for the Test Year. Parties believe that the Board's consideration of the Portlands Energy Centre in the leave to construct application should be consistent with the principles set out under Issue 1.4 below.

Parties agree that the 2007 capital budget is an envelope amount, and the Company will have discretion to determine which items will be removed or changed from the Company's filed capital budget in order to reduce the overall level of that budget. Notwithstanding this discretion, the Company agrees that it will not proceed with the Automatic Meter Reading (AMR) project. Intervenors do not necessarily accept, and presently take no position on, the Company's decisions as to how it will allocate and spend the 2007 capital budget. Parties agree that, assuming the incentive regulation rate setting process allows for it, a normal review of the Company's capital spending in the Test Year may be undertaken as part of the rate setting process for 2008. The issue of capital spending on the EnergyLink program, included in Issue 3.4, is not settled, but the Board's decision on that issue will not affect the overall capital budget for the Test Year, only the Company's ability to allocate funds to EnergyLink within that budget. Parties accept the Company's opening rate base for 2007.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

B1-1-1	Utility Rate Base
B1-1-2	Utility Rate Base Year to Year Summary
B1-2-1	Rate Base Capital Budget
B3-1-1	Ontario Utility Rate Base – Comparison of 2007 Test Year to 2006 Bridge Year
B3-1-2	Property, Plant and Equipment Summary Statement – Average of Monthly Averages 2007 Test Year
B3-1-3	Working Capital Summary of Average of Monthly Averages 2007 Test Year
B3-2-1	Utility Capital Expenditures Comparison Budget 2007 and Estimated 2006
B3-2-2	2007 Capital Expenditures by Project (Projects Exceeding $500,000)
B3-2-3	Gross Customer Additions and Average Cost per Customer Addition Budget 2007 and Estimated 2006
B3-2-4	System Expansion Portfolio – 2007
F3-1-3	Utility Rate Base 2007 Test Year
I-1-1 to 3	Board Staff Interrogatories 1 to 3
I-9-4 and 7	IGUA Interrogatories 4 and 7
I-16-1 to 3	SEC Interrogatories 1 to 3
I-24-5 to 7	VECC Interrogatories 5 to 7
L-9-1	Evidence of IGUA
M1-1-1	Impact Statement #1

1.2 Are the amounts proposed for Capital Expenditures in 2007 appropriate?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue, as part of the package, as follows:

See Issue 1.1.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of aspects of this issue.

Evidence: The evidence in relation to this issue includes the following:

B1-2-1	Rate Base Capital Budget
B1-2-2	Details of Capital Expenditure and Justification for Major Capital Projects over $500,000
B1-3-1	Safety & Integrity Initiatives
B1-3-2	Leave to Construct Projects
B1-4-1	Information Technology Capital Budget
B1-5-1	CIS Project
B1-6-1	EnVision Project
B1-7-1	Automated Meter Reading (AMR)
I-1-4 to 6	Board Staff Interrogatories 4 to 6
I-2-1 to 4	CCC Interrogatories 1 to 4
I-9-2 and 5 to 6	IGUA Interrogatories 2 and 5 to 6

I-16-4 to 10	SEC Interrogatories 4 to 10
I-24-8 to 12	VECC Interrogatories 8 to 12

1.3 Is the budget amount proposed in 2007 for Safety & Integrity projects appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

See Issue 1.1. The Company will determine the 2007 capital expenditures budget for Safety and Integrity projects within the envelope set out under Issue 1.1.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

B1-3-1	Safety & Integrity Initiatives
I-1-7	Board Staff Interrogatory 7
I-2-5 to 7	CCC Interrogatories 5 to 7
I-9-8	IGUA Interrogatory 8
I-16-11 to 12	SEC Interrogatories 11 to 12
I-24-13	VEC Interrogatory 13

1.4 How should the Board deal with the Leave to Construct ("LTC") projects included in the 2007 capital budget given that there will be separate Board Proceedings for the LTC projects?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

Parties are of the view that the Board's decisions determining the appropriate total amount of capital spending by the Company in any test period are most suitably made in a rate application. In general, parties agree that the Board's decision with respect to overall capital spending does not imply specific approval of any individual leave to construct projects ("LTC Projects"), nor a decision as to the economic feasibility of any individual LTC Project. Similarly, parties agree that, generally, a decision with respect to the economic feasibility of an individual LTC

Project does not, in and of itself, imply that it is appropriate to include capital spending pertaining to that LTC Project in the capital budget for a test year used by the Board to establish rates.

In the context of the foregoing, the parties agree that the Board should deal with LTC Projects included in any test year capital budget as follows:

1. The total capital expenditures budget for a particular test year, to be considered and approved in a rate application, should include some evidence on individual LTC Projects planned for that year. However, the Board should not be asked to approve individual LTC Projects in a rate case. In a rate case, evidence with respect to individual LTC Projects need not be as extensive as the evidence required to support a LTC Application.

2. The economic feasibility of an individual project is considered in a leave to construct application. A LTC Application should not result in any adjustment to the Company's capital expenditures budget aside from exceptional circumstances, and in those cases the Board should consider and make the adjustment expressly.

3. A LTC Application can be heard by the Board prior to its consideration of the capital budget consequences of the LTC Project in a rates proceeding. In the event the Board approves a LTC Application, it will not be necessary to examine the justification for the LTC Project in a subsequent rate proceeding although the issue of the appropriate size of the overall capital budget would remain in issue in that hearing, and the leave to construct approval could inform that decision.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

B1-3-2	Leave to Construct Projects
I-1-8 to 9	Board Staff Interrogatories 8 to 9
I-2-8	CCC Interrogatory 8
I-9-9	IGUA Interrogatory 9
I-16-13 to 14	SEC Interrogatories 13 to 14
I-19-4	TransAlta Interrogatory 4

1.5 Has the Company met the requirements of the Board's directive from the 2006 rate case to file an independent cost benchmark study for the EnVision project?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

> Parties agree that the Company has met the requirements of the Board's directive from the EB-2005-0001 Decision with Reasons by filing an independent cost benchmark study for the EnVision project.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

B2-2-1	Compass Report – Envision Cost Benchmark Analysis
B1-6-1	EnVision Project

1.6 What are the appropriate EnVision cost and benefits and how should they be reflected in 2007 rates?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

> Parties agree that Compass carried out an appropriate cost benchmark study of the EnVision Project. Parties differ on how that benchmark should be applied in determining the costs and benefits associated with EnVision that should be reflected in rates. In order to resolve the EnVision issues in this proceeding, the Company has agreed to reduce the revenue requirement by $500,000 through a reduction in the 2007 Other O&M budget. This reduction is reflected and included in the $181.5 million total Other O&M budget agreed to below at Issue 3.2. The Company will continue to report annually to stakeholders on the achievement of EnVision benefits in the form and the manner set out in Tables 1 and 2 in Exhibit B1/T6/S1/pp 8-9. Parties agree that unless there is a change in the overall NPV of the EnVision project, there will be no need to revisit the EnVision project in future regulatory proceedings.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

B2-2-1	Compass Report – Envision Cost Benchmark Analysis
B1-6-1	EnVision Project
1-2-9 to 17	CCC Interrogatories 9 to 17
1-16-15	SEC Interrogatory 15

1.7 Is the business case, including the total project amount of $133 million, proposed for the Automatic Meter Reading project ("AMR") justified?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

As part of the global settlement of 2007 rate base issues, the Company agrees not to proceed with the AMR project.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

B1-7-1	Automated Meter Reading (AMR)
I-1-10 to 13	Board Staff Interrogatories 10 to 13
I-2-18 to 22	CCC Interrogatories 18 to 22
I-9-11	IGUA Interrogatory 11
I-16-16	SEC Interrogatory 16
I-24-14	VECC Interrogatory 14

1.8 Is the proposed recovery of AMR costs in 2007 rates appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

> As part of the global settlement of 2007 rate base issues, the Company agrees not to proceed with the AMR project. As a result, this issue is no longer relevant.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

B1-7-1	Automated Meter Reading (AMR)
1-24-15 to 16	VECC Interrogatories 15 to 16

2 OPERATING REVENUE (Exhibit C)

2.1 Is the proposed amount for 2007 Transactional Services revenue appropriate, and is the associated sharing mechanism in accordance with the 2006 decision?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

> Parties agree that the Company will share net transactional services revenues with ratepayers on a 75:25 basis in favour of ratepayers for transportation-related transactional services and on a 90:10 basis in favour of ratepayers for storage-related transactional services. The Company agrees to credit $8 million in transactional services revenue to ratepayers, to be credited to the revenue requirement for the purpose of setting rates for the Test Year. This credit will not be allocated as between transportation and storage transactional services. The 2007 Transactional Services Deferral Account will include the total of the ratepayers' shares of the net transactional services revenue for transportation-related and for storage-related transactional services, less the $8 million credit and the O&M costs associated with storage-related transactional services (estimated at $.1 million in the Company's updated evidence at Ex. C1-4-2). For greater certainty, if the result of these calculations is that the year-end balance in the 2007

Transactional Services Deferral Account would be less than zero, the balance shall be deemed to be zero.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

C1-4-1	Transactional Services Revenue
C1-4-2	Transactional Services – Supplementary Evidence
I-1-14 to 15	Board Staff Interrogatories 14 to 15
I-2-23	CCC Interrogatory 23
I-9-13	IGUA Interrogatory 13
1-16-17	SEC Interrogatory 17
I-24-17 to 18	VECC Interrogatory 17 to 18
M1-1-1	Impact Statement #1

2.2 Is the proposed total 2007 Other Revenue Forecast appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

Parties agree to increase the forecast for Other Operating Revenue for the Test Year from $23.7 million to $28.9 million, inclusive of the $3.5 million incremental impact of the resolution of the Transactional Services issue (described above at Issue 2.1), an increase of $1.0 million from the forecast of Other Service Revenues in the Company's evidence and the imputation of revenue of $700,000 for the Natural Gas Vehicles (NGV) program for the Test Year (in order to reflect the revenue deficiency of the NGV program).

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

C1-5-1	Other Service and Late Payment Penalty Revenues
C3-5-1	Rate of Return on Capital Employed in the Natural Gas Vehicles Program

I-1-16	Board Staff Interrogatory 16
I-2-24 to 25	CCC Interrogatories 24 and 25
I-16-18	SEC Interrogatory 18
I-24-19 to 22	VECC Interrogatories 19 to 22
M1-1-1	Impact Statement No. 1
M1-2-5	Change in Revenue Requirement

2.3 Is the forecast of degree days appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

C2-4-1	Budget Degree Days
I-1-17	Board Staff Interrogatory 17
I-9-3 and 14	IGUA Interrogatories 3 and 14
1-5-1 to 12	Energy Probe Interrogatories 1 to 12
1-16-19 to 20	SEC Interrogatories 19 to 20
L-9-1	Evidence of IGUA

2.4 Are the average use-per-customer forecasts for rate class 1 and rate class 6 appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

C1-3-1	Volume Budget
C2-3-1	Average Rate Use 1
C2-3-2	Average Use Rate 6
I-1-18	Board Staff Interrogatory 18
I-2-26 to 28	CCC Interrogatories 26 to 28
I-16-21 to 23	SEC Interrogatories 21 to 23
I-24-22 to 25	VECC Interrogatories 22 to 25

2.5 Is the proposed 2007 contract gas volume and revenue forecast appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

C1-3-1	Volume Budget
I-1-19	Board Staff Interrogatory 19
I-1-12	IGUA Interrogatory 12

2.6 Is the proposed 2007 General Service gas volume and revenue forecast appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

C1-3-1	Volume Budget
C1-1-1	Operating Revenue Summary
C1-2-1	Revenue Forecast
C3-1-1	Utility Operating Revenue 2007 Test Year
C3-1-2	Comparison of Utility Operating Revenue Budget 2007 and Estimate 2006
I-1-20	Board Staff Interrogatory 20
1-24-23 to 25	VECC Interrogatories 23 to 25

3 OPERATING COST (Exhibit D)

3.1 Is the proposed 2007 gas cost forecast including the calculation of the PGVA Reference Price appropriate?

(Complete Settlement)

There is an agreement to settle this issue as follows:

Parties accept the Company's forecast of the cost consequences of the gas supply portfolio for the Test Year.

The Company agrees with certain parties that, when the issues list for the Natural Gas Forum proceeding about QRAM methodology is discussed, the Company will support the inclusion of an issue regarding the detailed calculation of the PGVA Reference Price.

Participating Parties: All parties participated in the negotiation and settlement of this issue except GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-4-1	Cost of Gas, Transportation and Storage
D1-4-2	Status of Contracts
D3-3-1	Summary of Gas Cost to Operations
D3-3-2	Summary of Gas Storage and Transportation Costs Fiscal 2007
D3-3-3	Canadian Peak Day Supply Mix
D3-3-4	Monthly Pricing Information
D3-3-5	Gas Supply/Demand
I-1-21	Board Staff Interrogatory 21
I-2-29	CCC Interrogatory 29
I-5-16 to 17	Energy Probe Interrogatory 16 to 17
I-9-16	IGUA Interrogatory 16
I-18-6	Superior Interrogatory 6
I-21-1 to 9	TransCanada Interrogatories 1 to 9
I-24-26	VECC Interrogatory 26

3.2 Is the overall level of the 2007 Operation and Maintenance Budget appropriate?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue, as part of the package, as follows:

> The Company's overall Operations and Maintenance (O&M) budget, as filed in Impact Statement No. 1, for the Test Year totalled $365.8 million and can be divided into a number of categories: (i) customer care expenses (including CIS, internal costs and provision for uncollectibles) – filed as $120.1 million; (ii) corporate cost allocations – filed as $22.9 million; (iii) demand side management (DSM) programs – filed as $22.0 million; and (iv) Other O&M – filed as $200.8 million. The Company has also included transition costs of $10 million related to customer care as a separate line item in its filing.
>
> Issues related the Company's customer care O&M budget (including the transition costs) are discussed below at Issues 7.1 to 7.4. Parties, except for GEC and Pollution Probe, agree on the balance of the Company's O&M budget for the Test Year.
>
> Parties acknowledge that the Company's O&M DSM budget for the Test Year shall be $22.0 million, as set out in the Board's Decision with Reasons in EB-2006-0021 (the DSM generic hearing).
>
> Parties agree that the Company's O&M budget for corporate cost allocations for the Test Year shall be $18.1 million. Parties agree to the overall level of this budget, but there is no specific agreement as to the amounts of each of the

individual allocations. The issues about the corporate cost allocation methodology set out in Issue 3.6 remain unsettled.

Parties, except for GEC and Pollution Probe, agree that the Company's Other O&M budget for the Test Year, filed as $200.8 million, shall be reduced by $19.3 million to $181.5 million. Subject to the comments below, parties agree that the amount of the Other O&M budget is an envelope amount and the Company will have discretion to determine which items will be removed or changed from the Company's Other O&M budget as filed in order to reduce the overall level of that budget. Intervenors do not necessarily accept, and presently take no position on, the Company's decisions as to how it will allocate and spend the 2007 Other O&M budget.

Notwithstanding the agreement on the overall level of the Company's Other O&M budget for the Test Year, parties agree that certain components of the Company's Opportunity Development planned activities for the Test Year, specifically marketing activities, fuel switching and EnergyLink, will be examined before the Board. Parties, except for GEC and Pollution Probe, agree that the examination of those sub-issues before the Board will not impact on the $181.5 million agreed-upon level of the Other O&M budget for the Test Year. Subject to the exception set out below, parties other than GEC and Pollution Probe agree that they will not take any position in this proceeding on how the Company ought to allocate the agreed-upon $181.5 million Other O&M budget. Notwithstanding the foregoing, in the event that the Board determines that the Company may not proceed with EnergyLink, it is understood that Schools and/or HVAC may advance arguments about how the Company ought to spend the O&M amounts totaling $1.3 million (Ex. I-26-4) that were otherwise budgeted for EnergyLink. Notwithstanding the foregoing, it is also understood that VECC may advance arguments that the Company ought to allocate funds as budgeted of $925,000 to low income fuel switching (Ex. 1-24-29). Additionally, the Company agrees that from and after the date of the Board's decision in this proceeding, it will not allocate any portion of the agreed-upon $181.5 million Other O&M budget to any specific marketing, fuel switching or EnergyLink activities that the Board specifically states the Company should not be undertaking.

GEC and Pollution Probe do not agree to the $181.5 million Other O&M budget. GEC and Pollution Probe wish to examine the Company's Opportunity Development (OD) O&M budget separately and do not agree to the overall level of $181.5 million for the Other O&M budget. No other parties, including the Company, will support or argue for any change (increase or decrease) to the agreed-upon Other O&M budget of $181.5 million.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, OAPPA, OESLP, Superior, TransCanada, TransAlta, Union Gas.

Approval: All participating parties accept and agree with the proposed settlement of aspects of this issue except Pollution Probe and GEC.

Evidence: The evidence in relation to this issue includes the following:

D1-1-1	Operating Cost Summary
D1-2-1	Operating, Maintenance and Other Costs
D2-1-1	Corporate Cost Allocation
D3-1-1	Operating Cost 2007 Test Year
D3-2-1	Operating Cost Comparison of Utility Cost and Expenses Budget 2007 and Estimate 2006
D3-2-2	Operating and Maintenance Expense by Department
D3-2-3	Operating and Maintenance Expense by Cost Type
I-1-22 to 24	Board Staff Interrogatories 22 to 24
I-2-30 to 35	CCC Interrogatories 30 to 35
I-9-2, 4 and 15	IGUA Interrogatories 2, 4 and 15
I-15-1 to 4	Pollution Probe Interrogatories 1 to 4
I-16-24 to 29	SEC Interrogatories 24 to 29
I-24-27 to 28	VECC Interrogatories 27 to 28
L-9-1	Evidence of IGUA
M1-1-1	Impact Statement #1

3.3 Is the Company's proposed fuel switching program appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-8-1	Opportunity Development – Market Development
I-1-25	Board Staff Interrogatory 25
I-2-36 to 39	CCC Interrogatories 36 to 39
I-7-1	GEC Interrogatory 1
I-22-6	Union Energy Interrogatory 6
I-24-29	VECC Interrogatory 29
I-26-1 to 3	HVAC Interrogatory 1 to 3

3.4 Is the Company's proposed Energy Link program appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-1-1	Operating Cost Summary
I-22-6	Union Energy Interrogatory 6
I-24-30	VECC Interrogatory 30
I-26-4 to 10	HVAC Interrogatories 4 to 10
L-22-1	Evidence of Union Energy
L-26-1	Evidence of HVAC
I-27-36 to 46	Enbridge Gas Distribution Interrogatories of Union Energy 36 to 46
I-30-1 to 21	Enbridge Gas Distribution Interrogatories of HVAC 1 to 21

3.5 Is the budget for Human Resources related costs appropriate?

(Complete Settlement)

There is an agreement to settle this issue as part of the package, as follows:

> Parties agree that any Human Resources related costs determined by the Company to be appropriate in the Test Year will be included as part of the agreed-upon $181.5 million Other O&M budget.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-2-1	Operating Costs and Maintenance and Other Costs
D1-2-2	Employee Expenses and Workforce Demographics
D3-2-4	Salaries and Wages and FTE Forecast 2007 Test Year
I-1-26	Board Staff Interrogatory 26
I-2-40 to 43	CCC Interrogatories 40 to 43
I-16-30 to 37	SEC Interrogatories 30 to 37
I-24-31 to 33	VECC Interrogatories 31 to 33

3.6 Do the revisions to the Regulatory Cost Allocation Methodology (RCAM) meet the Board's directives in the 2006 decision?

(No Settlement)

There is no agreement to settle this issue.

The issue of whether the revisions to RCAM meet the Board's directives from the 2006 decision has been a subject of the corporate cost allocation consultative. At this time, the final report from the consultant retained on behalf of the consultative has not been filed. As a result, no settlement can be reached on this issue at this time.

Evidence: The evidence in relation to this issue includes the following:

D2-1-1	Corporate Cost Allocation
G1-1-1	Corporate Cost Allocation Methodology
I-16-38 to 39	SEC Interrogatories 38 to 39

3.7 Is the proposed level of corporate cost allocation for 2007 appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

Parties agree that the Company's O&M budget for corporate cost allocations for the Test Year shall be $18.1 million. Parties agree to the overall level of this budget, but there is no specific agreement as to the amounts of each of the individual allocations.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-2-1	Operating Maintenance and Other Costs
D2-1-1	Corporate Cost Allocation
I-1-27 to 28	Board Staff Interrogatories 27 to 28
I-9-1	IGUA Interrogatory 1
I-24-34 to 37	VECC Interrogatories 34 to 37

3.8 Is Company's forecast level of Regulatory and OEB related costs for 2007 appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

> Parties agree that the Company's Regulatory and OEB related costs will be included as part of the agreed-upon Other O&M budget and that variances from the budget for 2007 rate proceeding related expenses will be recorded in the 2007 Ontario Hearings Costs Variance Account for consideration and disposition in a future proceeding.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-2-1	Operating Maintenance and Other Costs
D1-9-1	Regulatory Costs
I-1-29 to 30	Board Staff Interrogatories 29 to 30
I-2-44	CCC Interrogatory 44
I-16-40	SEC Interrogatory 40

3.9 Is Enbridge's decision to change to a December 31 taxation year-end , in 2007, appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

> Intervenors have relied on the Company's evidence that the change of taxation year-end for the Enbridge Gas Distribution Inc. corporate entity has no impact on the Company's 2007 cost of service. In conjunction with the agreement with respect to Issue 3.15, intervenors accept the Company's evidence in this regard.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-5-1	Taxation Year-End Change

I-1-31 to 34	Board Staff Interrogatories 31 to 34
I-16-41	SEC Interrogatory 41

3.10 Is the continuation of the Risk Management Program appropriate in the context of the Board's 2006 Decision directives?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-4-3	Gas Supply Risk Management
I-1-35 to 36	Board Staff Interrogatories 35 to 36
I-2-45	CCC Interrogatory 45
I-5-18 to 27	Energy Probe Interrogatories 18 to 27
I-18-7	Superior Interrogatory 7
I-24-38 to 39	VECC Interrogatories 38 to 39
L-5-1	Evidence of Energy Probe
I-36-1 to 6	Enbridge Gas Distribution Interrogatories of Energy Probe 1 to 6

3.11 Is the proposal to change depreciation rates for 2007, as proposed in the depreciation study, and the impact on 2007 customer rates, appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

> The Company agrees not to proceed with its request to change depreciation rates for 2007. Intervenors agree not to challenge the Company's existing depreciation rates for 2007. Notwithstanding this agreement, parties may examine the existing level of the Company's depreciation rates in the context of discussing and examining other outstanding issues in this proceeding.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-13-1	Depreciation Rate Change
D2-2-1	Depreciation Study

I-1-37 to 46	Board Staff Interrogatories 37 to 46
I-5-13 to 14	Energy Probe Interrogatories 13 to 14
I-9-18	IGUA Interrogatory 18
I-16-42 to 41	SEC Interrogatories 42 to 43
I-24-39.1 to 39.3	VECC Interrogatories 39.1 to 39.3
L-9-1	Evidence of IGUA

3.12 Is the proposal for the establishment of 2007 Deferral and Variance Accounts appropriate?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue, as part of the package, as follows:

> The Company's proposal to establish the following deferral and variance accounts for the Test Year is accepted by the parties for the reasons set out in the Company's evidence:
>
> 2007 Purchased Gas Variance Account ("2007 PGVA")
> 2007 Transactional Services Deferral Account ("2007 TSDA")
> 2007 Unaccounted for Gas Variance Account ("2007 UAFVA")
> 2007 Union Gas Deferral Account ("2007 UGDA")
> 2007 Class Action Suit Deferral Account ("2007 CASDA")
> 2007 Debt Redemption Deferral Account ("2007 DRDA")
> 2007 Deferred Rebate Account ("2007 DRA")
> 2007 Gas Distribution Access Rule Costs Deferral Account ("2007 GDACRDA")
> 2007 Manufactured Gas Plant Deferral Account ("2007 MGPDA")
> 2007 Ontario Hearing Costs Variance Account ("2007 OHCVA")
> 2007 Electric Program Earnings Sharing Deferral Account ("2007 EPESDA")
> 2007 Unbundled Rate Implementation Cost Deferral Account ("2007 URICDA")
> 2007 Unbundled Rates Customer Migration Deferral Account ("2007 URCMDA")
> 2007 Demand-Side Management Variance Account ("2007 DSMVA")
> 2007 Lost Revenue Adjustment Mechanism ("2007 LRAM")
> 2007 Shared Savings Mechanism Variance Account ("2007 SSMVA")
> 2007 Income Tax Rate Change Variance Account ("2007 ITRCVA")
>
> There is no agreement to the establishment of the following deferral and variance accounts, as those accounts are being dealt with as part of the customer care/CIS consultative process and through Issues 7.2 to 7.4:
>
> 2007 Customer Information System Procurement Deferral Account ("2007 CISPDA")
> 2007 Customer Care Procurement Deferral Account ("2007 CCPDA")
> 2007 Customer Care Supplier Transition Variance Account ("2007 CCSTVA")
>
> There is no agreement to the establishment of the following deferral account, as it is being dealt with as part of the open bill consultative process and through Issue 7.5:
>
> 2007 Open Bill Access Sharing Deferral Account ("2007 OBASDA")

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-7-1	Deferral and Variance Accounts
D1-7-3	Deferral and Variance Account Balances
I-1-47	Board Staff Interrogatory 47
I-2-46 to 48	CCC Interrogatories 46 to 48
I-7-2	GEC Interrogatory 2

3.13 Is the proposal for the disposition of existing Deferral and Variance Accounts appropriate?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue, as part of the package, as follows:

Enbridge Gas Distribution filed a summary of the actual deferral account and variance account balances for F2006 (D1-7-3); the summary is reproduced in Appendix A. The result of clearing certain of these accounts is that Enbridge Gas Distribution will credit customers $23.258.7 million in principal plus interest, based upon the December 31, 2006 balances, for F2006.

The balances recorded in the following deferral and variance accounts established for F2006, and the proposed clearance of such balances at the same time as the final rate order in this proceeding is implemented, are accepted by the other parties for the reasons given in the supporting evidence:

<u>Non Commodity Related Accounts</u>

2004 Demand-Side Management Variance Account ("2004 DSMVA")
2004 Lost Revenue Adjustment Mechanism ("2004 LRAM")
2004 Shared Savings Mechanism Variance Account ("2004 SSMVA")
2006 Deferred Rebate Account (“2006 DRA”)
2006 Debt Redemption Deferral Account (“2006 DRDA”)
2006 Ontario Hearing Costs Variance Account (“2006 OHCVA”)

<u>Commodity Related Accounts</u>

2006 Unaccounted for Gas Variance Account (“2006 UAFVA”)
2006 Transactional Services Deferral Account (“2006 TSDA”)

2006 Union Gas Deferral Account ("2006 UGDA")

Enbridge Gas Distribution does not seek to clear, in the Test Year, the balances recorded in the following deferral and variance accounts. Parties agree that the following previously-approved deferral and variance accounts are continued and the clearance of these accounts will be addressed by the Board in the future.

<u>Non Commodity Related Accounts</u>

2006 Demand-Side Management Variance Account ("2006 DSMVA")
2005 Demand-Side Management Variance Account ("2005 DSMVA")
2006 Lost Revenue Adjustment Mechanism ("2006 LRAM")
2005 Lost Revenue Adjustment Mechanism ("2005 LRAM")
2006 Shared Savings Mechanism Variance Account ("2006 SSMVA")
2005 Shared Savings Mechanism Variance Account ("2005 SSMVA")
2006 Manufactured Gas Plant Deferral Account ("2006 MGPDA")
2006 Corporate Cost Allocation Deferral Account ("2006 CCAMDA")
2006 Class Action Suit Deferral Account ("2006 CASDA")

<u>Commodity Related Account</u>

2006 Purchased Gas Variance Account ("2006 PGVA")

While Enbridge Gas Distribution seeks to clear the balances recorded in the following deferral and variance accounts in the Test Year, there is no agreement as to whether this is appropriate and these accounts will be addressed at the hearing:

2006 Gas Distribution Access Rule Costs Deferral Account ("2006 GDARCDA")
2005 Gas Distribution Access Rule Costs Deferral Account ("2005 GDARCDA")
2006 Alliance Vector Appeal Costs Deferral Account ("2006 AVACDA")
2006 Gas Supply Risk Management Program Deferral Account ("2006 GSRMPDA")
2006 Electric Program Earnings Sharing Deferral Account ("2006 EPESDA")
2006 Unbundled Rate Implementation Cost Deferral Account ("2006 URICDA")

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of aspects of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-7-1	Deferral and Variance Accounts
D1-7-2	Proposed Clearing of the 2006 Deferral Accounts
D1-7-3	Deferral and Variance Account Balances
A1-13-1	Status of Board Directives from Previous Board Decisions and/or Orders
A3-3-1	Financial Statements – Enbridge Gas Distribution Historical 2005 Year

A3-4-1	Annual Report (Actual) and Management Discussion and Analysis (MD&A)
I-2-49	CCC Interrogatory 49
I-16-44 to 45	SEC Interrogatories 44 to 45
I-24-40	VECC Interrogatory 40

3.14 Are the amounts proposed to be included in rates for capital and property taxes appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

The Company agrees to a $1.3 million reduction in its forecast of municipal property and other taxes for the Test Year.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D3-1-1	Operating Cost 2007 Test Year
I-9-3	IGUA Interrogatory 3
I-2-50	CCC Interrogatory 50

3.15 Is the amount proposed to be included in rates for income taxes, including the methodology, appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

Parties accept the Company's methodology for income taxes, and the amount to be included in rates for income taxes, for the purpose of setting rates for the Test Year, without prejudice to the ability of any party to raise issues with respect to the methodology and its resulting calculations, including but not limited to which inclusions and deductions are appropriate, in future rate proceedings. The Company agrees to create a 2007 Income Tax Rate Change Variance Account to capture the impact of any corporate income tax rate changes against Fiscal 2007 Board Approved taxable income (versus the Company's forecast of corporate income tax rates) that occur in 2007 as a result of Provincial and Federal government budgets that are passed in the Test Year.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

A3-2-1	Financial Statements – Utility Proforma Statements for Bridge and Test Year
A3-3-1	Financial Statements – Enbridge Gas Distribution Historical 2005 Year
A3-4-1	Annual Report (Actual) and Management Discussion and Analysis (MD&A)
A3-5-3	Annual/Audited Financial Reports (Historical) Enbridge Inc. – 2005 Year
D3-1-1	Operating Cost 2007 Test Year
I-16-46 to 47	SEC Interrogatories 46 to 47

4 COST OF CAPITAL (Exhibit E)

4.1 What is the Return on Equity (ROE) for EGDI for the 2007 test year as calculated pursuant to the ROE Guidelines?

(Complete Settlement)

There is an agreement to settle this issue as follows:

Parties agree that the ROE for the Company for the 2007 test year is 8.39%, as calculated pursuant to the ROE guidelines.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

E1-1-1	Cost of Capital Summary
E1-2-1	Cost of Capital
E2-1-1	Utility Business and Financial Risks
E2-1-2	Enbridge Gas Distribution Utility Business Risks – Environment
E2-1-3	Utility Equity Thickness Financial Risk Update
E2-2-1	Calculation of ROE

E3-1-1	Cost of Capital 2007 Test Year
E3-1-2	Summary Statement of Principal and Carrying Costs of Term Debt 2007 Test Year
E3-1-3	Unamortized Debt Discount and Expense Average of Monthly Averages 2007 Test Year
E3-1-4	Preference Shares Summary Statement of Principal and Carrying Cost 2007 Test Year
E3-1-5	Unamortized Preference Share Issue Expense Average of Monthly Averages 2007 Test Year
E3-1-6	Fiscal 2007 Calculation of Short-term Unfunded Debt
I-5-15	Energy Probe Interrogatory 15
I-24-41 to 43	VECC Interrogatories 41 to 43
M1-1-1	Impact Statement #1

4.2 Are Enbridge's proposed costs for its debt and preference share components of its capital structure appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

E1-1-1	Cost of Capital Summary
E1-2-1	Cost of Capital
I-1-48	Board Staff Interrogatory 48
I-16-48 to 50	SEC Interrogatories 48 to 50

4.3 Is the proposal to change the equity component of the deemed capital structure from 35% to 38% appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

E1-1-1	Cost of Capital Summary
E1-2-1	Cost of Capital
E2-1-1	Utility Business and Financial Risks
E2-1-2	Utility Equity Thickness Financial Risk Update
E2-1-2	Enbridge Gas Distribution Utility Business Risks – Environment
E2-2-1	Calculation of ROE
E3-1-1	Cost of Capital 2007 Test Year
I-2-51	CCC Interrogatory 51
I-9-19	IGUA Interrogatory 19
I-16-51 to 54	SEC Interrogatories 51 to 54
I-24-44 to 57	VECC Interrogatories 44 to 57
I-24-77 to 83	VECC Supplementary Interrogatories 77 to 83
L-9	Evidence of IGUA
L-27-1	Evidence of VECC, CCC and IGUA
L-27-2	Supplementary Evidence of VECC, CCC and IGUA
I-28-1 to 17	Enbridge Gas Distribution Interrogatories of VECC, CCC and IGUA 1 to 17

5 COST ALLOCATION (Exhibit G)

5.1 Is the Applicant's cost allocation appropriate and is it based in its 2006 Board approved methodology?

(Complete Settlement)

There is an agreement to settle this issue as follows:

> Subject to the comments below in respect of Issues 6.2, 6.4 and 8.1, and subject to a compliance review of the cost allocation that will be embedded in any rate orders arising from this proceeding, parties accept the Company's evidence in this proceeding about its cost allocation for the Test Year and agree that it is appropriate and consistent with the 2006 Board-approved methodology.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OESLP, Pollution Probe, Superior, TransAlta, TransCanada, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

G1-1-1	Cost Allocation Methodology
G2-1-1	Fully Allocated Cost Study
I-1-52	Board Staff Interrogatory 52
I-9-20	IGUA Interrogatory 20
I-24-59	VECC Interrogatory 69

5.2 Is the proposal to recover Demand Side Management costs in delivery charges, as opposed to load balancing charges, appropriate?

(Complete Settlement)

There is an agreement to settle this issue as follows:

> Parties accept the Company's proposal, as set out in the evidence, to recover Demand Side Management costs in delivery charges, rather than in load balancing charges.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

G2-3-1	Functionalization of Utility Rate Base
G2-3-2	Functionalization of Utility Working Capital
G2-3-3	Functionalization of Utility Net Investments
G2-3-4	Functionalization of Utility O&M
I-1-53	Board Staff Interrogatory 53

6 RATE DESIGN (Exhibit H)

6.1 Is the proposal to introduce delivery demand charges for Rates 100 and 145 reasonable?

(Complete Settlement)

There is an agreement to settle this issue as follows:

Parties accept the Company's proposal, as set out in the evidence, to introduce delivery demand charges for Rates 100 and 145.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OESLP, Pollution Probe, Superior, TransCanada, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue except TransAlta and VECC, which take no position.

Evidence: The evidence in relation to this issue includes the following:

H1-1-1	Rate Design
H2-1-1	Revenue Comparison – Current Revenue vs. Proposed Revenue
H2-2-1	Proposed Revenue Recovery by Rate Class
H2-3-1	Summary of Proposed Rate Change by Rate Class
H2-4-1	Calculation of Gas Supply Charges by Rate Class
H2-5-1	Detailed Revenue Calculations by Rate Class
H2-6-1	Rate Handbook
H2-7-1	Annual Bill Comparison
H3-1-1	Revenue Comparison – Current vs Proposed by Rate Class Proposed Methodology
H3-1-2	Proposed Unit Rates by Rate Class
H3-2-1	Proposed Revenue Recovery by Rate Class

H3-3-1	Summary of Proposed Rate Change
H3-4-1	Calculation of Gas Supply Charges by Rate Class
H3-5-1	Detailed Revenue Calculations by Rate Class
H3-6-1	Rate Handbook
H3-7-1	Annual Bill Comparison
I-1-54	Board Staff Interrogatory 54
I-12-1	OAPPA Interrogatory 1

6.2 Is the proposal to allocate revenue requirement between the customer classes and annually adjust the monthly customer charges and variable charges to recover the revenue deficiency reasonable?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue as follows:

> Parties accept the Company's proposal, as set out in the evidence, to annually adjust the monthly customer charges and variable charges to recover the revenue deficiency.
>
> There is no agreement about the Company's proposal to allocate revenue requirement between customer classes. Some parties are concerned that the allocation of the 2007 revenue deficiency as proposed in the Company's evidence results in the collection of revenues greater than allocated costs from Rate 1 and Rate 6 customers based on the Company's filed Revenue to Cost ratios of 1.02 and 1.01 for these rate classes. These parties wish to explore the proposed 2007 revenue requirement allocation in light of the evidence and interrogatory responses on this issue. Other parties support the Company's revenue deficiency allocation and will oppose changes to it.

Participating Parties: All parties participated in the negotiation and settlement of aspects of this issue except Direct Energy, GEC, HVAC, OESLP, Pollution Probe, Superior, TransCanada**.**

Approval: All participating parties accept and agree with the proposed settlement of aspects of this issue.

Evidence: The evidence in relation to this issue includes the following:

H1-1-1	Rate Design
H2-1-1	Revenue Comparison – Current Revenue vs. Proposed Revenue
H2-2-1	Proposed Revenue Recovery by Rate Class
H2-3-1	Summary of Proposed Rate Change by Rate Class
H2-4-1	Calculation of Gas Supply Charges by Rate Class
H2-5-1	Detailed Revenue Calculations by Rate Class
H2-6-1	Rate Handbook

H2-7-1	Annual Bill Comparison
H3-1-1	Revenue Comparison – Current vs Proposed by Rate Class Proposed Methodology
H3-1-2	Proposed Unit Rates by Rate Class
H3-2-1	Proposed Revenue Recovery by Rate Class
H3-3-1	Summary of Proposed Rate Change
H3-4-1	Calculation of Gas Supply Charges by Rate Class
H3-5-1	Detailed Revenue Calculations by Rate Class
H3-6-1	Rate Handbook
H3-7-1	Annual Bill Comparison
I-1-55	Board Staff Interrogatory 55
I-9-23	IGUA Interrogatory 23
I-12-2	OAPPA Interrogatory 2
I-24-70	VECC Interrogatory 70

6.3 Should the Board approve the contents of the Applicant's Rate Handbook?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue as follows:

> Parties agree that it is appropriate for the Board to continue to approve the Company's Rate Handbook, as part of the Rate Order resulting from Rate Case proceedings.
>
> There is no agreement on the Company's proposed Invoice Vendor Adjustment (IVA) charge.
>
> Subject to the issue about the IVA, parties agree that the Rate Handbook as filed should be approved by the Board.

Participating Parties: All parties participated in the negotiation and settlement of this issue except GEC, HVAC, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of aspects of this issue.

Evidence: The evidence in relation to this issue includes the following:

A1-14-1	Policies and Regulations of the Company with Respect to Gas Services and Schedule of Service Charges
A1-14-2	Changes to the Schedule of Service Charges
D1-10-2	Gas Distribution Access Rule
H1-1-1	Rate Design
H2-6-1	Rate Handbook
I-19-1	TransAlta Interrogatory 1
I-1-56	Board Staff Interrogatory 56
I-12-3	OAPPA Interrogatory 3
I-24-71 to 73	VECC Interrogatories 71 to 73

6.4 Is the proposed treatment of bundled transportation charges and T-service credit appropriate in light of the Board's Decision in RP-2003-0203 and the settlement agreement?

(Complete Settlement)

There is agreement to settle this issue as follows:

> Parties accept the Company's proposed treatment of bundled transportation charges and T-service credits. The final rate increases associated with the implementation of the settlement proposal of the changes in the allocation of upstream transportation charges in EB-2005-0001 will be implemented on October 1st, 2007. Effective October 1, 2007, the upstream transportation charges for all rate classes will recover the appropriate level of upstream transportation costs for all rate classes, so that there will be no over-contribution from Rates 1 and 6 with respect to upstream transportation costs.
>
> The Company will continue to charge and rebate the T-service credit for Ontario T-Service customers. The existing T-Service credit, equal to TransCanada's 100% load factor toll, will continue to be in effect until December 31, 2007. Effective January 1, 2008, the T-Service credit will be based on the weighted average cost of transportation, equal to the unit rate based on total utility transportation costs over total delivery volumes. The Company will treat T-Service credits for Ontario T-Service customers in this manner, as an "off-set", from January 1, 2008 until such time as the Company has a new billing system that permits a different approach. This approach satisfies the Board's directive regarding the Company's obligation to phase-out the T-service credit for Ontario T-Service customers as outlined in the RP-2003-0203 Settlement Proposal.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OESLP, Pollution Probe, Superior, TransCanada, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

H1-1-1	Rate Design
I-1-57	Board Staff Interrogatory 57
I-12-4	OAPPA Interrogatory 4

7 CUSTOMER CARE SUPPORT, CUSTOMER CARE SYSTEM, AND OPEN BILL ACCESS

7.1 Has Enbridge complied with the direction, in the EB-2005-0001 Decision, to file in evidence the following Customer Care Support Cost information: all agreements between Enbridge and CWLP, ECSI or any other EI-related entity related to the provision of customer care or CIS; the Program Agreement between CWLP and Accenture, including any amendments or revisions; financial statements for ECSI and CWLP (historical, bridge and test year); the return analyses described in the decision?

(No Settlement)

Issues related to customer care and CIS are the subject of continuing discussions as part of a consultative process involving the Company and stakeholders. Negotiations are continuing as part of the consultative process and parties expect to be able to report their progress and positions to the Board at the same time as the Settlement Proposal is presented for approval.

Evidence: The evidence in relation to this issue includes the following:

D1-12-1	Customer Care - Overview
D1-12-2	Customer Care and Transition Costs
D1-12-3	Customer Care – Benchmarking
I-1-58	Board Staff Interrogatory 58
I-9-17	IGUA Interrogatory 17
I-16-55 to 58	SEC Interrogatories 55 to 58

7.2 What actions or decisions are required by the Board regarding items in the 2006 and 2007 capital budgets which might be duplicated in the upcoming application for a Regulatory Asset Account?

(No Settlement)

Issues related to customer care and CIS are the subject of continuing discussions as part of a consultative process involving the Company and stakeholders. Negotiations are continuing as part of the consultative process and parties expect to be able to report their progress and positions to the Board at the same time as the Settlement Proposal is presented for approval.

Evidence: The evidence in relation to this issue includes the following:

D1-10-1	GDAR
I-1-59	Board Staff Interrogatory 59

7.3 Are the forecast costs of the new CIS system appropriate?

(No Settlement)

Issues related to customer care and CIS are the subject of continuing discussions as part of a consultative process involving the Company and stakeholders. Negotiations are continuing as part of the consultative process and parties expect to be able to report their progress and positions to the Board at the same time as the Settlement Proposal is presented for approval.

Evidence: The evidence in relation to this issue includes the following:

B1-5-1	CIS Project
I-1-60 to 63	Board Staff Interrogatories 60 to 63
I-9-10	IGUA Interrogatory 10
I-26-11	HVAC Interrogatory 11

7.4 What are the appropriate costs for CIS and Customer Care for 2007, including internal and transition costs?

(No Settlement)

Issues related to customer care and CIS are the subject of continuing discussions as part of a consultative process involving the Company and stakeholders. Negotiations are continuing as part of the consultative process and parties expect to be able to report their progress and positions to the Board at the same time as the Settlement Proposal is presented for approval.

Evidence: The evidence in relation to this issue includes the following:

B1-5-1	CIS Project
D1-12-1	Customer Care – Overview
D1-12-2	Customer Care and Transition Costs
D1-12-3	Customer Care – Benchmarking
D3-2-1	Operating Cost Comparison of Utility Cost and Expenses Budget 2007 and Estimate 2006
I-1-64 to 73	Board Staff Interrogatories 64 to 73
I-16-59	SEC Interrogatory 59

7.5 Is the Applicant's proposal of open bill access appropriate and consistent with the Board's direction in RP-2005-0001?

(No Settlement)

There is no agreement to settle this issue, although the consultative is ongoing.

Evidence: The evidence in relation to this issue includes the following:

8 OTHER ISSUES

8.1 What are the actions or decisions necessary for the Board to be assured that the Board's decisions, including settlements, in the NGEIR (EB-2005-0551) proceeding will be appropriately captured and reflected in this proceeding?

(Complete Settlement)

There is an agreement to settle this issue as follows:

All parties agree that the implications of the Board's decisions in the NGEIR (EB-2005-0551) proceeding have been captured in the Company's filing in this proceeding. This agreement is subject to the stipulation that certain parties have initiated Motions for Review of the Board's decisions in the NGEIR proceeding which, if successful, could require the Company to make consequential adjustments to its rates, including (without limitation) Rate 316.

The Company's obligations under the NGEIR Settlement Proposal pertaining to whether and when an automated solution should be developed and put in place remain in full force and effect.

Every three months the Company will provide to stakeholders a report on the number of customers that have committed to migrate and have migrated to the new unbundled Rates 300 and 315. If, at any time during the Test Year, 20 customers have committed to take EGD's unbundled rates, the Company will undertake a survey, using the least cost approach, to evaluate demand for unbundled Rates 300 and 315, and assess and report on the timing for development of an automated solution and accommodating additional customers through the manual solution within 90 days after the Company's 20th customer has committed to migrate to the new unbundled rates. If, at that time, the Company decides to proceed with a manual solution, it will continue to provide customers with a quarterly report on the status of migration including feedback from customers on the potential for future migration. The parties agree that the Company's costs associated with preparing and administering the survey will be recorded in the 2007 Unbundled Rate Implementation Cost Deferral Account. The parties further agree they will support recovery by the Company of the reasonably incurred survey costs in the 2007 Unbundled Rate Implementation Cost Deferral

Account on the understanding that the Company will seek to have all reasonably incurred costs recovered from large volume customers.

In order to allow customers to take advantage of the new Rate 300 and Rate 315, customers will have the opportunity to migrate to Rate 300 and 315 at all times during the Test Year until the point in time when 20 customers have migrated to the rate 300 series rates. Subject to the conditions of the Company's Early Termination Policy, the Company will permit migrating customers to terminate their bundled rate contracts early, on the understanding that customers will true up any imbalances in their existing contracts as per the provisions of the Company's Early Termination Policy.

If the survey results indicate that significantly more than 20 customers are prepared to commit to migrate, then the Company will undertake to develop an automated solution. If a smaller number of customers are prepared to commit to migrate, then the Company will conduct an analysis comparing the incremental cost of supporting incremental customers' activities and transactions using the manual solution versus the costs of an automated solution. The goal of the analysis will be to determine if it is feasible to expand the manual solution (and at what cost) versus the cost of an automated solution. Should an automated solution be required, the parties agree that the Company record associated costs in the Unbundled Rate Implementation Cost Deferral Account as per the NGEIR Settlement Proposal EB-2005-0551, Ex. S-1-1, p. 33.

If a manual solution permits more than 20 customers to migrate during the Test Year, any such additional spots will be implemented in a manner that is consistent with section 4(g) of the Settlement Agreement in EB-2005-0551 whereby 50% of the additional spots will be allocated to interested customers who will benefit the most from the service from a distribution rate perspective, and 50% of the additional spots will be allocated to interested customers entitled to subscribe for the service on the basis of a lottery system.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OESLP, Pollution Probe, Superior, TransCanada, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue except VECC which takes no position and did not participate in discussion on the issues discussed after the second paragraph above.

Evidence: The evidence in relation to this issue includes the following:

I-19-1 to 3	TransAlta Interrogatories 1 to 3
I-1-78 to 79	Board Staff Interrogatories 78 to 79
I-12-5 to 6	OAPPA Interrogatories 5 to 6

I-20-1	TransCanada Interrogatory 1

8.2 What are the actions or decisions necessary for the Board to be assured that the Board's decisions, including settlements, in the DSM (EB-2006-0021) proceeding will be appropriately captured and reflected in this proceeding?

(Complete Settlement)

There is an agreement to settle this issue as follows:

All parties agree that the implications of the Board's decisions in the DSM (EB-2006-0021) proceeding have been captured in the Company's filing in this proceeding.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

I-1-80 to 81	Board Staff Interrogatories 80 to 81
I-9-21 to 22	IGUA Interrogatories 21 to 22
I-24-76	VECC Interrogatory 76

9 RATE IMPLEMENTATION

9.1 How should the Board deal with any revenue deficiency applicable from January 1, 2007 to the date that the Board's decision is implemented?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue, as part of the package, as follows:

Parties agree that the Company can adjust rates to recover an additional $26.0 million, effective as of January 1, 2007, and that this will be implemented at the same time as the Company's April 1, 2007 QRAM is implemented. Parties agree with and support the Company's proposal to recover the full $26.0 million through (i) increased annualized rates for the remainder of the Test Year; and (ii) the use of a rate rider over the nine remaining months of the Test Year to recover the remaining balance of the $26.0 million. Intervenors agree that no issue or objection will be raised around whether any part of this $26.0 million is unrecoverable because it relates to the time period between January 1, 2007 and April 1, 2007.

There is no agreement as to whether or how the Company can recover any revenue deficiency in excess of $26.0 million.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties except Schools accept and agree with the proposed settlement of aspects of this issue.

Evidence: The evidence in relation to this issue includes the following:

A1-2-1	Application
I-1-82	Board Staff Interrogatory 82
I-16-62 to 53	SEC Interrogatories 62 to 63

9.2 Should the Board set interim rates, effective January 1, 2007, to allow Enbridge to begin to recover its prospective revenue deficiency?

(Complete Settlement)

There is an agreement to settle this issue as follows:

This issue is no longer relevant, since the January 1, 2007 date has passed.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

A1-2-1	Application
I-1-83 to 84	Board Staff Interrogatories 83 to 84

SUPPLEMENTARY SETTLEMENT PROPOSAL : ISSUE 7.5

The issues related to Issue 7.5 ("Is the Applicant's proposal of open bill access appropriate and consistent with the Board's direction in RP-2005-0001?") have been the subject of the ongoing Open Bill Consultative. Parties have been able to come to an agreement to settle aspects of this issue.

This incomplete settlement, if approved by the Board, will be added to the Settlement Proposal (Ex. N1-1-1) approved by the Board on January 29, 2007 (the "January 29th Settlement Proposal") and the provisions of this incomplete settlement will supersede the reference at page 43 of 47 of the January 29th Settlement Proposal which states that there is no settlement of Issue 7.5.

Parties agree that the provisions of the Introduction and Overview sections of the January 29th Settlement Proposal apply to this Supplementary Settlement Proposal, except for (i) the chart of settled issues, which does not reflect this incomplete settlement of Issue 7.5; and (ii) any references to revenue deficiency and rate impact of the settlement, which would have to be changed to reflect the incremental financial impact of this Supplementary Settlement Proposal.

With that preamble, the following section represents the incomplete settlement that has been agreed upon.

7.5 Is the Applicant's proposal of open bill access appropriate and consistent with the Board's direction in RP-2005-0001?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue, as follows:

The parties agree to settle the third party billing component ("Billing Services") of Issue 7.5 Open Bill Access on the basis that the Company can proceed with the Billing Services on the following terms:

1. ***Compliance with Board Directive.*** All parties accept the Company's decision to respond to the Board's directive in EB-2005-0001 in two stages: an interim solution, using the Company's existing CIS, and a comprehensive solution, using the Company's planned new CIS. This settlement constitutes the interim solution until otherwise ordered by the Board in the Board review referred to in #2 below. Subject to the

presentation to the Board of the comprehensive solution, discussed in #2 below, all parties agree that this settlement constitutes an appropriate response to the Board's directive.

2. ***Comprehensive Solution.*** The Company agrees that it will file an application to the Board prior to the end of 2008 proposing the comprehensive Billing Services offering. Such application should include: a) a detailed report on the experience with the interim solution, b) any available consultants' reports with respect to costing and/or market pricing, c) the results of any customer communications activities and any customer or industry surveys, d) minutes and/or reports of the activities of the stakeholder committee referred to in #8 below, and e) the Company's proposal on whether the Billing Services should continue, and if so on what terms. Without limiting the generality of the foregoing, the Company's proposal may include changes to pricing, costing, shareholder incentive, and any other aspects of the Billing Services. In the event that in the Company's application the Company or any party proposes that the Billing Services should not continue, that party must also propose a reasonable transition period to reflect the time required for anyone using the Billing Services to shift to alternate billing arrangements. Nothing in this settlement implies that any party admits to either the relevance or the appropriate weight to be given to any particular evidence in this subsequent application, and all parties will be free to argue as they see fit with respect to any proposed evidence.

3. ***Pricing.*** During the interim period, but at least until December 31, 2008 parties accept the prices proposed by the Company, $0.829 for shared bills and $1.389 for standalone bills. All participants using the Billing Services will pay the same prices for the same services. The parties agree that prices for the Billing Services and any changes from time to time to the rules relating to the OBSDA referred to in #4 below must be approved by the Board.

4. ***Startup Costs.*** The shareholder will bear the startup and bill re-design costs associated with the Billing Services but will be allowed to recover 4 cents/bill from the Open Bill Service Deferral Account (OBSDA) over a two year period until the costs are recovered. The shareholder will not bear the costs associated with adding the Billing Services to the new CIS. The latter costs will be included in the costs of the Billing Services and recovered in revenues from the service.

5. ***Ratepayer Benefit.*** Subject to the shareholder incentive, set forth below, all net benefits, whether through mitigation of common costs, or net profits from the OBA services, will accrue to the benefit of the ratepayers. The Company agrees to include in its 2007 revenue requirement a net benefit of the service of $5.389 million. This number is derived from calculations /u found in JT.5, as updated to reflect this settlement. To be sure, all parties also agree If the net benefit of the service is greater or less than the amount included in rates, the difference will be credited or debited, as the case may be, to a new variance account, the Open Bill Access Variance Account (OBAVA) and refunded or charged to ratepayers in the following year. The net benefit shall be calculated as the total revenues from Billing Services, less

   a. the incremental costs to deliver those services;
   b. the amount referred to in #4 above; and,
   c. the shareholder incentive referred to in #6 below.

6. ***Shareholder Incentive.*** The Company will receive no incentive for Billing Services provided to any affiliate of the Company. For the Billing Services by any other person, the Company will be paid a commission as follows subject to an annual maximum calculated as 50% of the program's net margin:
   a. With respect to any bill on which Direct Energy (which for all purposes of these terms should be interpreted as including any successor to Direct Energy's water heater business) is the sole third party billing entity, $0.02 per bill;

   b. With respect to any bill on which there is any third party billing entity charge other than Direct Energy on the bill:

      i. $0.10 per bill in any month that the Billing Services service has only one active billing entity other than affiliates or Direct Energy;
      ii. $0.15 per bill in any month that the Billing Services service has two active billing entities other than affiliates or Direct Energy;
      iii. $0.20 per bill in any month that the Billing Services service has three active billing entities other than affiliates or Direct Energy;
      iv. $0.25 per bill in any month that the Billing Services service has more than three active billing entities other than affiliates or Direct Energy;

An entity will only be considered an "active billing entity" in any month in which it is billing products or services on at least 500 EGD bills.

7. ***Costing and Pricing Studies:*** The Company agrees that it will retain an independent consultant or consultants to undertake costing and pricing analyses for the Billing Services. The consultant's work will include assistance in determining a market price, and a review and analysis of the incremental and fully-allocated costs of these services. The Company will solicit the stakeholder group's input on the independent consultant(s), and statement of work for those consultant(s), but the Company will retain the right to make the final selection and define the terms of the reference. The cost of these studies will be included in the OBSDA.

8. ***Stakeholder Input.*** The Company will establish a stakeholder committee that includes users of the Billing Services, as well as ratepayer and industry representatives, to review the rules associated with participation in Billing Services. All parties to the agreement will be invited to become members of the stakeholder committee. The committee will meet from time to time as required to consider changes to the rules. Any changes to the rules that materially change the nature of the service will be reviewed by the stakeholder committee and reported to the Board to determine if their approval is required. The stakeholder committee will also be solicited for input into the Company's proposed communications plan, and other issues as they arise.

9. ***Affiliate Participation.*** Affiliates of the Company (including for the purpose of this settlement related parties such as limited partnerships or trusts that are not technically affiliates) may use the Billing Services on the same terms as any other third party biller. However, all parties agree with the principle that the Billing Services should be implemented in a manner that avoids ratepayer and/or consumer confusion, and, to the extent possible, prevents any participant from gaining any unfair market advantage by reason of their association with the utility, if any. The Company agrees that during the interim period it will implement such measures as may be necessary to achieve this principle, including but not limited to including in the Billing Services and enforcing in a commercially reasonable manner the following service rules::

   (a) No person, whether affiliate or otherwise, may use or associate itself with any name or logo on the bill that is the same as, similar to, or confusing with any name or logo that is associated with the Company (e.g. the "Enbridge" name and swirl logo).

(b) No person may use the Billing Services in an abusive or unfair manner in that it deliberately creates the impression that it has a preferred position relative to other market participants because of its relationship with the utility.

Notwithstanding, these restrictions in no way shape or form creates any future precedent to rely upon regarding the use of the Enbridge name or logo.

The parties acknowledge their mutual intention to bring issues with respect to affiliate participation to the stakeholder committee for resolution, but this statement will not limit any rights any party may have, whether under the Affiliate Relationships Code or otherwise, to have disputes resolved in any forum.

10. ***EnergyLink™ Relevance.*** If the Board in this proceeding approves the EnergyLink™ program proposed by the Company, the parties agree that whether a company is an EnergyLink™ participant or not will not affect whether that company can use the Billing Services, nor the rules or conditions under which they use the service.

11. ***Information.*** The Company will develop with input from the stakeholder committee an appropriate customer communication plan specific to Billing Services The Company shall provide to the Board and make available to all parties to this settlement agreement a report that includes revenues from Billing Services, and the costs of the services on a fully-allocated basis,an incremental basis and in a manner when known that is consistent with the methodology recommended in the study noted in paragraph 7, to the extent that this is different .

12. ***Logos and Bill Messaging.*** Logos and bill messaging will be provided to all participants in the Billing Services at no charge to facilitate entry of new users and help consumers differentiate the various parties with amounts billed on the EGD bill. Any provision of logos and bill messaging for the Billing Services will apply in the same manner to commodity vendors using the ABC Services for a reasonable charge, but commodity messaging will not be allowed unless EGD or one of its affiliates starts to market system gas.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Energy Probe, IGUA, OAPPA, Superior, TransAlta, TransCanada and Union Gas,

Approval: All participating parties accept and agree with the proposed settlement of this issue except that GEC and Pollution Probe reserve the right to pursue in the Hearing whether the Board should order that third parties not be allowed to use the Billing Services for the billing of specific products on the basis of their environmental attributes.

SUPPLEMENTARY SETTLEMENT PROPOSAL : ISSUE 7.5

The issues related to Issue 7.5 ("Is the Applicant's proposal of open bill access appropriate and consistent with the Board's direction in RP-2005-0001?") have been the subject of the ongoing Open Bill Consultative. Parties have been able to come to an agreement to settle aspects of this issue.

This incomplete settlement, if approved by the Board, will be added to the Settlement Proposal (Ex. N1-1-1) approved by the Board on January 29, 2007 (the "January 29th Settlement Proposal") and the provisions of this incomplete settlement will supersede the reference at page 43 of 47 of the January 29th Settlement Proposal which states that there is no settlement of Issue 7.5.

Parties agree that the provisions of the Introduction and Overview sections of the January 29th Settlement Proposal apply to this Supplementary Settlement Proposal, except for (i) the chart of settled issues, which does not reflect this incomplete settlement of Issue 7.5; and (ii) any references to revenue deficiency and rate impact of the settlement, which would have to be changed to reflect the incremental financial impact of this Supplementary Settlement Proposal.

With that preamble, the following section represents the incomplete settlement that has been agreed upon.

7.5 Is the Applicant's proposal of open bill access appropriate and consistent with the Board's direction in RP-2005-0001?

(Incomplete Settlement)

There is an agreement of some parties to settle aspects of this issue, as follows:

<u>Proposed Billing Insert Settlement</u>

The parties agree to settle the billing insert ("Insert Service") component of Issue 7.5 Open Bill Access on the basis that the Company can proceed with the Insert Service on the following terms:

1. ***Compliance with Board Directive.*** All parties accept the Company's decision to respond to the Board's directive in EB-2005-0001 in two stages: an interim solution, using the Company's existing CIS, and a comprehensive solution, using the Company's planned new CIS. This settlement constitutes

the interim solution until otherwise ordered by the Board in the Board review referred to in #2 below. Subject to the presentation to the Board of the comprehensive solution, discussed in #2 below, all parties agree that this settlement constitutes an appropriate response to the Board's directive as it pertains to bill inserts.

2. ***Comprehensive Solution.*** The Company agrees that it will file an application to the Board prior to the end of 2008 proposing the comprehensive Billing Insert Service offering. Such application should include: a) a detailed report on the experience with the interim solution, b) any available consultants' reports with respect to costing and/or market pricing, c) the results of any customer communications activities and any customer or industry surveys, d) minutes and/or reports of the activities of the stakeholder committee referred to in #8 below, and e) the Company's proposal on whether the Insert Service should continue, and if so on what terms. Without limiting the generality of the foregoing, the Company's proposal may include changes to pricing, costing, shareholder incentive, and any other aspects of the Insert Service. Nothing in this settlement implies that any party admits to either the relevance or the appropriate weight to be given to any particular evidence in this subsequent application, and all parties will be free to argue as they see fit with respect to any proposed evidence.

3. ***Pricing.*** For the interim period of 2007 and 2008, the Company agrees to reduce the minimum bids for bill inserts by one cent resulting in an average insert charge of 4 cents. For greater clarity, there shall be no right of first refusal for parties using the Company's Insert Service. The parties agree that prices for the Insert Service, and any changes thereto from time to time, must be approved by the Board.

4. ***Costing and Pricing. T***he Company agrees that it will retain an independent consultant to undertake a costing and pricing analysis for the Bill Insert Service for the comprehensive period. The consultant's work will include assistance in determining a market price, and a review and analysis of the incremental and fully-allocated costs of these services for the new CIS. The Company will solicit the stakeholder group's input on the independent consultant, and statement of work for that consultant, but the Company will retain the right to make the final selection and define the terms of the reference. The cost of this study will be included in the Open Bill Service Deferral Account (OBSDA).

5. ***Startup Costs.*** The shareholder will record the startup costs associated with the Insert Service in 2007 in the OBSDA. The startup costs associated with

adding the Insert Service to the new CIS will be included in the costs of the Insert Service and recovered in revenues from the service.

6. ***Ratepayer Benefit.*** The Company agrees to record the costs and revenues from the Insert Service in 2007 in the OBSDA and that the net proceeds will be shared 50/50. The parties agree that the shareholder incentive mechanism for Insert Service may need to be revised after the interim period and after the cost/price review to be consistent with the Board's rules for natural gas incentive regulation.

7. ***Inserts.*** Bill inserts would be allowed as proposed by EGD but revised to limit the number of external inserts to five (5) when safety inserts are scheduled. In all months, two inserts would be reserved for parties wishing to purchase bill inserts in a limited geographic area based on price per insert bidding.

8. ***Stakeholder Input.*** The Company will establish a stakeholder committee that includes users of the Insert Service, as well as ratepayer and industry representatives, to review the rules associated with participation in the Insert Services. All parties to the agreement will be invited to become members of the stakeholder committee. The committee will meet from time to time as required to consider changes to the rules. Any changes to the rules that materially change the nature of the service will be reviewed by the stakeholder committee and reported to the Board to determine if their approval is required. The stakeholder committee will also be solicited for input into the Company's proposed communications plans, and other issues as they arise. To ensure that consumer interests are being addressed, EGD will conduct focus groups and customer surveys on inserts as soon as possible in 2007 and report the findings to the stakeholder committee to determine if remedial action is required. EGD will also prescreen insert users and review the content of their bill inserts to ensure proper use of its billing envelope.

9. ***Problem Resolution.*** If the revised bidding and allocation processes restrict access in three consecutive months or the number of customer complaints on inserts increases significantly in the first two months of operation, the stakeholder committee would be convened to address the concern(s), and if the problem cannot be resolved within two (2) additional months that aspect of the Insert Service would be discontinued until the problem is addressed.

10. ***Affiliate Participation.*** Affiliates of the Company (including for the purpose of this settlement related parties such as limited partnerships or trusts that are

not technically affiliates) may use the Insert Service on the same terms as any other third party biller. However, all parties agree with the principle that the Insert Service should be implemented in a manner that avoids ratepayer and/or consumer confusion, and, to the extent possible, prevents any participant from gaining any unfair market advantage by reason of their association with the utility, if any. The Company agrees that during the interim period it will implement such measures as may be necessary to achieve this principle, including but not limited to including in the Insert Services and enforcing in a commercially reasonable manner the following service rules::

(a) No person, whether affiliate or otherwise, may use or associate itself with any name or logo in the billing envelope that is the same as, similar to, or confusing with any name or logo that is associated with the Company (e.g. the “Enbridge” name and swirl logo).

(b) No person may use the Insert Service in an abusive or unfair manner in that it deliberately creates the impression that it has a preferred position relative to other market participants because of its relationship with the utility.

Notwithstanding, these restrictions in no way shape or form creates any future precedent to rely upon regarding the use of the Enbridge name or logo.

The parties acknowledge their mutual intention to bring issues with respect to affiliate participation to the stakeholder committee for resolution, but this statement will not limit any rights any party may have, whether under the Affiliate Relationships Code or otherwise, to have disputes resolved in any forum.

11. ***EnergyLink™ Relevance.*** If the Board in this proceeding approves the EnergyLink*™* program proposed by the Company, the parties agree that whether a company is an EnergyLink*™* participant or not will not affect whether that company can use the Insert Service, nor the rules or conditions under which they use the service, subject to the restriction on use of the Enbridge name and logo as described in Item 10 above.

12. This agreement should not be construed as a settlement of any aspect of issue 3.4, including but not limited to, arguments to restrict the Company’s ability to promote EnergyLink *™* by bill insert or otherwise. Notwithstanding, the Company agrees to provide a schedule of EnergyLink *™* inserts on an annual basis, as part of the Binding Request for Bids process.

13. ***Commodity Marketing.*** Commodity bill inserts and marketing will not be allowed in the billing envelope unless EGD or one of its affiliates receives OEB approval to promote and/or market system gas commodity, in which case retailers, marketers and vendors will be allowed to promote and/or market their commodity offers through the Insert Service.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Energy Probe, IGUA, OAPPA, TransAlta, TransCanada and Union Gas,

Approval: Enbridge Gas Distribution, Direct Energy, OESLP and Union Energy accept and agree with this proposed settlement. HVAC, VECC and Schools do not agree with the proposed settlement. CCC opposes the proposed settlement in order that it may be permitted to pursue cross-examination on the issue. GEC and Pollution Probe reserve the right to pursue in the Hearing whether the Board should order that third parties not be allowed to use the Billing Services for the billing of specific products on the basis of their environmental attributes. Superior opposes the proposed settlement on the principle that it is not supportive of a settlement position that would allow for the Company to promote system gas through billing inserts as contemplated in Paragraph 13.

Evidence: The evidence in relation to this issue includes the following:

SUPPLEMENTARY SETTLEMENT PROPOSAL : ISSUE 6.3

The Settlement Proposal filed as Exhibit N1, Tab 1, Schedule 1, which was approved by the Board on January 29, 2007 (the "January 29th, 2007 Settlement Proposal"), notes at page 39 of 47 that Issue 6.3 was an Incomplete Settlement. Specifically, there was no agreement on the Company's proposed Invoice Vendor Adjustment (IVA) charge. Discussions have continued in respect of the IVA charge and Parties have been able to come to an agreement to settle outstanding issues relating to the IVA charge.

If this Supplementary Settlement Proposal for the IVA charge is approved by the Board, it will be added to the January 29th, 2007 Settlement Proposal, and the provisions of this Supplementary Settlement Proposal will supersede the reference at page 39 of 47 of the January 29th, 2007 Settlement Proposal which states that there is No Settlement in respect of the IVA charge.

Parties agree that the provisions of the Introduction and Overview sections of the January 29th, 2007 Settlement Proposal apply to this Supplementary Settlement Proposal, except for the chart of settled issues, which does not reflect the complete settlement of Issue 6.3.

With this preamble, the following section represents the complete settlement that has been agreed upon.

6.3 Should the Board approve the contents of the Applicant's Rate Handbook?

(Complete Settlement)

There is an agreement to settle aspects of this issue, as follows:

The parties agree that:

1. The IVA charge by the Company will equal 0.65% of the absolute dollar value of the adjustment. Parties agree that this IVA charge is an interim measure that will apply from June 1, 2007 to December 31, 2007, and is without prejudice to any Party proposing an alternative IVA charge commencing January 1, 2008.

2. The Company will consult with interested parties and will consider the merits of bringing forward a different fee structure for a cost-based IVA charge. The Company will seek approval from the OEB for the new IVA charge, to be effective January 1, 2008.

3. Parties agree that the IVA charge is designed to only recover the costs incurred by the Company to provide this service. As a result, Parties agree that there is no need to adjust the revenue deficiency as a result of forecast IVA charge revenues and costs. The Company will provide parties with a summary of 2007 IVA charge revenues and costs subsequent to December 31, 2007.

***Participating Parties*:** All parties participated in the negotiation and settlement of this issue except Energy Probe, GEC, HVAC, LIEN, OAPPA, Pollution Probe, SEC, Superior, TransCanada, TransAlta, Union Energy and Union Gas.

Approval: All participating parties accept and agree with the proposed settlement of aspects of this issue. Without limiting the generality of the Introduction to the Settlement Proposal, VECC's acceptance of this proposed settlement is without prejudice to it proposing that IVA charges be reviewed as part of the Board's generic review of the QRAM/System Gas. CCC, HVAC, IGUA, Energy Probe, SEC, and Union Energy take no position.

Evidence: The evidence in relation to this issue includes the following:

D1-10-2, plus attachment	Gas Distribution Access Rule
Tr. 5, pp. 68, 73-74	

SETTLEMENT PROPOSAL FOR CUSTOMER CARE AND CUSTOMER INFORMATION SYSTEM ("CIS") ISSUES

I. PREAMBLE

The following issues related to Enbridge Gas Distribution's Customer Care O&M and Customer Information System ("CIS") capital budgets, and related matters, have been among the subjects addressed as part of the ongoing Customer Care/CIS Consultative:

7.1 Has Enbridge complied with the direction, in the EB-2005-0001 Decision, to file in evidence the following Customer Care Support Cost information: all agreements between Enbridge and CWLP, ECSI or any other EI-related entity related to the provision of customer care or CIS; the Program Agreement between CWLP and Accenture, including any amendments or revisions; financial statements for ECSI and CWLP (historical, bridge and test year); the return analyses described in the decision? (D1-12-3)

7.2 What actions or decisions are required by the Board regarding items in the 2006 and 2007 capital budgets which might be duplicated in the upcoming application for a Regulatory Asset Account? (D1-10-1, p. 2/AppA)

7.3 Are the forecast costs of the new CIS system appropriate? (B1-5-1, p. 3)

7.4 What are the appropriate costs for CIS and Customer Care for 2007, including internal and transition costs? (D1-12-1, p. 2 and D3-2-1, p. 1)

As set out below, parties have been able to come to an agreement to settle these issues, as well as other matters related to Customer Care and CIS.

All aspects of this Supplementary Settlement Proposal are subject to approval by the Board. The parties to the settlement all agree that this Supplementary Settlement Proposal is a package: the individual aspects of this agreement are inextricably linked to one another and none of the parts of this settlement are severable. As such, there is no agreement among the parties to settle any aspect of the issues addressed in this Supplementary Settlement Proposal in isolation from the balance of the issues addressed herein. The parties agree, therefore, that in the event that the Board does not accept this Supplementary Settlement Proposal in its entirety, then (in accordance with the Board's Settlement Conference Guidelines) the Board will reject the

Supplementary Settlement Proposal in its entirety and proceed to hearing on all of the issues listed above.

This Supplementary Settlement Proposal, if approved by the Board, will be added to the Settlement Proposal (Ex. N1-1-1) approved by the Board on January 29, 2007 (the "January 29th Settlement Proposal") and the provisions of this Supplementary Settlement Proposal will supersede the references at pages 41 and 42 of the January 29th Settlement Proposal which state that there is no settlement of Issues 7.1 to 7.4.

If approved by the Board, this Supplementary Settlement Proposal will reduce the Company's revenue deficiency for the Test Year by approximately $24.2 million, from the $52.1 million remaining as the revenue deficiency in the Company's Application, after the Settlement Proposal (Ex. N1-1-1) revenue deficiency of $29.9 million was approved by the Board on January 29, 2007 (with $26.0 million thereof recoverable in interim rates effective April 1, 2007). The remaining revenue deficiency at issue in the Company's Application is now about $26.1 million[1], taking into account the fact that parties are agreeing in this Supplementary Settlement Proposal that the Company can recover a revenue deficiency of approximately $1.8 million in respect of customer care and CIS costs in the Test Year.[2] This $1.8 million Customer Care revenue deficiency, which is described below in more detail, is the result of extra costs from customer growth, offset by a reduction in bad debt costs.

Finally, although it is not set out expressly in the sections that follow, the parties agree that, as part of this settlement package, Issue 7.2 is resolved because the Regulatory Asset Account application is no longer necessary. The parties also agree that, in response to Issue 7.1, the Company has filed those materials stipulated in the Board's EB-2005-0001 Decision that are currently available. There are, however, some agreements associated with the Company's move away from CustomerWorks Limited Partnership ("CWLP"), including transition agreements with Accenture Business Services for Utilities ("ABSU")[3], that are not completed. Accordingly, at this time Issue 7.1 is partially resolved and the parties expect that it will be completely resolved when those agreements are finalized and filed.

---

[1] Note that this does not include any impact of Supplementary Settlement Proposals related to bill access and IVA charges.

[2] The $1.8 million deficiency to be recovered for Customer Care is derived by starting with the customer care deficiency of $26 million, set out at lines 2 and 3 of the Table at Ex. N1-2-2, p. 2, and then subtracting $24.2 million, which is the agreed-upon revenue deficiency reduction that would result from approval of this Supplementary Settlement Proposal.

[3] For the purposes of this Supplementary Settlement Proposal, both Accenture Business Services for Utilities and Accenture Inc. will be referred to as "ABSU".

With that preamble, the following represents the settlement that has been agreed upon.

II INTRODUCTION

Beginning in 2000, Enbridge Gas Distribution Inc. ("Enbridge Gas Distribution" or the "Company") entered into a series of arrangements whereby CIS and Customer Care services were acquired through a related company, Enbridge Commercial Services Inc. ("ECSI"). ECSI subsequently entered into a limited partnership arrangement with Terasen Inc., CWLP, for the purpose of providing customer related business support and information technology services to utilities. Enbridge Gas Distribution entered into a new Customer Care services agreement with CWLP and consented to ECSI's assignment of its CIS service agreement to CWLP, both effective from January 1, 2002. In August 2002, CWLP entered into an agreement in writing with ABSU, hereinafter referred to as the "Program Agreement", whereby CWLP transferred certain assets and all operating personnel to ABSU, and ABSU agreed to provide Customer Care services, including CIS hosting services, on behalf of CWLP to Enbridge Gas Distribution and other utilities for the period that could be as long as 2002 to 2011 (inclusive) for amounts detailed in a Schedule to the Program Agreement. Since 2002, pursuant to the Program Agreement, ABSU has been performing the Customer Care and CIS services for the Company on behalf of CWLP.

A portion of the fees which the Company has paid to CWLP/ECSI to acquire CIS and Customer Care services was paid by CWLP/ECSI, ultimately, to Enbridge Gas Distribution's parent or other affiliates.

In a series of rate cases, the Intervenors expressed their objection to these arrangements, arguing that ratepayers should only be required to pay for CIS and Customer Care services at a market price or, failing a competitive process, at the cost of any affiliate, or related company, providing the services, including an appropriate return on such an endeavour. In the 2006 rate case decision, the Board agreed that what ABSU was paid to provide the services to Enbridge Gas Distribution for Customer Care and CIS services was relevant to the determination of the market prices for the services. The Board ultimately used CWLP revenue from Enbridge Gas Distribution, expressed as a proportion of CWLP's total revenues, as a tool to derive CWLP overearnings attributable to Enbridge Gas Distribution, and then, using the utility allowed return, the Board determined the amount recoverable from Enbridge Gas Distribution's ratepayers. The Board, in decisions in rate cases beginning in 2003 and culminating in Enbridge Gas Distribution's 2006 rates case, urged the Company to obtain CIS and Customer Care services by direct competitive tender which, in the Board's view, should exclude the right of first refusal in favour of CWLP.

Following the Decision with Reasons of the Board in EB-2005-0001, Enbridge Gas Distribution undertook to do the following:

1. Acquire a new Customer Information System (CIS) through a direct competitive tender;

2. Acquire Customer Care services through a direct competitive tender.

Enbridge Gas Distribution also convened a consultative process (the "Consultative") through which Intervenors could monitor and comment on these procurement processes. In light of the concern which Intervenors had, in past rate cases, expressed about Enbridge Gas Distribution's arrangements for acquiring CIS and Customer Care Services, the Intervenors wanted to be assured that the procurement processes were consistent, in all respects, with accepted industry standards, and that the arrangements resulting from the procurement processes will not result in amounts being paid by Enbridge Gas Distribution to CWLP, Enbridge Gas Distribution's affiliates, or its parent. Enbridge Gas Distribution convened the Consultative in part to give the Intervenors those assurances. To further ensure that the Consultative could achieve its goals, Intervenors were given access to independent expertise to advise them on the procurement processes and the results therefrom.

Through the Consultative, the Company informed Intervenors that CWLP has not indicated any intention to exercise its right of first refusal in respect of the new Customer Care or CIS services. CWLP/ABSU have now committed to include a clause in the transition agreements associated with the move to new service providers that will waive CWLP's right of first refusal when the transition agreements are signed.

The Company represents that, apart from the payments to be made by the Company to CWLP up to April 1, 2007, no more than $8.34 million in aggregate will be paid by any person to CWLP, ECSI, EI or any other related entity in relation to any Customer Care or CIS services included within this agreement and provided to Enbridge Gas Distribution by any person during the course of this agreement.

As a result of the work of the Consultative, Enbridge Gas Distribution and the Intervenors have been able to reach agreement on certain aspects of the procurement processes completed to date. The work of the Consultative is described in the pre-filed evidence of Mario Bauer, filed as Exhibit L-2.

The procurement processes will not be completed, with the selection of a new CIS and a new Customer Care service provider, until mid 2007. As a result, the cost of the new CIS and of the new Customer Care service provider cannot be estimated at this time. In addition, the prudence and cost consequences of the CIS and Customer Care arrangements cannot be determined until those arrangements have been finalized, which is expected to be in the first half of 2007. As well, the new CIS will not become operational until June 2009 and it is only at that time that final costs for the new CIS will be known. Finally, the shortlisted bidders for Customer Care services include ABSU and a third party, so there is the potential that a new service provider, other than ABSU, will be selected. The introduction of a Customer Care service provider, other than ABSU, will involve transition arrangements with ABSU and others in both 2007 and 2008, and the costs consequences and upper limits of those costs have been estimated. Final estimates of such costs cannot be made until a later date.

Within these practical constraints, the parties have settled Issues 7.1 through 7.4, which are the Customer Care and CIS issues in this EB-2006-0034 proceeding. The settlement necessarily reflects the fact that certain aspects of the CIS and Customer Care arrangements, including the final costs and contract terms, will not be known until later in 2007.

The parties have agreed that a placeholder amount will be used to establish the revenue requirement for Customer Care costs for 2007. The placeholder chosen is the cost-per-customer set by the Board in the EB-2005-0001 Decision, at $49.58. As a result of this settlement, the total Customer Care budget to be recovered in rates for 2007, including all internal and external costs (except for bad debt), and including all revenue requirement impacts of CIS, will be $90.8 million, plus an amount of $15.1 million representing the provision for uncollectible accounts.

The settlement includes provision for a "true-up" process to adjust the revenue requirement to reflect the prudent and reasonable forecast amounts resulting from the procurement processes, and to reflect the agreed-upon recovery of certain "transition" costs.

The parties believe that a six-year term, covering the period 2007 through 2012 inclusive, is the appropriate term over which to calculate the revenue requirement relating to Customer Care and CIS. The expected costs of CIS and Customer Care during that period may fluctuate year over year. The parties agree that the annual amounts included in rates should be smoothed, over the 2007-2012 term, to avoid swings in rates. The effect of the true-up process is (a) to capture any variance between the 2007 placeholder for Customer Care and CIS revenue requirement of $90.8 million and the normalized revenue requirement for 2007 and pay that variance to, or recover it from, the ratepayers in the 2008-2012 period, and (b) establish the component of the Company's revenue requirement relating to Customer Care and CIS (except bad debt) for the period 2007-2012, and smooth the rate impacts of that component over that period.

To reflect the settlement the parties have agreed upon a template (the "Template"), which sets out all of the relevant categories of expenses over the 2007 to 2012 period that relate to Customer Care and CIS (except for bad debt costs). The costs in a number of those categories can be established today, and the parties have therefore agreed to those amounts. However, some costs to be set out in the Template must be determined when the contract prices and other costs are known. For those costs, the parties have agreed to the parameters under which those costs will be calculated or forecast and then included in the true-up calculation.

As the parties anticipate the possibility of an incentive regulation ("IR") regime, the terms of which are expected to be established later in 2007, they believe that the true-up should occur at a time when the IR formula for the Company has been established. Once the contract for Customer Care services has been signed, and the terms of IR are known, which is expected to be in the fall of 2007, the parties have agreed that the true-up should take place, in accordance with the true-up rules set out in this Settlement Proposal and Appendix. Parties agree that adjustments may need to be made to aspects of this agreement in the event that the IR regime that, for the purposes of calculation, was assumed by the parties in creating the Template – ie. a price cap IR regime of five years in duration, beginning January 1, 2008 - is not established. Adjustments may need to be made to the normalization approach set out in the True-Up Rules (which are attached) to make it compatible with the IR model and formula that is approved for Enbridge Gas Distribution. Any such adjustments would not affect the total revenue requirement to be recovered over the term of this agreement, but they may impact upon the amount to be recovered in each year of the agreement under the normalization approach that is used.

Finally, the parties agree that the Consultative will continue to monitor the completion of the procurement process, up to and including reviewing the final terms of the contracts, and thereafter, the implementation of the CIS and Customer Care arrangements, which the parties agree will be no later than six months after the in-service date for the new CIS. As has been the case to date, the Intervenors involved in the Consultative agree that they will raise any concerns about the ongoing process, and the outcomes from that process, as soon as they have sufficient information to identify and communicate those concerns. If the Intervenors involved in the Consultative believe that they are not receiving sufficient information, they will advise the Company immediately. The parties agree that the Consultative will continue to work in a timely, responsive and reasonable manner until its mandate is completed. Finally, the parties agree that all costs of the Consultative, for as long as it continues, will be fully recoverable from ratepayers. Costs of the Consultative that are incurred in 2007 will be included in the already established 2007 Ontario Hearings Costs Variance Account (2007 OHCVA). Parties agree to support the continuation of appropriate deferral accounts in future years for the recording and disposition of future costs of the Consultative, unless these costs are included in the Company's regulatory O&M budget during the IR term.

II TERMS OF SETTLEMENT

Against that background, the parties have agreed as follows:

(A) 2007 O&M Customer Care costs

As noted above, certain of the anticipated costs associated with Customer Care during the period 2007 through 2012 will not be known until RFP processes currently being carried out by the Company are completed and market prices are identified. As a result, revenue requirement will be established for 2007 using a placeholder to calculate the Customer Care costs. The placeholder will be the Board-approved 2006 cost per customer of $49.58, times the projected number of customers in 2007, 1,831,283, to get a total Customer Care placeholder of $90.8 million for 2007.

The parties agree that projected bad debt costs (Provision for Uncollectible Accounts) of $15.1 million as filed by the Company shall be recoverable in rates in 2007. This agreement does not deal with bad debt costs beyond 2007; as a result, bad debt costs are not included in the True-Up calculation. For the period from 2008 to 2012, bad debt costs will be dealt with by the Board along with other O&M costs, separately from other Customer Care costs which are the subject of this agreement, in such other proceeding or proceedings as the Board may determine.

For the purposes of settlement, the Customer Care placeholder of $90.8 million plus bad debt costs of $15.1 million will replace the amounts in the Company's Application and pre-filed evidence which total $130.1 million, and are comprised of $101.6 million for Customer Care and CIS Service Charges, $3.4 million for Customer Care Internal Costs, $15.1 million for Provision for Uncollectibles and $10.0 million for transition costs (see Exhibit D1-2-1, p. 3, Table 1, lines 2 to 4 and Ex. D1-1-1, p. 1, Table 1, line 3). These internal and transition costs are addressed in the True-Up Rules which are attached as Appendix A.

As a result, the settlement of this item will reduce the Company's revenue deficiency for the Test Year by approximately $24.2 million, from the $52.1 million remaining as the revenue deficiency in the Company's Application, after the Settlement Proposal (Ex. N1-1-1) revenue deficiency of $29.9 million was approved by the Board on January 29, 2007 (with $26.0 million thereof recoverable in interim rates effective April 1, 2007). The remaining revenue deficiency at issue in the Company's Application is now about $26.1 million, taking into account the fact that parties are agreeing in this Supplementary Settlement Proposal that the Company can recover a revenue deficiency of approximately $1.8 million in respect of customer care and CIS costs in the Test Year (the amount that is the difference between the 2006 Board-approved budget of $104.1 million and the $105.9 million total amount for 2007 for Customer Care, CIS and bad debt costs). This $1.8 million Customer Care revenue deficiency can be derived by accounting for customer growth in F2007 over the previous year (the $49.58 placeholder is multiplied by 46,228, which is the forecast number of new customers in 2007) and adjusting for a reduction of $500,000 in bad debt costs, as compared to F2006.

(B) ***2007 Capital costs related to CIS***

The parties agree that any capital spending by the Company during the 2007 Test Year related to the new CIS shall be in addition to the Company's overall Board-approved capital budget of $300 million plus the costs of the Portlands Energy Centre LTC. This is consistent with the language in Issue 1.1 of the Settlement Proposal in this EB-2006-0034 proceeding, which was approved by the Board on January 29, 2007 and which stated that "[p]arties have reached a global settlement of all 2007 Rate Base issues, except for issues related to the capital budget for the new CIS system" (Ex. N1-1-1, p. 13). No capital expenditures in 2007 relating to the new CIS will be closed to rate base in 2007, and the new CIS will have no impact on 2007 rates.

(C) ***Selection process for new CIS and Customer Care service providers and Transition Plan***

As explained above in the Introduction section, it is anticipated that the selection of a new CIS and a new Customer Care service provider will occur in the second quarter of 2007, when the associated RFP processes are completed.

Once selections are made, contracts will have to be negotiated and settled with the chosen parties. At that time, some of the expected costs of the new CIS, and payments to be made to the new Customer Care service provider, will be established between Enbridge Gas Distribution and the service providers through contractual arrangements. The Consultative will continue to function until the completion of the procurement process, the implementation of those CIS and Customer Care arrangements and the completion of the true-up process described below. The Consultative will be involved with monitoring the selection process and reviewing the terms and prudence of the resulting contracts, including the reasonableness of their costs. Parties agree that the Consultative will continue to work in a timely, responsive and reasonable manner until its mandate is completed.

The selection processes for both the CIS and the Customer Care services RFPs are underway. At this point, the remaining shortlisted bidders for the Customer Care services include ABSU and a third party. The remaining shortlisted bidders for the system integrator component of the new CIS include ABSU and a third party. The parties have agreed that for the time period from January 1, 2007 to March 31, 2007, CWLP will continue to provide CIS and Customer Care services to Enbridge Gas Distribution. For the period commencing April 1, 2007 and concluding no later than September 30, 2008, Enbridge Gas Distribution is making arrangements with ABSU to provide the CIS and Customer Care services directly to Enbridge Gas Distribution, at least until the potential transition to new service providers is complete.

There are two types of transition costs addressed in this Supplementary Settlement Proposal: CIS transition costs and Customer Care transition costs.

The parties acknowledge and agree that all transition costs with respect to the new CIS are included in the $118.7 million capital cost of the new CIS (discussed below), whether or not ABSU is awarded the system integrator component of that project.

The parties further acknowledge and agree that, in the event that ABSU is chosen as the Customer Care service provider, there will be no transition costs associated with Customer Care services. In the event that the third party is chosen as the Customer Care service provider, then there will be transition costs associated with the move to the new service provider. Enbridge Gas Distribution has prepared, and has shared with the Consultative, a Transition Plan that sets out how Customer Care may be transitioned to a new service provider. The parties agree that there will be costs associated with any such transition, and that those costs are recoverable in the manner and amounts described in detail in the True-Up Rules at Appendix A. The Company agrees that it will keep the transition costs, and the transition time period, to a reasonable level while managing the risks associated with transition and ensuring that the ongoing provision of Customer Care services meets OEB-mandated service levels. In this regard, the Company agrees that while the maximum time period for transition to a new Customer Care service provider will be 18 months from April 1, 2007, it will make best efforts to shorten that time period. The Company will ensure that its arrangements with ABSU will allow the Company to direct ABSU to cease the provision of some or all Customer Care transition services before the end of 18 months and, as a result, to reduce the transition costs payable by Enbridge Gas Distribution to ABSU.

(D) ***<u>The True-Up process and Revenue Requirement for 2008 to 2012</u>***

(i) Overview

The parties agree that, on a date (the "True-Up Time") that is the later of (a) the date when the Company's Customer Care RFP is completed and the contract is signed, and

(b) the date when the Board's decision with respect to the duration, rules and formulae for IR that relate to Enbridge Gas Distribution is released, the parties will calculate a true-up and smoothing for the Customer Care amounts for 2007 to 2012, using the specific rules set forth in Appendix A to this Settlement Proposal (the "True-Up Rules").

As set out in more detail below in Appendix A, the amount of the Customer Care costs that are projected to be incurred by the Company during the 2007 to 2012 period, and which the Company will recover in rates, will be determined by the parties at the True-Up Time in accordance with the criteria specified in the True-Up Rules. The components of the Customer Care costs and revenue requirement are itemized in the "Customer Care and CIS Settlement Template" (already defined as the "Template"), which is attached to Appendix A.

It is the intention of the parties that the True-Up process will be used to determine the Customer Care amount for 2007 (the "Normalized 2007 Customer Care Revenue Requirement") that, when adjusted using the True-Up Rules for each year until 2012, will allow the Company to fully recover in rates the costs incurred in providing Customer Care services (including CIS) during the period from 2007 through 2012.

In the event that the parties are unable to agree on the amount of any component of the Normalized 2007 Customer Care Revenue Requirement or any number to be included in the Template, other than those numbers that are fixed by the terms of this agreement, then parties agree that the unresolved dispute will be determined by the Board in accordance with the criteria specified in the True-Up Rules. Specifically, if the parties have not agreed to the Normalized 2007 Customer Care Revenue Requirement within sixty days of the True-Up Time, they shall list the components of the calculation that are in dispute, and provide that list to the Board for determination in accordance with the criteria specified in the True-Up Rules.

The outcome of the True-Up process will be the subject of a separate application to the Board. That application will include, for Board approval, all numbers that are agreed upon and set in accordance with the True-Up Rules, as well as the list of the items remaining at issue to be determined by the Board.

(ii) 2007 Customer Care Variance Account

At True-Up Time, the Company will calculate the difference (the "2007 Customer Care Revenue Requirement Variance") between that amount of revenue requirement that is, pursuant to the True-Up Rules, recoverable for 2007 Customer Care costs (the Normalized 2007 Customer Care Revenue Requirement) and the placeholder of $90.8 million, and will credit or debit the 2007 Customer Care Revenue Requirement

Variance, as the case may be, to the 2007 Customer Care Variance Account. The balance in that account will be repaid to the ratepayers, or charged to the ratepayers, with interest, over the course of 2008 to 2012. The 2007 Customer Care Variance Account will be cleared in accordance with the True-Up Rules.

In order for effect to be given to this provision of this Settlement Proposal, parties agree that it is appropriate that a 2007 Customer Care Variance Account be created, and continued until 2012.

(iii) Revenue requirement for Customer Care costs between 2008 and 2012

The revenue requirement that the Company will be entitled to recover each year in respect of Customer Care costs (including CIS but not including bad debt) from 2008 to 2012 shall be the Normalized 2007 Customer Care Revenue Requirement, as adjusted for each year from 2008 to 2012 (inclusive) by the Incentive Regulation formula. The intention of the parties is that this will result in a relatively stable revenue requirement for CIS and Customer Care services over a five year period.

As set out above, and explained in the True-Up Rules, the "Normalized 2007 Customer Care Revenue Requirement" will be the amount that, when adjusted according to the True-Up Rules (including the rules for IR described as part of the True-Up Rules) for each year until 2012, will allow the Company to fully recover in rates the total of all forecast prudent and reasonable Customer Care costs (including CIS but not including bad debt) for the period from 2007 through 2012.

The parties agree that all O&M costs associated with Customer Care (except for bad debt costs), including O&M relating to the Company's proposed new CIS, are included in the calculation of Normalized 2007 Customer Care Revenue Requirement and therefore will be properly recovered in rates during the period 2007 through 2012 through the operation of the True-Up Rules.

The Company agrees that, once the outstanding items on the Template are determined, and completed, and, as a result, the Normalized 2007 Customer Care Revenue Requirement is established, the Company will not seek any adjustment to its rates or revenue requirement that is directly or indirectly based on changes in Customer Care costs during the term of this agreement. Intervenors similarly agree that they will not seek adjustments to the Company's rates or revenue requirement that is directly or indirectly based on changes in Customer Care costs. As expressed above, bad debt costs are not included as part of the Customer Care costs that are the subject of this agreement from 2008 to 2012.

Notwithstanding the limitations expressed in the preceding paragraph, the parties agree that in the event that new legislative or regulatory requirements, that are currently unknown and that are beyond the Company's control, are imposed on the Company, in the period up to and including 2012, and those requirements materially change the level of Customer Care costs, then any of the parties shall be entitled to make application to the Board for adjustments to rates or revenue requirement as appropriate. The materiality threshold that applies to this aspect of the agreement will be established at the IR proceeding. The parties agree that the rights conferred in this paragraph will be no greater than any rights to revisit any issue based on changes in legislative or regulatory requirements that are established as part of the IR rules that apply to the Company.

In order to give effect to certain aspects of the True-Up Rules, as detailed in Appendix A, parties agree that it is appropriate that 2007 and 2008 Customer Care Transition Costs Variance Accounts be created to track certain transition costs related to Customer Care. The transition costs to be tracked in these accounts relate to activities that ABSU and external contractors and internal resources will undertake to transfer knowledge and services to the new service provider. This will include such tasks as training, documentation and management of the vendors through the transition. The transition costs to be tracked in these accounts are subject to a maximum total amount of $11.1 million. The details of the 2007 and 2008 Customer Care Transition Costs Variance Accounts are set out below, as part of the True-Up Rules.

(iv) New CIS

As the Board is aware, the Company is planning to replace its current CIS service with a new CIS that will be owned by the Company. When this system is implemented, which is expected in 2009, its capital cost will be included as part of the Company's utility rate base. Through the Consultative process, and subject to an adjustment described below, the parties have agreed that a reasonable cost for this asset is $118.7 million, including procurement costs of $5.1 million. The parties agree that rates will be set during the period of this agreement on the basis of a CIS cost that will be no higher than $118.7 million. This $118.7 million budget consists of an amount of $42 million for system integrator contract costs, which are subject to a direct competitive tender process, and an amount of about $76.7 million which the Company will manage and control during the CIS procurement and implementation process.

All parties agree that the Company's revenue requirement associated with Customer Care activities for the 2007 to 2012 period will incorporate a portion of the cost for the new CIS of $118.7 million, including procurement costs of $5.1 million, as set out below. The procurement process that provides support for the reasonableness of this cost is described in the evidence of Mario Bauer (Exhibit L-2), and the CIS cost analysis attached thereto. The parties agree that this $118.7 million cost is subject to reduction in the event that the system integrator contract costs arrived at through the CIS procurement process are less than $42 million. In the event that the system integrator costs are $42 million or more, then the parties agree to the cost of $118.7 million for the completion of the Template and the term of this agreement.

While the revenue requirement attributable to CIS shown in Row 3 of the Template is not yet finalized, the parties agree upon the following:

1. As stated above, the parties agree upon the prudence of the CIS procurement process and the capital cost for the new CIS of $118.7 million, which includes procurement costs of $5.1 million.

2. The parties agree that the amounts to be recovered in rates will be reduced, if the system integrator contract costs arrived at through the CIS procurement process are less than $42 million.

3. Subject to the restrictions on CIS costs set forth in this agreement, there is agreement that all prudently incurred and reasonable costs associated with the new CIS, including return and income taxes, should be recoverable in rates, during the term of this agreement, and for the 10-year economic life of the new CIS assets.

4. The parties agree that the term of this agreement will be six years from 2007 to 2012, in order to enable the smoothing and managing of the recovery of the revenue requirement attributable to the new CIS during those years.

5. The parties agree that they support the decision to procure the new CIS as prudent, the inclusion of the new CIS in rate base in 2009, and the recovery of all amounts associated with the new CIS subject to the terms of this agreement. Subject to any adjustment that may be made to rate base as of December 31, 2012 to reflect the actual costs of the new CIS, as set forth below, the parties agree that, as of January 1, 2013, the amount included in opening rate base for the new CIS shall be its 2012 closing net book value of approximately $71.4 million.

6. The parties agree that, for rate-making purposes, the in-service date of the new CIS will be deemed to be July 1, 2009, regardless of the actual in-service date, and the rate base for the new CIS will be calculated in all respects as if it was brought into service on July 1, 2009.

7. The parties agree that, for rate-making purposes, CIS Capital Costs at the end of the term of this Agreement will be treated as follows:

    a. If the actual costs of the New CIS are less than $118.7 million, then the $71.4 million amount included in the January 1, 2013 opening rate base for the New CIS shall be appropriately adjusted downwards;

    b. No capital costs in addition to the amount of $118.7 million will be eligible for closure to rate base on January 1, 2013, unless Enbridge Gas Distribution then demonstrates the reasonableness and prudence of such additional costs; and on the further condition that the only additional amounts eligible for consideration will be confined to increases in the system integrator costs beyond the $42 million provision for those costs included within the budget of $118.7 million.

On this basis, and subject to later adjustment as described at point 2 above, the parties request the Board, as part of the approval of this Settlement Proposal, to approve the prudence and $118.7 million cost of the new CIS, which includes procurement costs of $5.1 million.

The parties agree that there are three, and only three, possible adjustments to be made later to the revenue requirement attributable to CIS for the period 2009 through 2012, as shown in Row 3 of the Template.

The first possible adjustment relates to the tax savings associated with the high Capital Cost Allowance (CCA) for IT hardware and software for the CIS asset. The high CCA produces substantial tax savings in the first two years of the asset's ten year life. The Company acknowledges and agrees that the ratepayers are to receive credit for the full value of these tax savings. The tax rules provide that Enbridge Gas Distribution will be kept whole with respect to income taxes over the full economic life of utility assets, including the 10-year life of the CIS assets. Parties disagree over when the tax savings should be reflected in revenue requirement and rates.

To support a settlement, the parties agree, for ratemaking purposes, to the use of the values included in Row 3 of the Template in determining the revenue requirement for use at True-Up Time. Those values are calculated as if the CIS costs, including tax savings, were calculated on a conventional forward test year cost of service basis for each year during the period 2009-2012. The Company has agreed to use this assumption on the understanding that Enbridge Gas Distribution retains the right to bring an application before the Board seeking a different approach to the timing of when the tax savings are reflected in revenue requirement. Enbridge Gas Distribution agrees that it will, if it elects to make such application, file that application by June 30, 2007. Intervenors' rights to oppose any such application remain unfettered and they retain the right to rely on any and all grounds of opposition considered by them to be appropriate. The parties agree that there will be no inference that Enbridge Gas Distribution has tacitly acquiesced to values in Row 3, by accepting them in this Supplementary Settlement Agreement, and all parties acknowledge that the Company's acceptance of the values in Row 3 is "without prejudice" to the application described above, should the Company decide to file it by June 30, 2007. In the event that the Board approves a different approach to the timing of when the tax savings are reflected in revenue requirement, then parties agree that the values shown in Row 3 of the Template are to be adjusted accordingly. If Enbridge Gas Distribution does not file such an application by June 30, 2007, or if Enbridge Gas Distribution files such an application but the relief requested is not granted, then, subject to the remaining possible adjustments described below, the values in Row 3 of the Template will remain as stated therein.

The two remaining potential adjustments to the CIS revenue requirement amounts for the period 2009 through 2012, as shown in Row 3 of the Template, pertain to Enbridge Gas Distribution's equity ratio and the possibility that the system integrator contract costs resulting from the CIS procurement process are less than $42 million.

The amounts in Row 3 of the Template reflect a 35% level of deemed equity for the Company. The issue of the appropriate level of deemed equity for the Company is currently before the Board in this F2007 rate case, and there may be changes from the 35% level. Parties agree that the amounts in Row 3 of the Template should be adjusted at True-Up Time in the event that the Company's level of deemed equity is changed in the Board's decision in the F2007 rate case.

The amounts in Row 3 of the Template reflect a $118.7 million cost for the new CIS. In the event that the system integrator contract costs arrived at through the CIS RFP process are less than $42 million, then parties agree that the amounts in Row 3 should be adjusted accordingly. In the event that the system integrator costs are $42 million or more, then the parties agree to the cost of $118.7 million for the term of this agreement.

Subject to the outcome of any application which Enbridge Gas Distribution may bring before the Board, as described above, Enbridge Gas Distribution agrees that once the outstanding items on the Template are determined, and completed, and as a result the Normalized 2008 Customer Care Revenue Requirement is established, the Company will not seek any adjustment to its rates or revenue requirement relating to the cost of the new CIS during the term of this agreement. Intervenors similarly agree that they will not seek adjustments to the Company's rates or revenue requirement that are directly or indirectly based on changes in CIS costs.

Notwithstanding the limitations expressed in the preceding paragraphs, the parties agree that in the event that new legislative or regulatory requirements, that are currently unknown and that are beyond the Company's control, are imposed on the Company, in the period up to and including 2012, and those requirements materially change the level of CIS costs, then any of the parties shall be entitled to make application to the Board for adjustments to rates or revenue requirement as appropriate. The materiality threshold that applies to this aspect of the agreement will be established at the IR proceeding. The parties agree that the rights conferred in this paragraph will be no greater than any rights to revisit any issue based on changes in legislative or regulatory requirements that are established as part of the IR rules that apply to the Company.

(v) Future revenue-generating opportunities from the new CIS

The Company agrees to use its best efforts to identify and take advantage of opportunities to use the new CIS asset to provide CIS services to third party organizations to generate additional revenue opportunities, and that the gains from any such opportunities shall be shared with ratepayers in a manner to be agreed upon. A consultative group, including Intervenors, may be convened to consider how such opportunities would be addressed. The parties agree that, in the event that the sharing of such gains cannot be agreed upon by the parties, then they will put the issue of the appropriate gainsharing to be used to the Board. The parties agree that any gains to be shared with ratepayers would be cleared to ratepayers by way of an annual adjustment to delivery rates.

Billing services on the Enbridge Gas Distribution bill are covered by the Supplementary Settlement Proposal related to open bill access (Ex. N1-1-1, Appendix C), and are not included in or affected by the provisions set out above.

APPENDIX A – TRUE-UP RULES

Attached to this Appendix A is a document entitled "Customer Care and CIS Settlement Template" (the "Template"). The parties have completed each of the boxes A1 through G17 of the Template, by inserting a dollar amount, or zero, or a TBD (To Be Determined) which will be completed at the True-Up Time. The following rules apply to the completion of the Template:

1) Where in the Template there is a dollar figure or zero already inserted in any box, that figure is agreed by the parties, and subject to paragraphs 3, 4 and 6 below, will not be altered.

2) The figures agreed to by the parties which are fixed and not subject to change, and which are already included in certain boxes within the Template, include the following:

    a. Rows 1, 2 and 2a: rows 1 and 2 represent the amounts that parties agree can be recovered in rates related to payments by Enbridge Gas Distribution to ABSU to provide CIS services and the payments by ABSU to ECSI for the use of the existing CIS asset, until the new CIS asset is in service. Row 2a represents the amounts to be paid to CWLP for the use of the CIS asset from January 1, 2007 to March 31, 2007. Parties agree that a total of $28.9 million shall be included on these rows, divided into the individual amounts included in the Template.

    b. Row 4: parties agree to the figures included in the Template as the amounts to be paid for the hosting and support of the new CIS. These amounts are based on Enbridge Gas Distribution estimates which the Intervenors, with the support of their consultants, have reviewed and found to be reasonable.

    c. Row 5: parties agree to the figures included in the Template as the amounts to be recovered for the Company's backoffice costs (excluding bad debt) associated with both the old and the new CIS. These amounts are based on Enbridge Gas Distribution estimates which the Intervenors, with the support of their consultants, have reviewed and found to be reasonable.

    d. Rows 6 and 7: SAP has been chosen as the provider for the software that will support the new CIS. This software may require some modifications or adaptations, from time to time, to fully support the CIS. The parties agree to the figures included rows 6 and 7 of the Template as the amounts to be paid to SAP for licence fees and for modifications that may be necessary. These amounts are based on Enbridge Gas Distribution estimates which the Intervenors, with the support of their consultants, have reviewed and found to be reasonable.

e. Row 8: box 8A includes the amount of $16.9 million, which is the amount that parties have agreed can be recovered in rates related to the provision of Customer Care services by CWLP for the period from January 1, 2007 to March 31, 2007 (which is the date on which ABSU will begin providing Customer Care services on a temporary or permanent basis). Given that CWLP will stop providing services to Enbridge Gas Distribution as of April 2007, the amounts to be reflected in boxes 8B, 8C, 8D, 8E and 8F are zero.

f. Row 11: parties agree to the figures included in the Template as the amounts to be recovered for Customer Care licences to support the existing and new Customer Care service provider delivery of Collections, E-Billing and text to speech voice capability functions. These amounts are based on Enbridge Gas Distribution estimates which Intervenors, with the support of their consultants, have reviewed and found to be reasonable.

g. Row 12: parties agree to the figures included in the Template as the amounts to be recovered for the Company's backoffice costs (excluding bad debt) associated with Customer Care services. These amounts are based on Enbridge Gas Distribution estimates which Intervenors, with the support of their consultants, have reviewed and found to be reasonable.

h. Row 13: this row includes the costs incurred by the Company, and accepted for recovery from ratepayers, related to the procurement of a new customer care service provider. The parties have agreed that a total amount of $4.9 million may be recovered at row 13. This total amount represents the internal and external procurement costs for the new Customer Care services that have been determined by the parties to be prudently incurred and reasonable for recovery from ratepayers. This total amount is allocated equally over the five years from 2008 to 2012. Thus, the amount of $0.98 million is inserted in each of the boxes A13 to F13.

i. Row 17: the total number of customers for each year.

3) Row 3 includes the revenue requirement associated with the new CIS for each of the years from 2007 to 2012, to be filled in as follows:

a. The amounts in boxes A3 and B3 shall be zero, since there is no revenue requirement associated with the new CIS until 2009.

b. The amounts in boxes C3, D3, E3 and F3 represent the annual revenue requirement associated with each of 2009, 2010, 2011 and 2012 for the new CIS. These amounts, which total $46.210 million, are based upon the agreed-upon cost of the new CIS of $118.7 million. The derivation of these amounts is set out in the spreadsheets attached as Appendix B and the total of $46.210 million is the sum of the items in Columns 1, 2, 3 and 4 at line 12 on the first page of Appendix B. These amounts are subject to adjustment as follows:

   i. the amounts in row 3 of the Template reflect a $118.7 million cost for the new CIS. In the event that the system integrator contract costs arrived at through the CIS RFP process are less than $42 and the overall cost is therefore reduced, then parties agree that the amounts in row 3 should be changed to correspond to the lower new CIS cost;

   ii. the amounts in row 3 of the Template reflect a 35% level of deemed equity for the Company. The issue of the appropriate level of deemed equity for the Company is currently before the Board in this F2007 rate case, and there may be changes from the 35% level. Parties agree that the amounts in row 3 of the Template should be changed in the event that the Company's level of deemed equity is changed;

   iii. In the event that the Company is successful in an application to the Board for a different approach to the timing of when tax savings associated with the new CIS are reflected in revenue requirement, then corresponding changes will be made to the amounts in row 3.

4) The amounts to be inserted in boxes A9 and B9 shall be determined by the parties as the prudent and reasonable amounts for recovery from ratepayers for sums paid or forecast to be payable by the Company to ABSU for Customer Care services during the period April 1, 2007 through September 30, 2008, in accordance with the following criteria:

   a. In the event that ABSU is chosen as the new service provider for Customer Care services from and after April 1, 2007 until December 31, 2012, then the figures to be inserted in boxes A9 and B9 are zero, because there will be no need for a transition period to a new service provider;

b. In the event that a third party other than ABSU is chosen as the new service provider for Customer Care services, then there will be the need for a transition period, for a maximum of 18 months from April 1, 2007, during which ABSU will provide Customer Care services until the new service provider can be fully phased-in.

c. The Company has reached agreement with ABSU for Customer Care services to be provided, on a transition basis for 2007 and 2008 in the event that ABSU is not the successful Customer Care bidder. For settlement purposes, subject to subparagraph (d) below, the Parties agree that amounts of up to $52,263,000 for 2007 and $42,623,000 for 2008 will be included in boxes A9 and B9. These numbers represent the maximum agreed-upon level of costs that the Company may recover in rates in respect of the amounts charged by ABSU during 2007 and 2008 for Customer Care services, on a transitional basis, based on a recoverable cost of $38 per customer per year and a transition period of 18 months;

d. The Company will make best efforts to reduce the length of the transition period from 18 months, and to reduce the actual forecast costs per customer from ABSU to be less than currently forecast. In the event that the actual costs to date and updated forecast costs from ABSU at True-up Time for Customer Care services for the transition period are less than $52,263,000 for 2007 or $42,623,000 for 2008, then the numbers to be inserted in boxes A9 and B9 will be the actual costs to date and updated forecast costs at True-Up Time.

e. The amounts to be inserted in boxes C9, D9, E9 and F9 are zero because, in any event, the transition period for customer care services will not extend beyond 2008.

5) The amounts to be inserted in boxes A10 to F10 are the reasonable forecast annual costs of the new Customer Care service provider, to be determined at the True-Up Time through the results of the Customer Care procurement process. In the event that ABSU is chosen as the new service provider, it is expected that these amounts will be effective as of April 1, 2007. In the event that a third party other than ABSU is chosen as the new service provider, it is expected that these amounts will begin at some time in 2007 or 2008, because of the need for transition time and activities. The amounts to be included in these boxes are subject to review by the Consultative for prudence and reasonableness. In the event that the Intervenors and the Company do not agree, the issue of prudence and reasonableness will be determined by the Board.

6) The amounts at rows 14 and 15 represent the transition costs associated with moving from CWLP as the Customer Care service provider to a different third party service provider. The transition costs to be included in these rows, and tracked in the 2007 and 2008 Customer Care Transition Costs Variance Accounts, relate to activities that ABSU and external contractors and internal resources will undertake to transfer knowledge and services to the new service provider. This will include such tasks as training, documentation and management of the vendors through the transition.

   a. In any event, the number in boxes A14/A15 will be zero.

   b. In the event that ABSU is chosen as the new Customer Care service provider then the amounts to be inserted in boxes B14 to F14 and B15 to F15 are zero and subparagraphs 6(c) to (f) do not apply.

   c. In the event that a different third party is chosen as the new Customer Care service provider, then a total amount of $11.1 million will be included on rows 14 and 15. This total amount will be split equally between the years 2008 to 2012, in the amount of $2.22 million per year. Thus, each of boxes B14/B15, C14/C15, D14/D15, E14/E15 and F14/F15 will include the number $2.22 million.

   d. The Company will record all prudent and reasonable amounts spent for services, both internal and external, to facilitate the transition from CWLP/ABSU providing Customer Care services to a new service provider in the 2007 and 2008 Customer Care Transition Costs Variance Accounts, to a total maximum of $11.1 million. It is agreed that amounts paid for internal costs shall not include the costs of employees or other resources already included in the budget for the year and re-assigned to this transition, unless a specific new resource was acquired to backfill those other functions.

   e. Commencing in 2008, and continuing each year until 2012, the Company will expense the amount of $2.22 million for Customer Care costs, and will at the same time, deduct the same amount from the total amounts recorded in the 2007 and 2008 Customer Care Transition Costs Variance Accounts. The parties agree that, even if the outstanding balance in the 2007 and 2008 Customer Care Transition Costs Variance Accounts becomes zero before 2012, the Company is still entitled to expense and recover the amount of $2.22 million for each year until 2012. The parties further agree that no negative balances will be reflected in the 2007 and 2008 Customer Care Transition Costs Variance Accounts.

f. Parties agree that if the total amounts recorded in the 2007 and 2008 Customer Care Transition Costs Variance Accounts are less than $11.1 million as of December 31, 2008, then the difference between $11.1 million and the total amounts recorded in the 2007 and 2008 Customer Care Transition Costs Variance Accounts will be credited to ratepayers with interest in equal amounts in 2009 to 2012.

7) Row 16 will be the totals of each of the columns, to be completed when all of the above figures are determined.

8) Column G will be the totals of each of the rows, to be completed when all of the above figures are determined.

9) Box G16 will be the total of all Customer Care costs and revenue requirement forecast for the period (the "Total Customer Care Forecast").

10) Box G17, already completed, is the forecast total of annual numbers of customers during the period (the "Customer Count").

At True-Up Time, once the Template has been completed, then the Normalized 2007 Customer Care Revenue Requirement can be determined. This will be calculated by starting with the Total Customer Care Revenue Requirement for 2007 to 2012, which is the sum of boxes A16 to F16. That Total Customer Care Revenue Requirement will then be placed into an amortization model that calculates, using the IR annual adjustment that is approved for Enbridge Gas Distribution, the Normalized 2007 Customer Care Revenue Requirement which is the number that, when adjusted for IR annual adjustment for each year from 2008 through 2012, would allow the Company to fully recover the Adjusted Customer Care Revenue Requirement for 2007 to 2012.

At the same time, parties will calculate the 2007 Customer Care Revenue Requirement Variance by taking the difference between the Normalized 2007 Customer Care Revenue Requirement and the placeholder of $90.8 million. The Company will credit or debit the 2007 Customer Care Revenue Requirement Variance, as the case may be, to the 2007 Customer Care Variance Account. The balance in that account will be repaid to the ratepayers, or charged to the ratepayers, with interest, over the course of 2008 to 2012.

Attached to this Appendix A is an illustrative example of how the True-Up will be applied. For the purpose of this example, the following assumptions have been employed: (i) at row 3, the CIS cost is recovered by recognizing the tax shield benefit in the first four years, and a deemed equity level of 35% is assumed; (ii) ABSU is not awarded the Customer Care contract, so there are transition costs included at row 9; (iii) at row 10, the new CIS service provider contract cost is $60 million per year; and (iv) the

IR Annual Adjustment is 1%. The illustrative example sets out the steps that are followed, and the amortization model that is used, to derive the 2007 Customer Care Revenue Requirement Variance and the Normalized Customer Care Revenue Requirements for 2007 to 2012.

Customer Care and CIS Settlement Template

#	Category of Cost	A 2007	B 2008	C 2009	D 2010	E 2011	F 2012	G Totals

17	Number of Customers	1,831,283	1,878,004	1,925,563	1,973,575	2,021,588	2,069,600	11,699,613

	True-Up Process Step	A	B	C	D	E	F	G
18	The Normalized 2007 Customer Care Revenue Requirement can be determined. This will be calculated by starting with the Total Customer Care Revenue Requirement for 2007 to 2012, which is the amount in box G16	$545,990,575						
19	That Total Customer Care Revenue Requirement will then be placed into an amortization model that calculates, using the IR annual adjustment that is approved for Enbridge Gas Distribution, the Normalized 2007 Customer Care Revenue Requirement which is the number that, when adjusted for IR annual adjustment for each year from 2008 through 2012, will allow the Company to fully recover the Total Customer Care Revenue Requirement for 2007 to 2012	$88,749,876.15						
20	The Normalized 2007 Customer Care Revenue Requirement will then be compared to the 2007 placeholder of $90.8 million, and the difference will be the 2007 Customer Care Revenue Requirement Variance.	($2,050,124)						
21	The Company will credit or debit the 2007 Customer Care Revenue Requirement Variance, as the case may be, to the 2007 Customer Care Variance Account. The balance in that account will be repaid to the ratepayers, or charged to the ratepayers, with interest, over the course of 2008 to 2012.		($410,025)	($410,025)	($410,025)	($410,025)	($410,025)	
22	The Normalized 2008 Customer Care Revenue Requirement will be the Normalized 2007 Customer Care Revenue Requirement, plus or minus the IR annual adjustment that is approved for Enbridge Gas Distribution.		$89,637,375	$90,533,749	$91,439,086	$92,353,477	$93,277,012	
23	Total Customer Care Revenue By Year (Including repayment of 2007 variance)	$ 90,800,000	$ 89,227,350	$ 90,123,724	$ 91,029,061	$ 91,943,452	$ 92,866,987	$ 545,990,575
24	Normalized Customer Care Revenue Requirement Per Customer without Bad Debt	$ 49.58	$ 47.51	$ 46.80	$ 46.12	$ 45.48	$ 44.87	
25	IR Annual Adjustment	1%

INTERIM RATE ORDER ARISING FROM 2007 TEST YEAR SETTLEMENT PROPOSAL (EB-2006-0034)

Enbridge Gas Distribution Inc. ("EGDI") filed an application dated August 25, 2006 with the Ontario Energy Board (the "Board") under the Section 36 of the *Ontario Energy Board Act*, requesting a rate increase effective January 1, 2007. The Board issued a Notice of Application dated September 7, 2006 and subsequently has issued seven procedural orders. The procedural orders provided for, among other things, the convening of a Settlement Conference and direction for the filing and hearing of any Settlement Proposal.

The Settlement Conference commenced on December 11, 2006 and a Settlement Proposal was filed with the Board on January 24, 2007. Parties to the Settlement indicated that there were ongoing consultations on certain unsettled issues and additional settled issues could be filed during the course of the proceeding. If additional issues were partly or completely settled, the parties would file a supplementary settlement agreement that would explain the settlements, and the financial incremental impacts of such settlements. The Board heard and, with clarifications made on the record, accepted the Settlement Proposal on January 29, 2006.

The Settlement indicated that the implementation of the settlement package of issues, comprised of issues 1.1 to 1.8, 2.1, 2.2, 3.2, 3.5, 3.7 to 3.9, 3.11 to 3.15 and 9.1, will result in a revenue deficiency of $29.9 million. The Settlement Proposal included the agreement by all parties that …

> … for rate implementation purposes only, the Company can adjust rates to recover an additional $26.0 million, effective as of January 1, 2007, and that this will be implemented at the same time as the Company's April 1, 2007 QRAM is implemented. GEC's and Pollution Probe's agreement in this regard is subject to any later adjustments to the Company's recovery of revenue deficiency that might be required as a result of Issue 3.2. Schools' agreement in this regard is subject to any later adjustments to the Company's recovery of revenue deficiency that might be required as a result of Issue 9.1. (Ex.N1 Tab1 Schedule 1 p9 /filed January 24, 2007)

On February 23, 2007 EGDI filed a draft interim rate order, including supporting documentation, for the Board's approval. EGDI indicated that the draft order reflected the impacts of the 2007 Settlement Proposal dated January 24, 2007. EGDI proposed that intervenors wishing to comment on the draft should file their submissions by March 2, 2007. EGDI also indicated that it would file a draft rate order under docket number EB-2007-0049 on March 2, 2007 seeking approval of rates effective April 1, 2007 using the Board approved QRAM methodology. The rates approved in EB-2007-0049 would immediately supersede those included, as appendix A, in this rate order.

The draft interim order included the following elements:

- Interim rates designed to recover a 2007 Test Year Revenue Requirement of $3,098.557 million.

- Revenue Adjustment Rate Rider applicable to billed volumes during the period April 1, 2007 to December 31, 2007 to recover $5.074 million in revenue. $5.074 million is the amount EGDI would have recovered if the proposed interim rates had been implemented on January 1, 2007.

On March 2, 2007 TransCanada Energy Ltd. submitted a request for explanation and reasons regarding the increase in Rate 125. EGDI provided a response on March 9, 2007.

Under proceeding EB-2007-0049, the April 2007 QRAM application, the Industrial Gas Users Association ("IGUA") submitted their concerns about the rates proposed in that proceeding and indicated their objections in the event that they did not receive a satisfactory explanation for the increase in certain rates. TransAlta Cogeneration L.P. and TransAlta Energy Corp also filed a submission indicating their support of IGUA's position. The QRAM panel referred this and subsequent IGUA and EGDI correspondence to this proceeding for consideration. During Day 15 of the EB-2006-0034 oral proceeding, IGUA indicated that it no longer objected to the proposed rates.

Upon reviewing the filed materials, the Board finds it appropriate to proceed with an interim rate order, effective January 1, 2007 with implementation beginning April 1, 2007.

A final rate order will be issued by the Board subsequent to the issuance of the Board's 2007 Test Year Decision with Reasons.

The Board notes that the rates in this Order will be immediately superceded by the rates approved in the April 2007 QRAM Decision and Order (EB-2007-0049)

THE BOARD ORDERS THAT:

1. The 2007 Settlement Proposal, dated January 24, 2007, attached as Appendix "A" and Supporting Documentation, attached as Appendix "B" to this order, are accepted as the basis for the rates in this order.

2. Rate Rider E, attached as Appendix “C”, will apply as a rate adjustment to a consumer’s actual consumption for the period April 1, 2007 to December 31, 2007.

3. The rates in the Rate Handbook, attached as Appendix “D” to this interim order, are hereby approved effective January 1, 2007. These rates will be immediately superceded by the rates resulting from the April 2007 QRAM decision.

DATED at Toronto, March 26, 2007

ONTARIO ENERGY BOARD

DATED MARCH 26, 2007

SETTLEMENT PROPOSAL

JANUARY 24, 2007

TABLE OF CONTENTS

<u>ISSUE</u>	**<u>DESCRIPTION (& EVIDENTIARY REFERENCE)</u>**
2.3	Is the forecast of degree days appropriate? (C2-4-1)
2.4	Are the average use-per-customer forecasts for rate class 1 and rate class 6 appropriate? (C1-3-1 and C2-3-1)
2.5	Is the proposed 2007 contract gas volume and revenue forecast appropriate? (C1-3-1)
2.6	Is the proposed 2007 General Service gas volume and revenue forecast appropriate? (C1-3-1)
3	**OPERATING COST (Exhibit D)**
3.1	Is the proposed 2007 gas cost forecast including the calculation of the PGVA Reference Price appropriate? (D1-4-1, D1-4-2)
3.2	Is the overall level of the 2007 Operation and Maintenance Budget appropriate? (D1-2-1)
3.3	Is the Company's proposed fuel switching program appropriate?
3.4	Is the Company's proposed Energy Link Program appropriate?
3.5	Is the budget for Human Resources related costs appropriate? (D1-4-1)
3.6	Do the revisions to the Regulatory Cost Allocation Methodology (RCAM) meet the Board's directives in the 2006 decision?
3.7	Is the proposed level of corporate cost allocation for 2007 appropriate?
3.8	Is Company's forecast level of Regulatory and OEB related costs for 2007 appropriate?
3.9	Is Enbridge's decision to change to a December 31 taxation year-end , in 2007, appropriate? (D1-5-1)
3.10	Is the continuation of the Risk Management Program appropriate in the context of the Board's 2006 Decision directives? (D1-4-3)
3.11	Is the proposal to change depreciation rates for 2007, as proposed in the depreciation study, and the impact on 2007 customer rates,

ISSUE	DESCRIPTION (& EVIDENTIARY REFERENCE)
	appropriate? (D1-13-1, D2-2-1)
3.12	Is the proposal for the establishment of 2007 Deferral and Variance Accounts appropriate? (D1-7-1)
3.13	Is the proposal for the disposition of existing Deferral and Variance Accounts appropriate? (D1-7-2)
3.14	Are the amounts proposed to be included in rates for capital and property taxes appropriate?
3.15	Is the amount proposed to be included in rates for income taxes, including the methodology, appropriate?
4	**COST OF CAPITAL (Exhibit E)**
4.1	What is the Return on Equity (ROE) for EGDI for the 2007 test year as calculated pursuant to the ROE Guidelines?
4.2	Are Enbridge's proposed costs for its debt and preference share components of its capital structure appropriate? (E1-2-1)
4.3	Is the proposal to change the equity component of the deemed capital structure from 35% to 38% appropriate? (E2-2-1)
5	**COST ALLOCATION (Exhibit G)**
5.1	Is the Applicant's cost allocation appropriate and is it based in its 2006 Board approved methodology? (G2-T1-S1)
5.2	Is the proposal to recover Demand Side Management costs in delivery charges, as opposed to load balancing charges, appropriate? (from G2-3-1 to G2-3-4)
6	**RATE DESIGN (Exhibit H)**
6.1	Is the proposal to introduce delivery demand charges for Rates 100 and 145 reasonable? (H1-1-1)
6.2	Is the proposal to allocate revenue requirement between the customer classes and annually adjust the monthly customer charges and variable charges to recover the revenue deficiency reasonable? (H1-1-1)

ISSUE DESCRIPTION (& EVIDENTIARY REFERENCE)

6.3 Should the Board approve the contents of the Applicant's Rate Handbook? (H1-1-1, H2-6-1; A1-14-2)

6.4 Is the proposed treatment of bundled transportation charges and T-service credit appropriate in light of the Board's Decision in RP-2003-0203 and the settlement agreement? (H1-1-1)

7 CUSTOMER CARE SUPPORT, CUSTOMER CARE SYSTEM, AND OPEN BILL ACCESS

7.1 Has Enbridge complied with the direction, in the EB-2005-0001 Decision, to file in evidence the following Customer Care Support Cost information: all agreements between Enbridge and CWLP, ECSI or any other EI-related entity related to the provision of customer care or CIS; the Program Agreement between CWLP and Accenture, including any amendments or revisions; financial statements for ECSI and CWLP (historical, bridge and test year); the return analyses described in the decision? (D1-12-3)

7.2 What actions or decisions are required by the Board regarding items in the 2006 and 2007 capital budgets which might be duplicated in the upcoming application for a Regulatory Asset Account? (D1-10-1, p. 2/AppA)

7.3 Are the forecast costs of the new CIS system appropriate? (B1-5-1, p. 3)

7.4 What are the appropriate costs for CIS and Customer Care for 2007, including internal and transition costs? (D1-12-1, p. 2 and D3-2-1, p. 1)

7.5 Is the Applicant's proposal of open bill access appropriate and consistent with the Board's direction in RP 2005-0001? (D1-11-1 to 5)

8 OTHER ISSUES

8.1 What are the actions or decisions necessary for the Board to be assured that the Board's decisions, including settlements, in the NGEIR (EB-2005-0551) proceeding will be appropriately captured and reflected in this proceeding?

8.2 What are the actions or decisions necessary for the Board to be assured that the Board's decisions, including settlements, in the DSM

ISSUE	DESCRIPTION (& EVIDENTIARY REFERENCE)
	(EB-2006-0021) proceeding will be appropriately captured and reflected in this proceeding?
9	**RATE IMPLEMENTATION**
9.1	How should the Board deal with any revenue deficiency applicable from January 1, 2007 to the date that the Board's decision is implemented?
9.2	Should the Board set interim rates, effective January 1, 2007, to allow Enbridge to begin to recover its prospective revenue deficiency?

ATTACHMENTS

Appendix A- Deferral and Variance Accounts Balances

Appendix B- Approximations of rate impacts of the Settlement Proposal

PREAMBLE

This Settlement Proposal is filed with the Ontario Energy Board ("OEB" or "Board") in connection with the application of Enbridge Gas Distribution Inc. ("Enbridge Gas Distribution" or the "Company"), for an order or orders approving or fixing rates for the sale, distribution, transmission, and storage of gas for its 2007 fiscal year (the "Test Year").[1] A Settlement Conference was held between December 11, 2006 and January 5, 2007 in accordance with the *Ontario Energy Board Rules of Practice and Procedure* (the "Rules") and the Board's *Settlement Conference Guidelines* ("Settlement Guidelines"). Ken Rosenberg acted as facilitator for the Settlement Conference. Settlement discussions between parties continued after that time. This Settlement Proposal arises from the Settlement Conference and subsequent discussions.

Enbridge Gas Distribution and the following intervenors (collectively, the "parties"), as well as Ontario Energy Board technical staff ("Board Staff"), participated in the Settlement Conference:

CONSUMERS COUNCIL OF CANADA (CCC)
DIRECT ENERGY MARKETING LIMITED (Direct Energy)
ENERGY PROBE RESEARCH FOUNDATION (Energy Probe)
GREEN ENERGY COALITION (GEC)
HVAC COALITION INC. (HVAC)
INDUSTRIAL GAS USERS ASSOCIATION (IGUA)
ONTARIO ASSOCIATION OF PHYSICAL PLANT ADMINISTRATORS (OAPPA)
ONTARIO ENERGY SAVINGS L.P. (OESLP)
POLLUTION PROBE
SCHOOL ENERGY COALITION (Schools)
SUPERIOR ENERGY MANAGEMENT (a division of Superior Plus Inc.) (Superior)
TRANSALTA COGENERATION L.P. AND TRANSALTA ENERGY CORP. (TransAlta)
TRANSCANADA PIPELINES LIMITED (TransCanada)
UNION ENERGY LIMITED PARTNERSHIP (Union Energy)
UNION GAS LIMITED (Union)
VULNERABLE ENERGY CONSUMERS COALITION (VECC)

The Settlement Proposal deals with all of the issues listed at Appendix "A" to the Board's Procedural Order #2, dated October 20, 2006 (the "Issues List"). The numbers ascribed to each of the issues correlate to the section numbers in the Settlement Proposal and each issue falls within one of the following three categories:

1. ***complete settlement*** **–** if the Settlement Proposal is accepted by the Board, the issue will not be addressed at the hearing because Enbridge

[1] In this Settlement Proposal, the terms "2007 fiscal year", "fiscal 2007" and "Test Year" each refer to the twelve-month period commencing January 1, 2007 and ending December 31, 2007.

Gas Distribution and all other parties who take any position on the issue agree to the proposed settlement;

2. ***incomplete settlement* –** if the Settlement Proposal is accepted by the Board, portions of the issue will be addressed at the hearing because parties are only able to agree on some, but not all, aspects of the issue; and,

3. ***no settlement* –** the issue will be addressed at the hearing because the parties who participated in the negotiation of the issue are unable to reach a settlement on the issue.

More particularly, the Settlement Proposal depicts the 47 issues enumerated on the Issues List as follows:

Complete Settlement Parties will not address the issue at the hearing	**Incomplete Settlement** Parties will address one or more parts of the issue at the hearing	**No Settlement** Parties will address the issue at the hearing
25 issues completely settled Issues 1.1, 1.3 to 1.8, 2.1, 2.2, 3.1, 3.5, 3.7 to 3.9, 3.11, 3.14, 3.15, 4.1, 5.1, 5.2, 6.1, 6.4, 8.1, 8.2 and 9.2	7 issues partly settled Issues 1.2, 3.2, 3.12, 3.13, 6.2, 6.3 and 9.1	15 issues not settled Issues 2.3 to 2.6, 3.3, 3.4, 3.6, 3.10, 4.2, 4.3 and 7.1 to 7.5

Issue 3.2, which relates to the Company's O&M Budget for the Test Year is an incomplete settlement, however, it should be noted that GEC and Pollution Probe object to the settled portions of this issue. Issue 9.1, which relates to rate implementation, is an incomplete settlement, however, it should be noted that Schools objects to the settled portions of this issue.

The description of each issue assumes that all parties participated in the negotiation of the issue, unless specifically noted otherwise. Any parties that are identified as not having participated in the negotiations of the issue also take no position on any settlement or other wording pertaining to the issue. Board Staff participated in the Settlement Conference, and has advised the parties that it does not oppose the proposed settlement on any of the completely settled or partly settled issues. However, in accordance with the Rules and the Settlement Guidelines, Board Staff takes no position on any issue and, as a result, is not a party to the Settlement Proposal.

The Settlement Proposal describes the agreements reached on the completely settled and partially settled issues. The Settlement Proposal identifies the parties who agree and who disagree with each settlement, or alternatively who take no position on the issue. Finally, the Settlement Proposal provides a direct link between each settled issue and the supporting evidence in the record to date. In this regard, the parties who agree with the individual settlements are of the view that the evidence provided is sufficient to support the Settlement Proposal in relation to the settled issues and, moreover, that the quality and detail of the supporting evidence, together with the corresponding rationale, will allow the Board to make findings agreeing with the proposed resolution of the settled issues. In the event that the Board does not accept the proposed settlement of any issue, further evidence may be required on the issue for the Board to consider it fully.

Best efforts have been made to identify all of the evidence that relates to each settled issue. The supporting evidence for each settled issue is identified individually by reference to its exhibit number in an abbreviated format; for example, Exhibit A1, Tab 8, Schedule 1 is referred to as A1-8-1. A concise description of the content of each exhibit is also provided. In this regard, Enbridge Gas Distribution's response to an interrogatory is described by citing the name of the party and the number of the interrogatory (e.g., Board Staff Interrogatory #1). The identification and listing of the evidence that relates to each settled issue is provided to assist the Board. The identification and listing of the evidence that relates to each settled issue is not intended to limit any party who wishes to assert that other evidence is relevant to a particular settled issue.

The parties agree that all positions, information, documents, negotiations and discussion of any kind whatsoever which took place or were exchanged during the Settlement Conference are strictly confidential and without prejudice, and inadmissible unless relevant to the resolution of any ambiguity that subsequently arises with respect to the interpretation of any provision of this Settlement Proposal.

According to the Settlement Guidelines (p. 3), the parties must consider whether a settlement proposal should include an appropriate adjustment mechanism for any settled issue that may be affected by external factors. Enbridge Gas Distribution and the other parties who participated in the Settlement Conference consider that no settled issue requires an adjustment mechanism other than those expressly set forth herein.

Issues 1.1 to 1.8, 2.1, 2.2, 3.2, 3.5, 3.7 to 3.9, 3.11 to 3.15 and 9.1 have been settled by parties as a package (the “package”), subject to the objections of GEC, Pollution Probe and Schools, as noted earlier, and none of the parts of this package are severable. All parties agree that, for rate implementation purposes only, the Company can adjust rates to recover an additional $26.0 million, effective as of January 1, 2007, and that this will be implemented at the same time as the Company’s April 1, 2007 QRAM is implemented. GEC’s and Pollution Probe’s agreement in this regard is subject to any later adjustments to the Company’s recovery of revenue deficiency that might be required as a result of

Issue 3.2. Schools' agreement in this regard is subject to any later adjustments to the Company's recovery of revenue deficiency that might be required as a result of Issue 9.1. Subject to considering the objections of GEC, Pollution Probe and Schools during the hearing, if the Board does not, prior to the commencement of the hearing of the evidence in EB-2006-0034, accept the package in its entirety, then there is no Settlement Proposal (unless the parties agree that any portion of the package that the Board does accept may continue as part of a valid Settlement Proposal). None of the parties can withdraw from the Settlement Proposal except in accordance with Rule 32 of the Rules. Finally, unless stated otherwise, the settlement of any particular issue in this proceeding is without prejudice to the rights of parties to raise the same issue in any future proceeding.

OVERVIEW

In order to address certain issues that have continued to be the subject of debate and discussion over a number of years, and in order to satisfy Board directions from the Decision with Reasons in the EB-2005-0001 case (the 2006 rate case), during the past year the Company has entered into a number of consultative processes with stakeholders. These consultatives were convened in respect of EnVision (issues 1.5 and 1.6), Corporate Cost Allocation (issues 3.6 and 3.7), customer care and CIS (issues 3.2 and 7.1 to 7.4) and open bill access (issue 7.5). These consultative processes have contributed greatly to the ability of all parties to come to settlements on many of these issues, as set out below. Several of the consultative processes are ongoing and may lead to settlement of additional issues. If additional issues are partly or completely settled, parties propose to file a supplementary settlement agreement that would explain the settlements, and the incremental financial impacts of such settlements.

Parties have been able to agree upon the package, which includes settlement of many of the issues raised in this proceeding. While some issues remain outstanding and unresolved, the impact of this Settlement Proposal, if accepted, is that the scope and length of the proceeding will be substantially reduced.

The Company's Application sought recovery of a revenue deficiency of $167.8 million. This figure was updated to $158.7 million in Impact Statement No. 1, to account for, among other things, the ROE for the Test Year of 8.39%.

Parties have agreed upon the settlement package of issues that, if accepted, would
reduce the revenue deficiency by $76.7 million. This would result in a remaining revenue /c
deficiency of $82.0 million. /c

The implementation of the settlement package of issues will result in a revenue deficiency
of $29.9 million, based on the Company's filing which expresses the revenue deficiency /c
as being relative to the Board-approved rates for F2006, and all of the items that make up

and contribute to those rates including, for example, the agreed-upon level of degree days for F2006.

The issues that are not settled by the Settlement Proposal represent an additional revenue deficiency amount of $52.1 million, based on the Company's filing, which will /c
require determination by the Board in the hearing. Based on positions that may be taken by parties in the hearing, the potential outcomes arising from the determination of these unsettled issues by the Board range from an incremental revenue sufficiency of approximately $5 million to an incremental revenue deficiency of $52.1 million. /c

Some intervenors assert that, if they are successful on outstanding issues (in particular issues related to Issue 2.2 regarding degree days), then there could be a revenue sufficiency in respect of those issues. Parties are able to agree, however, that for rate implementation purposes only, the Company can adjust rates to recover an additional $26.0 million, effective as of January 1, 2007, and that this will be implemented at the same time as the Company's April 1, 2007 QRAM is implemented. This amount of $26.0 million will be subtracted from the total revenue deficiency resulting from the Board's final decision in this proceeding (which will include all impacts of this Settlement Proposal). The resulting revenue deficiency (or sufficiency) will be reflected and recovered in rates by the Company, subject to the outcome of Issue 9.1.

When implemented, the recovery of an additional $26.0 million will result in average increases, on an annual basis, of approximately 2% for Rate 1 customers, 1% for Rate 6 customers and between 0% and 2% increases for other rate classes. These average rate increases are relative to the July 1, 2006 QRAM rate and are calculated for a T-service customer, excluding commodity costs, and do not include impacts from the phase-in of cost allocation changes on October 1, 2006 and October 1, 2007. When these rate impacts are compared to the January 1, 2007 QRAM rate, the results are virtually identical as shown in Appendix B. The phase-in of cost allocation changes on October 1, 2007 will reduce the amounts recovered from Rate 1 and Rate 6 by approximately $5.01 million and $4.8 million respectively, and increase the amounts recovered from Rate 115, Rate 135 and Rate 170 by about $5.97 million, $0.6 million and $3.2 million respectively, as shown in Appendix B. The determination by the Board of the issues that are not settled will have additional rate impacts.

Attached as Appendix B is an approximation of the annual T-service rate increases that would result from the recovery of additional amounts of $26.0 million (the immediate additional amount to be recovered if the Settlement Proposal is accepted) and $82.0 /c
million (the maximum recoverable revenue deficiency if the Settlement Proposal is accepted and the Board decides the unsettled issues by adopting the Company's position on these issues). These approximations do not take account of the clearance of deferral and variance accounts, the phase-in of cost allocation changes or any allocation changes that might result from the resolution of Issue 6.2. These average annual T-service rate impact estimates are not indicative of the percentage T-service rate increase that will

occur on April 1, 2007, compared to T-service rates in force on March 31, 2007. T-service rate increases effective April 1, 2007 will include the rate increase associated with the nine month Rate Rider described in Issue 9.1. The Company believes, based on the analysis that it has undertaken, that these approximations of average annual T-service rate impacts, which are expressed relative to the July 1, 2006 QRAM rates and the January 1, 2007 QRAM rates, and are calculated for a T-service customer excluding commodity costs, are correct within +/- 0.5%.

1 RATE BASE (Exhibit B)

1.1 Are the amounts proposed for the 2007 Rate Base appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

Parties have reached a global settlement of all 2007 Rate Base issues, except for issues related to the capital budget for the new CIS system. Issues related to the new CIS system are discussed below at Issues 7.2 to 7.4. The capital spending for the new CIS system will have no rate base impact in 2007. Parties agree that the Company will reduce the revenue deficiency associated with 2007 Rate Base issues by a total of $8 million, as compared to the Company's filed evidence. This will result in a 2007 capital budget of approximately $300 million, plus the cost of the Portlands Energy Centre Leave to Construct project, which is estimated at $18 million during the Test Year. The Portlands Energy Centre project, if approved in the leave to construct application, will not affect rates for the Test Year. Parties believe that the Board's consideration of the Portlands Energy Centre in the leave to construct application should be consistent with the principles set out under Issue 1.4 below.

Parties agree that the 2007 capital budget is an envelope amount, and the Company will have discretion to determine which items will be removed or changed from the Company's filed capital budget in order to reduce the overall level of that budget. Notwithstanding this discretion, the Company agrees that it will not proceed with the Automatic Meter Reading (AMR) project. Intervenors do not necessarily accept, and presently take no position on, the Company's decisions as to how it will allocate and spend the 2007 capital budget. Parties agree that, assuming the incentive regulation rate setting process allows for it, a normal review of the Company's capital spending in the Test Year may be undertaken as part of the rate setting process for 2008. The issue of capital spending on the EnergyLink program, included in Issue 3.4, is not settled, but the Board's decision on that issue will not affect the overall capital budget for the Test Year, only the Company's ability to allocate funds to EnergyLink within that budget. Parties accept the Company's opening rate base for 2007.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

B1-1-1	Utility Rate Base
B1-1-2	Utility Rate Base Year to Year Summary
B1-2-1	Rate Base Capital Budget
B3-1-1	Ontario Utility Rate Base – Comparison of 2007 Test Year to 2006 Bridge Year
B3-1-2	Property, Plant and Equipment Summary Statement – Average of Monthly Averages 2007 Test Year
B3-1-3	Working Capital Summary of Average of Monthly Averages 2007 Test Year
B3-2-1	Utility Capital Expenditures Comparison Budget 2007 and Estimated 2006
B3-2-2	2007 Capital Expenditures by Project (Projects Exceeding $500,000)
B3-2-3	Gross Customer Additions and Average Cost per Customer Addition Budget 2007 and Estimated 2006
B3-2-4	System Expansion Portfolio – 2007
F3-1-3	Utility Rate Base 2007 Test Year
I-1-1 to 3	Board Staff Interrogatories 1 to 3
I-9-4 and 7	IGUA Interrogatories 4 and 7
I-16-1 to 3	SEC Interrogatories 1 to 3
I-24-5 to 7	VECC Interrogatories 5 to 7
L-9-1	Evidence of IGUA
M1-1-1	Impact Statement #1

1.2 Are the amounts proposed for Capital Expenditures in 2007 appropriate?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue, as part of the package, as follows:

See Issue 1.1.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of aspects of this issue.

Evidence: The evidence in relation to this issue includes the following:

B1-2-1	Rate Base Capital Budget
B1-2-2	Details of Capital Expenditure and Justification for Major Capital Projects over $500,000
B1-3-1	Safety & Integrity Initiatives
B1-3-2	Leave to Construct Projects
B1-4-1	Information Technology Capital Budget
B1-5-1	CIS Project
B1-6-1	EnVision Project
B1-7-1	Automated Meter Reading (AMR)
I-1-4 to 6	Board Staff Interrogatories 4 to 6
I-2-1 to 4	CCC Interrogatories 1 to 4
I-9-2 and 5 to 6	IGUA Interrogatories 2 and 5 to 6

I-16-4 to 10	SEC Interrogatories 4 to 10
I-24-8 to 12	VECC Interrogatories 8 to 12

1.3 Is the budget amount proposed in 2007 for Safety & Integrity projects appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

See Issue 1.1. The Company will determine the 2007 capital expenditures budget for Safety and Integrity projects within the envelope set out under Issue 1.1.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

B1-3-1	Safety & Integrity Initiatives
I-1-7	Board Staff Interrogatory 7
I-2-5 to 7	CCC Interrogatories 5 to 7
I-9-8	IGUA Interrogatory 8
I-16-11 to 12	SEC Interrogatories 11 to 12
I-24-13	VEC Interrogatory 13

1.4 How should the Board deal with the Leave to Construct ("LTC") projects included in the 2007 capital budget given that there will be separate Board Proceedings for the LTC projects?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

Parties are of the view that the Board's decisions determining the appropriate total amount of capital spending by the Company in any test period are most suitably made in a rate application. In general, parties agree that the Board's decision with respect to overall capital spending does not imply specific approval of any individual leave to construct projects ("LTC Projects"), nor a decision as to the economic feasibility of any individual LTC Project. Similarly, parties agree that, generally, a decision with respect to the economic feasibility of an individual LTC

Project does not, in and of itself, imply that it is appropriate to include capital spending pertaining to that LTC Project in the capital budget for a test year used by the Board to establish rates.

In the context of the foregoing, the parties agree that the Board should deal with LTC Projects included in any test year capital budget as follows:

1. The total capital expenditures budget for a particular test year, to be considered and approved in a rate application, should include some evidence on individual LTC Projects planned for that year. However, the Board should not be asked to approve individual LTC Projects in a rate case. In a rate case, evidence with respect to individual LTC Projects need not be as extensive as the evidence required to support a LTC Application.

2. The economic feasibility of an individual project is considered in a leave to construct application. A LTC Application should not result in any adjustment to the Company's capital expenditures budget aside from exceptional circumstances, and in those cases the Board should consider and make the adjustment expressly.

3. A LTC Application can be heard by the Board prior to its consideration of the capital budget consequences of the LTC Project in a rates proceeding. In the event the Board approves a LTC Application, it will not be necessary to examine the justification for the LTC Project in a subsequent rate proceeding although the issue of the appropriate size of the overall capital budget would remain in issue in that hearing, and the leave to construct approval could inform that decision.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

B1-3-2	Leave to Construct Projects
I-1-8 to 9	Board Staff Interrogatories 8 to 9
I-2-8	CCC Interrogatory 8
I-9-9	IGUA Interrogatory 9
I-16-13 to 14	SEC Interrogatories 13 to 14
I-19-4	TransAlta Interrogatory 4

1.5 Has the Company met the requirements of the Board's directive from the 2006 rate case to file an independent cost benchmark study for the EnVision project?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

Parties agree that the Company has met the requirements of the Board's directive from the EB-2005-0001 Decision with Reasons by filing an independent cost benchmark study for the EnVision project.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

B2-2-1	Compass Report – Envision Cost Benchmark Analysis
B1-6-1	EnVision Project

1.6 What are the appropriate EnVision cost and benefits and how should they be reflected in 2007 rates?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

Parties agree that Compass carried out an appropriate cost benchmark study of the EnVision Project. Parties differ on how that benchmark should be applied in determining the costs and benefits associated with EnVision that should be reflected in rates. In order to resolve the EnVision issues in this proceeding, the Company has agreed to reduce the revenue requirement by $500,000 through a reduction in the 2007 Other O&M budget. This reduction is reflected and included in the $181.5 million total Other O&M budget agreed to below at Issue 3.2. The Company will continue to report annually to stakeholders on the achievement of EnVision benefits in the form and the manner set out in Tables 1 and 2 in Exhibit B1/T6/S1/pp 8-9. Parties agree that unless there is a change in the overall NPV of the EnVision project, there will be no need to revisit the EnVision project in future regulatory proceedings.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

B2-2-1	Compass Report – Envision Cost Benchmark Analysis
B1-6-1	EnVision Project
1-2-9 to 17	CCC Interrogatories 9 to 17
1-16-15	SEC Interrogatory 15

1.7 Is the business case, including the total project amount of $133 million, proposed for the Automatic Meter Reading project ("AMR") justified?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

As part of the global settlement of 2007 rate base issues, the Company agrees not to proceed with the AMR project.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

B1-7-1	Automated Meter Reading (AMR)
I-1-10 to 13	Board Staff Interrogatories 10 to 13
I-2-18 to 22	CCC Interrogatories 18 to 22
I-9-11	IGUA Interrogatory 11
I-16-16	SEC Interrogatory 16
I-24-14	VECC Interrogatory 14

1.8 Is the proposed recovery of AMR costs in 2007 rates appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

As part of the global settlement of 2007 rate base issues, the Company agrees not to proceed with the AMR project. As a result, this issue is no longer relevant.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

B1-7-1	Automated Meter Reading (AMR)
1-24-15 to 16	VECC Interrogatories 15 to 16

2 OPERATING REVENUE (Exhibit C)

2.1 Is the proposed amount for 2007 Transactional Services revenue appropriate, and is the associated sharing mechanism in accordance with the 2006 decision?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

Parties agree that the Company will share net transactional services revenues with ratepayers on a 75:25 basis in favour of ratepayers for transportation-related transactional services and on a 90:10 basis in favour of ratepayers for storage-related transactional services. The Company agrees to credit $8 million in transactional services revenue to ratepayers, to be credited to the revenue requirement for the purpose of setting rates for the Test Year. This credit will not be allocated as between transportation and storage transactional services. The 2007 Transactional Services Deferral Account will include the total of the ratepayers' shares of the net transactional services revenue for transportation-related and for storage-related transactional services, less the $8 million credit and the O&M costs associated with storage-related transactional services (estimated at $.1 million in the Company's updated evidence at Ex. C1-4-2). For greater certainty, if the result of these calculations is that the year-end balance in the 2007

Transactional Services Deferral Account would be less than zero, the balance shall be deemed to be zero.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

C1-4-1	Transactional Services Revenue
C1-4-2	Transactional Services – Supplementary Evidence
I-1-14 to 15	Board Staff Interrogatories 14 to 15
I-2-23	CCC Interrogatory 23
I-9-13	IGUA Interrogatory 13
1-16-17	SEC Interrogatory 17
I-24-17 to 18	VECC Interrogatory 17 to 18
M1-1-1	Impact Statement #1

2.2 Is the proposed total 2007 Other Revenue Forecast appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

Parties agree to increase the forecast for Other Operating Revenue for the Test Year from $23.7 million to $28.9 million, inclusive of the $3.5 million incremental impact of the resolution of the Transactional Services issue (described above at Issue 2.1), an increase of $1.0 million from the forecast of Other Service Revenues in the Company's evidence and the imputation of revenue of $700,000 for the Natural Gas Vehicles (NGV) program for the Test Year (in order to reflect the revenue deficiency of the NGV program).

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

C1-5-1	Other Service and Late Payment Penalty Revenues
C3-5-1	Rate of Return on Capital Employed in the Natural Gas Vehicles Program

I-1-16	Board Staff Interrogatory 16
I-2-24 to 25	CCC Interrogatories 24 and 25
I-16-18	SEC Interrogatory 18
I-24-19 to 22	VECC Interrogatories 19 to 22
M1-1-1	Impact Statement No. 1
M1-2-5	Change in Revenue Requirement

2.3 Is the forecast of degree days appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

C2-4-1	Budget Degree Days
I-1-17	Board Staff Interrogatory 17
I-9-3 and 14	IGUA Interrogatories 3 and 14
1-5-1 to 12	Energy Probe Interrogatories 1 to 12
1-16-19 to 20	SEC Interrogatories 19 to 20
L-9-1	Evidence of IGUA

2.4 Are the average use-per-customer forecasts for rate class 1 and rate class 6 appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

C1-3-1	Volume Budget
C2-3-1	Average Rate Use 1
C2-3-2	Average Use Rate 6
I-1-18	Board Staff Interrogatory 18
I-2-26 to 28	CCC Interrogatories 26 to 28
I-16-21 to 23	SEC Interrogatories 21 to 23
I-24-22 to 25	VECC Interrogatories 22 to 25

2.5 Is the proposed 2007 contract gas volume and revenue forecast appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

C1-3-1	Volume Budget
I-1-19	Board Staff Interrogatory 19
I-1-12	IGUA Interrogatory 12

2.6 Is the proposed 2007 General Service gas volume and revenue forecast appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

C1-3-1	Volume Budget
C1-1-1	Operating Revenue Summary
C1-2-1	Revenue Forecast
C3-1-1	Utility Operating Revenue 2007 Test Year
C3-1-2	Comparison of Utility Operating Revenue Budget 2007 and Estimate 2006
I-1-20	Board Staff Interrogatory 20
1-24-23 to 25	VECC Interrogatories 23 to 25

3 OPERATING COST (Exhibit D)

3.1 Is the proposed 2007 gas cost forecast including the calculation of the PGVA Reference Price appropriate?

(Complete Settlement)

There is an agreement to settle this issue as follows:

Parties accept the Company's forecast of the cost consequences of the gas supply portfolio for the Test Year.

The Company agrees with certain parties that, when the issues list for the Natural Gas Forum proceeding about QRAM methodology is discussed, the Company will support the inclusion of an issue regarding the detailed calculation of the PGVA Reference Price.

Participating Parties: All parties participated in the negotiation and settlement of this issue except GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-4-1	Cost of Gas, Transportation and Storage
D1-4-2	Status of Contracts
D3-3-1	Summary of Gas Cost to Operations
D3-3-2	Summary of Gas Storage and Transportation Costs Fiscal 2007
D3-3-3	Canadian Peak Day Supply Mix
D3-3-4	Monthly Pricing Information
D3-3-5	Gas Supply/Demand
I-1-21	Board Staff Interrogatory 21
I-2-29	CCC Interrogatory 29
I-5-16 to 17	Energy Probe Interrogatory 16 to 17
I-9-16	IGUA Interrogatory 16
I-18-6	Superior Interrogatory 6
I-21-1 to 9	TransCanada Interrogatories 1 to 9
I-24-26	VECC Interrogatory 26

3.2 Is the overall level of the 2007 Operation and Maintenance Budget appropriate?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue, as part of the package, as follows:

The Company's overall Operations and Maintenance (O&M) budget, as filed in Impact Statement No. 1, for the Test Year totalled $365.8 million and can be divided into a number of categories: (i) customer care expenses (including CIS, internal costs and provision for uncollectibles) – filed as $120.1 million; (ii) corporate cost allocations – filed as $22.9 million; (iii) demand side management (DSM) programs – filed as $22.0 million; and (iv) Other O&M – filed as $200.8 million. The Company has also included transition costs of $10 million related to customer care as a separate line item in its filing.

Issues related the Company's customer care O&M budget (including the transition costs) are discussed below at Issues 7.1 to 7.4. Parties, except for GEC and Pollution Probe, agree on the balance of the Company's O&M budget for the Test Year.

Parties acknowledge that the Company's O&M DSM budget for the Test Year shall be $22.0 million, as set out in the Board's Decision with Reasons in EB-2006-0021 (the DSM generic hearing).

Parties agree that the Company's O&M budget for corporate cost allocations for the Test Year shall be $18.1 million. Parties agree to the overall level of this budget, but there is no specific agreement as to the amounts of each of the individual allocations. The issues about the corporate cost allocation methodology set out in Issue 3.6 remain unsettled.

Parties, except for GEC and Pollution Probe, agree that the Company's Other O&M budget for the Test Year, filed as $200.8 million, shall be reduced by $19.3 million to $181.5 million. Subject to the comments below, parties agree that the amount of the Other O&M budget is an envelope amount and the Company will have discretion to determine which items will be removed or changed from the Company's Other O&M budget as filed in order to reduce the overall level of that budget. Intervenors do not necessarily accept, and presently take no position on, the Company's decisions as to how it will allocate and spend the 2007 Other O&M budget.

Notwithstanding the agreement on the overall level of the Company's Other O&M budget for the Test Year, parties agree that certain components of the Company's Opportunity Development planned activities for the Test Year, specifically marketing activities, fuel switching and EnergyLink, will be examined before the Board. Parties, except for GEC and Pollution Probe, agree that the examination of those sub-issues before the Board will not impact on the $181.5 million agreed-upon level of the Other O&M budget for the Test Year. Subject to the exception set out below, parties other than GEC and Pollution Probe agree that they will not take any position in this proceeding on how the Company ought to allocate the agreed-upon $181.5 million Other O&M budget. Notwithstanding the foregoing, in the event that the Board determines that the Company may not proceed with EnergyLink, it is understood that Schools and/or HVAC may advance arguments about how the Company ought to spend the O&M amounts totaling $1.3 million (Ex. I-26-4) that were otherwise budgeted for EnergyLink. Notwithstanding the foregoing, it is also understood that VECC may advance arguments that the Company ought to allocate funds as budgeted of $925,000 to low income fuel switching (Ex. 1-24-29). Additionally, the Company agrees that from and after the date of the Board's decision in this proceeding, it will not allocate any portion of the agreed-upon $181.5 million Other O&M budget to any specific marketing, fuel switching or EnergyLink activities that the Board specifically states the Company should not be undertaking.

GEC and Pollution Probe do not agree to the $181.5 million Other O&M budget. GEC and Pollution Probe wish to examine the Company's Opportunity Development (OD) O&M budget separately and do not agree to the overall level of $181.5 million for the Other O&M budget. No other parties, including the Company, will support or argue for any change (increase or decrease) to the agreed-upon Other O&M budget of $181.5 million.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, OAPPA, OESLP, Superior, TransCanada, TransAlta, Union Gas.

Approval: All participating parties accept and agree with the proposed settlement of aspects of this issue except Pollution Probe and GEC.

Evidence: The evidence in relation to this issue includes the following:

D1-1-1	Operating Cost Summary
D1-2-1	Operating, Maintenance and Other Costs
D2-1-1	Corporate Cost Allocation
D3-1-1	Operating Cost 2007 Test Year
D3-2-1	Operating Cost Comparison of Utility Cost and Expenses Budget 2007 and Estimate 2006
D3-2-2	Operating and Maintenance Expense by Department
D3-2-3	Operating and Maintenance Expense by Cost Type
I-1-22 to 24	Board Staff Interrogatories 22 to 24
I-2-30 to 35	CCC Interrogatories 30 to 35
I-9-2, 4 and 15	IGUA Interrogatories 2, 4 and 15
I-15-1 to 4	Pollution Probe Interrogatories 1 to 4

I-24-27 to 28	VECC Interrogatories 27 to 28
L-9-1	Evidence of IGUA
M1-1-1	Impact Statement #1

3.3 Is the Company's proposed fuel switching program appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-8-1	Opportunity Development – Market Development
I-1-25	Board Staff Interrogatory 25
I-2-36 to 39	CCC Interrogatories 36 to 39
I-7-1	GEC Interrogatory 1
I-22-6	Union Energy Interrogatory 6
I-24-29	VECC Interrogatory 29
I-26-1 to 3	HVAC Interrogatory 1 to 3

3.4 Is the Company's proposed Energy Link program appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-1-1	Operating Cost Summary
I-22-6	Union Energy Interrogatory 6
I-24-30	VECC Interrogatory 30
I-26-4 to 10	HVAC Interrogatories 4 to 10
L-22-1	Evidence of Union Energy
L-26-1	Evidence of HVAC
I-27-36 to 46	Enbridge Gas Distribution Interrogatories of Union Energy 36 to 46
I-30-1 to 21	Enbridge Gas Distribution Interrogatories of HVAC 1 to 21

3.5 Is the budget for Human Resources related costs appropriate?

(Complete Settlement)

There is an agreement to settle this issue as part of the package, as follows:

> Parties agree that any Human Resources related costs determined by the Company to be appropriate in the Test Year will be included as part of the agreed-upon $181.5 million Other O&M budget.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-2-1	Operating Costs and Maintenance and Other Costs
D1-2-2	Employee Expenses and Workforce Demographics
D3-2-4	Salaries and Wages and FTE Forecast 2007 Test Year
I-1-26	Board Staff Interrogatory 26
I-2-40 to 43	CCC Interrogatories 40 to 43
I-16-30 to 37	SEC Interrogatories 30 to 37
I-24-31 to 33	VECC Interrogatories 31 to 33

3.6 Do the revisions to the Regulatory Cost Allocation Methodology (RCAM) meet the Board's directives in the 2006 decision?

(No Settlement)

There is no agreement to settle this issue.

The issue of whether the revisions to RCAM meet the Board's directives from the 2006 decision has been a subject of the corporate cost allocation consultative. At this time, the final report from the consultant retained on behalf of the consultative has not been filed. As a result, no settlement can be reached on this issue at this time.

Evidence: The evidence in relation to this issue includes the following:

D2-1-1	Corporate Cost Allocation
G1-1-1	Corporate Cost Allocation Methodology
I-16-38 to 39	SEC Interrogatories 38 to 39

3.7 Is the proposed level of corporate cost allocation for 2007 appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

Parties agree that the Company's O&M budget for corporate cost allocations for the Test Year shall be $18.1 million. Parties agree to the overall level of this budget, but there is no specific agreement as to the amounts of each of the individual allocations.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-2-1	Operating Maintenance and Other Costs
D2-1-1	Corporate Cost Allocation
I-1-27 to 28	Board Staff Interrogatories 27 to 28
I-9-1	IGUA Interrogatory 1
I-24-34 to 37	VECC Interrogatories 34 to 37

3.8 Is Company's forecast level of Regulatory and OEB related costs for 2007 appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

> Parties agree that the Company's Regulatory and OEB related costs will be included as part of the agreed-upon Other O&M budget and that variances from the budget for 2007 rate proceeding related expenses will be recorded in the 2007 Ontario Hearings Costs Variance Account for consideration and disposition in a future proceeding.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-2-1	Operating Maintenance and Other Costs
D1-9-1	Regulatory Costs
I-1-29 to 30	Board Staff Interrogatories 29 to 30
I-2-44	CCC Interrogatory 44
I-16-40	SEC Interrogatory 40

3.9 Is Enbridge's decision to change to a December 31 taxation year-end , in 2007, appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

> Intervenors have relied on the Company's evidence that the change of taxation year-end for the Enbridge Gas Distribution Inc. corporate entity has no impact on the Company's 2007 cost of service. In conjunction with the agreement with respect to Issue 3.15, intervenors accept the Company's evidence in this regard.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-5-1	Taxation Year-End Change

I-1-31 to 34	Board Staff Interrogatories 31 to 34
I-16-41	SEC Interrogatory 41

3.10 Is the continuation of the Risk Management Program appropriate in the context of the Board's 2006 Decision directives?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-4-3	Gas Supply Risk Management
I-1-35 to 36	Board Staff Interrogatories 35 to 36
I-2-45	CCC Interrogatory 45
I-5-18 to 27	Energy Probe Interrogatories 18 to 27
I-18-7	Superior Interrogatory 7
I-24-38 to 39	VECC Interrogatories 38 to 39
L-5-1	Evidence of Energy Probe
I-36-1 to 6	Enbridge Gas Distribution Interrogatories of Energy Probe 1 to 6

3.11 Is the proposal to change depreciation rates for 2007, as proposed in the depreciation study, and the impact on 2007 customer rates, appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

> The Company agrees not to proceed with its request to change depreciation rates for 2007. Intervenors agree not to challenge the Company's existing depreciation rates for 2007. Notwithstanding this agreement, parties may examine the existing level of the Company's depreciation rates in the context of discussing and examining other outstanding issues in this proceeding.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-13-1	Depreciation Rate Change
D2-2-1	Depreciation Study

I-1-37 to 46	Board Staff Interrogatories 37 to 46
I-5-13 to 14	Energy Probe Interrogatories 13 to 14
I-9-18	IGUA Interrogatory 18
I-16-42 to 41	SEC Interrogatories 42 to 43
I-24-39.1 to 39.3	VECC Interrogatories 39.1 to 39.3
L-9-1	Evidence of IGUA

3.12 Is the proposal for the establishment of 2007 Deferral and Variance Accounts appropriate?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue, as part of the package, as follows:

The Company's proposal to establish the following deferral and variance accounts for the Test Year is accepted by the parties for the reasons set out in the Company's evidence:

2007 Purchased Gas Variance Account ("2007 PGVA")
2007 Transactional Services Deferral Account ("2007 TSDA")
2007 Unaccounted for Gas Variance Account ("2007 UAFVA")
2007 Union Gas Deferral Account ("2007 UGDA")
2007 Class Action Suit Deferral Account ("2007 CASDA")
2007 Debt Redemption Deferral Account ("2007 DRDA")
2007 Deferred Rebate Account ("2007 DRA")
2007 Gas Distribution Access Rule Costs Deferral Account ("2007 GDACRDA")
2007 Manufactured Gas Plant Deferral Account ("2007 MGPDA")
2007 Ontario Hearing Costs Variance Account ("2007 OHCVA")
2007 Electric Program Earnings Sharing Deferral Account ("2007 EPESDA")
2007 Unbundled Rate Implementation Cost Deferral Account ("2007 URICDA")
2007 Unbundled Rates Customer Migration Deferral Account ("2007 URCMDA")
2007 Demand-Side Management Variance Account ("2007 DSMVA")
2007 Lost Revenue Adjustment Mechanism ("2007 LRAM")
2007 Shared Savings Mechanism Variance Account ("2007 SSMVA")
2007 Income Tax Rate Change Variance Account ("2007 ITRCVA")

There is no agreement to the establishment of the following deferral and variance accounts, as those accounts are being dealt with as part of the customer care/CIS consultative process and through Issues 7.2 to 7.4:

2007 Customer Information System Procurement Deferral Account ("2007 CISPDA")
2007 Customer Care Procurement Deferral Account ("2007 CCPDA")
2007 Customer Care Supplier Transition Variance Account ("2007 CCSTVA")

There is no agreement to the establishment of the following deferral account, as it is being dealt with as part of the open bill consultative process and through Issue 7.5:

2007 Open Bill Access Sharing Deferral Account ("2007 OBASDA")

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-7-1	Deferral and Variance Accounts
D1-7-3	Deferral and Variance Account Balances
I-1-47	Board Staff Interrogatory 47
I-2-46 to 48	CCC Interrogatories 46 to 48
I-7-2	GEC Interrogatory 2

3.13 Is the proposal for the disposition of existing Deferral and Variance Accounts appropriate?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue, as part of the package, as follows:

Enbridge Gas Distribution filed a summary of the actual deferral account and variance account balances for F2006 (D1-7-3); the summary is reproduced in Appendix A. The result of clearing certain of these accounts is that Enbridge Gas Distribution will credit customers $23.258.7 million in principal plus interest, based upon the December 31, 2006 balances, for F2006.

The balances recorded in the following deferral and variance accounts established for F2006, and the proposed clearance of such balances at the same time as the final rate order in this proceeding is implemented, are accepted by the other parties for the reasons given in the supporting evidence:

Non Commodity Related Accounts

2004 Demand-Side Management Variance Account ("2004 DSMVA")
2004 Lost Revenue Adjustment Mechanism ("2004 LRAM")
2004 Shared Savings Mechanism Variance Account ("2004 SSMVA")
2006 Deferred Rebate Account (“2006 DRA”)
2006 Debt Redemption Deferral Account (“2006 DRDA”)
2006 Ontario Hearing Costs Variance Account (“2006 OHCVA”)

Commodity Related Accounts

2006 Unaccounted for Gas Variance Account (“2006 UAFVA”)
2006 Transactional Services Deferral Account (“2006 TSDA”)

2006 Union Gas Deferral Account ("2006 UGDA")

Enbridge Gas Distribution does not seek to clear, in the Test Year, the balances recorded in the following deferral and variance accounts. Parties agree that the following previously-approved deferral and variance accounts are continued and the clearance of these accounts will be addressed by the Board in the future.

<u>Non Commodity Related Accounts</u>

2006 Demand-Side Management Variance Account ("2006 DSMVA")
2005 Demand-Side Management Variance Account ("2005 DSMVA")
2006 Lost Revenue Adjustment Mechanism ("2006 LRAM")
2005 Lost Revenue Adjustment Mechanism ("2005 LRAM")
2006 Shared Savings Mechanism Variance Account ("2006 SSMVA")
2005 Shared Savings Mechanism Variance Account ("2005 SSMVA")
2006 Manufactured Gas Plant Deferral Account (“2006 MGPDA”)
2006 Corporate Cost Allocation Deferral Account (“2006 CCAMDA”)
2006 Class Action Suit Deferral Account (“2006 CASDA”)

<u>Commodity Related Account</u>

2006 Purchased Gas Variance Account ("2006 PGVA")

While Enbridge Gas Distribution seeks to clear the balances recorded in the following deferral and variance accounts in the Test Year, there is no agreement as to whether this is appropriate and these accounts will be addressed at the hearing:

2006 Gas Distribution Access Rule Costs Deferral Account (“2006 GDARCDA”)
2005 Gas Distribution Access Rule Costs Deferral Account (“2005 GDARCDA”)
2006 Alliance Vector Appeal Costs Deferral Account (“2006 AVACDA”)
2006 Gas Supply Risk Management Program Deferral Account (“2006 GSRMPDA”)
2006 Electric Program Earnings Sharing Deferral Account (“2006 EPESDA”)
2006 Unbundled Rate Implementation Cost Deferral Account (“2006 URICDA”)

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of aspects of this issue.

Evidence: The evidence in relation to this issue includes the following:

D1-7-1	Deferral and Variance Accounts
D1-7-2	Proposed Clearing of the 2006 Deferral Accounts
D1-7-3	Deferral and Variance Account Balances
A1-13-1	Status of Board Directives from Previous Board Decisions and/or Orders
A3-3-1	Financial Statements – Enbridge Gas Distribution Historical 2005 Year

A3-4-1	Annual Report (Actual) and Management Discussion and Analysis (MD&A)
I-2-49	CCC Interrogatory 49
I-16-44 to 45	SEC Interrogatories 44 to 45
I-24-40	VECC Interrogatory 40

3.14 Are the amounts proposed to be included in rates for capital and property taxes appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

The Company agrees to a $1.3 million reduction in its forecast of municipal property and other taxes for the Test Year.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

D3-1-1	Operating Cost 2007 Test Year
I-9-3	IGUA Interrogatory 3
I-2-50	CCC Interrogatory 50

3.15 Is the amount proposed to be included in rates for income taxes, including the methodology, appropriate?

(Complete Settlement)

There is an agreement to settle this issue, as part of the package, as follows:

Parties accept the Company's methodology for income taxes, and the amount to be included in rates for income taxes, for the purpose of setting rates for the Test Year, without prejudice to the ability of any party to raise issues with respect to the methodology and its resulting calculations, including but not limited to which inclusions and deductions are appropriate, in future rate proceedings. The Company agrees to create a 2007 Income Tax Rate Change Variance Account to capture the impact of any corporate income tax rate changes against Fiscal 2007 Board Approved taxable income (versus the Company's forecast of corporate income tax rates) that occur in 2007 as a result of Provincial and Federal government budgets that are passed in the Test Year.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

A3-2-1	Financial Statements – Utility Proforma Statements for Bridge and Test Year
A3-3-1	Financial Statements – Enbridge Gas Distribution Historical 2005 Year
A3-4-1	Annual Report (Actual) and Management Discussion and Analysis (MD&A)
A3-5-3	Annual/Audited Financial Reports (Historical) Enbridge Inc. – 2005 Year
D3-1-1	Operating Cost 2007 Test Year
I-16-46 to 47	SEC Interrogatories 46 to 47

4 COST OF CAPITAL (Exhibit E)

4.1 What is the Return on Equity (ROE) for EGDI for the 2007 test year as calculated pursuant to the ROE Guidelines?

(Complete Settlement)

There is an agreement to settle this issue as follows:

Parties agree that the ROE for the Company for the 2007 test year is 8.39%, as calculated pursuant to the ROE guidelines.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

E1-1-1	Cost of Capital Summary
E1-2-1	Cost of Capital
E2-1-1	Utility Business and Financial Risks
E2-1-2	Enbridge Gas Distribution Utility Business Risks – Environment
E2-1-3	Utility Equity Thickness Financial Risk Update
E2-2-1	Calculation of ROE

E3-1-1	Cost of Capital 2007 Test Year
E3-1-2	Summary Statement of Principal and Carrying Costs of Term Debt 2007 Test Year
E3-1-3	Unamortized Debt Discount and Expense Average of Monthly Averages 2007 Test Year
E3-1-4	Preference Shares Summary Statement of Principal and Carrying Cost 2007 Test Year
E3-1-5	Unamortized Preference Share Issue Expense Average of Monthly Averages 2007 Test Year
E3-1-6	Fiscal 2007 Calculation of Short-term Unfunded Debt
I-5-15	Energy Probe Interrogatory 15
I-24-41 to 43	VECC Interrogatories 41 to 43
M1-1-1	Impact Statement #1

4.2 Are Enbridge's proposed costs for its debt and preference share components of its capital structure appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

E1-1-1	Cost of Capital Summary
E1-2-1	Cost of Capital
I-1-48	Board Staff Interrogatory 48
I-16-48 to 50	SEC Interrogatories 48 to 50

4.3 Is the proposal to change the equity component of the deemed capital structure from 35% to 38% appropriate?

(No Settlement)

There is no agreement to settle this issue.

Evidence: The evidence in relation to this issue includes the following:

E1-1-1	Cost of Capital Summary
E1-2-1	Cost of Capital
E2-1-1	Utility Business and Financial Risks
E2-1-2	Utility Equity Thickness Financial Risk Update
E2-1-2	Enbridge Gas Distribution Utility Business Risks – Environment
E2-2-1	Calculation of ROE
E3-1-1	Cost of Capital 2007 Test Year
I-2-51	CCC Interrogatory 51
I-9-19	IGUA Interrogatory 19
I-16-51 to 54	SEC Interrogatories 51 to 54
I-24-44 to 57	VECC Interrogatories 44 to 57
I-24-77 to 83	VECC Supplementary Interrogatories 77 to 83
L-9	Evidence of IGUA
L-27-1	Evidence of VECC, CCC and IGUA
L-27-2	Supplementary Evidence of VECC, CCC and IGUA
I-28-1 to 17	Enbridge Gas Distribution Interrogatories of VECC, CCC and IGUA 1 to 17

5 COST ALLOCATION (Exhibit G)

5.1 Is the Applicant's cost allocation appropriate and is it based in its 2006 Board approved methodology?

(Complete Settlement)

There is an agreement to settle this issue as follows:

Subject to the comments below in respect of Issues 6.2, 6.4 and 8.1, and subject to a compliance review of the cost allocation that will be embedded in any rate orders arising from this proceeding, parties accept the Company's evidence in this proceeding about its cost allocation for the Test Year and agree that it is appropriate and consistent with the 2006 Board-approved methodology.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OESLP, Pollution Probe, Superior, TransAlta, TransCanada, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

G1-1-1	Cost Allocation Methodology
G2-1-1	Fully Allocated Cost Study
I-1-52	Board Staff Interrogatory 52
I-9-20	IGUA Interrogatory 20
I-24-59	VECC Interrogatory 69

5.2 Is the proposal to recover Demand Side Management costs in delivery charges, as opposed to load balancing charges, appropriate?

(Complete Settlement)

There is an agreement to settle this issue as follows:

Parties accept the Company's proposal, as set out in the evidence, to recover Demand Side Management costs in delivery charges, rather than in load balancing charges.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

G2-3-1	Functionalization of Utility Rate Base
G2-3-2	Functionalization of Utility Working Capital
G2-3-3	Functionalization of Utility Net Investments
G2-3-4	Functionalization of Utility O&M
I-1-53	Board Staff Interrogatory 53

6 RATE DESIGN (Exhibit H)

6.1 Is the proposal to introduce delivery demand charges for Rates 100 and 145 reasonable?

(Complete Settlement)

There is an agreement to settle this issue as follows:

Parties accept the Company's proposal, as set out in the evidence, to introduce delivery demand charges for Rates 100 and 145.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OESLP, Pollution Probe, Superior, TransCanada, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue except TransAlta and VECC, which take no position.

Evidence: The evidence in relation to this issue includes the following:

H1-1-1	Rate Design
H2-1-1	Revenue Comparison – Current Revenue vs. Proposed Revenue
H2-2-1	Proposed Revenue Recovery by Rate Class
H2-3-1	Summary of Proposed Rate Change by Rate Class
H2-4-1	Calculation of Gas Supply Charges by Rate Class
H2-5-1	Detailed Revenue Calculations by Rate Class
H2-6-1	Rate Handbook
H2-7-1	Annual Bill Comparison
H3-1-1	Revenue Comparison – Current vs Proposed by Rate Class Proposed Methodology
H3-1-2	Proposed Unit Rates by Rate Class
H3-2-1	Proposed Revenue Recovery by Rate Class

H3-3-1	Summary of Proposed Rate Change
H3-4-1	Calculation of Gas Supply Charges by Rate Class
H3-5-1	Detailed Revenue Calculations by Rate Class
H3-6-1	Rate Handbook
H3-7-1	Annual Bill Comparison
I-1-54	Board Staff Interrogatory 54
I-12-1	OAPPA Interrogatory 1

6.2 Is the proposal to allocate revenue requirement between the customer classes and annually adjust the monthly customer charges and variable charges to recover the revenue deficiency reasonable?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue as follows:

> Parties accept the Company's proposal, as set out in the evidence, to annually adjust the monthly customer charges and variable charges to recover the revenue deficiency.
>
> There is no agreement about the Company's proposal to allocate revenue requirement between customer classes. Some parties are concerned that the allocation of the 2007 revenue deficiency as proposed in the Company's evidence results in the collection of revenues greater than allocated costs from Rate 1 and Rate 6 customers based on the Company's filed Revenue to Cost ratios of 1.02 and 1.01 for these rate classes. These parties wish to explore the proposed 2007 revenue requirement allocation in light of the evidence and interrogatory responses on this issue. Other parties support the Company's revenue deficiency allocation and will oppose changes to it.

Participating Parties: All parties participated in the negotiation and settlement of aspects of this issue except Direct Energy, GEC, HVAC, OESLP, Pollution Probe, Superior, TransCanada**.**

Approval: All participating parties accept and agree with the proposed settlement of aspects of this issue.

Evidence: The evidence in relation to this issue includes the following:

H1-1-1	Rate Design
H2-1-1	Revenue Comparison – Current Revenue vs. Proposed Revenue
H2-2-1	Proposed Revenue Recovery by Rate Class
H2-3-1	Summary of Proposed Rate Change by Rate Class
H2-4-1	Calculation of Gas Supply Charges by Rate Class
H2-5-1	Detailed Revenue Calculations by Rate Class
H2-6-1	Rate Handbook

H2-7-1	Annual Bill Comparison
H3-1-1	Revenue Comparison – Current vs Proposed by Rate Class Proposed Methodology
H3-1-2	Proposed Unit Rates by Rate Class
H3-2-1	Proposed Revenue Recovery by Rate Class
H3-3-1	Summary of Proposed Rate Change
H3-4-1	Calculation of Gas Supply Charges by Rate Class
H3-5-1	Detailed Revenue Calculations by Rate Class
H3-6-1	Rate Handbook
H3-7-1	Annual Bill Comparison
I-1-55	Board Staff Interrogatory 55
I-9-23	IGUA Interrogatory 23
I-12-2	OAPPA Interrogatory 2
I-24-70	VECC Interrogatory 70

6.3 Should the Board approve the contents of the Applicant's Rate Handbook?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue as follows:

> Parties agree that it is appropriate for the Board to continue to approve the Company's Rate Handbook, as part of the Rate Order resulting from Rate Case proceedings.
>
> There is no agreement on the Company's proposed Invoice Vendor Adjustment (IVA) charge.
>
> Subject to the issue about the IVA, parties agree that the Rate Handbook as filed should be approved by the Board.

Participating Parties: All parties participated in the negotiation and settlement of this issue except GEC, HVAC, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of aspects of this issue.

Evidence: The evidence in relation to this issue includes the following:

A1-14-1	Policies and Regulations of the Company with Respect to Gas Services and Schedule of Service Charges
A1-14-2	Changes to the Schedule of Service Charges
D1-10-2	Gas Distribution Access Rule
H1-1-1	Rate Design
H2-6-1	Rate Handbook
I-19-1	TransAlta Interrogatory 1
I-1-56	Board Staff Interrogatory 56
I-12-3	OAPPA Interrogatory 3
I-24-71 to 73	VECC Interrogatories 71 to 73

6.4 Is the proposed treatment of bundled transportation charges and T-service credit appropriate in light of the Board's Decision in RP-2003-0203 and the settlement agreement?

(Complete Settlement)

There is agreement to settle this issue as follows:

Parties accept the Company's proposed treatment of bundled transportation charges and T-service credits. The final rate increases associated with the implementation of the settlement proposal of the changes in the allocation of upstream transportation charges in EB-2005-0001 will be implemented on October 1st, 2007. Effective October 1, 2007, the upstream transportation charges for all rate classes will recover the appropriate level of upstream transportation costs for all rate classes, so that there will be no over-contribution from Rates 1 and 6 with respect to upstream transportation costs.

The Company will continue to charge and rebate the T-service credit for Ontario T-Service customers. The existing T-Service credit, equal to TransCanada's 100% load factor toll, will continue to be in effect until December 31, 2007. Effective January 1, 2008, the T-Service credit will be based on the weighted average cost of transportation, equal to the unit rate based on total utility transportation costs over total delivery volumes. The Company will treat T-Service credits for Ontario T-Service customers in this manner, as an "off-set", from January 1, 2008 until such time as the Company has a new billing system that permits a different approach. This approach satisfies the Board's directive regarding the Company's obligation to phase-out the T-service credit for Ontario T-Service customers as outlined in the RP-2003-0203 Settlement Proposal.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OESLP, Pollution Probe, Superior, TransCanada, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

H1-1-1	Rate Design
I-1-57	Board Staff Interrogatory 57
I-12-4	OAPPA Interrogatory 4

7 CUSTOMER CARE SUPPORT, CUSTOMER CARE SYSTEM, AND OPEN BILL ACCESS

7.1 Has Enbridge complied with the direction, in the EB-2005-0001 Decision, to file in evidence the following Customer Care Support Cost information: all agreements between Enbridge and CWLP, ECSI or any other EI-related entity related to the provision of customer care or CIS; the Program Agreement between CWLP and Accenture, including any amendments or revisions; financial statements for ECSI and CWLP (historical, bridge and test year); the return analyses described in the decision?

(No Settlement)

Issues related to customer care and CIS are the subject of continuing discussions as part of a consultative process involving the Company and stakeholders. Negotiations are continuing as part of the consultative process and parties expect to be able to report their progress and positions to the Board at the same time as the Settlement Proposal is presented for approval.

Evidence: The evidence in relation to this issue includes the following:

D1-12-1	Customer Care - Overview
D1-12-2	Customer Care and Transition Costs
D1-12-3	Customer Care – Benchmarking
I-1-58	Board Staff Interrogatory 58
I-9-17	IGUA Interrogatory 17
I-16-55 to 58	SEC Interrogatories 55 to 58

7.2 What actions or decisions are required by the Board regarding items in the 2006 and 2007 capital budgets which might be duplicated in the upcoming application for a Regulatory Asset Account?

(No Settlement)

Issues related to customer care and CIS are the subject of continuing discussions as part of a consultative process involving the Company and stakeholders. Negotiations are continuing as part of the consultative process and parties expect to be able to report their progress and positions to the Board at the same time as the Settlement Proposal is presented for approval.

Evidence: The evidence in relation to this issue includes the following:

D1-10-1	GDAR
I-1-59	Board Staff Interrogatory 59

7.3 Are the forecast costs of the new CIS system appropriate?

(No Settlement)

Issues related to customer care and CIS are the subject of continuing discussions as part of a consultative process involving the Company and stakeholders. Negotiations are continuing as part of the consultative process and parties expect to be able to report their progress and positions to the Board at the same time as the Settlement Proposal is presented for approval.

Evidence: The evidence in relation to this issue includes the following:

B1-5-1	CIS Project
I-1-60 to 63	Board Staff Interrogatories 60 to 63
I-9-10	IGUA Interrogatory 10
I-26-11	HVAC Interrogatory 11

7.4 What are the appropriate costs for CIS and Customer Care for 2007, including internal and transition costs?

(No Settlement)

Issues related to customer care and CIS are the subject of continuing discussions as part of a consultative process involving the Company and stakeholders. Negotiations are continuing as part of the consultative process and parties expect to be able to report their progress and positions to the Board at the same time as the Settlement Proposal is presented for approval.

Evidence: The evidence in relation to this issue includes the following:

B1-5-1	CIS Project
D1-12-1	Customer Care – Overview
D1-12-2	Customer Care and Transition Costs
D1-12-3	Customer Care – Benchmarking
D3-2-1	Operating Cost Comparison of Utility Cost and Expenses Budget 2007 and Estimate 2006
I-1-64 to 73	Board Staff Interrogatories 64 to 73
I-16-59	SEC Interrogatory 59

7.5 Is the Applicant's proposal of open bill access appropriate and consistent with the Board's direction in RP-2005-0001?

(No Settlement)

There is no agreement to settle this issue, although the consultative is ongoing.

Evidence: The evidence in relation to this issue includes the following:

D1-11-1	Open Bill Access
D1-11-2	Statement of Principles, Objectives and Operating Arrangements for the Consultation Process for Enbridge Gas Distribution's Open Bill Access Proposal
D1-11-3	Open Bill Access Consultative Process

8 OTHER ISSUES

8.1 What are the actions or decisions necessary for the Board to be assured that the Board's decisions, including settlements, in the NGEIR (EB-2005-0551) proceeding will be appropriately captured and reflected in this proceeding?

(Complete Settlement)

There is an agreement to settle this issue as follows:

All parties agree that the implications of the Board's decisions in the NGEIR (EB-2005-0551) proceeding have been captured in the Company's filing in this proceeding. This agreement is subject to the stipulation that certain parties have initiated Motions for Review of the Board's decisions in the NGEIR proceeding which, if successful, could require the Company to make consequential adjustments to its rates, including (without limitation) Rate 316.

The Company's obligations under the NGEIR Settlement Proposal pertaining to whether and when an automated solution should be developed and put in place remain in full force and effect.

Every three months the Company will provide to stakeholders a report on the number of customers that have committed to migrate and have migrated to the new unbundled Rates 300 and 315. If, at any time during the Test Year, 20 customers have committed to take EGD's unbundled rates, the Company will undertake a survey, using the least cost approach, to evaluate demand for unbundled Rates 300 and 315, and assess and report on the timing for development of an automated solution and accommodating additional customers through the manual solution within 90 days after the Company's 20th customer has committed to migrate to the new unbundled rates. If, at that time, the Company decides to proceed with a manual solution, it will continue to provide customers with a quarterly report on the status of migration including feedback from customers on the potential for future migration. The parties agree that the Company's costs associated with preparing and administering the survey will be recorded in the 2007 Unbundled Rate Implementation Cost Deferral Account. The parties further agree they will support recovery by the Company of the reasonably incurred survey costs in the 2007 Unbundled Rate Implementation Cost Deferral

Account on the understanding that the Company will seek to have all reasonably incurred costs recovered from large volume customers.

In order to allow customers to take advantage of the new Rate 300 and Rate 315, customers will have the opportunity to migrate to Rate 300 and 315 at all times during the Test Year until the point in time when 20 customers have migrated to the rate 300 series rates. Subject to the conditions of the Company's Early Termination Policy, the Company will permit migrating customers to terminate their bundled rate contracts early, on the understanding that customers will true up any imbalances in their existing contracts as per the provisions of the Company's Early Termination Policy.

If the survey results indicate that significantly more than 20 customers are prepared to commit to migrate, then the Company will undertake to develop an automated solution. If a smaller number of customers are prepared to commit to migrate, then the Company will conduct an analysis comparing the incremental cost of supporting incremental customers' activities and transactions using the manual solution versus the costs of an automated solution. The goal of the analysis will be to determine if it is feasible to expand the manual solution (and at what cost) versus the cost of an automated solution. Should an automated solution be required, the parties agree that the Company record associated costs in the Unbundled Rate Implementation Cost Deferral Account as per the NGEIR Settlement Proposal EB-2005-0551, Ex. S-1-1, p. 33.

If a manual solution permits more than 20 customers to migrate during the Test Year, any such additional spots will be implemented in a manner that is consistent with section 4(g) of the Settlement Agreement in EB-2005-0551 whereby 50% of the additional spots will be allocated to interested customers who will benefit the most from the service from a distribution rate perspective, and 50% of the additional spots will be allocated to interested customers entitled to subscribe for the service on the basis of a lottery system.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OESLP, Pollution Probe, Superior, TransCanada, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue except VECC which takes no position and did not participate in discussion on the issues discussed after the second paragraph above.

Evidence: The evidence in relation to this issue includes the following:

I-19-1 to 3	TransAlta Interrogatories 1 to 3
I-1-78 to 79	Board Staff Interrogatories 78 to 79
I-12-5 to 6	OAPPA Interrogatories 5 to 6

I-20-1	TransCanada Interrogatory 1

8.2 What are the actions or decisions necessary for the Board to be assured that the Board's decisions, including settlements, in the DSM (EB-2006-0021) proceeding will be appropriately captured and reflected in this proceeding?

(Complete Settlement)

There is an agreement to settle this issue as follows:

All parties agree that the implications of the Board's decisions in the DSM (EB-2006-0021) proceeding have been captured in the Company's filing in this proceeding.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

I-1-80 to 81	Board Staff Interrogatories 80 to 81
I-9-21 to 22	IGUA Interrogatories 21 to 22
I-24-76	VECC Interrogatory 76

9 RATE IMPLEMENTATION

9.1 How should the Board deal with any revenue deficiency applicable from January 1, 2007 to the date that the Board's decision is implemented?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue, as part of the package, as follows:

Parties agree that the Company can adjust rates to recover an additional $26.0 million, effective as of January 1, 2007, and that this will be implemented at the same time as the Company's April 1, 2007 QRAM is implemented. Parties agree with and support the Company's proposal to recover the full $26.0 million through (i) increased annualized rates for the remainder of the Test Year; and (ii) the use of a rate rider over the nine remaining months of the Test Year to recover the remaining balance of the $26.0 million. Intervenors agree that no issue or objection will be raised around whether any part of this $26.0 million is unrecoverable because it relates to the time period between January 1, 2007 and April 1, 2007.

There is no agreement as to whether or how the Company can recover any revenue deficiency in excess of $26.0 million.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OAPPA, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties except Schools accept and agree with the proposed settlement of aspects of this issue.

Evidence: The evidence in relation to this issue includes the following:

A1-2-1	Application
I-1-82	Board Staff Interrogatory 82
I-16-62 to 53	SEC Interrogatories 62 to 63

9.2 Should the Board set interim rates, effective January 1, 2007, to allow Enbridge to begin to recover its prospective revenue deficiency?

(Complete Settlement)

There is an agreement to settle this issue as follows:

This issue is no longer relevant, since the January 1, 2007 date has passed.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Direct Energy, GEC, HVAC, OESLP, Pollution Probe, Superior, TransCanada, TransAlta, Union Gas, Union Energy.

Approval: All participating parties accept and agree with the proposed settlement of this issue.

Evidence: The evidence in relation to this issue includes the following:

A1-2-1	Application
I-1-83 to 84	Board Staff Interrogatories 83 to 84
I-16-64 to 65	SEC Interrogatories 64 to 65

SUPPLEMENTARY SETTLEMENT PROPOSAL : ISSUE 7.5

The issues related to Issue 7.5 ("Is the Applicant's proposal of open bill access appropriate and consistent with the Board's direction in RP-2005-0001?") have been the subject of the ongoing Open Bill Consultative. Parties have been able to come to an agreement to settle aspects of this issue.

This incomplete settlement, if approved by the Board, will be added to the Settlement Proposal (Ex. N1-1-1) approved by the Board on January 29, 2007 (the "January 29th Settlement Proposal") and the provisions of this incomplete settlement will supersede the reference at page 43 of 47 of the January 29th Settlement Proposal which states that there is no settlement of Issue 7.5.

Parties agree that the provisions of the Introduction and Overview sections of the January 29th Settlement Proposal apply to this Supplementary Settlement Proposal, except for (i) the chart of settled issues, which does not reflect this incomplete settlement of Issue 7.5; and (ii) any references to revenue deficiency and rate impact of the settlement, which would have to be changed to reflect the incremental financial impact of this Supplementary Settlement Proposal.

With that preamble, the following section represents the incomplete settlement that has been agreed upon.

7.5 Is the Applicant's proposal of open bill access appropriate and consistent with the Board's direction in RP-2005-0001?

(Incomplete Settlement)

There is an agreement to settle aspects of this issue, as follows:

The parties agree to settle the third party billing component ("Billing Services") of Issue 7.5 Open Bill Access on the basis that the Company can proceed with the Billing Services on the following terms:

1. ***Compliance with Board Directive.*** All parties accept the Company's decision to respond to the Board's directive in EB-2005-0001 in two stages: an interim solution, using the Company's existing CIS, and a comprehensive solution, using the Company's planned new CIS. This settlement constitutes the interim solution until otherwise ordered by the Board in the Board review referred to in #2 below. Subject to the

presentation to the Board of the comprehensive solution, discussed in #2 below, all parties agree that this settlement constitutes an appropriate response to the Board's directive.

2. ***Comprehensive Solution.*** The Company agrees that it will file an application to the Board prior to the end of 2008 proposing the comprehensive Billing Services offering. Such application should include: a) a detailed report on the experience with the interim solution, b) any available consultants' reports with respect to costing and/or market pricing, c) the results of any customer communications activities and any customer or industry surveys, d) minutes and/or reports of the activities of the stakeholder committee referred to in #8 below, and e) the Company's proposal on whether the Billing Services should continue, and if so on what terms. Without limiting the generality of the foregoing, the Company's proposal may include changes to pricing, costing, shareholder incentive, and any other aspects of the Billing Services. In the event that in the Company's application the Company or any party proposes that the Billing Services should not continue, that party must also propose a reasonable transition period to reflect the time required for anyone using the Billing Services to shift to alternate billing arrangements. Nothing in this settlement implies that any party admits to either the relevance or the appropriate weight to be given to any particular evidence in this subsequent application, and all parties will be free to argue as they see fit with respect to any proposed evidence.

3. ***Pricing.*** During the interim period, but at least until December 31, 2008 parties accept the prices proposed by the Company, $0.829 for shared bills and $1.389 for standalone bills. All participants using the Billing Services will pay the same prices for the same services. The parties agree that prices for the Billing Services and any changes from time to time to the rules relating to the OBSDA referred to in #4 below must be approved by the Board.

4. ***Startup Costs.*** The shareholder will bear the startup and bill re-design costs associated with the Billing Services but will be allowed to recover 4 cents/bill from the Open Bill Service Deferral Account (OBSDA) over a two year period until the costs are recovered. The shareholder will not bear the costs associated with adding the Billing Services to the new CIS. The latter costs will be included in the costs of the Billing Services and recovered in revenues from the service.

5. ***Ratepayer Benefit.*** Subject to the shareholder incentive, set forth below, all net benefits, whether through mitigation of common costs, or net profits from the OBA services, will accrue to the benefit of the ratepayers. The Company agrees to include in its 2007 revenue requirement a net benefit of the service of $5.389 million. This number is derived from calculations /u found in JT.5, as updated to reflect this settlement. To be sure, all parties also agree If the net benefit of the service is greater or less than the amount included in rates, the difference will be credited or debited, as the case may be, to a new variance account, the Open Bill Access Variance Account (OBAVA) and refunded or charged to ratepayers in the following year. The net benefit shall be calculated as the total revenues from Billing Services, less

   a. the incremental costs to deliver those services;
   b. the amount referred to in #4 above; and,
   c. the shareholder incentive referred to in #6 below.

6. ***Shareholder Incentive.*** The Company will receive no incentive for Billing Services provided to any affiliate of the Company. For the Billing Services by any other person, the Company will be paid a commission as follows subject to an annual maximum calculated as 50% of the program's net margin:
   a. With respect to any bill on which Direct Energy (which for all purposes of these terms should be interpreted as including any successor to Direct Energy's water heater business) is the sole third party billing entity, $0.02 per bill;

   b. With respect to any bill on which there is any third party billing entity charge other than Direct Energy on the bill:

      i. $0.10 per bill in any month that the Billing Services service has only one active billing entity other than affiliates or Direct Energy;
      ii. $0.15 per bill in any month that the Billing Services service has two active billing entities other than affiliates or Direct Energy;
      iii. $0.20 per bill in any month that the Billing Services service has three active billing entities other than affiliates or Direct Energy;
      iv. $0.25 per bill in any month that the Billing Services service has more than three active billing entities other than affiliates or Direct Energy;

An entity will only be considered an "active billing entity" in any month in which it is billing products or services on at least 500 EGD bills.

7. ***Costing and Pricing Studies:*** The Company agrees that it will retain an independent consultant or consultants to undertake costing and pricing analyses for the Billing Services. The consultant's work will include assistance in determining a market price, and a review and analysis of the incremental and fully-allocated costs of these services. The Company will solicit the stakeholder group's input on the independent consultant(s), and statement of work for those consultant(s), but the Company will retain the right to make the final selection and define the terms of the reference. The cost of these studies will be included in the OBSDA.

8. ***Stakeholder Input.*** The Company will establish a stakeholder committee that includes users of the Billing Services, as well as ratepayer and industry representatives, to review the rules associated with participation in Billing Services. All parties to the agreement will be invited to become members of the stakeholder committee. The committee will meet from time to time as required to consider changes to the rules. Any changes to the rules that materially change the nature of the service will be reviewed by the stakeholder committee and reported to the Board to determine if their approval is required. The stakeholder committee will also be solicited for input into the Company's proposed communications plan, and other issues as they arise.

9. ***Affiliate Participation.*** Affiliates of the Company (including for the purpose of this settlement related parties such as limited partnerships or trusts that are not technically affiliates) may use the Billing Services on the same terms as any other third party biller. However, all parties agree with the principle that the Billing Services should be implemented in a manner that avoids ratepayer and/or consumer confusion, and, to the extent possible, prevents any participant from gaining any unfair market advantage by reason of their association with the utility, if any. The Company agrees that during the interim period it will implement such measures as may be necessary to achieve this principle, including but not limited to including in the Billing Services and enforcing in a commercially reasonable manner the following service rules::

   (a) No person, whether affiliate or otherwise, may use or associate itself with any name or logo on the bill that is the same as, similar to, or confusing with any name or logo that is associated with the Company (e.g. the "Enbridge" name and swirl logo).

(b) No person may use the Billing Services in an abusive or unfair manner in that it deliberately creates the impression that it has a preferred position relative to other market participants because of its relationship with the utility.

Notwithstanding, these restrictions in no way shape or form creates any future precedent to rely upon regarding the use of the Enbridge name or logo.

The parties acknowledge their mutual intention to bring issues with respect to affiliate participation to the stakeholder committee for resolution, but this statement will not limit any rights any party may have, whether under the Affiliate Relationships Code or otherwise, to have disputes resolved in any forum.

10. ***EnergyLink™ Relevance.*** If the Board in this proceeding approves the EnergyLink™ program proposed by the Company, the parties agree that whether a company is an EnergyLink™ participant or not will not affect whether that company can use the Billing Services, nor the rules or conditions under which they use the service.

11. ***Information.*** The Company will develop with input from the stakeholder committee an appropriate customer communication plan specific to Billing Services The Company shall provide to the Board and make available to all parties to this settlement agreement a report that includes revenues from Billing Services, and the costs of the services on a fully-allocated basis,an incremental basis and in a manner when known that is consistent with the methodology recommended in the study noted in paragraph 7, to the extent that this is different .

12. ***Logos and Bill Messaging.*** Logos and bill messaging will be provided to all participants in the Billing Services at no charge to facilitate entry of new users and help consumers differentiate the various parties with amounts billed on the EGD bill. Any provision of logos and bill messaging for the Billing Services will apply in the same manner to commodity vendors using the ABC Services for a reasonable charge, but commodity messaging will not be allowed unless EGD or one of its affiliates starts to market system gas.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Energy Probe, IGUA, OAPPA, Superior, TransAlta, TransCanada and Union Gas,

Approval: All participating parties accept and agree with the proposed settlement of this issue except that GEC and Pollution Probe reserve the right to pursue in the Hearing whether the Board should order that third parties not be allowed to use the Billing Services for the billing of specific products on the basis of their environmental attributes.

JT1-JT22	Undertakings from January 10, 2007 Technical Conference

SUPPLEMENTARY SETTLEMENT PROPOSAL : ISSUE 7.5

The issues related to Issue 7.5 ("Is the Applicant's proposal of open bill access appropriate and consistent with the Board's direction in RP-2005-0001?") have been the subject of the ongoing Open Bill Consultative. Parties have been able to come to an agreement to settle aspects of this issue.

This incomplete settlement, if approved by the Board, will be added to the Settlement Proposal (Ex. N1-1-1) approved by the Board on January 29, 2007 (the "January 29th Settlement Proposal") and the provisions of this incomplete settlement will supersede the reference at page 43 of 47 of the January 29th Settlement Proposal which states that there is no settlement of Issue 7.5.

Parties agree that the provisions of the Introduction and Overview sections of the January 29th Settlement Proposal apply to this Supplementary Settlement Proposal, except for (i) the chart of settled issues, which does not reflect this incomplete settlement of Issue 7.5; and (ii) any references to revenue deficiency and rate impact of the settlement, which would have to be changed to reflect the incremental financial impact of this Supplementary Settlement Proposal.

With that preamble, the following section represents the incomplete settlement that has been agreed upon.

7.5 Is the Applicant's proposal of open bill access appropriate and consistent with the Board's direction in RP-2005-0001?

(Incomplete Settlement)

There is an agreement of some parties to settle aspects of this issue, as follows:

Proposed Billing Insert Settlement

The parties agree to settle the billing insert ("Insert Service") component of Issue 7.5 Open Bill Access on the basis that the Company can proceed with the Insert Service on the following terms:

1. ***Compliance with Board Directive.*** All parties accept the Company's decision to respond to the Board's directive in EB-2005-0001 in two stages: an interim solution, using the Company's existing CIS, and a comprehensive solution, using the Company's planned new CIS. This settlement constitutes

the interim solution until otherwise ordered by the Board in the Board review referred to in #2 below. Subject to the presentation to the Board of the comprehensive solution, discussed in #2 below, all parties agree that this settlement constitutes an appropriate response to the Board's directive as it pertains to bill inserts.

2. ***Comprehensive Solution.*** The Company agrees that it will file an application to the Board prior to the end of 2008 proposing the comprehensive Billing Insert Service offering. Such application should include: a) a detailed report on the experience with the interim solution, b) any available consultants' reports with respect to costing and/or market pricing, c) the results of any customer communications activities and any customer or industry surveys, d) minutes and/or reports of the activities of the stakeholder committee referred to in #8 below, and e) the Company's proposal on whether the Insert Service should continue, and if so on what terms. Without limiting the generality of the foregoing, the Company's proposal may include changes to pricing, costing, shareholder incentive, and any other aspects of the Insert Service. Nothing in this settlement implies that any party admits to either the relevance or the appropriate weight to be given to any particular evidence in this subsequent application, and all parties will be free to argue as they see fit with respect to any proposed evidence.

3. ***Pricing.*** For the interim period of 2007 and 2008, the Company agrees to reduce the minimum bids for bill inserts by one cent resulting in an average insert charge of 4 cents. For greater clarity, there shall be no right of first refusal for parties using the Company's Insert Service. The parties agree that prices for the Insert Service, and any changes thereto from time to time, must be approved by the Board.

4. ***Costing and Pricing. T***he Company agrees that it will retain an independent consultant to undertake a costing and pricing analysis for the Bill Insert Service for the comprehensive period. The consultant's work will include assistance in determining a market price, and a review and analysis of the incremental and fully-allocated costs of these services for the new CIS. The Company will solicit the stakeholder group's input on the independent consultant, and statement of work for that consultant, but the Company will retain the right to make the final selection and define the terms of the reference. The cost of this study will be included in the Open Bill Service Deferral Account (OBSDA).

5. ***Startup Costs.*** The shareholder will record the startup costs associated with the Insert Service in 2007 in the OBSDA. The startup costs associated with

adding the Insert Service to the new CIS will be included in the costs of the Insert Service and recovered in revenues from the service.

6. ***Ratepayer Benefit.*** The Company agrees to record the costs and revenues from the Insert Service in 2007 in the OBSDA and that the net proceeds will be shared 50/50. The parties agree that the shareholder incentive mechanism for Insert Service may need to be revised after the interim period and after the cost/price review to be consistent with the Board's rules for natural gas incentive regulation.

7. ***Inserts.*** Bill inserts would be allowed as proposed by EGD but revised to limit the number of external inserts to five (5) when safety inserts are scheduled. In all months, two inserts would be reserved for parties wishing to purchase bill inserts in a limited geographic area based on price per insert bidding.

8. ***Stakeholder Input.*** The Company will establish a stakeholder committee that includes users of the Insert Service, as well as ratepayer and industry representatives, to review the rules associated with participation in the Insert Services. All parties to the agreement will be invited to become members of the stakeholder committee. The committee will meet from time to time as required to consider changes to the rules. Any changes to the rules that materially change the nature of the service will be reviewed by the stakeholder committee and reported to the Board to determine if their approval is required. The stakeholder committee will also be solicited for input into the Company's proposed communications plans, and other issues as they arise. To ensure that consumer interests are being addressed, EGD will conduct focus groups and customer surveys on inserts as soon as possible in 2007 and report the findings to the stakeholder committee to determine if remedial action is required. EGD will also prescreen insert users and review the content of their bill inserts to ensure proper use of its billing envelope.

9. ***Problem Resolution.*** If the revised bidding and allocation processes restrict access in three consecutive months or the number of customer complaints on inserts increases significantly in the first two months of operation, the stakeholder committee would be convened to address the concern(s), and if the problem cannot be resolved within two (2) additional months that aspect of the Insert Service would be discontinued until the problem is addressed.

10. ***Affiliate Participation.*** Affiliates of the Company (including for the purpose of this settlement related parties such as limited partnerships or trusts that are

not technically affiliates) may use the Insert Service on the same terms as any other third party biller. However, all parties agree with the principle that the Insert Service should be implemented in a manner that avoids ratepayer and/or consumer confusion, and, to the extent possible, prevents any participant from gaining any unfair market advantage by reason of their association with the utility, if any. The Company agrees that during the interim period it will implement such measures as may be necessary to achieve this principle, including but not limited to including in the Insert Services and enforcing in a commercially reasonable manner the following service rules::

(a) No person, whether affiliate or otherwise, may use or associate itself with any name or logo in the billing envelope that is the same as, similar to, or confusing with any name or logo that is associated with the Company (e.g. the “Enbridge” name and swirl logo).

(b) No person may use the Insert Service in an abusive or unfair manner in that it deliberately creates the impression that it has a preferred position relative to other market participants because of its relationship with the utility.

Notwithstanding, these restrictions in no way shape or form creates any future precedent to rely upon regarding the use of the Enbridge name or logo.

The parties acknowledge their mutual intention to bring issues with respect to affiliate participation to the stakeholder committee for resolution, but this statement will not limit any rights any party may have, whether under the Affiliate Relationships Code or otherwise, to have disputes resolved in any forum.

11. ***EnergyLink^{TM} Relevance.*** If the Board in this proceeding approves the EnergyLink***TM*** program proposed by the Company, the parties agree that whether a company is an EnergyLink***TM*** participant or not will not affect whether that company can use the Insert Service, nor the rules or conditions under which they use the service, subject to the restriction on use of the Enbridge name and logo as described in Item 10 above.

12. This agreement should not be construed as a settlement of any aspect of issue 3.4, including but not limited to, arguments to restrict the Company’s ability to promote EnergyLink ***TM*** by bill insert or otherwise. Notwithstanding, the Company agrees to provide a schedule of EnergyLink ***TM*** inserts on an annual basis, as part of the Binding Request for Bids process.

13. ***Commodity Marketing.*** Commodity bill inserts and marketing will not be allowed in the billing envelope unless EGD or one of its affiliates receives OEB approval to promote and/or market system gas commodity, in which case retailers, marketers and vendors will be allowed to promote and/or market their commodity offers through the Insert Service.

Participating Parties: All parties participated in the negotiation and settlement of this issue except Energy Probe, IGUA, OAPPA, TransAlta, TransCanada and Union Gas,

Approval: Enbridge Gas Distribution, Direct Energy, OESLP and Union Energy accept and agree with this proposed settlement. HVAC, VECC and Schools do not agree with the proposed settlement. CCC opposes the proposed settlement in order that it may be permitted to pursue cross-examination on the issue. GEC and Pollution Probe reserve the right to pursue in the Hearing whether the Board should order that third parties not be allowed to use the Billing Services for the billing of specific products on the basis of their environmental attributes. Superior opposes the proposed settlement on the principle that it is not supportive of a settlement position that would allow for the Company to promote system gas through billing inserts as contemplated in Paragraph 13.

SUPPLEMENTARY SETTLEMENT PROPOSAL : ISSUE 6.3

The Settlement Proposal filed as Exhibit N1, Tab 1, Schedule 1, which was approved by the Board on January 29, 2007 (the "January 29th, 2007 Settlement Proposal"), notes at page 39 of 47 that Issue 6.3 was an Incomplete Settlement. Specifically, there was no agreement on the Company's proposed Invoice Vendor Adjustment (IVA) charge. Discussions have continued in respect of the IVA charge and Parties have been able to come to an agreement to settle outstanding issues relating to the IVA charge.

If this Supplementary Settlement Proposal for the IVA charge is approved by the Board, it will be added to the January 29th, 2007 Settlement Proposal, and the provisions of this Supplementary Settlement Proposal will supersede the reference at page 39 of 47 of the January 29th, 2007 Settlement Proposal which states that there is No Settlement in respect of the IVA charge.

Parties agree that the provisions of the Introduction and Overview sections of the January 29th, 2007 Settlement Proposal apply to this Supplementary Settlement Proposal, except for the chart of settled issues, which does not reflect the complete settlement of Issue 6.3.

With this preamble, the following section represents the complete settlement that has been agreed upon.

6.3 Should the Board approve the contents of the Applicant's Rate Handbook?

(Complete Settlement)

There is an agreement to settle aspects of this issue, as follows:

The parties agree that:

1. The IVA charge by the Company will equal 0.65% of the absolute dollar value of the adjustment. Parties agree that this IVA charge is an interim measure that will apply from June 1, 2007 to December 31, 2007, and is without prejudice to any Party proposing an alternative IVA charge commencing January 1, 2008.

2. The Company will consult with interested parties and will consider the merits of bringing forward a different fee structure for a cost-based IVA charge. The Company will seek approval from the OEB for the new IVA charge, to be effective January 1, 2008.

3. Parties agree that the IVA charge is designed to only recover the costs incurred by the Company to provide this service. As a result, Parties agree that there is no need to adjust the revenue deficiency as a result of forecast IVA charge revenues and costs. The Company will provide parties with a summary of 2007 IVA charge revenues and costs subsequent to December 31, 2007.

Participating Parties**:** All parties participated in the negotiation and settlement of this issue except Energy Probe, GEC, HVAC, LIEN, OAPPA, Pollution Probe, SEC, Superior, TransCanada, TransAlta, Union Energy and Union Gas.

Approval: All participating parties accept and agree with the proposed settlement of aspects of this issue. Without limiting the generality of the Introduction to the Settlement Proposal, VECC's acceptance of this proposed settlement is without prejudice to it proposing that IVA charges be reviewed as part of the Board's generic review of the QRAM/System Gas. CCC, HVAC, IGUA, Energy Probe, SEC, and Union Energy take no position.

Evidence: The evidence in relation to this issue includes the following:

D1-10-2, plus attachment	Gas Distribution Access Rule
Tr. 5, pp. 68, 73-74	

SETTLEMENT PROPOSAL FOR CUSTOMER CARE AND CUSTOMER INFORMATION SYSTEM ("CIS") ISSUES

I. PREAMBLE

The following issues related to Enbridge Gas Distribution's Customer Care O&M and Customer Information System ("CIS") capital budgets, and related matters, have been among the subjects addressed as part of the ongoing Customer Care/CIS Consultative:

7.1 Has Enbridge complied with the direction, in the EB-2005-0001 Decision, to file in evidence the following Customer Care Support Cost information: all agreements between Enbridge and CWLP, ECSI or any other EI-related entity related to the provision of customer care or CIS; the Program Agreement between CWLP and Accenture, including any amendments or revisions; financial statements for ECSI and CWLP (historical, bridge and test year); the return analyses described in the decision? (D1-12-3)

7.2 What actions or decisions are required by the Board regarding items in the 2006 and 2007 capital budgets which might be duplicated in the upcoming application for a Regulatory Asset Account? (D1-10-1, p. 2/AppA)

7.3 Are the forecast costs of the new CIS system appropriate? (B1-5-1, p. 3)

7.4 What are the appropriate costs for CIS and Customer Care for 2007, including internal and transition costs? (D1-12-1, p. 2 and D3-2-1, p. 1)

As set out below, parties have been able to come to an agreement to settle these issues, as well as other matters related to Customer Care and CIS.

All aspects of this Supplementary Settlement Proposal are subject to approval by the Board. The parties to the settlement all agree that this Supplementary Settlement Proposal is a package: the individual aspects of this agreement are inextricably linked to one another and none of the parts of this settlement are severable. As such, there is no agreement among the parties to settle any aspect of the issues addressed in this Supplementary Settlement Proposal in isolation from the balance of the issues addressed herein. The parties agree, therefore, that in the event that the Board does not accept this Supplementary Settlement Proposal in its entirety, then (in accordance with the Board's Settlement Conference Guidelines) the Board will reject the

Supplementary Settlement Proposal in its entirety and proceed to hearing on all of the issues listed above.

This Supplementary Settlement Proposal, if approved by the Board, will be added to the Settlement Proposal (Ex. N1-1-1) approved by the Board on January 29, 2007 (the "January 29th Settlement Proposal") and the provisions of this Supplementary Settlement Proposal will supersede the references at pages 41 and 42 of the January 29th Settlement Proposal which state that there is no settlement of Issues 7.1 to 7.4.

If approved by the Board, this Supplementary Settlement Proposal will reduce the Company's revenue deficiency for the Test Year by approximately $24.2 million, from the $52.1 million remaining as the revenue deficiency in the Company's Application, after the Settlement Proposal (Ex. N1-1-1) revenue deficiency of $29.9 million was approved by the Board on January 29, 2007 (with $26.0 million thereof recoverable in interim rates effective April 1, 2007). The remaining revenue deficiency at issue in the Company's Application is now about $26.1 million[1], taking into account the fact that parties are agreeing in this Supplementary Settlement Proposal that the Company can recover a revenue deficiency of approximately $1.8 million in respect of customer care and CIS costs in the Test Year.[2] This $1.8 million Customer Care revenue deficiency, which is described below in more detail, is the result of extra costs from customer growth, offset by a reduction in bad debt costs.

Finally, although it is not set out expressly in the sections that follow, the parties agree that, as part of this settlement package, Issue 7.2 is resolved because the Regulatory Asset Account application is no longer necessary. The parties also agree that, in response to Issue 7.1, the Company has filed those materials stipulated in the Board's EB-2005-0001 Decision that are currently available. There are, however, some agreements associated with the Company's move away from CustomerWorks Limited Partnership ("CWLP"), including transition agreements with Accenture Business Services for Utilities ("ABSU")[3], that are not completed. Accordingly, at this time Issue 7.1 is partially resolved and the parties expect that it will be completely resolved when those agreements are finalized and filed.

---

[1] Note that this does not include any impact of Supplementary Settlement Proposals related to bill access and IVA charges.

[2] The $1.8 million deficiency to be recovered for Customer Care is derived by starting with the customer care deficiency of $26 million, set out at lines 2 and 3 of the Table at Ex. N1-2-2, p. 2, and then subtracting $24.2 million, which is the agreed-upon revenue deficiency reduction that would result from approval of this Supplementary Settlement Proposal.

[3] For the purposes of this Supplementary Settlement Proposal, both Accenture Business Services for Utilities and Accenture Inc. will be referred to as "ABSU".

With that preamble, the following represents the settlement that has been agreed upon.

II INTRODUCTION

Beginning in 2000, Enbridge Gas Distribution Inc. ("Enbridge Gas Distribution" or the "Company") entered into a series of arrangements whereby CIS and Customer Care services were acquired through a related company, Enbridge Commercial Services Inc. ("ECSI"). ECSI subsequently entered into a limited partnership arrangement with Terasen Inc., CWLP, for the purpose of providing customer related business support and information technology services to utilities. Enbridge Gas Distribution entered into a new Customer Care services agreement with CWLP and consented to ECSI's assignment of its CIS service agreement to CWLP, both effective from January 1, 2002. In August 2002, CWLP entered into an agreement in writing with ABSU, hereinafter referred to as the "Program Agreement", whereby CWLP transferred certain assets and all operating personnel to ABSU, and ABSU agreed to provide Customer Care services, including CIS hosting services, on behalf of CWLP to Enbridge Gas Distribution and other utilities for the period that could be as long as 2002 to 2011 (inclusive) for amounts detailed in a Schedule to the Program Agreement. Since 2002, pursuant to the Program Agreement, ABSU has been performing the Customer Care and CIS services for the Company on behalf of CWLP.

A portion of the fees which the Company has paid to CWLP/ECSI to acquire CIS and Customer Care services was paid by CWLP/ECSI, ultimately, to Enbridge Gas Distribution's parent or other affiliates.

In a series of rate cases, the Intervenors expressed their objection to these arrangements, arguing that ratepayers should only be required to pay for CIS and Customer Care services at a market price or, failing a competitive process, at the cost of any affiliate, or related company, providing the services, including an appropriate return on such an endeavour. In the 2006 rate case decision, the Board agreed that what ABSU was paid to provide the services to Enbridge Gas Distribution for Customer Care and CIS services was relevant to the determination of the market prices for the services. The Board ultimately used CWLP revenue from Enbridge Gas Distribution, expressed as a proportion of CWLP's total revenues, as a tool to derive CWLP overearnings attributable to Enbridge Gas Distribution, and then, using the utility allowed return, the Board determined the amount recoverable from Enbridge Gas Distribution's ratepayers. The Board, in decisions in rate cases beginning in 2003 and culminating in Enbridge Gas Distribution's 2006 rates case, urged the Company to obtain CIS and Customer Care services by direct competitive tender which, in the Board's view, should exclude the right of first refusal in favour of CWLP.

Following the Decision with Reasons of the Board in EB-2005-0001, Enbridge Gas Distribution undertook to do the following:

1. Acquire a new Customer Information System (CIS) through a direct competitive tender;

2. Acquire Customer Care services through a direct competitive tender.

Enbridge Gas Distribution also convened a consultative process (the "Consultative") through which Intervenors could monitor and comment on these procurement processes. In light of the concern which Intervenors had, in past rate cases, expressed about Enbridge Gas Distribution's arrangements for acquiring CIS and Customer Care Services, the Intervenors wanted to be assured that the procurement processes were consistent, in all respects, with accepted industry standards, and that the arrangements resulting from the procurement processes will not result in amounts being paid by Enbridge Gas Distribution to CWLP, Enbridge Gas Distribution's affiliates, or its parent. Enbridge Gas Distribution convened the Consultative in part to give the Intervenors those assurances. To further ensure that the Consultative could achieve its goals, Intervenors were given access to independent expertise to advise them on the procurement processes and the results therefrom.

Through the Consultative, the Company informed Intervenors that CWLP has not indicated any intention to exercise its right of first refusal in respect of the new Customer Care or CIS services. CWLP/ABSU have now committed to include a clause in the transition agreements associated with the move to new service providers that will waive CWLP's right of first refusal when the transition agreements are signed.

The Company represents that, apart from the payments to be made by the Company to CWLP up to April 1, 2007, no more than $8.34 million in aggregate will be paid by any person to CWLP, ECSI, EI or any other related entity in relation to any Customer Care or CIS services included within this agreement and provided to Enbridge Gas Distribution by any person during the course of this agreement.

As a result of the work of the Consultative, Enbridge Gas Distribution and the Intervenors have been able to reach agreement on certain aspects of the procurement processes completed to date. The work of the Consultative is described in the pre-filed evidence of Mario Bauer, filed as Exhibit L-2.

The procurement processes will not be completed, with the selection of a new CIS and a new Customer Care service provider, until mid 2007. As a result, the cost of the new CIS and of the new Customer Care service provider cannot be estimated at this time. In addition, the prudence and cost consequences of the CIS and Customer Care arrangements cannot be determined until those arrangements have been finalized, which is expected to be in the first half of 2007. As well, the new CIS will not become operational until June 2009 and it is only at that time that final costs for the new CIS will be known. Finally, the shortlisted bidders for Customer Care services include ABSU and a third party, so there is the potential that a new service provider, other than ABSU, will be selected. The introduction of a Customer Care service provider, other than ABSU, will involve transition arrangements with ABSU and others in both 2007 and 2008, and the costs consequences and upper limits of those costs have been estimated. Final estimates of such costs cannot be made until a later date.

Within these practical constraints, the parties have settled Issues 7.1 through 7.4, which are the Customer Care and CIS issues in this EB-2006-0034 proceeding. The settlement necessarily reflects the fact that certain aspects of the CIS and Customer Care arrangements, including the final costs and contract terms, will not be known until later in 2007.

The parties have agreed that a placeholder amount will be used to establish the revenue requirement for Customer Care costs for 2007. The placeholder chosen is the cost-per-customer set by the Board in the EB-2005-0001 Decision, at $49.58. As a result of this settlement, the total Customer Care budget to be recovered in rates for 2007, including all internal and external costs (except for bad debt), and including all revenue requirement impacts of CIS, will be $90.8 million, plus an amount of $15.1 million representing the provision for uncollectible accounts.

The settlement includes provision for a “true-up” process to adjust the revenue requirement to reflect the prudent and reasonable forecast amounts resulting from the procurement processes, and to reflect the agreed-upon recovery of certain “transition” costs.

The parties believe that a six-year term, covering the period 2007 through 2012 inclusive, is the appropriate term over which to calculate the revenue requirement relating to Customer Care and CIS. The expected costs of CIS and Customer Care during that period may fluctuate year over year. The parties agree that the annual amounts included in rates should be smoothed, over the 2007-2012 term, to avoid swings in rates. The effect of the true-up process is (a) to capture any variance between the 2007 placeholder for Customer Care and CIS revenue requirement of $90.8 million and the normalized revenue requirement for 2007 and pay that variance to, or recover it from, the ratepayers in the 2008-2012 period, and (b) establish the component of the Company’s revenue requirement relating to Customer Care and CIS (except bad debt) for the period 2007-2012, and smooth the rate impacts of that component over that period.

To reflect the settlement the parties have agreed upon a template (the “Template”), which sets out all of the relevant categories of expenses over the 2007 to 2012 period that relate to Customer Care and CIS (except for bad debt costs). The costs in a number of those categories can be established today, and the parties have therefore agreed to those amounts. However, some costs to be set out in the Template must be determined when the contract prices and other costs are known. For those costs, the parties have agreed to the parameters under which those costs will be calculated or forecast and then included in the true-up calculation.

As the parties anticipate the possibility of an incentive regulation ("IR") regime, the terms of which are expected to be established later in 2007, they believe that the true-up should occur at a time when the IR formula for the Company has been established. Once the contract for Customer Care services has been signed, and the terms of IR are known, which is expected to be in the fall of 2007, the parties have agreed that the true-up should take place, in accordance with the true-up rules set out in this Settlement Proposal and Appendix. Parties agree that adjustments may need to be made to aspects of this agreement in the event that the IR regime that, for the purposes of calculation, was assumed by the parties in creating the Template – ie. a price cap IR regime of five years in duration, beginning January 1, 2008 - is not established. Adjustments may need to be made to the normalization approach set out in the True-Up Rules (which are attached) to make it compatible with the IR model and formula that is approved for Enbridge Gas Distribution. Any such adjustments would not affect the total revenue requirement to be recovered over the term of this agreement, but they may impact upon the amount to be recovered in each year of the agreement under the normalization approach that is used.

Finally, the parties agree that the Consultative will continue to monitor the completion of the procurement process, up to and including reviewing the final terms of the contracts, and thereafter, the implementation of the CIS and Customer Care arrangements, which the parties agree will be no later than six months after the in-service date for the new CIS. As has been the case to date, the Intervenors involved in the Consultative agree that they will raise any concerns about the ongoing process, and the outcomes from that process, as soon as they have sufficient information to identify and communicate those concerns. If the Intervenors involved in the Consultative believe that they are not receiving sufficient information, they will advise the Company immediately. The parties agree that the Consultative will continue to work in a timely, responsive and reasonable manner until its mandate is completed. Finally, the parties agree that all costs of the Consultative, for as long as it continues, will be fully recoverable from ratepayers. Costs of the Consultative that are incurred in 2007 will be included in the already established 2007 Ontario Hearings Costs Variance Account (2007 OHCVA). Parties agree to support the continuation of appropriate deferral accounts in future years for the recording and disposition of future costs of the Consultative, unless these costs are included in the Company's regulatory O&M budget during the IR term.

II TERMS OF SETTLEMENT

Against that background, the parties have agreed as follows:

(A) 2007 O&M Customer Care costs

As noted above, certain of the anticipated costs associated with Customer Care during the period 2007 through 2012 will not be known until RFP processes currently being carried out by the Company are completed and market prices are identified. As a result, revenue requirement will be established for 2007 using a placeholder to calculate the Customer Care costs. The placeholder will be the Board-approved 2006 cost per customer of $49.58, times the projected number of customers in 2007, 1,831,283, to get a total Customer Care placeholder of $90.8 million for 2007.

The parties agree that projected bad debt costs (Provision for Uncollectible Accounts) of $15.1 million as filed by the Company shall be recoverable in rates in 2007. This agreement does not deal with bad debt costs beyond 2007; as a result, bad debt costs are not included in the True-Up calculation. For the period from 2008 to 2012, bad debt costs will be dealt with by the Board along with other O&M costs, separately from other Customer Care costs which are the subject of this agreement, in such other proceeding or proceedings as the Board may determine.

For the purposes of settlement, the Customer Care placeholder of $90.8 million plus bad debt costs of $15.1 million will replace the amounts in the Company's Application and pre-filed evidence which total $130.1 million, and are comprised of $101.6 million for Customer Care and CIS Service Charges, $3.4 million for Customer Care Internal Costs, $15.1 million for Provision for Uncollectibles and $10.0 million for transition costs (see Exhibit D1-2-1, p. 3, Table 1, lines 2 to 4 and Ex. D1-1-1, p. 1, Table 1, line 3). These internal and transition costs are addressed in the True-Up Rules which are attached as Appendix A.

As a result, the settlement of this item will reduce the Company's revenue deficiency for the Test Year by approximately $24.2 million, from the $52.1 million remaining as the revenue deficiency in the Company's Application, after the Settlement Proposal (Ex. N1-1-1) revenue deficiency of $29.9 million was approved by the Board on January 29, 2007 (with $26.0 million thereof recoverable in interim rates effective April 1, 2007). The remaining revenue deficiency at issue in the Company's Application is now about $26.1 million, taking into account the fact that parties are agreeing in this Supplementary Settlement Proposal that the Company can recover a revenue deficiency of approximately $1.8 million in respect of customer care and CIS costs in the Test Year (the amount that is the difference between the 2006 Board-approved budget of $104.1 million and the $105.9 million total amount for 2007 for Customer Care, CIS and bad debt costs). This $1.8 million Customer Care revenue deficiency can be derived by accounting for customer growth in F2007 over the previous year (the $49.58 placeholder is multiplied by 46,228, which is the forecast number of new customers in 2007) and adjusting for a reduction of $500,000 in bad debt costs, as compared to F2006.

(B) <u>2007 Capital costs related to CIS</u>

The parties agree that any capital spending by the Company during the 2007 Test Year related to the new CIS shall be in addition to the Company's overall Board-approved capital budget of $300 million plus the costs of the Portlands Energy Centre LTC. This is consistent with the language in Issue 1.1 of the Settlement Proposal in this EB-2006-0034 proceeding, which was approved by the Board on January 29, 2007 and which stated that "[p]arties have reached a global settlement of all 2007 Rate Base issues, except for issues related to the capital budget for the new CIS system" (Ex. N1-1-1, p. 13). No capital expenditures in 2007 relating to the new CIS will be closed to rate base in 2007, and the new CIS will have no impact on 2007 rates.

(C) <u>Selection process for new CIS and Customer Care service providers and Transition Plan</u>

As explained above in the Introduction section, it is anticipated that the selection of a new CIS and a new Customer Care service provider will occur in the second quarter of 2007, when the associated RFP processes are completed.

Once selections are made, contracts will have to be negotiated and settled with the chosen parties. At that time, some of the expected costs of the new CIS, and payments to be made to the new Customer Care service provider, will be established between Enbridge Gas Distribution and the service providers through contractual arrangements. The Consultative will continue to function until the completion of the procurement process, the implementation of those CIS and Customer Care arrangements and the completion of the true-up process described below. The Consultative will be involved with monitoring the selection process and reviewing the terms and prudence of the resulting contracts, including the reasonableness of their costs. Parties agree that the Consultative will continue to work in a timely, responsive and reasonable manner until its mandate is completed.

The selection processes for both the CIS and the Customer Care services RFPs are underway. At this point, the remaining shortlisted bidders for the Customer Care services include ABSU and a third party. The remaining shortlisted bidders for the system integrator component of the new CIS include ABSU and a third party. The parties have agreed that for the time period from January 1, 2007 to March 31, 2007, CWLP will continue to provide CIS and Customer Care services to Enbridge Gas Distribution. For the period commencing April 1, 2007 and concluding no later than September 30, 2008, Enbridge Gas Distribution is making arrangements with ABSU to provide the CIS and Customer Care services directly to Enbridge Gas Distribution, at least until the potential transition to new service providers is complete.

There are two types of transition costs addressed in this Supplementary Settlement Proposal: CIS transition costs and Customer Care transition costs.

The parties acknowledge and agree that all transition costs with respect to the new CIS are included in the $118.7 million capital cost of the new CIS (discussed below), whether or not ABSU is awarded the system integrator component of that project.

The parties further acknowledge and agree that, in the event that ABSU is chosen as the Customer Care service provider, there will be no transition costs associated with Customer Care services. In the event that the third party is chosen as the Customer Care service provider, then there will be transition costs associated with the move to the new service provider. Enbridge Gas Distribution has prepared, and has shared with the Consultative, a Transition Plan that sets out how Customer Care may be transitioned to a new service provider. The parties agree that there will be costs associated with any such transition, and that those costs are recoverable in the manner and amounts described in detail in the True-Up Rules at Appendix A. The Company agrees that it will keep the transition costs, and the transition time period, to a reasonable level while managing the risks associated with transition and ensuring that the ongoing provision of Customer Care services meets OEB-mandated service levels. In this regard, the Company agrees that while the maximum time period for transition to a new Customer Care service provider will be 18 months from April 1, 2007, it will make best efforts to shorten that time period. The Company will ensure that its arrangements with ABSU will allow the Company to direct ABSU to cease the provision of some or all Customer Care transition services before the end of 18 months and, as a result, to reduce the transition costs payable by Enbridge Gas Distribution to ABSU.

(D) <u>The True-Up process and Revenue Requirement for 2008 to 2012</u>

(i) Overview

The parties agree that, on a date (the "True-Up Time") that is the later of (a) the date when the Company's Customer Care RFP is completed and the contract is signed, and

(b) the date when the Board's decision with respect to the duration, rules and formulae for IR that relate to Enbridge Gas Distribution is released, the parties will calculate a true-up and smoothing for the Customer Care amounts for 2007 to 2012, using the specific rules set forth in Appendix A to this Settlement Proposal (the "True-Up Rules").

As set out in more detail below in Appendix A, the amount of the Customer Care costs that are projected to be incurred by the Company during the 2007 to 2012 period, and which the Company will recover in rates, will be determined by the parties at the True-Up Time in accordance with the criteria specified in the True-Up Rules. The components of the Customer Care costs and revenue requirement are itemized in the "Customer Care and CIS Settlement Template" (already defined as the "Template"), which is attached to Appendix A.

It is the intention of the parties that the True-Up process will be used to determine the Customer Care amount for 2007 (the "Normalized 2007 Customer Care Revenue Requirement") that, when adjusted using the True-Up Rules for each year until 2012, will allow the Company to fully recover in rates the costs incurred in providing Customer Care services (including CIS) during the period from 2007 through 2012.

In the event that the parties are unable to agree on the amount of any component of the Normalized 2007 Customer Care Revenue Requirement or any number to be included in the Template, other than those numbers that are fixed by the terms of this agreement, then parties agree that the unresolved dispute will be determined by the Board in accordance with the criteria specified in the True-Up Rules. Specifically, if the parties have not agreed to the Normalized 2007 Customer Care Revenue Requirement within sixty days of the True-Up Time, they shall list the components of the calculation that are in dispute, and provide that list to the Board for determination in accordance with the criteria specified in the True-Up Rules.

The outcome of the True-Up process will be the subject of a separate application to the Board. That application will include, for Board approval, all numbers that are agreed upon and set in accordance with the True-Up Rules, as well as the list of the items remaining at issue to be determined by the Board.

(ii) 2007 Customer Care Variance Account

At True-Up Time, the Company will calculate the difference (the "2007 Customer Care Revenue Requirement Variance") between that amount of revenue requirement that is, pursuant to the True-Up Rules, recoverable for 2007 Customer Care costs (the Normalized 2007 Customer Care Revenue Requirement) and the placeholder of $90.8 million, and will credit or debit the 2007 Customer Care Revenue Requirement

Variance, as the case may be, to the 2007 Customer Care Variance Account. The balance in that account will be repaid to the ratepayers, or charged to the ratepayers, with interest, over the course of 2008 to 2012. The 2007 Customer Care Variance Account will be cleared in accordance with the True-Up Rules.

In order for effect to be given to this provision of this Settlement Proposal, parties agree that it is appropriate that a 2007 Customer Care Variance Account be created, and continued until 2012.

(iii) Revenue requirement for Customer Care costs between 2008 and 2012

The revenue requirement that the Company will be entitled to recover each year in respect of Customer Care costs (including CIS but not including bad debt) from 2008 to 2012 shall be the Normalized 2007 Customer Care Revenue Requirement, as adjusted for each year from 2008 to 2012 (inclusive) by the Incentive Regulation formula. The intention of the parties is that this will result in a relatively stable revenue requirement for CIS and Customer Care services over a five year period.

As set out above, and explained in the True-Up Rules, the "Normalized 2007 Customer Care Revenue Requirement" will be the amount that, when adjusted according to the True-Up Rules (including the rules for IR described as part of the True-Up Rules) for each year until 2012, will allow the Company to fully recover in rates the total of all forecast prudent and reasonable Customer Care costs (including CIS but not including bad debt) for the period from 2007 through 2012.

The parties agree that all O&M costs associated with Customer Care (except for bad debt costs), including O&M relating to the Company's proposed new CIS, are included in the calculation of Normalized 2007 Customer Care Revenue Requirement and therefore will be properly recovered in rates during the period 2007 through 2012 through the operation of the True-Up Rules.

The Company agrees that, once the outstanding items on the Template are determined, and completed, and, as a result, the Normalized 2007 Customer Care Revenue Requirement is established, the Company will not seek any adjustment to its rates or revenue requirement that is directly or indirectly based on changes in Customer Care costs during the term of this agreement. Intervenors similarly agree that they will not seek adjustments to the Company's rates or revenue requirement that is directly or indirectly based on changes in Customer Care costs. As expressed above, bad debt costs are not included as part of the Customer Care costs that are the subject of this agreement from 2008 to 2012.

Notwithstanding the limitations expressed in the preceding paragraph, the parties agree that in the event that new legislative or regulatory requirements, that are currently unknown and that are beyond the Company's control, are imposed on the Company, in the period up to and including 2012, and those requirements materially change the level of Customer Care costs, then any of the parties shall be entitled to make application to the Board for adjustments to rates or revenue requirement as appropriate. The materiality threshold that applies to this aspect of the agreement will be established at the IR proceeding. The parties agree that the rights conferred in this paragraph will be no greater than any rights to revisit any issue based on changes in legislative or regulatory requirements that are established as part of the IR rules that apply to the Company.

In order to give effect to certain aspects of the True-Up Rules, as detailed in Appendix A, parties agree that it is appropriate that 2007 and 2008 Customer Care Transition Costs Variance Accounts be created to track certain transition costs related to Customer Care. The transition costs to be tracked in these accounts relate to activities that ABSU and external contractors and internal resources will undertake to transfer knowledge and services to the new service provider. This will include such tasks as training, documentation and management of the vendors through the transition. The transition costs to be tracked in these accounts are subject to a maximum total amount of $11.1 million. The details of the 2007 and 2008 Customer Care Transition Costs Variance Accounts are set out below, as part of the True-Up Rules.

(iv) New CIS

As the Board is aware, the Company is planning to replace its current CIS service with a new CIS that will be owned by the Company. When this system is implemented, which is expected in 2009, its capital cost will be included as part of the Company's utility rate base. Through the Consultative process, and subject to an adjustment described below, the parties have agreed that a reasonable cost for this asset is $118.7 million, including procurement costs of $5.1 million. The parties agree that rates will be set during the period of this agreement on the basis of a CIS cost that will be no higher than $118.7 million. This $118.7 million budget consists of an amount of $42 million for system integrator contract costs, which are subject to a direct competitive tender process, and an amount of about $76.7 million which the Company will manage and control during the CIS procurement and implementation process.

All parties agree that the Company's revenue requirement associated with Customer Care activities for the 2007 to 2012 period will incorporate a portion of the cost for the new CIS of $118.7 million, including procurement costs of $5.1 million, as set out below. The procurement process that provides support for the reasonableness of this cost is described in the evidence of Mario Bauer (Exhibit L-2), and the CIS cost analysis attached thereto. The parties agree that this $118.7 million cost is subject to reduction in the event that the system integrator contract costs arrived at through the CIS procurement process are less than $42 million. In the event that the system integrator costs are $42 million or more, then the parties agree to the cost of $118.7 million for the completion of the Template and the term of this agreement.

While the revenue requirement attributable to CIS shown in Row 3 of the Template is not yet finalized, the parties agree upon the following:

1. As stated above, the parties agree upon the prudence of the CIS procurement process and the capital cost for the new CIS of $118.7 million, which includes procurement costs of $5.1 million.

2. The parties agree that the amounts to be recovered in rates will be reduced, if the system integrator contract costs arrived at through the CIS procurement process are less than $42 million.

3. Subject to the restrictions on CIS costs set forth in this agreement, there is agreement that all prudently incurred and reasonable costs associated with the new CIS, including return and income taxes, should be recoverable in rates, during the term of this agreement, and for the 10-year economic life of the new CIS assets.

4. The parties agree that the term of this agreement will be six years from 2007 to 2012, in order to enable the smoothing and managing of the recovery of the revenue requirement attributable to the new CIS during those years.

5. The parties agree that they support the decision to procure the new CIS as prudent, the inclusion of the new CIS in rate base in 2009, and the recovery of all amounts associated with the new CIS subject to the terms of this agreement. Subject to any adjustment that may be made to rate base as of December 31, 2012 to reflect the actual costs of the new CIS, as set forth below, the parties agree that, as of January 1, 2013, the amount included in opening rate base for the new CIS shall be its 2012 closing net book value of approximately $71.4 million.

6. The parties agree that, for rate-making purposes, the in-service date of the new CIS will be deemed to be July 1, 2009, regardless of the actual in-service date, and the rate base for the new CIS will be calculated in all respects as if it was brought into service on July 1, 2009.

7. The parties agree that, for rate-making purposes, CIS Capital Costs at the end of the term of this Agreement will be treated as follows:

   a. If the actual costs of the New CIS are less than $118.7 million, then the $71.4 million amount included in the January 1, 2013 opening rate base for the New CIS shall be appropriately adjusted downwards;

   b. No capital costs in addition to the amount of $118.7 million will be eligible for closure to rate base on January 1, 2013, unless Enbridge Gas Distribution then demonstrates the reasonableness and prudence of such additional costs; and on the further condition that the only additional amounts eligible for consideration will be confined to increases in the system integrator costs beyond the $42 million provision for those costs included within the budget of $118.7 million.

On this basis, and subject to later adjustment as described at point 2 above, the parties request the Board, as part of the approval of this Settlement Proposal, to approve the prudence and $118.7 million cost of the new CIS, which includes procurement costs of $5.1 million.

The parties agree that there are three, and only three, possible adjustments to be made later to the revenue requirement attributable to CIS for the period 2009 through 2012, as shown in Row 3 of the Template.

The first possible adjustment relates to the tax savings associated with the high Capital Cost Allowance (CCA) for IT hardware and software for the CIS asset. The high CCA produces substantial tax savings in the first two years of the asset's ten year life. The Company acknowledges and agrees that the ratepayers are to receive credit for the full value of these tax savings. The tax rules provide that Enbridge Gas Distribution will be kept whole with respect to income taxes over the full economic life of utility assets, including the 10-year life of the CIS assets. Parties disagree over when the tax savings should be reflected in revenue requirement and rates.

To support a settlement, the parties agree, for ratemaking purposes, to the use of the values included in Row 3 of the Template in determining the revenue requirement for use at True-Up Time. Those values are calculated as if the CIS costs, including tax savings, were calculated on a conventional forward test year cost of service basis for each year during the period 2009-2012. The Company has agreed to use this assumption on the understanding that Enbridge Gas Distribution retains the right to bring an application before the Board seeking a different approach to the timing of when the tax savings are reflected in revenue requirement. Enbridge Gas Distribution agrees that it will, if it elects to make such application, file that application by June 30, 2007. Intervenors' rights to oppose any such application remain unfettered and they retain the right to rely on any and all grounds of opposition considered by them to be appropriate. The parties agree that there will be no inference that Enbridge Gas Distribution has tacitly acquiesced to values in Row 3, by accepting them in this Supplementary Settlement Agreement, and all parties acknowledge that the Company's acceptance of the values in Row 3 is "without prejudice" to the application described above, should the Company decide to file it by June 30, 2007. In the event that the Board approves a different approach to the timing of when the tax savings are reflected in revenue requirement, then parties agree that the values shown in Row 3 of the Template are to be adjusted accordingly. If Enbridge Gas Distribution does not file such an application by June 30, 2007, or if Enbridge Gas Distribution files such an application but the relief requested is not granted, then, subject to the remaining possible adjustments described below, the values in Row 3 of the Template will remain as stated therein.

The two remaining potential adjustments to the CIS revenue requirement amounts for the period 2009 through 2012, as shown in Row 3 of the Template, pertain to Enbridge Gas Distribution's equity ratio and the possibility that the system integrator contract costs resulting from the CIS procurement process are less than $42 million.

The amounts in Row 3 of the Template reflect a 35% level of deemed equity for the Company. The issue of the appropriate level of deemed equity for the Company is currently before the Board in this F2007 rate case, and there may be changes from the 35% level. Parties agree that the amounts in Row 3 of the Template should be adjusted at True-Up Time in the event that the Company's level of deemed equity is changed in the Board's decision in the F2007 rate case.

The amounts in Row 3 of the Template reflect a $118.7 million cost for the new CIS. In the event that the system integrator contract costs arrived at through the CIS RFP process are less than $42 million, then parties agree that the amounts in Row 3 should be adjusted accordingly. In the event that the system integrator costs are $42 million or more, then the parties agree to the cost of $118.7 million for the term of this agreement.

Subject to the outcome of any application which Enbridge Gas Distribution may bring before the Board, as described above, Enbridge Gas Distribution agrees that once the outstanding items on the Template are determined, and completed, and as a result the Normalized 2008 Customer Care Revenue Requirement is established, the Company will not seek any adjustment to its rates or revenue requirement relating to the cost of the new CIS during the term of this agreement. Intervenors similarly agree that they will not seek adjustments to the Company's rates or revenue requirement that are directly or indirectly based on changes in CIS costs.

Notwithstanding the limitations expressed in the preceding paragraphs, the parties agree that in the event that new legislative or regulatory requirements, that are currently unknown and that are beyond the Company's control, are imposed on the Company, in the period up to and including 2012, and those requirements materially change the level of CIS costs, then any of the parties shall be entitled to make application to the Board for adjustments to rates or revenue requirement as appropriate. The materiality threshold that applies to this aspect of the agreement will be established at the IR proceeding. The parties agree that the rights conferred in this paragraph will be no greater than any rights to revisit any issue based on changes in legislative or regulatory requirements that are established as part of the IR rules that apply to the Company.

(v) Future revenue-generating opportunities from the new CIS

The Company agrees to use its best efforts to identify and take advantage of opportunities to use the new CIS asset to provide CIS services to third party organizations to generate additional revenue opportunities, and that the gains from any such opportunities shall be shared with ratepayers in a manner to be agreed upon. A consultative group, including Intervenors, may be convened to consider how such opportunities would be addressed. The parties agree that, in the event that the sharing of such gains cannot be agreed upon by the parties, then they will put the issue of the appropriate gainsharing to be used to the Board. The parties agree that any gains to be shared with ratepayers would be cleared to ratepayers by way of an annual adjustment to delivery rates.

Billing services on the Enbridge Gas Distribution bill are covered by the Supplementary Settlement Proposal related to open bill access (Ex. N1-1-1, Appendix C), and are not included in or affected by the provisions set out above.

APPENDIX A – TRUE-UP RULES

Attached to this Appendix A is a document entitled "Customer Care and CIS Settlement Template" (the "Template"). The parties have completed each of the boxes A1 through G17 of the Template, by inserting a dollar amount, or zero, or a TBD (To Be Determined) which will be completed at the True-Up Time. The following rules apply to the completion of the Template:

1) Where in the Template there is a dollar figure or zero already inserted in any box, that figure is agreed by the parties, and subject to paragraphs 3, 4 and 6 below, will not be altered.

2) The figures agreed to by the parties which are fixed and not subject to change, and which are already included in certain boxes within the Template, include the following:

    a. Rows 1, 2 and 2a: rows 1 and 2 represent the amounts that parties agree can be recovered in rates related to payments by Enbridge Gas Distribution to ABSU to provide CIS services and the payments by ABSU to ECSI for the use of the existing CIS asset, until the new CIS asset is in service. Row 2a represents the amounts to be paid to CWLP for the use of the CIS asset from January 1, 2007 to March 31, 2007. Parties agree that a total of $28.9 million shall be included on these rows, divided into the individual amounts included in the Template.

    b. Row 4: parties agree to the figures included in the Template as the amounts to be paid for the hosting and support of the new CIS. These amounts are based on Enbridge Gas Distribution estimates which the Intervenors, with the support of their consultants, have reviewed and found to be reasonable.

    c. Row 5: parties agree to the figures included in the Template as the amounts to be recovered for the Company's backoffice costs (excluding bad debt) associated with both the old and the new CIS. These amounts are based on Enbridge Gas Distribution estimates which the Intervenors, with the support of their consultants, have reviewed and found to be reasonable.

    d. Rows 6 and 7: SAP has been chosen as the provider for the software that will support the new CIS. This software may require some modifications or adaptations, from time to time, to fully support the CIS. The parties agree to the figures included rows 6 and 7 of the Template as the amounts to be paid to SAP for licence fees and for modifications that may be necessary. These amounts are based on Enbridge Gas Distribution estimates which the Intervenors, with the support of their consultants, have reviewed and found to be reasonable.

e. Row 8: box 8A includes the amount of $16.9 million, which is the amount that parties have agreed can be recovered in rates related to the provision of Customer Care services by CWLP for the period from January 1, 2007 to March 31, 2007 (which is the date on which ABSU will begin providing Customer Care services on a temporary or permanent basis). Given that CWLP will stop providing services to Enbridge Gas Distribution as of April 2007, the amounts to be reflected in boxes 8B, 8C, 8D, 8E and 8F are zero.

f. Row 11: parties agree to the figures included in the Template as the amounts to be recovered for Customer Care licences to support the existing and new Customer Care service provider delivery of Collections, E-Billing and text to speech voice capability functions. These amounts are based on Enbridge Gas Distribution estimates which Intervenors, with the support of their consultants, have reviewed and found to be reasonable.

g. Row 12: parties agree to the figures included in the Template as the amounts to be recovered for the Company's backoffice costs (excluding bad debt) associated with Customer Care services. These amounts are based on Enbridge Gas Distribution estimates which Intervenors, with the support of their consultants, have reviewed and found to be reasonable.

h. Row 13: this row includes the costs incurred by the Company, and accepted for recovery from ratepayers, related to the procurement of a new customer care service provider. The parties have agreed that a total amount of $4.9 million may be recovered at row 13. This total amount represents the internal and external procurement costs for the new Customer Care services that have been determined by the parties to be prudently incurred and reasonable for recovery from ratepayers. This total amount is allocated equally over the five years from 2008 to 2012. Thus, the amount of $0.98 million is inserted in each of the boxes A13 to F13.

i. Row 17: the total number of customers for each year.

3) Row 3 includes the revenue requirement associated with the new CIS for each of the years from 2007 to 2012, to be filled in as follows:

a. The amounts in boxes A3 and B3 shall be zero, since there is no revenue requirement associated with the new CIS until 2009.

b. The amounts in boxes C3, D3, E3 and F3 represent the annual revenue requirement associated with each of 2009, 2010, 2011 and 2012 for the new CIS. These amounts, which total $46.210 million, are based upon the agreed-upon cost of the new CIS of $118.7 million. The derivation of these amounts is set out in the spreadsheets attached as Appendix B and the total of $46.210 million is the sum of the items in Columns 1, 2, 3 and 4 at line 12 on the first page of Appendix B. These amounts are subject to adjustment as follows:

   i. the amounts in row 3 of the Template reflect a $118.7 million cost for the new CIS. In the event that the system integrator contract costs arrived at through the CIS RFP process are less than $42 and the overall cost is therefore reduced, then parties agree that the amounts in row 3 should be changed to correspond to the lower new CIS cost;

   ii. the amounts in row 3 of the Template reflect a 35% level of deemed equity for the Company. The issue of the appropriate level of deemed equity for the Company is currently before the Board in this F2007 rate case, and there may be changes from the 35% level. Parties agree that the amounts in row 3 of the Template should be changed in the event that the Company's level of deemed equity is changed;

   iii. In the event that the Company is successful in an application to the Board for a different approach to the timing of when tax savings associated with the new CIS are reflected in revenue requirement, then corresponding changes will be made to the amounts in row 3.

4) The amounts to be inserted in boxes A9 and B9 shall be determined by the parties as the prudent and reasonable amounts for recovery from ratepayers for sums paid or forecast to be payable by the Company to ABSU for Customer Care services during the period April 1, 2007 through September 30, 2008, in accordance with the following criteria:

   a. In the event that ABSU is chosen as the new service provider for Customer Care services from and after April 1, 2007 until December 31, 2012, then the figures to be inserted in boxes A9 and B9 are zero, because there will be no need for a transition period to a new service provider;

b. In the event that a third party other than ABSU is chosen as the new service provider for Customer Care services, then there will be the need for a transition period, for a maximum of 18 months from April 1, 2007, during which ABSU will provide Customer Care services until the new service provider can be fully phased-in.

c. The Company has reached agreement with ABSU for Customer Care services to be provided, on a transition basis for 2007 and 2008 in the event that ABSU is not the successful Customer Care bidder. For settlement purposes, subject to subparagraph (d) below, the Parties agree that amounts of up to $52,263,000 for 2007 and $42,623,000 for 2008 will be included in boxes A9 and B9. These numbers represent the maximum agreed-upon level of costs that the Company may recover in rates in respect of the amounts charged by ABSU during 2007 and 2008 for Customer Care services, on a transitional basis, based on a recoverable cost of $38 per customer per year and a transition period of 18 months;

d. The Company will make best efforts to reduce the length of the transition period from 18 months, and to reduce the actual forecast costs per customer from ABSU to be less than currently forecast. In the event that the actual costs to date and updated forecast costs from ABSU at True-up Time for Customer Care services for the transition period are less than $52,263,000 for 2007 or $42,623,000 for 2008, then the numbers to be inserted in boxes A9 and B9 will be the actual costs to date and updated forecast costs at True-Up Time.

e. The amounts to be inserted in boxes C9, D9, E9 and F9 are zero because, in any event, the transition period for customer care services will not extend beyond 2008.

5) The amounts to be inserted in boxes A10 to F10 are the reasonable forecast annual costs of the new Customer Care service provider, to be determined at the True-Up Time through the results of the Customer Care procurement process. In the event that ABSU is chosen as the new service provider, it is expected that these amounts will be effective as of April 1, 2007. In the event that a third party other than ABSU is chosen as the new service provider, it is expected that these amounts will begin at some time in 2007 or 2008, because of the need for transition time and activities. The amounts to be included in these boxes are subject to review by the Consultative for prudence and reasonableness. In the event that the Intervenors and the Company do not agree, the issue of prudence and reasonableness will be determined by the Board.

6) The amounts at rows 14 and 15 represent the transition costs associated with moving from CWLP as the Customer Care service provider to a different third party service provider. The transition costs to be included in these rows, and tracked in the 2007 and 2008 Customer Care Transition Costs Variance Accounts, relate to activities that ABSU and external contractors and internal resources will undertake to transfer knowledge and services to the new service provider. This will include such tasks as training, documentation and management of the vendors through the transition.

    a. In any event, the number in boxes A14/A15 will be zero.

    b. In the event that ABSU is chosen as the new Customer Care service provider then the amounts to be inserted in boxes B14 to F14 and B15 to F15 are zero and subparagraphs 6(c) to (f) do not apply.

    c. In the event that a different third party is chosen as the new Customer Care service provider, then a total amount of $11.1 million will be included on rows 14 and 15. This total amount will be split equally between the years 2008 to 2012, in the amount of $2.22 million per year. Thus, each of boxes B14/B15, C14/C15, D14/D15, E14/E15 and F14/F15 will include the number $2.22 million.

    d. The Company will record all prudent and reasonable amounts spent for services, both internal and external, to facilitate the transition from CWLP/ABSU providing Customer Care services to a new service provider in the 2007 and 2008 Customer Care Transition Costs Variance Accounts, to a total maximum of $11.1 million. It is agreed that amounts paid for internal costs shall not include the costs of employees or other resources already included in the budget for the year and re-assigned to this transition, unless a specific new resource was acquired to backfill those other functions.

    e. Commencing in 2008, and continuing each year until 2012, the Company will expense the amount of $2.22 million for Customer Care costs, and will at the same time, deduct the same amount from the total amounts recorded in the 2007 and 2008 Customer Care Transition Costs Variance Accounts. The parties agree that, even if the outstanding balance in the 2007 and 2008 Customer Care Transition Costs Variance Accounts becomes zero before 2012, the Company is still entitled to expense and recover the amount of $2.22 million for each year until 2012. The parties further agree that no negative balances will be reflected in the 2007 and 2008 Customer Care Transition Costs Variance Accounts.

f. Parties agree that if the total amounts recorded in the 2007 and 2008 Customer Care Transition Costs Variance Accounts are less than $11.1 million as of December 31, 2008, then the difference between $11.1 million and the total amounts recorded in the 2007 and 2008 Customer Care Transition Costs Variance Accounts will be credited to ratepayers with interest in equal amounts in 2009 to 2012.

7) Row 16 will be the totals of each of the columns, to be completed when all of the above figures are determined.

8) Column G will be the totals of each of the rows, to be completed when all of the above figures are determined.

9) Box G16 will be the total of all Customer Care costs and revenue requirement forecast for the period (the "Total Customer Care Forecast").

10) Box G17, already completed, is the forecast total of annual numbers of customers during the period (the "Customer Count").

At True-Up Time, once the Template has been completed, then the Normalized 2007 Customer Care Revenue Requirement can be determined. This will be calculated by starting with the Total Customer Care Revenue Requirement for 2007 to 2012, which is the sum of boxes A16 to F16. That Total Customer Care Revenue Requirement will then be placed into an amortization model that calculates, using the IR annual adjustment that is approved for Enbridge Gas Distribution, the Normalized 2007 Customer Care Revenue Requirement which is the number that, when adjusted for IR annual adjustment for each year from 2008 through 2012, would allow the Company to fully recover the Adjusted Customer Care Revenue Requirement for 2007 to 2012.

At the same time, parties will calculate the 2007 Customer Care Revenue Requirement Variance by taking the difference between the Normalized 2007 Customer Care Revenue Requirement and the placeholder of $90.8 million. The Company will credit or debit the 2007 Customer Care Revenue Requirement Variance, as the case may be, to the 2007 Customer Care Variance Account. The balance in that account will be repaid to the ratepayers, or charged to the ratepayers, with interest, over the course of 2008 to 2012.

Attached to this Appendix A is an illustrative example of how the True-Up will be applied. For the purpose of this example, the following assumptions have been employed: (i) at row 3, the CIS cost is recovered by recognizing the tax shield benefit in the first four years, and a deemed equity level of 35% is assumed; (ii) ABSU is not awarded the Customer Care contract, so there are transition costs included at row 9; (iii) at row 10, the new CIS service provider contract cost is $60 million per year; and (iv) the

IR Annual Adjustment is 1%. The illustrative example sets out the steps that are followed, and the amortization model that is used, to derive the 2007 Customer Care Revenue Requirement Variance and the Normalized Customer Care Revenue Requirements for 2007 to 2012.

	True-Up Process Step	A	B	C	D	E	F	G
18	The Normalized 2007 Customer Care Revenue Requirement can be determined. This will be calculated by starting with the Total Customer Care Revenue Requirement for 2007 to 2012, which is the amount in box G16	$545,990,575						
19	That Total Customer Care Revenue Requirement will then be placed into an amortization model that calculates, using the IR annual adjustment that is approved for Enbridge Gas Distribution, the Normalized 2007 Customer Care Revenue Requirement which is the number that, when adjusted for IR annual adjustment for each year from 2008 through 2012, will allow the Company to fully recover the Total Customer Care Revenue Requirement for 2007 to 2012	$88,749,876.15						
20	The Normalized 2007 Customer Care Revenue Requirement will then be compared to the 2007 placeholder of $90.8 million, and the difference will be the 2007 Customer Care Revenue Requirement Variance.	($2,050,124)						
21	The Company will credit or debit the 2007 Customer Care Revenue Requirement Variance, as the case may be, to the 2007 Customer Care Variance Account. The balance in that account will be repaid to the ratepayers, or charged to the ratepayers, with interest, over the course of 2008 to 2012.		($410,025)	($410,025)	($410,025)	($410,025)	($410,025)	
22	The Normalized 2008 Customer Care Revenue Requirement will be the Normalized 2007 Customer Care Revenue Requirement, plus or minus the IR annual adjustment that is approved for Enbridge Gas Distribution.		$89,637,375	$90,533,749	$91,439,086	$92,353,477	$93,277,012	
23	Total Customer Care Revenue By Year (Including repayment of 2007 variance)	$ 90,800,000	$ 89,227,350	$ 90,123,724	$ 91,029,061	$ 91,943,452	$ 92,866,987	$ 545,990,575
24	Normalized Customer Care Revenue Requirement Per Customer without Bad Debt	$ 49.58	$ 47.51	$ 46.80	$ 46.12	$ 45.48	$ 44.87	
25	IR Annual Adjustment	1%

2007 TEST YEAR
FINANCIAL IMPACT OF THE SETTLEMENT PROPOSAL

1. This exhibit is being filed in order to provide the Board with the financial impact of the Settlement Proposal filed at Exhibit N1.T1.S1 against the Company's updated deficiency request filed at Exhibit M1, Tab 2, Schedule 1. Acceptance of the Settlement Proposal will decrease the Company's gross revenue deficiency in the 2007 Test Year by $76.7 million, from $158.7 million as shown at Exhibit M1.T2.S1, to $82.0 million as shown at Exhibit N1, Tab 2, Schedule 2. The $82.0 million gross deficiency amount includes within it, a gross deficiency amount of $29.9 million related to issues which have been agreed to in the Settlement Proposal, and a gross deficiency amount of $52.1 million relating to issues which remain unresolved. The financial adjustments which achieve the $82.0 million deficiency amount are shown within Schedules 2 through 6 of this exhibit while the adjustments which result in the $29.9 million deficiency are shown within Schedule 2, pages 1 and 2.

Rate Base (Exhibit N1.T2.S3)

2. The Company's rate base forecast will decrease by $54.6 million, from $3,798.3 million at Exhibit M1.T2.S2 to $3,743.7 million at Exhibit N1.T2.S3, p.1, Line 13, as a result of the Settlement Proposal.

3. The $56.4 million reduction to the property, plant and equipment portion of rate base is the summary impact of reductions to the capital expenditure budget (Exhibit N1.T1.S1 – Issues 1.1 through 1.8) and the removal of the proposed changes to depreciation rates within the depreciation study (Exhibit N1.T1.S1 – Issue 3.11).

Witness: K. Culbert

4. The working cash allowance component of rate base has been recalculated to reflect the impact of the Settlement Proposal with respect to the decrease in operation and maintenance costs included in the calculation (Exhibit N1.T1.S1. – Issues 1.6 and 3.2), resulting in a $1.8 million increase. A decrease in O&M results in an increase in working cash allowance because of the negative O&M lag day factor embedded in the calculation. A negative O&M lag day factor multiplied by a reduced O&M value, results in a lower credit within the working cash allowance calculation and thus a higher total working cash allowance. The working cash allowance calculation of $2.5 million is filed at Exhibit N1.T2.S3, on page 3, and compares to the level of $0.7 million filed at Exhibit M1.T2.S2, page 3.

<u>Utility Income (Exhibit N1.T2.S4)</u>

5. Acceptance of the Settlement Proposal will result in an increase to the Company's forecast of net income in the amount of $46.2 million, from $188.4 million at Exhibit M1.T2.S3 to $234.6 million at Exhibit N1.T2.S4, pg.1, line 22. The individual revenue and expense items which have been adjusted as a result of the Settlement Proposal can be examined at Exhibit N1.T.2.S4, on pages 1 through 3, and are discussed in the following paragraphs.

6. Other operating revenue will increase by $5.2 million, from $23.7 million at Exhibit M1.T2.S3, line 4 to $28.9 million at Exhibit N1.T2.S4, pg.1, line 4, as a result of the Settlement Proposal for the following:
   - Transactional Services revenue increase of $3.5 million (Exhibit N1.T1.S1 – Issue 2.1),
   - Service charges & DPAC revenue increase of $1.0 million (Exhibit N1.T1.S1 – Issue 2.2); and
   - imputed NGV program revenue of $0.7 million (Exhibit N1.T1.S1 - Issue 2.2).

7. As a result of the Settlement Proposal relating to DSM, Corporate Cost Allocation and Other O&M, operation and maintenance costs will decrease by $24.1 million, from $365.8 million at Exhibit M1.T2.S3, pg.1, line 9 to $341.7 million at Exhibit N1.T2.S4, pg.1, line 9. This is the result of a $0.5 million EnVision related other O&M reduction, a further $18.8 million general reduction to other O&M and a $4.8 million reduction to the corporate cost allocation amount as agreed to in the Settlement Proposal (Exhibit N1.T1.S1 – Issues 1.6 & 3.2).

8. Depreciation and amortization expense decreases by $27.5 million as a result of the Settlement Proposal. Of this decrease, $24.8 million is due to the agreed upon withdrawal of the depreciation rate changes within the proposed depreciation study (Exhibit N1.T1.S1 – Issue 3.11) while $2.7 million is due to the agreed upon reductions to capital expenditures (Exhibit N1.T1.S1 – Issues 1.1 through 1.8).

9. Municipal and other taxes will decrease by $1.7 million, from $47.6 million at Exhibit M1.T2.S3, pg.1, line 14 to $45.9 million (Exhibit N1.T2.S4, pg.1, line 14) as a result of a general reduction to municipal and other taxes of $1.3 million within the Settlement Proposal (Exhibit N1.T1.S1 – Issue 3.14) and a reduction in capital taxes due to capital expenditure reductions within the Settlement Proposal at (Exhibit N1.T1.S1 – Issues 1.1 through 1.8).

10. As a result of the Settlement Proposal, Utility income before income taxes will increase by $58.5 million, which will result in an increase in income taxes excluding the tax shield provided by interest expense in the amount of $12.0 million. The tax shield provided by interest expense will decrease by $0.3 million as a result of the decline in rate base of $54.6 million (Exhibit N1.T2.S3, pg.1, line 13). The decrease

in the tax shield provided by interest expense associated with the decline in rate base is partially offset by a 0.04% increase in the capital structure return component of long and short-term debt which has increased from 4.31% as filed at Exhibit M1.T2.S4, pg.1, Line 3, Col. 4 to 4.35% found at Exhibit N1.T2.S5, pg.1, line 3, Col. 4. Total income taxes will increase by $12.3 million, from $48.1 million filed at Exhibit M1.T2.S3, pg.1, line 21 to $60.4 million at Exhibit N1.T2.S4, pg.1, line 21.

Capital Structure (Exhibit N1.T2.S5)

11. The proposed method and costs of financing capital requirements have been incorporated into the capital structure found (Exhibit N1.T2.S5, pg.1). The overall rate of return on rate base of 7.67% includes an 8.39% rate of return on common equity as determined by the current Board approved formula as agreed to in the Settlement Proposal. (Exhibit N1.T1.S1 - Issue 4.1)

12. Utility income in the amount of $234.6 million represents an indicated return of 6.27% on a rate base of $3,743.7 million, indicating a deficiency in return in the amount of 1.40% in comparison to the requested overall rate of return of 7.67%. This results in a net deficiency of $52.4 million and a gross revenue deficiency of $82.0 million, as shown at Exhibit N1, Tab 2, Schedule 5.

13. Acceptance of the Settlement Proposal will result in a gross revenue deficiency of $82.0 million, which is a decrease of $76.7 million, as shown at Exhibit N1, Tab 2, Schedule 6, in comparison to the Company's deficiency request filed at Exhibit M1, Tab 2, Schedules 4 & 5 in the amount of $158.7 million.

Utility ADR Impact Summary

Explanation of Adjustments to Utility Income
2007 Test Year

Line No. Adj'd	Adjustments ($Millions)	Explanation
4.	5.2	**Other operating revenue** To reflect the impact of a $3.5 million increase in the ratepayer guaranteed amount of Transactional Services revenue, an increase in Other Revenue of $1.0 million, and imputing revenue of $0.7 million to the NGV program as a result of the settlement of Issues 2.1 and 2.2.
9.	(24.1)	**Operation and maintenance** To reflect the impact of a $0.5 million Envision related O&M reduction, a $4.8 million reduction to achieve the agreed upon corporate cost allocation amount of $18.1 million, and a further $18.8 million reduction to achieve the agreed upon other O&M amount of $181.5 million per the settlement of Issues 1.6 and 3.2.
11.	(27.5)	**Depreciation and amortization** To reflect the impact on depreciation and amortization arising from capital expenditure reductions due to the settlement of Issues 1.1 through 1.8, and from a return to the use of existing Board Approved depreciation rates as a result of the settlement of Issue 3.11.
14.	(1.7)	**Municipal and other taxes** To reflect the impact of a $1.3 million reduction to municipal taxes, per the settlement of Issue 3.14, and a $0.4 million reduction to capital taxes that results from the reduction of capital expenditures agreed to in Issues 1.1 through 1.8 of the Settlement Proposal.
19.	12.0	**Income taxes - excluding interest shield** To reflect adjustments to utility income taxes as a result of the above noted changes contributing to higher taxable income and income tax excluding the interest tax shield. The Utility's income tax calculations are found in Exhibit N1, Tab 2, Schedule 4, page 3.

APPENDIX "B"

TO INTERIM RATE ORDER

BOARD FILE NO. EB-2006-0034

DATED MARCH 26, 2007

Supporting Documentation

Documentation for Working Papers Supporting the EB-2006-0034 Interim Rate Order

The attached working papers provide support for the Rate Handbook filed as Appendix A to the Draft Interim Rate Order for January 1, 2007 interim rates. The Rate Handbook reflects the OEB approved EB-2006-0034 Settlement Agreement as filed at Exhibit N1, Tab 1, Schedule 1.

The rates shown in the Rate Handbook are designed to recover the revenue requirement stemming from the EB-2006-0034 Settlement Agreement and incorporate the July 1, 2006 (EB-2006-0099) rates as the base rates. The revenue deficiency as outlined in the Settlement Agreement is derived based on the following:

	($'000)	Reference
Revenue at Existing Rates	3,072.6	H2, Tab 2, Schedule 1 Including DPAC
Revenue Requirement	3,098.6	H2, Tab 2, Schedule 1 Including DPAC
Gross Revenue Deficiency	26.0	

The following sections have been changed or removed in the Rate Handbook and result from the EB-2006-0034 Settlement Agreement:

Issue	Location in Handbook
6.3 - Glossary of Terms	
Affiliated Gas Users	Page 1
Annual Contract Demand ("ACD")	Page 1
Authorized Volume	Page 1
Banked Gas Account	Page 1
Billing Contract Demand	Page 1
Billing Month	Page 1
Bundled Service	Page 1
Buy/Sell Price	Page 1
Contract Demand	Page 1
Curtailment Credit	Page 1
Daily Capacity Repurchase Quantity	Page 1
Customer Charge	Page 1
Daily Gas Quantity	Page 1
Demand Charge	Page 2
Direct Purchase	Page 2
Firm Service	Page 2
Firm Service Tendered ("FST")	Page 2
Firm Transportation ("FT")	Page 2
Gas Purchase Agreement	Page 2
Gas Sale Contract	Page 2
Gas Supply Load Balancing Charge	Page 2

The working papers are laid out as follows:

H2: Design of Rates using FACS shown at G2
G2: Fully Allocated Cost Study (FACS) using 2007 Board Approved methodology

Description of H2 Exhibits

The rates shown in the H2 exhibits are designed to recover the allocation of the revenue requirement based on the cost allocation methodology as approved in the EB-2006-0034 Settlement Agreement.

All exhibits in the H2 series follow the same format as in previous rate filings and rate orders and are listed below:

a) Tab 1, Schedule 1 of this exhibit summarizes, by rate class, and rate component, the revenues at existing and 2007 Interim rates found in EB-2006-0034. The forecast of billed revenues at 2006 July QRAM rates (Interim EB-2006-0099) is shown in columns 1 through 5. The revenues at the 2007 Interim rates are shown in columns 11 through 15. The net change in revenue, or the revenue deficiency/sufficiency, by component, is shown in columns 6 to 10. The total in column 10 indicates the forecast revenue deficiency that will be recovered from billed revenues. Schedule 2 displays the revenue requirement, unit rates and associated volumes by rate class and component.

b) The Tab 2 schedule summarizes the revenues shown in Schedule 1 and presents the unbilled revenues at current and 2007 Interim rates to yield calendar year revenues.

c) The schedule at Tab 3 compares the unit rates from EB-2006-0099 to the 2007 Interim unit rates.

d) Exhibits under Tab 4 show the derivation of gas supply commodity, gas supply load balancing rates and transportation rates from the cost allocated to the rate classes in the FACS which is found at Exhibit G2. The derivation of the Seasonal credits is found at page 3.

e) The schedules under Tab 5 show the detailed revenue calculations by rate class.

f) Annual bill comparisons indicating the impact of the 2007 Interim rates on typical customers relative to the July 1, 2006 rates are shown at Tab 7.

g) Tab 8 shows the derivation of the Rider E unit rates. The unit rates are derived by comparing the revenue at existing rates (EB-2006-0099) to the revenue at 2007 Interim rates. The revenues are based on the rates applied to the 2007 forecast volumes for the months of April to December 2007. This analysis can be found in pages 3 to 7 of Tab 8. Page 2 of Tab 8 derives the unit rates by component based on the change in revenue divided by the forecast volume. Page 1 is the determination of the unit rates based on the type of service.

DOCUMENTATION FOR WORKING PAPERS SUPPORTING THE SETTLEMENT PROPOSAL: EB-2006-0034

Description of Cost Allocation (G2) Exhibits

The G2 exhibits, also referred to as the Fully Allocated Cost Study (FACS), allocate the test year revenue requirement to the customer rate classes.

All G2 series exhibits have been updated for the Impact Statement No.1 (EB-2006-0034, Exhibit M1), which the Company filed with the Board on December 06, 2006, and the Settlement Proposal (EB-2006-0034, Exhibit N1), which the Board approved on January 29, 2007.

The cost of service total of $3,098.6 million shown at G2/T2/S1/P1/L4/C1 equals revenues at existing rates of $3,071.8 million (N1/T2/S2/P1/L8/C2), plus direct purchase revenues at existing rates of $0.9 million (H2/T2/S1/P1/L15/C4), plus a settled deficiency in the amount of $26.0 million (N1/T1/S1/P46/Item 9.1).

As outlined in the Settlement Proposal at Issue 9.1, the parties agree that the Company can adjust rates to recover a $26.0 million deficiency effective as of January 1, 2007.

In its original filing the Company requested a $167.8 million deficiency. The Impact Statement No. 1 and Settlement Proposal adjustments reduce the deficiency to $26.0 million as follows:

Original Deficiency	167.8
Adjustments to Net Investments	(30.4)
Adjustments to O&M and Storage Costs	(28.5)
Adjustments to Return and Taxes	(82.9)
Deficiency from the Settlement Proposal to be Recovered in Rates Effective Jan. 01, 2007	26.0

Notes:

1) Adjustments reflect total net adjustments in Tables 2, 3 and 4 below.

The adjustments to rate base, net investments and operating and maintenance (O&M) expenses reflect the specific impacts of settled issues. The adjustments to return and taxes reflect the impact on return and taxes from settled issues and also capture deficiency consequences from unsettled issues.

The following four tables illustrate how the adjustments were made in the FACS for both the Impact Statement No. 1 and the Settlement Proposal.

The adjustments are compared to the Company's original filing with respect to:

- rate base for plant, equipment and working capital allowance;
- net investments;
- O&M and storage costs; and
- return and taxes.

Table 1: Rate Base Adjustments to Plant, Equipment and Working Capital Allowance

#	Item	Impact Statement Adjustment	Settlement Proposal Adjustment	Net Adjustment	Reference
1.0	Distribution Plant(1)	0	(56.4)	(56.4)	G2/T3/S1/P1/L2/C1
2.0	General Plant	0	0	0	G2/T3/S1/P1/L3/C1
3.0	Working Capital Allow.(2)	(3.0)	1.8	(1.2)	G2/T3/S1/P1/L6/C1
4.0	Total	(3.0)	(54.6)	(57.6)	

Notes:

1) The impact on rate base and accumulated depreciation from the settlement of Issues 1.1 through 1.8 and Issue 3.11.

2) The impact on working capital allowance from the EB-2005-0551 NGEIR Decision to reflect cost-based storage rates for services acquired from Union Gas and from reduction to O&M expenses as per the Settlement Proposal.

Table 2: Adjustments to Net Investments

#	Item	Impact Statement Adjustment	Settlement Proposal Adjustment	Net Adjustment	Reference
1.1	Depreciation(1)	0	(27.5)	(27.5)	G2/T3/S3/P1/L1.1/C1
1.2	Other Taxes(2)	0	(1.7)	(1.7)	G2/T3/S3/P1/L1.2+1.3/C1
1.0	Total Investments	0	(29.2)	(29.2)	G2/T3/S3/P1/L1/C1
2.0	Misc. Revenues(3)	3.5	(4.7)	(1.2)	G2/T3/S3/P1/L2/C1
3.0	Total	3.5	(33.9)	(30.4)	

Notes:

1) The impact on depreciation and amortization from reduction in capital expenditures and from existing Board-approved depreciation rates as per the settlement of Issues 1.1 through 1.8 and Issue 3.11 respectively.

2) The impact on other taxes from $1.3 M reduction in municipal taxes and $0.4 M reduction in capital taxes as per the settlement of Issue 3.14 and Issues 1.1 through 1.8 respectively.

3) The impact on misc. revenues from transactional services' revenues and increases in other and NGV program revenues. Note that misc. revenues are shown as credits in G2 exhibits.

Table 3: Adjustments to Operating and Maintenance (O&M) and Storage Costs

#	Item	Impact Statement Adjustment	Settlement Proposal Adjustment	Net Adjustment	Reference
1.0	Storage with Union Gas(1)	(6.0)	0	(6.0)	G2/T6/S2/P2/L4.1+4.2/C3
2.0	DSM and other(2)	1.6	0	1.6	G2/T3/S4/P2/L4.10+4.11/C1
3.0	Utility O&M and Storage(3)	0	(24.1)	(24.1)	G2/T3/S4 & G2/T6+7/S2+3
4.0	Total	(4.4)	(24.1)	(28.5)	

Notes:

1) The impact on storage service with Union Gas from the EB-2005-0551 NGEIR Decision to reflect cost-based storage rates.

2) The impact on DSM from the EB-2006-0021 Decision to set DSM budget at $22.0 M, which required an increase of $1.7 M to the $20.3 M DSM budget embedded in the original filing. Includes a $0.1 M reduction in other O&M for which reference is not provided.

3) The impact on utility O&M and storage costs from the Settlement Proposal. These adjustments are reflected in exhibits G2/T3/S4/Items 2 through 8/C1 and G2/T6/S2/P2/L1.5+2.4 and G2/T7/S3/P1/L2.1+2.2+2.3.

Table 4: Adjustments to Return & Taxes

#	Item	Impact Statement Adjustment	Settlement Proposal Adjustment	Net Adjustment	Reference
1.0	Return & Taxes	(7.8)	(71.3)	(79.1)	G2/T5/S3/P1/L6/C3
2.0	Tecumseh Return & Taxes	(0.4)	(3.4)	(3.8)	G2/T7/S3/P1/L1
3.0	Total(1)	(8.2)	(74.7)	(82.9)	

Notes:

1) The impact on return and taxes from settled issues and deficiency consequences from unsettled issues.

The G2 exhibits provided in this filing follow the same format as in previous rate filings or rate orders:

a) Tab 2 exhibits provide a summary of the FACS' results. They outline the allocation of the proposed revenue requirement, return on the allocated rate base and the revenue to cost ratio by rate class.

b) Tab 3 exhibits functionalize rate base, working capital, net investment, and O&M costs into similar operating functions to facilitate identification of costs that are associated with a distinct aspect of the Company. The functionalization of costs allows for consistent treatment of similar costs.

c) Tab 4 exhibits classify the functionalized costs into categories that vary between rate classes by an identifiable factor or allocator. In this step the costs are classified to three general cost groups based on whether they vary with volumetric demands, peak demands, or other customer specific demands. The costs are further sub-classified within these three broad categories of classification when required.

d) Tab 5 exhibits allocate the classified cost to each rate class based on allocation factors that are referenced on the exhibits.

e) Tab 6 exhibits provide rate base, working capital and net investment functionalization factors, classify transportation and storage costs and gas costs to operations, and provide cost of service allocation factors and allocation percentages.

f) Tab 7 exhibits provide functionalization and classification of costs for Tecumseh Gas. These costs are then used to charge back storage costs to Enbridge Gas Distribution's in-franchise customers and to derive ex-franchise storage rates.

8.	**Rate 145**	(0.1556)	(0.1402)
9.	**Rate 170**	0.0174	0.0153
10.	**Rate 200**	0.1244	0.1204
11.	**Rate 300**	n/a	(0.0640)

Notes: Sales Service Rider includes Distribution, Gas Supply Load Balancing and Gas Supply Commodity unit rates shown on Page 2.
Transportation Service Rider equals Sales Service Rider less Gas Supply Commodity unit rate.

RATE HANDBOOK

ENBRIDGE GAS DISTRIBUTION

HANDBOOK OF RATES AND DISTRIBUTION SERVICES

INDEX

Part I

GLOSSARY OF TERMS

In this Handbook of Rates and Distribution Services, each term set out below shall have the meaning set out opposite it:

Annual Turnover Volume ("ATV"): The sum of the contracted volumes injected into and withdrawn from storage by an applicant within a contract year.

Annual Volume Deficiency: The difference between the Minimum Annual Volume and the volume actually taken in a contract year, if such volume is less than the Minimum Annual Volume.

Applicant: The party who makes application to the Company for one or more of the services of the Company and such term includes any party receiving one or more of the services of the Company.

Authorized Volume: In regards to Sales Service Agreements, the Contract Demand.

In regards to Bundled Transportation Service arrangements, the Contract Demand (CD) less the amount by which the Applicant's Mean Daily Volume (MDV) exceeds the Daily Delivered Volume (Delivery) and less the volume by which the Applicant has been ordered to curtail or discontinue the use of gas (Curtailment Volume) or otherwise represented as:

CD – (MDV – Delivery) – Curtailment Volume

Back-stopping: A service whereby alternative supplies of gas may be available in the event that an Applicant's supply of gas is not available for delivery to the Company.

Banked Gas Account: A record of the amount of gas delivered by the Applicant to the Company in respect of a Terminal Location (credits) and of volume of gas taken by the Applicant at the Terminal Location (debits)

Billing Contract Demand: Applicable only to new customers who take Dedicated Service under Rate 125. The Company and the Applicant shall determine a Billing Contract Demand which would result in annual revenues over the term of the contract that would enable the Company to recover the invested capital, return on capital, and O&M costs of the Dedicated Service in accordance with its system expansion policies.

Billing Month: A period of approximately thirty (30) days following which the Company renders a bill to an applicant. The billing month is determined by the Company's monthly Reading and Billing Schedule. With respect to rate 135 LVDC's, there are eight summer months and four winter months.

Board: Ontario Energy Board. (OEB)

Bundled Service: A service in which the demand for natural gas at a Terminal Location is met by the Company utilizing Load balancing resources.

Buy/Sell Arrangement: An arrangement, the terms of which are provided for in one or more agreements to which one or more of an end user of gas (being a party that buys from the Company gas delivered to a Terminal Location), an affiliate of an end user and a marketer, broker or agent of an end user is a party and the Company is a party, and pursuant to which the Company agrees to buy from the end user or its affiliate a supply of gas and to sell to the end user gas delivered to a Terminal Location served from the gas distribution network. The Company will not enter into any new buy/sell agreement after April 1, 1999.

Buy/Sell Price: The Price per cubic meter which the Company would pay for gas purchased pursuant to a Buy/Sell Arrangement in which the purchase takes place in Ontario.

Commodity Charge: A charge per unit volume of gas actually taken by the Applicant, as distinguished from a demand charge which is based on the maximum daily volume an Applicant has the right to take.

Company: Enbridge Gas Distribution Inc.

Contract Demand: A contractually specified volume of gas applicable to service under a particular Rate Schedule for each Terminal Location which is the maximum volume of gas the Company is required to deliver on a daily basis under a Large Volume Distribution Contract.

Cubic Metre ("m^3"): That volume of gas which at a temperature of 15 degrees Celsius and at an absolute pressure of 101.325 kilopascals ("kPa") occupies one cubic metre. "10^3m^3" means 1,000 cubic metres.

Curtailment: An interruption in an Applicant's gas supply at a Terminal Location resulting from compliance with a request or an order by the Company to discontinue or curtail the use of gas.

Curtailment Credit: A credit available to interruptible customers to recognize the benefits they provide to the system during the winter months.

Curtailment Delivered Supply (CDS): An additional volume of gas, in excess of the Applicant's Mean Daily Volume and determined by mutual agreement between the Applicant and the Company, which is Nominated and delivered by or on behalf of the Applicant to a point of interconnection with the Company's distribution system on a day of Curtailment.

Customer Charge: A monthly fixed charge that reflects being connected to the gas distribution system.

Daily Consumption VS Gas Quantity: The volume of natural gas taken on a day at a Terminal Location as measured by daily metering equipment or, where the Company does not own and maintain daily metering equipment at a Terminal Location, the volume of gas taken within a billing period divided by the number of days in the billing period.

Daily Delivered Volume: The volume of gas accepted by the Company as having been delivered by an Applicant to the Company on a day.

Dedicated Service: An Unbundled Service provided through a gas distribution pipeline that is initially constructed to serve a single customer, and for which the volume of gas is measured through a billing meter that is directly connected to a third party transporter or other third party facility, when service commences.

Delivery Charge: A component of the Rate Schedule through which the Company recovers its operating costs.

Demand Charge: A fixed monthly charge which is applied to the Contract Demand specified in a Service Contract.

Demand Overrun: The amount of gas taken at a Terminal Location exceeding the Contract Demand.

Direct Purchase: Natural gas supply purchase arrangements transacted directly between the Applicant and one or more parties, including the Company.

Disconnect and Reconnect Charges: The charges levied by the Company for disconnecting or reconnecting an Applicant from or to the Company's distribution system.

Diversion: Delivery of gas on a day to a delivery point different from the normal delivery point specified in a Service Contract.

Firm Service: A service for a continuous delivery of gas without curtailment, except under extraordinary circumstances.

Firm Transportation ("FT"): Firm Transportation service offered by upstream pipelines to move gas from a receipt point to a delivery point, as defined by the pipeline.

Force Majeure: A contract clause intended to excuse one or more parties from their obligations under a contract, in situations where performance is frustrated by unusual or severe circumstances beyond their control such as flood, fire, war, or prolonged labour strike.

Gas: Natural Gas.

Gas Delivery Agreement: A written agreement pursuant to which the Company agrees to transport gas on the Applicant's behalf to a specified Terminal Location.

Gas Distribution Network: The physical facilities owned by the Company and utilized to contain, move and measure natural gas.

Gas Sale Contract: A written agreement pursuant to which the Company agrees to supply and deliver gas to a specified Terminal Location.

Gas Supply Charge: A charge for the gas commodity purchased by the applicant.

Gas Supply Load Balancing Charge: A charge in the Rate Schedules where the Company recovers the cost of ensuring gas supply matches consumption on a daily basis.

General Service Rates: The Rate Schedules applicable to those Bundled Services for which a specific contract between the Company and the Applicant is not generally required. The General Service Rates include Rates 1, 6, and 9 of the Company.

Gigajoule ("GJ"): See Joule.

Hourly Demand: A contractually specified volume of gas applicable to service under a particular Rate Schedule which is the maximum volume of gas the Company is required to deliver to an Applicant on a hourly basis under a Service Contract.

Imperial Conversion Factors:

Volume:		
1,000 cubic feet (cf)	=	1 Mcf
	=	28.32784 cubic metres (m^3)
1 billion cubic feet (cf)	=	28.32784 $10^6 m^3$
Pressure:		
1 pound force per square inch (p.s.i.)	=	6.894757 kilopascals (kPa)
1 inch Water Column (in W.C.) (60°F)	=	0.249 kPa (15.5°C)
1 standard atmosphere	=	101.325 kPa
Energy:		
1 million British thermal units	=	1 MMBtu
	=	1.055056 gigajoules (GJ)
948,213.3 Btu	=	1 GJ
Monetary Value:		
$1 per Mcf	=	$0.03530096 per m^3
$1 per MMBtu	=	$0.9482133 per GJ

Interruptible Service: Gas service which is subject to curtailment for either capacity and/or supply reasons, at the option of the Company.

Intra-Alberta Service: Firm transportation service on the Nova pipeline system under which volumes are delivered to an Intra-Alberta point of acceptance.

Joule ("J"): The amount of work done when the point of application of a force of one newton is displaced a distance of one metre in the direction of the force. One megajoule ("MJ") means 1,000,000 joules; one gigajoule ("GJ") means 1,000,000,000 joules.

Large Volume Distribution Contract: (LVDC): A written agreement pursuant to which the Company agrees to supply and deliver gas to a specified Terminal Location.

Large Volume Distribution Contract Rates: The Rate Schedules applicable for annual consumption exceeding 340,000 cubic metres of gas per year and for which a specific contract between the Company and the Applicant is required.

Load-Balancing: The balancing of the gas supply to meet demand. Storage and other peak supply sources, curtailment of interruptible services, and diversions from one delivery point to another may be used by the Company.

Make-up Volume: A volume of gas nominated and delivered, pursuant to mutually agreed arrangements, by an Applicant to the Company for the purpose of reducing or eliminating a net debit balance in the Applicant's Banked Gas Account.

Mean Daily Volume (MDV): The volume of gas which an Applicant who delivers gas to the Company, under a T-Service arrangement, agrees to deliver to the Company each day in the term of the arrangement.

Metric Conversion Factors:

Volume:

1 cubic metre (m^3)	=	35.30096 cubic feet (cf)
1,000 cubic metres	=	10^3m^3
	=	35,300.96 cf
	=	35.30096 Mcf
28.32784 m^3	=	1 Mcf

Pressure:

1 kilopascal (kPa)	=	1,000 pascals
	=	0.145 pounds per square inch (p.s.i.)
101.325 kPa	=	one standard atmosphere

Energy:

1 megajoule (MJ)	=	1,000,000 joules
	=	948.2133 British thermal units (Btu)
1 gigajoule (GJ)	=	948,213.3 Btu
1.055056 GJ	=	1 MMBtu

Monetary Value:

$1 per 10^3m^3	=	$0.02832784 per Mcf
$1 per gigajoule	=	$1.055056 per MMBtu

Minimum Annual Volume: The minimum annual volume as stated in the customer's contract, also Section E.

Natural Gas: Natural and/or residue gas comprised primarily of methane.

Nominated Volume: The volume of gas which an Applicant has advised the Company it will deliver to the Company in a day.

Nominate, Nomination: The procedure of advising the Company of the volume which the Applicant expects to deliver to the Company in a day.

Ontario Energy Board: An agency of the Ontario Government which, amongst other things, approves the Company's Rate Schedules (Part V of this HANDBOOK) and the matters described in Parts III and IV of this HANDBOOK.

Point of Acceptance: The point at which the Company accepts delivery of a supply of natural gas for transportation to, or purchase from, the Applicant.

Rate Schedule: A numbered rate of the Company as fixed or approved by the OEB. that specifies rates, applicability, character of service, terms and conditions of service and the effective date.

Seasonal Credit: A credit applicable to Rate 135 customers to recognize the benefits they provide to the storage operations during the winter period.

Service Contract: An agreement between the Company and the Applicant which describes the responsibilities of each party in respect to the arrangements for the Company to provide Sales Service or Transportation Service to one or more Terminal Locations.

System Sales Service: A service of the Company in which the Company acquires and sells to the Applicant the Applicant's natural gas requirements.

T-Service: Transportation Service.

Terminal Location: The building or other facility of the Applicant at or in which natural gas will be used by the Applicant.

Transportation Service: A service in which the Company agrees to transport gas on the Applicant's behalf to a specified Terminal Location.

Unbundled Service: A service in which the demand for natural gas at a Terminal Location is met by the Applicant contracting for separate services (upstream transportation, load balancing/storage, transportation on the Company's distribution system) of which only Transportation Service is mandatory with the Company.

Western Canada Buy Price: The price per cubic metre which the Company would pay for gas pursuant to a Buy/Sell Agreement in which the purchase takes place in Western Canada.

PART II

RATES AND SERVICES AVAILABLE

The provisions of this PART II are intended to provide a general description of services offered by the Company and certain matters relating thereto. Such provisions are not definitive or comprehensive as to their subject matter and may be changed by the Company at any time without notice.

SECTION A - INTRODUCTION

1. In Franchise Services

Enbridge Gas Distribution provides in franchise services for the transportation of natural gas from the point of its delivery to Enbridge Gas Distribution to the Terminal Location at which the gas will be used. The natural gas to be transported may be owned by the Applicant for service or by the Company. In the latter case, it will be sold to the customer at the outlet of the meter located at the Terminal Location.

Applicants may elect to have the Company provide all-inclusively the services which are mutually agreed to be required or they may select (from the 300 series of rates, and Rate 125) only the amounts of those services which they consider they need.

The all-inclusive services are provided pursuant to Rates 1, 6 and 9, ("the General Service Rates") and Rates 100, 110, 115, 135, 145, and 170 ("the Large Volume Service Rates"). Individual services are available under Rates 125, 300, and 315 ("the Unbundled Service Rates").

Service to residential locations is provided pursuant to Rate 1.

Service which may be interrupted at the option of the Company is available, at rates lower than would apply for equivalent service under a firm rate schedule, pursuant to Rates 145, 170. Under all other rate schedules, service is provided upon demand by the Applicant, i.e., on a firm service basis.

2. Ex-Franchise Services

Enbridge Gas Distribution provides ex-franchise services for the transportation of natural gas through its distribution system to a point of interconnection with the distribution system of other distributors of natural gas. Such service is provided pursuant to Rate 200 and provides for the bundled transportation of gas owned by the Company, owned by customers of that distributor, or owned by that distributor.

For the purposes of interpreting the terms and conditions contained in this Handbook of Rates and Distribution Services the ex - franchise distributor shall be considered to be the applicant for the transportation of its customer owned gas and shall assume all the obligations of transportation as if it owned the gas.

Nominations for transportation service must specify whether the volume to be transported is to displace firm or interruptible demand or general service.

In addition, the Company provides Compression, Storage, and Transmission services on its Tecumseh system under Rates 325, 330 and 331.

SECTION B - DIRECT PURCHASE ARRANGEMENTS

Applicants who purchase their natural gas requirements directly from someone other than the Company or who are brokers or agents for an end user, may arrange to transport gas on the Company's distribution network in conjunction with a Western Buy/Sell Arrangement or pursuant to an Ontario Delivery Transportation Service Arrangement, whether Bundled or Unbundled, or a Western Bundled Transportation Service Arrangement.

B. Western Canada Buy/Sell in a Western Canada Buy/Sell Arrangement the Applicant delivers gas to a point in Western Canada which connects with the transmission pipeline of TransCanada PipeLines Limited. At that point, the Company purchases the gas from the Applicant at a price specified in Rider 'B' of the rate schedules less the costs for transmission of the gas from the point of purchase to a point in Ontario at which the Company's gas distribution network connects with a transmission pipeline system. The Company will not be entering into any new Western Canada buy/sell arrangements after April 1, 1999.

C. Ontario Delivery T-Service Arrangements

In an Ontario Delivery T-Service Arrangement the Applicant delivers gas, to a contractually agreed-upon point of acceptance in Ontario.

Delivery from the point of direct interconnection with the Company's gas distribution network to a Terminal Location served from the Company's gas distribution network may be obtained by the Applicant either under the Bundled Service Rate Schedules or under the Unbundled Service Rate Schedules.

(i) Bundled T-Service

Bundled T-Service is so called because all of the services required by the Applicant (delivery and load balancing) are provided for the prices specified in the applicable Rate Schedule. In a Bundled T-Service arrangement the Applicant contracts to deliver each day to the Company a Mean Daily Volume of gas. Fluctuations in the demand for gas at the Terminal Location are balanced by the Company.

(ii) Unbundled T-Service

The Unbundled Service Rates allow an Applicant to contract for only such kinds of service as the Applicant chooses. The potential advantage to an Applicant is that the chosen amounts of service may be less than the amounts required by an average customer represented in the applicable Rate Schedule, in which case the Applicant may be able to reduce the costs otherwise payable under Bundled T-Service.

D. Western Delivery T-Service Arrangement

In a Western Delivery T-Service Arrangement the Applicant contracts to deliver each day to a point on the TransCanada PipeLines Ltd. transmission system in Western Canada a Mean Daily Volume of gas plus fuel gas. Delivery from that point to the Terminal Location is carried out by the Company using its contracted capacity on the TransCanada PipeLines Limited. system and its gas distribution network. Unbundled T-Service in Ontario is not available with the Western Delivery Option.

An Applicant desiring to receive Transportation Service or to establish a Buy/Sell Agreement must first enter into the applicable written agreements with the Company.

PART III

TERMS AND CONDITIONS APPLICABLE TO ALL SERVICES

The provisions of this PART III are applicable to, and only to, Sales Service and Transportation Service.

SECTION A - AVAILABILITY

Unless otherwise stated in a Rate Schedule, the Company's rates and services are available throughout the entire franchised area serviced by the Company. Transportation service and/or sales service will be provided subject to the Company having the capacity in its gas distribution network to provide the service requested. When the Company is requested to supply the natural gas to be delivered, service shall be available subject to the Company having available to it a supply of gas adequate to meet the requirement without jeopardizing the supply to its existing customers.

Service shall be made available after acceptance by the Company of an application for service to a Terminal Location at which the natural gas will be used.

SECTION B - ENERGY CONTENT

The price of natural gas sold at a Terminal Location is based on the assumption that each cubic metre of such natural gas contains a certain number of megajoules of energy which number is specified in the Rate Schedules. Variations in cost resulting from the energy content of the gas actually delivered to the Company by its supplier(s) differing from the assumed energy content will be recorded and used to adjust future bills. Such adjustments shall be made in accordance with practices approved from time to time by the Ontario Energy Board.

SECTION C - SUBSTITUTION PROVISION

The Company may deliver gas from any standby equipment provided that the gas so delivered shall be reasonably equivalent to the natural gas normally delivered.

SECTION D - BILLS

Bills will be mailed or delivered monthly or at such other time period as set out in the Service Contract. Gas consumption to which the Company's rates apply will be determined by the Company either by meter reading or by the Company's estimate of consumption where meter reading has not occurred. The rates and charges applicable to a billing month shall be those applicable to the calendar month which includes the last day of the billing month.

SECTION E - MINIMUM BILLS

The minimum bill per month applicable to service under any particular Rate Schedule shall be the Customer Charge plus any applicable Contract Demand Charges for Delivery, Gas Supply Load Balancing, and Gas Supply and any applicable Direct Purchase Administration Charge, all as provided for in the applicable Rate Schedule.

In addition, for service under each of the Large Volume Distribution Contact Rates, if in a contract year a volume of gas equal to or greater than the product of the Contract Demand multiplied by a contractually specified multiple of the Contract Demand ("Minimum Annual Volume") is not taken at the Terminal Location the Applicant shall pay, in addition to the minimum monthly bills, the amount obtained when the difference between the Minimum Annual Volume and the volume taken in the contract year (such difference being the Annual Volume Deficiency) is multiplied by the applicable Minimum Bill Charge(s) as provided for in the applicable Rate Schedule. Notwithstanding the foregoing, the Minimum Annual Volume shall be the greater of the Minimum Annual Volume as determined above and 340,000 m^3.

If gas deliveries to the Terminal Location have been ordered to be curtailed or discontinued in a contract year at the request of the Company and have been curtailed or discontinued as ordered, the Minimum Annual Volume shall be reduced for each day of curtailment or discontinuance by the excess of the Contract Demand over the volume delivered to the Terminal Location on such day.

SECTION F - PAYMENT CONDITIONS

Enbridge Gas Distribution charges are due when the bill is received, which is considered to be three days after the date the bill is rendered, or within such other time period as set out in the Service Contract. A late payment charge of 1.5% of all of the unpaid Enbridge Gas Distribution charges, including all applicable federal and provincial taxes, is applied to the account on the seventeenth (17^{th}) day following the date the bill is due.

SECTION G - TERM OF ARRANGEMENT

When gas service is provided and there is no written agreement in effect relating to the provision of such service, the term for which such service is to continue shall be one year. The term shall automatically be extended for a further year immediately following the expiry of any initial one year term or one year extension unless reasonable notice to terminate service is given to the Company, in a manner acceptable to the Company, prior to the expiry of the term. An Applicant receiving such service who temporarily discontinues service in the initial one year term or any one year extension and does not pay all the minimum bills for the period of such temporary discontinuance of service shall, upon the continuance of service, be liable to pay an amount equal to the unpaid minimum bills for such period. When a written agreement is in effect relating to the provision of gas service, the term for which such service is to continue shall be as provided for in the agreement.

SECTION H - RESALE PROHIBITION

Gas taken at a Terminal Location shall not be resold other than in accordance with all applicable laws and regulations and orders of any governmental authority or OEB having jurisdiction.

SECTION I - MEASUREMENT

The Company will install, operate and maintain at a Terminal Location such measurement equipment of suitable capacity and design as is required to measure the volume of gas delivered. Any special conditions for measurement are contained in the General Terms and Conditions which form part of each Large Volume Distribution Contract.

SECTION J - RATES IN CONTRACTS

Notwithstanding any rates for service specified in any Service Contract, the rates and charges provided for in an applicable Rate Schedule shall apply for service rendered on and after the effective date stated in such Rate Schedule until such Rate Schedule ceases to be applicable.

SECTION K - ADVICE RE: CURTAILMENT

The Company, if requested, will advise Applicants taking interruptible service of its estimate of service curtailment for the forthcoming winter. Such estimate will be provided as guidance to the Applicant in arranging for alternate fuel supply requirements. Abnormal weather and/or other unforeseen events may cause greater or lesser curtailment of service than expected.

SECTION L - DAILY DELIVERED VOLUMES

For purposes including that of calculating daily overrun gas volumes, the Company will recognize as having been delivered to it on a given day the sum of:

a) the volume of gas delivered under Intra-Alberta transportation arrangements, if any, plus;

b) the volume of gas delivered under FT transportation arrangements, if any, plus;

SECTION M - AUTHORIZED OVERRUN GAS

If an Applicant requests permission to exceed the Authorized Volume for a day, and such authorization is granted, such gas shall constitute Authorized Overrun Gas. Such gas shall either be sold by the Company to the Applicant pursuant to the provisions of Rate 320 applicable on such day, or, at the Company's sole discretion, under the Rate Schedule the customer is purchasing prior to such request. If the Applicant is supplying their own gas requirements and if the Applicant request and at the Company's sole discretion, such Overrun Gas will be debited to the Applicant's Baked gas Account.

SECTION N - UNAUTHORIZED SUPPLY OVERRUN GAS

If an Applicant for Transportation Service pursuant to the General Service Rates on any day delivers to the Company a Daily Delivered Volume less than the Mean Daily Volume, the volume of gas by which the Mean Daily Volume applicable to such day exceeds the Daily Delivered Volume delivered by the Applicant to the Company on such day shall constitute Unauthorized Supply Overrun Gas and shall be deemed to have been taken and purchased on such day. The rate applicable to such volume shall be 150% of the average price on each day on which an overrun occurred for the calendar month as published in the Gas Daily for the Niagara and Iroquois export points for the CDA and the EDA delivery areas respectively.

Unauthorized Supply Overrun Gas for a day applicable to a Service Contract with an Applicant for service under the Large Volume Distribution Contract Rates is:

(a) the volume of gas by which the Daily Gas Quantity under the Service Contract on such day exceeds the Authorized Volume for such day, if any

plus

(b) if the day is in the months of December to March inclusive for an Applicant taking service on Rate 135, or if the day is a day on or in respect of which the Applicant has been requested in accordance with the Service Contract to curtail or discontinue the use of gas and the Service Contract is in whole or in part for interruptible Transportation Service, the volume of gas, if any, by which

(i) the Mean Daily Volume set out in the Service Contract and is applicable to such day exceeds

(ii) the Daily Delivered Volume delivered by the Applicant to the Company on such day, which excess volume of gas shall be deemed to have been taken and purchased by the Applicant on such day.

The Applicant shall pay the Company for Unauthorized Supply Overrun Gas at the rate applicable to Unauthorized Supply Overrun Gas as provided for in the Rate Schedule(s) applicable to the Service Contract.

Unauthorized Supply Overrun Gas for a day applicable to a Service Contract with an Applicant for service under Rate 125 or Rate 300 shall be determined from the provisions of the applicable Rate Schedule. The Applicant shall pay the Company for Unauthorized Supply Overrun Gas at the rate applicable to Unauthorized Supply Overrun Gas as provided for in the Rate Schedule(s) applicable to the Service Contract.

PART IV

TERMS AND CONDITIONS – DIRECT PURCHASE ARRANGEMENTS

Any Applicant, at the time of applying for service, may elect, in and for the term of any Service Contract, to deliver its own natural gas requirements to the Company and the Company shall deliver gas to a Terminal Location as required by the Applicant, subject to the terms and conditions contained in the applicable Rate Schedule and in the Service Contract. For Buy/Sell Arrangements and Bundled T-Service the deliveries by the Applicant to the Company shall be at the Applicant's estimated mean daily rate of consumption.

Backstopping of an Applicant's natural gas supply for Transportation Service arrangements will be available pursuant to Rate 320 subject to the Company's ability to do so using reasonable commercial efforts. Gas Purchase Agreements in respect to Buy/Sell Arrangements shall specify terms and conditions available to the Company to alleviate certain consequences of the Applicant's failure to deliver the required volume of gas.

The following Terms and Conditions shall apply to, and only to, Transportation Service and/or Gas Purchase Agreements.

SECTION A - NOMINATIONS

An Applicant delivering gas to the Company pursuant to a contract is responsible for advising the Company, by means of a contractually specified Nomination procedure, of the daily volume of gas to be delivered to the Company by or on behalf of the Applicant.

An initial daily volume must be Nominated by a contractually specified time before the first day on which gas is to be delivered to the Company. Any Nomination, once accepted by the Company, shall be considered as a standing nomination applicable to each subsequent day in a contract term unless specifically varied by written notice to the Company.

A contract may specify certain contractual provisions that are applicable in the event that an Applicant either fails to advise of a revised daily nomination or fails to deliver the daily volume so nominated.

A Nominated Volume in excess of the Applicant's Maximum Daily Volume as specified in the Service Contract will not be accepted except as specifically provided for in any contract.

SECTION B - OBLIGATION TO DELIVER

During any period of curtailment or discontinuance of Bundled interruptible Transportation Service as ordered by the Company, any Applicant supplying its own gas requirements must, on such day, deliver to the Company the Mean Daily Volume of gas specified in any Service Contract.

An Applicant taking service on Rate 135 must deliver to the Company the Mean Daily Volume of gas specified in the Service Contract in the months of December to March, inclusive.

Applicants taking service on General Service rates pursuant to a Direct Purchase Agreement must, on each day in the term of such agreement, deliver to the Company the Mean Daily Volume of gas specified in such agreement.

SECTION C - DIVERSION RIGHTS

Subject to compliance with the Terms and Conditions of all Required Orders, an Applicant who has entered into a Transportation Service Agreement or Agreements which provide(s) for deliveries to the Company for more than one Terminal Location shall have the right, on such terms and only on such terms as are specified in the applicable Transportation Service Agreement, to divert deliveries from one or more contractually specified Terminal Locations to other contractually specified Terminal Locations.

SECTION D - BANKED GAS ACCOUNT

For T-Service Applicants, the Company shall keep a record ("Banked Gas Account") of the volume of gas delivered by the Applicant to the Company in respect of a Terminal Location (credits) and of the volume of gas taken by the Applicant at the Terminal Location (debits). (Any volume of gas sold by the Company to the Applicant in respect to the Terminal Location shall not be debited to the Banked Gas Account). The Company shall periodically report to the Applicant the net balance in the Applicant's Banked Gas Account.

SECTION E - DISPOSITION OF BANKED GAS ACCOUNT BALANCES

A. The following Terms and Conditions shall apply to Bundled T-Service:

(a) At the end of each contract year, disposition of any net debit balance in the Banked Gas Account shall be made as follows:

The Applicant, by written notice to the Company within thirty (30) days of the end of the contract year, may elect to return to the Company, in kind, during the one hundred and eighty (180) days following the end of the contract year that portion of any debit balance in the Banked Gas Account as at the end of the contract year not exceeding a volume of twenty times the Applicant's Mean Daily Volume by the Applicant delivering to the Company on days agreed upon by the Company and the Applicant a volume of gas greater than the Mean Daily Volume, if any, applicable to such day under a Service Contract. Any volume of gas returned to the Company as aforesaid shall not be credited to the Banked Gas Account in the subsequent contract year. Any debit balance in the Banked Gas Account as at the end of the contract year which is not both elected to be returned, and actually returned, to the Company as aforesaid shall be deemed to have been sold to the Applicant and the Applicant shall pay for such gas within ten (10) days of the rendering of a bill therefor. The rate applicable to such gas shall be 120% of the average price over the contracted year, based on the published index price for the Monthly AECO/NIT supply adjusted for Nova's AECO to Empress transportation tolls and compressor fuel costs.

(b)A credit balance in the Banked Gas Account as at the end of the contract year must be eliminated in one or more of the following manners, namely:

(i) Subject to clause (ii), if the Applicant continues to take service from the Company under a contract pursuant to which the Applicant delivers gas to the Company and the Applicant so elects (by written notice to the Company within thirty (30) days of the end of the contract year), that portion of such balance which the Applicant stipulates in such written notice and which does not exceed twenty times the Applicant's Mean Daily Volume may be carried forward as a credit to the Banked Gas Account for the next succeeding contract year. Any volume duly elected to be carried forward under this clause shall, and may only, be reduced within the period of one hundred and eighty (180) days ("Adjustment Period") immediately following the contract year, by the Applicant delivering to the Company, on days in the Adjustment Period agreed upon by the Company and the Applicant ("Adjustment Days"), a volume of gas less than the Mean Daily Volume applicable to such day under a Service Contract. Subject to the foregoing, the credit balance in the Banked Gas Account shall be deemed to be reduced on each Adjustment Day by the volume ("Daily Reduction Volume") by which the Mean Daily Volume applicable to such day exceeds the greater of the volume of gas delivered by the Applicant on such day and the Nominated Volume for such day which was accepted by the Company.

(ii) Any portion of a credit balance in the Banked Gas Account which is not eligible to be eliminated in accordance with clause (i), or which the Applicant elects (by written notice to the Company within thirty (30) days of the end of the contract year) to sell under this clause, shall be deemed to have been tendered for sale to the Company and the Company shall purchase such portion at a price per cubic metre of eighty percent (80%) of the average price over the contract year, based on the published index price for the Monthly AECO/NIT supply adjusted for Nova's AECO to Empress transportation tolls and compressor fuel costs, less the average Ontario Transportation Service Credit over the contract year. Any volume of gas deemed to have been so tendered for sale shall be deemed to have been eliminated from the credit balance of the Banked Gas Account.

During the Adjustment Period the Company shall use reasonable efforts to accept the Applicant's reduced gas deliveries. Any credit balance in the Banked Gas Account not eliminated as aforesaid in the Adjustment Period shall be forfeited to, and be the property of, the Company, and such volume of gas shall be debited to the Banked Gas Account as at the end of the Adjustment Period.

Subject to its ability to do so, the Company will attempt to accommodate arrangements which would permit adjustments to Banked Gas Account balances at times and in a manner which are mutually agreed upon by the Applicant and the Company.

B. The following Terms and Conditions shall apply to Unbundled T-Service:

The Terms and Conditions for disposition of Banked Gas Account balances shall be as specified in the applicable Service Contracts.

RATE NUMBER: 1	RESIDENTIAL SERVICE

APPLICABILITY:

To any Applicant needing to use the Company's natural gas distribution network to have transported a supply of natural gas to a residential building served through one meter and containing no more than six dwelling units ("Terminal Location").

RATE:

Rates per cubic metre assume an energy content of 37.69 MJ/m³.

	Billing Month January to December
Monthly Customer Charge	**$11.88**
Delivery Charge per cubic metre	
For the first 30 m³ per month	**14.8804 ¢/m³**
For the next 55 m³ per month	**14.2171 ¢/m³**
For the next 85 m³ per month	**13.6973 ¢/m³**
For all over 170 m³ per month	**13.3103 ¢/m³**
System Sales Gas Supply Charge per cubic metre (If applicable)	**34.1108 ¢/m³**

The rates quoted above shall be subject to the Gas Cost Adjustment contained in Rider “C” and the Revenue Adjustment Rider contained in Rider "E". Also, meter readings will be adjusted by the Atmospheric Pressure Factor relevant to the customer’s location as shown in Rider “F”.
The Gas Supply Charge is applicable if the Applicant is not providing its own supply of natural gas for transportation.

DIRECT PURCHASE ARRANGEMENTS:

Rider "A" or Rider "B" shall be applicable to Applicants who enter into Direct Purchase Arrangements under this Rate Schedule.

TERMS AND CONDITIONS OF SERVICE:

The provisions of PARTS III and IV of the Company's **HANDBOOK OF RATES AND DISTRIBUTION SERVICES** apply, as contemplated therein, to service under this Rate Schedule.

EFFECTIVE DATE:

To apply to bills rendered for gas consumed by customers on and after January 1, 2007 under Sales Service and Transportation Service. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates as the Board Order, EB-2006-0288.

RATE NUMBER: 6	GENERAL SERVICE

APPLICABILITY:

To any Applicant needing to use the Company's natural gas distribution network to have transported a supply of natural gas to a single terminal location ("Terminal Location") for non-residential purposes.

RATE:

Rates per cubic metre assume an energy content of 37.69 MJ/m³.

	Billing Month January to December
Monthly Customer Charge	**$23.58**
Delivery Charge per cubic metre	
For the first 500 m³ per month	**13.9886 ¢/m³**
For the next 1050 m³ per month	**11.7886 ¢/m³**
For the next 4500 m³ per month	**10.2485 ¢/m³**
For the next 7000 m³ per month	**9.2586 ¢/m³**
For the next 15250 m³ per month	**8.8185 ¢/m³**
For all over 28300 m³ per month	**8.7085 ¢/m³**
System Sales Gas Supply Charge per cubic metre (If applicable)	**34.2738 ¢/m³**

The rates quoted above shall be subject to the Gas Cost Adjustment contained in Rider “C” and the Revenue Adjustment Rider contained in Rider "E". Also, meter readings will be adjusted by the Atmospheric Pressure Factor relevant to the customer’s location as shown in Rider “F”.
The Gas Supply Charge is applicable if the Applicant is not providing its own supply of natural gas for transportation.

DIRECT PURCHASE ARRANGEMENTS:

Rider "A" or Rider "B" shall be applicable to Applicants who enter into Direct Purchase Arrangements under this Rate Schedule.

TERMS AND CONDITIONS OF SERVICE:

The provisions of PARTS III and IV of the Company's **HANDBOOK OF RATES AND DISTRIBUTION SERVICES** apply, as contemplated therein, to service under this Rate Schedule.

EFFECTIVE DATE:

To apply to bills rendered for gas consumed by customers on and after January 1, 2007 under Sales Service and Transportation Service. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates as the Board Order, EB-2006-0288.

APPLICABILITY:

To any Applicant needing to use the Company's natural gas distribution network to have transported a supply of natural gas to a single terminal location ("Terminal Location") at which, such gas is authorized by the Company to be resold by filling pressurized containers.

RATE:

Rates per cubic metre assume an energy content of 37.69 MJ/m³.

	Billing Month January to December
Monthly Customer Charge	**$220.55**
Delivery Charge per cubic metre	
For the first 20,000 m³ per month	**13.6756 ¢/m³**
For all over 20,000 m³ per month	**13.0346 ¢/m³**
System Sales Gas Supply Charge per cubic metre (If applicable)	**33.9398 ¢/m³**

The rates quoted above shall be subject to the Gas Cost Adjustment contained in Rider “C” and the Revenue Adjustment Rider contained in Rider "E". In addition, meter readings will be adjusted by the Atmospheric Pressure Factor relevant to the customer’s location as shown in Rider "F". The Gas Supply Charge is applicable if the Applicant is not providing its own supply of natural gas for transportation.

DIRECT PURCHASE ARRANGEMENTS:

Rider "A" or Rider "B" shall be applicable to Applicants who enter into Direct Purchase Arrangements under this Rate Schedule.

TERMS AND CONDITIONS OF SERVICE:

The provisions of PARTS III and IV of the Company's **HANDBOOK OF RATES AND DISTRIBUTION SERVICES** apply, as contemplated therein, to service under this Rate Schedule.

EFFECTIVE DATE:

To apply to bills rendered for gas consumed by customers on and after January 1, 2007 under Sales Service and Transportation Service. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates as the Board Order, EB-2006-0288.

APPLICABILITY:

To any Applicant who enters into a Service Contract with the Company to use the Company's natural gas distribution network for the transportation, to a single terminal location ("Terminal Location"), of a specified annual volume of natural gas of not less than 340,000 cubic metres to be delivered at a specified maximum daily rate.

CHARACTER OF SERVICE:

Service shall be continuous (firm) except for events as specified in the Service Contract including force majeure.

RATE:

Rates per cubic metre assume an energy content of 37.69 MJ/m³.

	Billing Month January to December
Monthly Customer Charge	**$115.10**
Delivery Charge	
Per cubic metre of Contract Demand	**8.0000 ¢/m³**
For the first 14,000 m³ per month	**4.8245 ¢/m³**
For the next 28,000 m³ per month	**3.4655 ¢/m³**
For all over 42,000 m³ per month	**2.9065 ¢/m³**
Gas Supply Load Balancing Charge	**4.3285 ¢/m³**
System Sales Gas Supply Charge per cubic metre (If applicable)	**33.9953 ¢/m³**

The rates quoted above shall be subject to the Gas Cost Adjustment contained in Rider "C" and the Revenue Adjustment Rider contained in Rider "E". In addition, meter readings will be adjusted by the Atmospheric Pressure Factor relevant to the customer's location as shown in Rider "F". The Gas Supply Charge is applicable if the Applicant is not providing its own supply of natural gas for transportation.

DIRECT PURCHASE ARRANGEMENTS:

Rider "A" or Rider "B" shall be applicable to Applicants who enter into Direct Purchase Arrangements under this Rate Schedule.

UNAUTHORIZED OVERRUN GAS RATE:

When the Applicant takes Unauthorized Supply Overrun Gas, the Applicant shall purchase such gas at a rate of 150% of the average price on each day on which an overrun occurred for the calendar month as published in the Gas Daily for the Niagara and Iroquois export points for the CDA and EDA respectively.

On the second and subsequent occasion in a contract year when the Applicant takes Unauthorized Demand Overrun Gas, a new Contract Demand will be established and shall be charged equal to 120% of the applicable monthly charge for twelve months of the current contract term, including retroactively based on the terms of the Service Contract.

MINIMUM BILL:

Per cubic metre of Annual Volume Deficiency
(See Terms and Conditions of Service):

9.0554 ¢/m³

TERMS AND CONDITIONS OF SERVICE:

The provisions of PARTS III and IV of the Company's **HANDBOOK OF RATES AND DISTRIBUTION SERVICES** apply, as contemplated therein, to service under this Rate Schedule.

EFFECTIVE DATE:

To apply to bills rendered for gas consumed by customers on and after January 1, 2007 under Sales Service and Transportation Service. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates as the Board Order, EB-2006-0288.

RATE NUMBER: **110**	**LARGE VOLUME LOAD FACTOR SERVICE**

APPLICABILITY:

To any Applicant who enters into a Service Contract with the Company to use the Company's natural gas distribution network for the transportation, to a single terminal location ("Terminal Location"), of an annual supply of natural gas of not less than 183 times a specified maximum daily volume of not less than 1,865 cubic metres.

CHARACTER OF SERVICE:

Service shall be continuous (firm) except for events as specified in the Service Contract including force majeure.

RATE:

Rates per cubic metre assume an energy content of 37.69 MJ/m³.

	Billing Month
	January to December
Monthly Customer Charge	**$554.50**
Delivery Charge	
Per cubic metre of Contract Demand	**22.1800 ¢/m³**
Per cubic metre of gas delivered	
For the first 1,000,000 m³ per month	**0.5044 ¢/m³**
For all over 1,000,000 m³ per month	**0.3544 ¢/m³**
Gas Supply Load Balancing Charge	**3.8370 ¢/m³**
System Sales Gas Supply Charge per cubic metre (If applicable)	**33.9398 ¢/m³**

The rates quoted above shall be subject to the Gas Cost Adjustment contained in Rider “C” and the Revenue Adjustment Rider contained in Rider "E". In addition, meter readings will be adjusted by the Atmospheric Pressure Factor relevant to the customer’s location as shown in Rider "F". The Gas Supply Charge is applicable if the Applicant is not providing its own supply of natural gas for transportation.

DIRECT PURCHASE ARRANGEMENTS:

Rider "A" or Rider "B" shall be applicable to Applicants who enter into Direct Purchase Arrangements under this Rate Schedule.

UNAUTHORIZED OVERRUN GAS RATE:

When the Applicant takes Unauthorized Supply Overrun Gas, the Applicant shall purchase such gas at a rate of 150% of the average price on each day on which an overrun occurred for the calendar month as published in the Gas Daily for the Niagara and Iroquois export points for the CDA and EDA respectively.

On the second and subsequent occasion in a contract year when the Applicant takes Unauthorized Demand Overrun Gas, a new Contract Demand will be established and shall be charged equal to 120% of the applicable monthly charge for twelve months of the current contract term, including retroactively based on the terms of the Service Contract.

MINIMUM BILL:

Per cubic metre of Annual Volume Deficiency
(See Terms and Conditions of Service):

4.2438 ¢/m³

In determining the Annual Volume Deficiency, the minimum bill multiplier shall not be less than 183.

TERMS AND CONDITIONS OF SERVICE:

The provisions of PARTS III and IV of the Company's **HANDBOOK OF RATES AND DISTRIBUTION SERVICES** apply, as contemplated therein, to service under this Rate Schedule.

EFFECTIVE DATE:

To apply to bills rendered for gas consumed by customers on and after January 1, 2007 under Sales Service and Transportation Service. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates as the Board Order, EB-2006-0288.

RATE NUMBER: **115**	**LARGE VOLUME LOAD FACTOR SERVICE**

APPLICABILITY:

To any Applicant who enters into a Service Contract with the Company to use the Company's natural gas distribution network for the transportation, to a single terminal location ("Terminal Location"), of an annual supply of natural gas of not less than 292 times a specified maximum daily volume of not less than 1,165 cubic metres.

CHARACTER OF SERVICE:

Service shall be continuous (firm) except for events as specified in the Service Contract including force majeure.

RATE:

Rates per cubic metre assume an energy content of 37.69 MJ/m³.

	Billing Month January to December
Monthly Customer Charge	**$610.78**
Delivery Charge	
Per cubic metre of Contract Demand	**24.4300 ¢/m³**
Per cubic metre of gas delivered	
For the first 1,000,000 m³ per month	**0.2730 ¢/m³**
For all over 1,000,000 m³ per month	**0.1730 ¢/m³**
Gas Supply Load Balancing Charge	**3.0382 ¢/m³**
System Sales Gas Supply Charge per cubic metre (If applicable)	**33.9398 ¢/m³**

The rates quoted above shall be subject to the Gas Cost Adjustment contained in Rider "C" and the Revenue Adjustment Rider contained in Rider "E". In addition, meter readings will be adjusted by the Atmospheric Pressure Factor relevant to the customer's location as shown in Rider "F". The Gas Supply Charge is applicable if the Applicant is not providing its own supply of natural gas for transportation.

DIRECT PURCHASE ARRANGEMENTS:

Rider "A" or Rider "B" shall be applicable to Applicants who enter into Direct Purchase Arrangements under this Rate Schedule.

UNAUTHORIZED OVERRUN GAS RATE:

When the Applicant takes Unauthorized Supply Overrun Gas, the Applicant shall purchase such gas at a rate of 150% of the average price on each day on which an overrun occurred for the calendar month as published in the Gas Daily for the Niagara and Iroquois export points for the CDA and EDA respectively.

On the second and subsequent occasion in a contract year when the Applicant takes Unauthorized Demand Overrun Gas, a new Contract Demand will be established and shall be charged equal to 120% of the applicable monthly charge for twelve months of the current contract term, including retroactively based on the terms of the Service Contract.

RATE NUMBER: **115**

MINIMUM BILL:

Per cubic metre of Annual Volume Deficiency
(See Terms and Conditions of Service):

3.2136 ¢/m³

In determining the Annual Volume Deficiency the minimum bill multiplier shall not be less than 292.

TERMS AND CONDITIONS OF SERVICE:

The provisions of PARTS III and IV of the Company's **HANDBOOK OF RATES AND DISTRIBUTION SERVICES** apply, as contemplated therein, to service under this Rate Schedule.

EFFECTIVE DATE:

To apply to bills rendered for gas consumed by customers on and after January 1, 2007 under Sales Service and Transportation Service. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates as the Board Order, EB-2006-0288.

RATE NUMBER: **125**	**EXTRA LARGE FIRM DISTRIBUTION SERVICE**

APPLICABILITY:

To any Applicant who enters into a Service Contract with the Company to use the Company's natural gas distribution network for the transportation, to a single terminal location ("Terminal Location"), of a specified maximum daily volume of natural gas. The maximum daily volume for billing purposes, Contract Demand or Billing Contract Demand, as applicable, shall not be less than 600,000 cubic metres. The Service under this rate requires Automatic Meter Reading (AMR) capability.

CHARACTER OF SERVICE:

Service shall be firm except for events specified in the Service Contract including force majeure.

For Non-Dedicated Service the monthly demand charges payable shall be based on the Contract Demand which shall be 24 times the Hourly Demand and the Applicant shall not exceed the Hourly Demand.

For Dedicated Service the monthly demand charges payable shall be based on the Billing Contract Demand specified in the Service Contract. The Applicant shall not exceed an hourly flow calculated as 1/24th of the Contract Demand specified in the Service Contract.

DISTRIBUTION RATES:

The following rates and charges, as applicable, shall apply for deliveries to the Terminal Location.

Monthly Customer Charge	**$500.00**
Demand Charge	
Per cubic metre of the Contract Demand or the Billing Contract Demand, as applicable, per month	**8.9017 ¢/m³**
Direct Purchase Administration Charge	**$50.00**
Forecast Unaccounted For Gas Percentage	**0.3%**

Monthly Minimum Bill: The Monthly Customer Charge plus the Monthly Demand Charge.

TERMS AND CONDITIONS OF SERVICE:

1. To the extent that this Rate Schedule does not specifically address matters set out in PARTS III and IV of the Company's **HANDBOOK OF RATES AND DISTRIBUTION SERVICES** then the provisions in those Parts shall apply, as contemplated therein, to service under this Rate Schedule.

2. **Unaccounted for Gas (UFG) Adjustment Factor**:

   The Applicant is required to deliver to the Company on a daily basis the sum of: (a) the volume of gas to be delivered to the Applicant's Terminal Location; and (b) a volume of gas equal to the forecast unaccounted for gas percentage as stated above multiplied by (a). In the case of a Dedicated Service, the Unaccounted for Gas volume requirement is not applicable.

3. **Nominations**:

   Customer shall nominate gas delivery daily based on the gross commodity delivery required to serve the customer's daily load plus the UFG. Customers may change daily nominations based on the nomination windows within a day as defined by the customer contract with TransCanada PipeLines (TCPL) or Union Gas Limited.

   Schedule of nominations under Rate 125 has to match upstream nominations. This rate does not allow for any more flexibility than exists upstream of the EGD gas distribution system. Where the customer's nomination does not match the confirmed upstream nomination, the nomination will be confirmed at the upstream value.

   Customer may nominate gas to a contractually specified Primary Delivery Area that may be EGD's Central Delivery Area (CDA) or EGD's Eastern Delivery Area (EDA). The Company may accept deliveries at a Secondary Delivery Area such as Dawn, at its sole discretion. Quantities of gas nominated to the system cannot exceed the Contract Demand, unless Make-up Gas or Authorized Overrun is permitted.

Customers with multiple Rate 125 contracts within a Primary Delivery Area may combine nominations subject to system operating requirements and subject to the Contract Demand for each Terminal Location. For combined nominations the customer shall specify the quantity of gas to each Terminal Location and the order in which gas is to be delivered to each Terminal Location. The specified order of deliveries shall be used to administer Load Balancing Provisions to each Terminal Location. When system conditions require delivery to a single Terminal Location only, nominations with different Terminal Locations may not be combined.

The Company permits pooling of Rate 125 contracts for legally related customers who meet the Business Corporations Act (Ontario) ("OBCA") definition of "affiliates" to allow for the management of those contracts by a single manager. The single manager is jointly liable with the individual customers for all of their obligations under the contracts, while the individual customers are severally liable for all of their obligations under their own contracts.

4. **Authorized Demand Overrun:**

The Company may, at its sole discretion, authorize consumption of gas in excess of the Contract Demand for limited periods within a month, provided local distribution facilities have sufficient capacity to accommodate higher demand. In such circumstances, customer shall nominate gas delivery based on the gross commodity delivery (the sum of the customer's Contract Demand and the authorized overrun amount) required to serve the customer's daily load, plus the UFG. In the event that gas usage exceeds the gas delivery on a day where demand overrun is authorized, the excess gas consumption shall be deemed Supply Overrun Gas.
Such service shall not exceed 5 days in any contract year. Based on the terms of the Service Contract, requests beyond 5 days will constitute a request for a new Contract Demand level with retroactive charges. The new Contract Demand level may be restricted by the capability of the local distribution facilities to accommodate higher demand.

Automatic authorization of transportation overrun over the Billing Contract Demand will be given in the case of Dedicated Service to the Terminal Location provided that pipeline capacity is available and subject to the Contract Demand as specified in the Service Contract.

Authorized Demand Overrun Rate	**0.29 ¢/m³**

The Authorized Demand Overrun Rate may be applied to commissioning volumes at the Company's sole discretion, for a contractual period of not more than one year, as specified in the Service Contract.

5. **Unauthorized Demand Overrun:**

Any gas consumed in excess of the Contract Demand and/or maximum hourly flow requirements, if not authorized, will be deemed to be Unauthorized Demand Overrun gas. Unauthorized Demand Overrun gas may establish a new Contract Demand effective immediately and shall be subject to a charge equal to 120 % of the applicable monthly charge for twelve months of the current contract term, including retroactively based on terms of Service Contract. Based on capability of the local distribution facilities to accommodate higher demand, different conditions may apply as specified in the applicable Service Contract. Unauthorized Demand Overrun gas shall also be subject to Unauthorized Supply Overrun provisions.

6. **Unauthorized Supply Overrun:**

Any volume of gas taken by the Applicant on a day at the Terminal Location which exceeds the sum of:

i. any applicable provisions of Rate 315 and any applicable Load Balancing Provision pursuant to Rate 125, plus

ii. the volume of gas delivered by the Applicant on that day shall constitute Unauthorized Supply Overrun Gas.

The Company may also deem volumes of gas to be Unauthorized Supply Overrun gas in other circumstances, as set out in the Load Balancing Provisions of Rate 125.

Any gas deemed to be Unauthorized Overrun gas shall be purchased by the customer at a price (Pe), which is equal to 150% of the highest price in effect for that day as defined below***.**

7. **Unauthorized Supply Underrun:**

Any volume of gas delivered by the Applicant on any day in excess of the sum of:

i. any applicable provisions of Rate 315 and any applicable Load Balancing Provision pursuant to Rate 125, plus

ii. the volume of gas taken by the Applicant at the Terminal Location on that day shall be classified as Supply Underrun Gas.

The Company may also deem volumes of gas to be Unauthorized Supply Underrun gas in other circumstances, as set out in the Load Balancing Provisions of Rate 125.

Any gas deemed to be Unauthorized Supply Underrun Gas shall be purchased by the Company at a price (P_u) which is equal to fifty percent (50%) of the lowest price in effect for that day as defined below**.

* where the price P_e expressed in cents / cubic metre is defined as follows:
$P_e = (P_m * E_r * 100 * 0.03769 / 1.055056) * 1.5$

P_m = highest daily price in U.S. $/mmBtu published in the Gas Daily, a Platts Publication, for that day under the column "Absolute", for the Niagara export point if the terminal location is in the CDA delivery area, and the Iroquois export point if the terminal location is in the EDA delivery area.

E_r = Noon day spot exchange rate expressed in Canadian dollars per U.S. dollar for such day quoted by the Bank of Canada in the following day's Globe & Mail Publication.

1.055056 = Conversion factor from mmBtu to GJ.

0.03769 = Conversion factor from GJ to cubic metres.

** where the price P_u expressed in cents / cubic metre is defined as follows:
$P_u = (P_l * E_r * 100 * 0.03769 / 1.055056) * 0.5$

P_l = lowest daily price in U.S. $/mmBtu published in the Gas Daily, a Platts Publication, for that day under the column "Absolute", for the Niagara export point if the terminal location is in the CDA delivery area, and the Iroquois export point if the terminal location is in the EDA delivery area.

Term of Contract:

A minimum of one year. A longer-term contract may be required if incremental contracts/assets/facilities have been procured/built for the customer. Migration from an unbundled rate to bundled rate may be restricted subject to availability of adequate transportation and storage assets.

Right to Terminate Service:

The Company reserves the right to terminate service to customers served hereunder where the customer's failure to comply with the parameters of this rate schedule, including the load balancing provisions, jeopardizes either the safety or reliability of the gas system. The Company shall provide notice to the customer of such termination; however, no notice is required to alleviate emergency conditions.

LOAD BALANCING PROVISIONS:

Load Balancing Provisions shall apply at the customer's Terminal Location or at the location of the meter installation for a customer served from a dedicated facility. In the event of an imbalance any excess delivery above the customer's actual consumption or delivery less than the actual consumption shall be subject to the Load Balancing Provisions.

Definitions:

Aggregate Delivery:

The Aggregate Delivery for a customer's account shall equal the sum of the confirmed nominations of the customer for delivery of gas to the applicable delivery area from all pipeline sources including where applicable, the confirmed nominations of the customer for Storage Service under Rate 316 or Rate 315 and any available No-Notice Storage Service under Rate 315 for delivery of gas to the Applicable Delivery Area.

Applicable Delivery Area:

The Applicable Delivery Area for each customer shall be specified by contract as a Primary Delivery Area. Where system-operating conditions permit, the Company, in its sole discretion, may accept a Secondary Delivery Area as the Applicable Delivery Area by confirming the customer's nomination of such area. Confirmation of a Secondary Delivery Area for a period of a gas day shall cause such area to become the Applicable Delivery Area for such day. Where delivery occurs at both a Terminal Location and a Secondary Delivery Area on a given day, the sum of the confirmed deliveries may not exceed the Contract Demand, unless Demand Overrun and/or Make-up Gas is authorized.

Primary Delivery Area:

The Primary Delivery Area shall be delivery area such as EGD's Central Delivery Area (CDA) or EGD's Eastern Delivery Area (EDA).

Secondary Delivery Area:

A Secondary Delivery Area may be a delivery area such as Dawn where the Company, at its sole discretion, determines that operating conditions permit gas deliveries for a customer.

Actual Consumption:

The Actual Consumption of the customer shall be the metered quantity of gas consumed at the customer's Terminal Location or in the event of combined nominations at the Terminal Locations specified.

Net Available Delivery:

The Net Available Delivery shall equal the Aggregate Delivery times one minus the annually determined percentage of Unaccounted for Gas (UFG) as reported by the Company.

Daily Imbalance:

The Daily Imbalance shall be the absolute value of the difference between Actual Consumption and Net Available Delivery.

Cumulative Imbalance (also referred to as Banked Gas Account):

The Cumulative Imbalance shall be the sum of the difference between Actual Consumption and Net Available Delivery since the date the customer last balanced or was deemed to have balanced its cumulative imbalance account.

Maximum Contractual Imbalance:

The Maximum Contractual Imbalance shall be equal to 60% of the customer's Contract Demand for non dedicated service and 60% of the Billing Contract Demand for dedicated service.

Winter and Summer Seasons:

The winter season shall commence on the date that the Company provides notice of the start of the winter period and conclude on the date that the Company provides notice of the end of the winter period. The summer season shall constitute all other days. The Company shall provide advance notice to the customer of the start and end of the winter season as soon as reasonably possible, but in no event not less than 2 days prior to the start or end.

Operational Flow Order:

An Operational Flow Order (OFO) shall constitute an issuance of instructions to protect the operational capacity and integrity of the Company's system, including distribution and/or storage assets, and/or connected transmission pipelines.

Enbridge Gas Distribution, acting reasonably, may call for an OFO in the following circumstances:

- Capacity constraint on the system, or portions of the system, or upstream systems, that are fully utilized;
- Conditions where the potential exists that forecasted system demand plus reserves for short notice services provided by the Company and allowances for power generation customers' balancing requirements would exceed facility capabilities and/or provisions of 3rd party contracts;
- Pressures on the system or specific portions of the system are too high or too low for safe operations;
- Storage system constraints on capacity or pressure or caused by equipment problems resulting in limited ability to inject or withdraw from storage;
- Pipeline equipment failures and/or damage that prohibits the flow of gas;
- Any and all other circumstances where the potential for system failure exists.

Daily Balancing Fee:

On any day where the customer has a Daily Imbalance the customer shall pay a Daily Balancing Fee equal to:

(Tier 1 Quantity X Tier 1 Fee) + (Tier 2 Quantity X Tier 2 Fee) + (Applicable Penalty Fee for Imbalance in excess of the Maximum Contractual Imbalance X the amount of Daily Imbalance in excess of the Maximum Contractual Imbalance)

Where Tier 1 and 2 Fees and Quantities are set forth as follows:

Tier 1 = 0.8857 cents/m3 applied to Daily Imbalance of greater than 2% but less than 10% of the Maximum Contractual Imbalance

Tier 2 = 1.0628 cents/m3 applied to Daily Imbalance of greater than 10% but less than the Maximum Contractual Imbalance

In addition for Tier 2, instances where the Daily Imbalance represents an under delivery of gas during the winter season shall constitute Unauthorized Supply Overrun Gas for all gas in excess of 10% of Maximum Contractual Imbalance. Where the Daily Imbalance represents an over delivery of gas during the summer season, the Company reserves the right to deem as Unauthorized Supply Underrun Gas for all gas in excess of 10% of Maximum Contractual Imbalance. The Company will issue a 24-hour advance notice to customers of its intent to impose cash out for over delivery of gas during the summer season.

The customers shall also pay any Load Balancing Agreement (LBA) charges imposed by the pipeline on days when the customer has a Daily Imbalance provided such imbalance matches the direction of the pipeline imbalance. LBA charges shall first be allocated to customers served under Rates 125 and 300. The system bears a portion of these charges only to the extent that the system incurs such charges based on its operation excluding the operation of customers under Rates 125 and 300. In that event, LBA charges shall be prorated based on the relative imbalances. The Company will provide the customer with a derivation of any such charges.

Customer's Actual Consumption cannot exceed Net Available Delivery when the Company issues an Operational Flow Order in the winter. Net nominations must not be less than consumption at the Terminal Location. Any negative Daily Imbalance on a winter Operational Flow Order day shall be deemed to be Unauthorized Supply Overrun. Customer's Net Available Delivery cannot exceed Actual Consumption when the Company issues an Operational Flow Order in the summer. Actual Consumption must not be less than net nomination at the Terminal Location. Any positive Daily Imbalance on a summer Operational Flow Order day shall be deemed to be Unauthorized Supply Underrun.

The Company will waive Daily Balancing Fee and Cumulative Imbalance Charge on the day of an Operational Flow Order if the customer used less gas that the amount the customer delivered to the system during the winter season or the customer used more gas than the amount the customer delivered to the system during the summer season. The Company will issue a 24-hour advance notice to customers of Operational Flow Orders and suspension of Load Balancing Provisions.

Cumulative Imbalance Charges:

Customers may trade Cumulative Imbalances within a delivery area. Customers may also title transfer gas from their Cumulative Imbalances Account (Banked Gas Account) into a Rate 316 storage account of the customer provided that the customer has space available in the storage account to accommodate the transfer.

Customers shall be permitted to nominate Make-up Gas, subject to operating constraints, provided that Make-up Gas plus Aggregate Delivery do not exceed the Contract Demand. The Company may, on days with no operating constraints, authorize Make-up Gas that, in conjunction with Aggregate Delivery, exceeds the Contract Demand.

The customer's Cumulative Imbalance cannot exceed its Maximum Contractual Imbalance. In the event that the customer cannot title transfer gas from their Cumulative Imbalances Account (Banked Gas Account) in whole or in part to storage the Company shall deem the excess imbalance to be Unauthorized Overrun or Underrun gas, as appropriate.

The Cumulative Imbalance Fee shall be equal to 0.9999 cents/m3 per unit of imbalance.

In addition, on any day that the Company declares an Operational Flow Order, negative Cumulative Imbalances greater than 10 % of Maximum Contractual Imbalance in the winter season shall be deemed to be Unauthorized Overrun Gas. The Company reserves the right to deem positive Cumulative Imbalances greater than 10% of Maximum Contractual Imbalance in the summer season as Unauthorized Supply Underun Gas. The Company will issue a 24-hour advance notice to customers of Operational Flow Orders including cash out instructions for Cumulative Imbalances greater than 10 % of Maximum Contractual Imbalance.

EFFECTIVE DATE:

To apply to bills rendered for gas delivered on or after July 1, 2007 or such earlier date as the Board may specify. This rate schedule is effective July 1, 2007 or such earlier date as the Board may specify.

APPLICABILITY:

To any Applicant who enters into a Service Contract with the Company to use the Company's natural gas distribution network for the transportation, to a single terminal location ("Terminal Location"), of an annual supply of natural gas of not less than 340,000 cubic metres.

CHARACTER OF SERVICE:

Service shall be continuous (firm) except for events as specified in the Service Contract including force majeure. A maximum of five percent of the contracted annual volume may be taken by the Applicant in a single month during the months of December to March inclusively.

RATE:

Rates per cubic metre assume an energy content of 37.69 MJ/m³.

	Billing Month	
	December to March	**April to November**
Monthly Customer Charge	**\$110.53**	**\$110.53**
Delivery Charge		
For the first 14,000 m³ per month	**6.6488 ¢/m³**	**1.9488 ¢/m³**
For the next 28,000 m³ per month	**5.4488 ¢/m³**	**1.2488 ¢/m³**
For all over 42,000 m³ per month	**5.0488 ¢/m³**	**1.0488 ¢/m³**
Gas Supply Load Balancing Charge	**2.5757 ¢/m³**	**2.5757 ¢/m³**
System Sales Gas Supply Charge per cubic metre (If applicable)	**34.0023 ¢/m³**	**34.0023 ¢/m³**

The rates quoted above shall be subject to the Gas Cost Adjustment contained in Rider “C” and the Revenue Adjustment Rider contained in Rider "E". In addition, meter readings will be adjusted by the Atmospheric Pressure Factor relevant to the customer’s location as shown in Rider "F". The Gas Supply Charge is applicable if the Applicant is not providing its own supply of natural gas for transportation.

DIRECT PURCHASE ARRANGEMENTS:

Rider "A" or Rider "B" shall be applicable to Applicants who enter into Direct Purchase Arrangements under this Rate Schedule.

UNAUTHORIZED OVERRUN GAS RATE:

When the Applicant takes Unauthorized Supply Overrun Gas, the Applicant shall purchase such gas at a rate of 150% of the average price on each day on which an overrun occurred for the calendar month as published in the Gas Daily for the Niagara and Iroquois export points for the CDA and EDA respectively.

Failure to deliver a volume of gas equal to the Mean Daily Volume set out in the Service Contract during the months of December to March inclusive may result in the Applicant not being eligible for service under this rate in a subsequent contract period, at the Company's sole discretion.

SEASONAL CREDIT:

Rate per cubic metre of Mean Daily Volume from December to March **\$ 0.77 /m³**

RATE NUMBER: **135**

SEASONAL OVERRUN CHARGE:

During the months of December through March inclusively, any volume of gas taken in a single month in excess of five percent of the annual contract volume (Seasonal Overrun Monthly Volume) will be subject to Seasonal Overrun Charges in place of both the Delivery and Gas Supply Load Balancing Charges. The Seasonal Overrun Charge applicable for the months of December and March shall be calculated as 2.0 times the sum of the Gas Supply Load Balancing Charge and the maximum Delivery Charge. The Seasonal Overrun Charge applicable for the months of January and February shall be calculated as 5.0 times the sum of the Load Balancing Charge and the maximum Delivery Charge.

Seasonal Overrun Charges:

December and March	**18.4490 ¢/m³**
January and February	**46.1225 ¢/m³**

MINIMUM BILL:

Per cubic metre of Annual Volume Deficiency (See Terms and Conditions of Service):	**5.9936 ¢/m³**

TERMS AND CONDITIONS OF SERVICE:

The provisions of PARTS III and IV of the Company's **HANDBOOK OF RATES AND DISTRIBUTION SERVICES** apply, as contemplated therein, to service under this Rate Schedule.

EFFECTIVE DATE:

To apply to bills rendered for gas consumed by customers on and after January 1, 2007 under Sales Service and Transportation Service. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates as the Board Order, EB-2006-0288.

APPLICABILITY:

To any Applicant who enters into a Service Contract with the Company to use the Company's natural gas distribution network for the transportation of a specified maximum daily volume of natural gas to a single terminal location ("Terminal Location") which can accommodate the total interruption of gas service as ordered by the Company exercising its sole discretion. Any Applicant for service under this rate schedule must agree to transport a minimum annual volume of 340,000 cubic metres.

CHARACTER OF SERVICE:

In addition to events as specified in the Service Contract including force majeure, service shall be subject to curtailment or discontinuance upon the Company issuing a notice not less than 72 hours prior to the time at which such curtailment or discontinuance is to commence. An Applicant may, by contract, agree to accept a shorter notice period.

RATE:

Rates per cubic metre assume an energy content of 37.69 MJ/m³.

	Billing Month January to December
Monthly Customer Charge	**$117.11**
Delivery Charge	
Per cubic metre of Firm Contract Demand	**8.0000 ¢/m³**
For the first 14,000 m³ per month	**2.8296 ¢/m³**
For the next 28,000 m³ per month	**1.4706 ¢/m³**
For all over 42,000 m³ per month	**0.9116 ¢/m³**
Gas Supply Load Balancing Charge	**4.0740 ¢/m³**
System Sales Gas Supply Charge per cubic metre (If applicable)	**34.0363 ¢/m³**

The rates quoted above shall be subject to the Gas Cost Adjustment contained in Rider “C” and the Revenue Adjustment Rider contained in Rider "E". In addition, meter readings will be adjusted by the Atmospheric Pressure Factor relevant to the customer’s location as shown in Rider "F". The Gas Supply Charge is applicable if the Applicant is not providing its own supply of natural gas for transportation.

DIRECT PURCHASE ARRANGEMENTS:

Rider "A" or Rider "B" shall be applicable to Applicants who enter into Direct Purchase Arrangements under this Rate Schedule.

CURTAILMENT CREDIT:

Rate for 16 hours of notice per cubic metre of Mean Daily Volume from December to March	**$**	**0.50 /m³**
Rate for 72 hours of notice per cubic metre of Mean Daily Volume from December to March	**$**	**0.11 /m³**

In addition, if the Applicant is supplying its own gas requirements, the gas delivered by the Applicant during the period of curtailment shall be purchased by the Company for the Company's use. The purchase price for such gas will be equal to the price that is reported for the month, in the first issue of the Natural Gas *Market Report* published by Canadian Enerdata Ltd. during the month, as the "current" "Avg." (i.e., average) "Alberta One-Month Firm Spot Price" for "AECO 'C' and Nova Inventory Transfer" in the table entitled "Domestic spot gas prices", adjusted for AECO to Empress transportation tolls and compressor fuel costs.

For the areas specified in Appendix A to this Rate Schedule, the Company's gas distribution network does not have sufficient physical capacity under current operating conditions to accommodate the provision of firm service to existing interruptible locations. For any location presently served or any new Applicant for service pursuant to this Rate Schedule in these areas, the Company shall purchase the rights to take service hereunder at 1.25 ¢/m³ per unit of Daily Capacity Repurchase Quantity.

UNAUTHORIZED OVERRUN GAS RATE:

When the Applicant takes Unauthorized Supply Overrun Gas, the Applicant shall purchase such gas at a rate of 150% of the average price on each day on which an overrun occurred for the calendar month as published in the Gas Daily for the Niagara and Iroquois export points for the CDA and EDA respectively.

On the second and subsequent occasion in a contract year when the Applicant takes Unauthorized Demand Overrun Gas, a new Contract Demand will be established and shall be charged equal to 120% of the applicable monthly charge for twelve months of the current contract term, including retroactively based on the terms of the Service Contract.

The third instance of such failure in any contract year may result in the Applicant forfeiting the right to be served under this Rate Schedule. In such case service hereunder would cease, notwithstanding any Service Contract between the Company and the Applicant. Gas supply and/or transportation service would continue to be available to the Applicant pursuant to the provisions of the Company's Rate 6 until a Service Contract pursuant to another applicable Rate Schedule was executed.

MINIMUM BILL:

Per cubic metre of Annual Volume Deficiency (See Terms and Conditions of Service):	**6.8060 ¢/m³**

TERMS AND CONDITIONS OF SERVICE:

The provisions of PARTS III and IV of the Company's **HANDBOOK OF RATES AND DISTRIBUTION SERVICES** apply, as contemplated therein, to service under this Rate Schedule.

EFFECTIVE DATE:

To apply to bills rendered for gas consumed by customers on and after January 1, 2007 under Sales Service and Transportation Service. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates as the Board Order, EB-2006-0288.

APPLICABILITY:

To any Applicant who enters into a Service Contract with the Company to use the Company's natural gas distribution network for the transportation of a specified maximum daily volume of natural gas of not less than 30,000 cubic metres and a minimum annual volume of 5,000,000 cubic metres to a single terminal location ("Terminal Location") which can accommodate the total interruption of gas service when required by the Company. The Company, exercising its sole discretion, may order interruption of gas service upon not less than four (4) hours notice.

CHARACTER OF SERVICE:

In addition to events as specified in the Service Contract including force majeure, service shall be subject to curtailment or discontinuance upon the Company issuing a notice not less than 4 hours prior to the time at which such curtailment or discontinuance is to commence.

RATE:

Rates per cubic metre assume an energy content of 37.69 MJ/m³.

	Billing Month January to December
Monthly Customer Charge	**$268.95**
Delivery Charge	
Per cubic metre of Contract Demand	**4.0300 ¢/m³**
Per cubic metre of gas delivered	
For the first 1,000,000 m³ per month	**0.5113 ¢/m³**
For all over 1,000,000 m³ per month	**0.3113 ¢/m³**
Gas Supply Load Balancing Charge	**3.4209 ¢/m³**
System Sales Gas Supply Charge per cubic metre (If applicable)	**33.9398 ¢/m³**

The rates quoted above shall be subject to the Gas Cost Adjustment contained in Rider “C” and the Revenue Adjustment Rider contained in Rider "E". In addition, meter readings will be adjusted by the Atmospheric Pressure Factor relevant to the customer’s location as shown in Rider "F". The Gas Supply Charge is applicable if the Applicant is not providing its own supply of natural gas for transportation.

DIRECT PURCHASE ARRANGEMENTS:

Rider "A" or Rider "B" shall be applicable to Applicants who enter into Direct Purchase Arrangements under this Rate Schedule.

CURTAILMENT CREDIT:

Rate for 4 hours of notice per cubic metre of Mean Daily Volume from December to March **$ 1.10 /m³**

In addition, if the Applicant is supplying its own gas requirements, the gas delivered by the Applicant during the period of curtailment shall be purchased by the Company for the Company's use. The purchase price for such gas will be equal to the price that is reported for the month, in the first issue of the Natural Gas *Market Report* published by Canadian Enerdata Ltd. during the month, as the "current" "Avg." (i.e., average) "Alberta One-Month Firm Spot Price" for "AECO 'C' and Nova Inventory Transfer" in the table entitled "Domestic spot gas prices", adjusted for AECO to Empress transportation tolls and compressor fuel costs.

For the areas specified in Appendix A to this Rate Schedule, the Company's gas distribution network does not have sufficient physical capacity under current operating conditions to accommodate the provision of firm service to existing interruptible locations. For any location presently served or any new Applicant for service pursuant to this Rate Schedule in these areas, the Company shall purchase the rights to take service hereunder at 1.25 ¢/m³ per unit of Daily Capacity Repurchase Quantity.

UNAUTHORIZED OVERRUN GAS RATE:

When the Applicant takes Unauthorized Supply Overrun Gas, the Applicant shall purchase such gas at a rate of 150% of the average price on each day on which an overrun occurred for the calendar month as published in the Gas Daily for the Niagara and Iroquois export points for the CDA and EDA respectively.

On the second and subsequent occasion in a contract year when the Applicant takes Unauthorized Demand Overrun Gas, a new Contract Demand will be established and shall be charged equal to 120% of the applicable monthly charge for twelve months of the current contract term, including retroactively based on the terms of the Service Contract.

The third instance of such failure in any contract year may result in the Applicant forfeiting the right to be served under this Rate Schedule. In such case service hereunder would cease, notwithstanding any Service Contract between the Company and the Applicant. Gas supply and/or transportation service would continue to be available to the Applicant pursuant to the provisions of the Company's Rate 6 until a Service Contract pursuant to another applicable Rate Schedule was executed.

MINIMUM BILL:

Per cubic metre of Annual Volume Deficiency
(See Terms and Conditions of Service): **3.8346 ¢/m³**

TERMS AND CONDITIONS OF SERVICE:

The provisions of PARTS III and IV of the Company's **HANDBOOK OF RATES AND DISTRIBUTION SERVICES** apply, as contemplated therein, to service under this Rate Schedule.

EFFECTIVE DATE:

To apply to bills rendered for gas consumed by customers on and after January 1, 2007 under Sales Service and Transportation Service. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates as the Board Order, EB-2006-0288.

APPLICABILITY:

To any Distributor who enters into a Service Contract with the Company to use the Company's natural gas distribution network for the transportation of an annual supply of natural gas to customers outside of the Company's franchise area.

CHARACTER OF SERVICE:

Service shall be continuous (firm), except for events as specified in the Service Contract including force majeure, up to the contracted firm daily demand and subject to curtailment or discontinuance, of demand in excess of the firm contract demand, upon the Company issuing a notice not less than 4 hours prior to the time at which such curtailment or discontinuance is to commence.

RATE:

Rates per cubic metre assume an energy content of 37.69 MJ/m³.

	Billing Month **January to December**
Monthly Customer Charge	
The monthly customer charge shall be negotiated with the applicant and shall not exceed:	**$2,000.00**
Delivery Charge	
Per cubic metre of Firm Contract Demand	**13.8300 ¢/m³**
Per cubic metre of gas delivered	**0.9629 ¢/m³**
Gas Supply Load Balancing Charge	**4.3007 ¢/m³**
System Sales Gas Supply Charge per cubic metre (If applicable)	**33.9398 ¢/m³**
Buy/Sell Sales Gas Supply Charge per cubic metre (If applicable)	**33.9212 ¢/m³**

The rates quoted above shall be subject to the Gas Inventory Adjustment contained in Rider "C" and the Revenue Adjustment Rider contained in Rider "E". Also, meter readings will be adjusted by the Atmospheric Pressure Factor relevant to the customer's location as shown in Rider "F". The Gas Supply Charge is applicable to volumes of natural gas purchased from the Company. The volumes purchased shall be the volumes delivered at the Point of Delivery less any volumes, which the Company does not own and are received at the Point of Acceptance for delivery to the Applicant at the Point of Delivery.

DIRECT PURCHASE ARRANGEMENTS:

Rider "A" or Rider "B" shall be applicable to Applicants who enter into Direct Purchase Arrangements under this Rate Schedule.

CURTAILMENT CREDIT:

Rate for 4 hours of notice per cubic metre of Mean Daily Volume from December to March **$ 1.10 /m³**

In addition, if the Applicant is supplying its own gas requirements, the gas delivered by the Applicant during the period of curtailment shall be purchased by the Company for the Company's use. The purchase price for such gas will be equal to the price that is reported for the month, in the first issue of the Natural Gas *Market Report* published by Canadian Enerdata Ltd. during the month, as the "current" "Avg." (i.e., average) "Alberta One-Month Firm Spot Price" for "AECO 'C' and Nova Inventory Transfer" in the table entitled "Domestic spot gas prices", adjusted for AECO to Empress transportation tolls and compressor fuel costs.

For the areas specified in Appendix A to this Rate Schedule, the Company's gas distribution network does not have sufficient physical capacity under current operating conditions to accommodate the provision of firm service to existing interruptible locations. For any location presently served or any new Applicant for service pursuant to this Rate Schedule in these areas, the Company shall purchase the rights to take service hereunder at 1.25 ¢/m³ per unit of Daily Capacity Repurchase Quantity.

UNAUTHORIZED OVERRUN GAS RATE:

When the Applicant takes Unauthorized Supply Overrun Gas, the Applicant shall purchase such gas at a rate of 150% of the average price on each day on which an overrun occurred for the calendar month as published in the Gas Daily for the Niagara and Iroquois export points for the CDA and EDA respectively.

On the second and subsequent occasion in a contract year when the Applicant takes Unauthorized Demand Overrun Gas, a new Contract Demand will be established and shall be charged equal to 120% of the applicable monthly charge for twelve months of the current contract term, including retroactively based on the terms of the Service Contract.

The third instance of such failure in any contract year may result in the Applicant forfeiting the right to be served under this Rate Schedule. In such case service hereunder would cease, notwithstanding any Service Contract between the Company and the Applicant. Gas supply and/or transportation service would continue to be available to the Applicant pursuant to the provisions of the Company's Rate 6 until a Service Contract pursuant to another applicable Rate Schedule was executed.

MINIMUM BILL:

Per cubic metre of Annual Volume Deficiency (See Terms and Conditions of Service):	**5.1661 ¢/m³**

TERMS AND CONDITIONS OF SERVICE:

The provisions of PARTS III and IV of the Company's **HANDBOOK OF RATES AND DISTRIBUTION SERVICES** apply, as contemplated therein, to service under this Rate Schedule.

EFFECTIVE DATE:

To apply to bills rendered for gas consumed by customers on and after January 1, 2007 under Sales Service including Buy/Sell Arrangements and Transportation Service. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates as the Board Order, EB-2006-0288.

RATE NUMBER: **300**	**FIRM OR INTERRUPTIBLE DISTRIBUTION SERVICE**

APPLICABILITY:

To any Applicant who enters into a Service Contract with the Company to use the Company's natural gas distribution network for the transportation to a single Terminal Location of a specified maximum daily volume of natural gas. The Company reserves the right to limit service under this schedule to customers whose maximum contract demand does not exceed 600,000 m3. The Service under this rate requires Automatic Meter Reading (AMR) capability. Service under this schedule is firm unless a customer is currently served under interruptible distribution service or the Company, in its sole judgment, determines that existing delivery facilities cannot adequately serve the load on a firm basis.

The unitized Monthly Contract Demand Charge is also applicable to volumes delivered to any Applicant taking service under a Curtailment Delivered Supply contract with the Company. The unitized rate equals the applicable Monthly Contract Demand Charge times 12/365.

CHARACTER OF SERVICE:

The Service shall be continuous (firm) except for events specified in the Service Contract including force majeure. The Applicant is neither allowed to take a daily quantity of gas greater than the Contract Demand nor an hourly amount in excess of the Contract Demand divided by 24, without the Company's prior consent. Interruptible Distribution Service is provided on a best efforts basis subject to the events identified in the service contract including force majeure and, in addition, shall be subject to curtailment or discontinuance of service when the Company notifies the customer under normal circumstances 4 hours prior to the time that service is subject to curtailment or discontinuance. Under emergency conditions, the Company may curtail or discontinue service on one-hour notice. The Interruptible Service Customer is not allowed to exceed maximum hourly flow requirements as specified in Service Contract.

DISTRIBUTION RATES:

Monthly Customer Charge	**$500.00**
Monthly Contract Demand Charge Firm	**24.0202 ¢/m³**
Interruptible Service:	
Minimum Delivery Charge	**0.3512 ¢/m³**
Maximum Delivery Charge	**0.9476 ¢/m³**
Forecast Unaccounted For Gas Percentage	**0.3%**

Monthly Minimum Bill: The Monthly Customer Charge plus the Monthly Contract Demand Charge.

TERMS AND CONDITIONS OF SERVICE:

1. To the extent that this Rate Schedule does not specifically address matters set out in PARTS III and IV of the Company's **HANDBOOK OF RATES AND DISTRIBUTION SERVICES** then the provisions in those Parts shall apply, as contemplated therein, to service under this Rate Schedule.

2. **Unaccounted for Gas (UFG) Adjustment Factor**:

   The Applicant is required to deliver to the Company on a daily basis the sum of: (a) the volume of gas to be delivered to the Applicant's Terminal Location; and (b) a volume of gas equal to the forecast unaccounted for gas percentage as stated above multiplied by (a).

3. **Nominations**:

   Customer shall nominate gas delivery daily based on the gross commodity delivery required to serve the customer's daily load plus the UFG, net of No-Notice Storage Service provisions under Rate 315, if applicable. The amount of gas delivered under No-Notice Storage Service will also be reduced by the UFG adjustment factor for delivery to the customer's meter.

   Customers may change daily nominations based on the nomination windows within a day as defined by the customer contract with TransCanada PipeLines (TCPL) or Union Gas Limited.

   Schedule of nominations under Rate 300 has to match upstream nominations. This rate does not allow for any more flexibility than exists upstream of the EGD gas distribution system. Where the customer's nomination does not match the confirmed upstream nomination, the nomination will be confirmed at the upstream value.

Customer may nominate gas to a contractually specified Primary Delivery Area that may be EGD's Central Delivery Area (CDA) or EGD's Eastern Delivery Area (EDA). The Company may accept deliveries at a Secondary Delivery Area such as Dawn, at its sole discretion. Quantities of gas nominated to the system cannot exceed Contract Demand, unless Make-up Gas or Authorized Overrun is permitted.

Customers with multiple Rate 300 contracts within a Primary Delivery Area may combine nominations subject to system operating requirements and subject to the Contract Demand for each Terminal Location. For combined nominations the customer shall specify the quantity of gas to each Terminal Location and the order in which gas is to be delivered to each Terminal Location. The specified order of deliveries shall be used to administer Load Balancing Provisions to each Terminal Location. When system conditions require delivery to a single Terminal Location only, nominations with different Terminal Locations may not be combined.

4. **Authorized Demand Overrun:**

The Company may, at its sole discretion, authorize consumption of gas in excess of the Contract Demand for limited periods within a month, provided local distribution facilities have sufficient capacity to accommodate higher demand. In such circumstances, customer shall nominate gas delivery based on the gross commodity delivery required to serve the customer's daily load, including quantities of gas in excess of the Contract Demand, plus the UFG. The Load Balancing Provisions and/or No-Notice Storage Service provisions under Rate 315 cannot be used for Authorized Demand Overrun. Failure to nominate gas deliveries to match Authorized Demand Overrun shall constitute Unauthorized Supply Overrun.

The rate applicable to Authorized Demand Overrun shall equal the applicable Monthly Demand Charge times 12/365 provided, however, that such service shall not exceed 5 days in any contract year. Requests beyond 5 days will constitute a request for a new Contract Demand level, with retroactive charges based on terms of Service Contract.

5. **Unauthorized Demand Overrun:**

Any gas consumed in excess of the Contract Demand and/or maximum hourly flow requirements, if not authorized, will be deemed to be Unauthorized Demand Overrun gas. Unauthorized Demand Overrun gas will establish a new Contract Demand and shall be subject to a charge equal to 120 % of the applicable monthly charge for twelve months of the current contract term, including retroactively based on terms of Service Contract. Unauthorized Demand Overrun gas shall also be subject to Unauthorized Supply Overrun provisions. Where a customer receives interruptible service hereunder and consumes gas during a period of interruption, such gas shall be deemed Unauthorized Supply Overrun. In addition to charges for Unauthorized Supply Overrun, interruptible customers consuming gas during a scheduled interruption shall pay a penalty charge of $18.00 per m3.

6. **Unauthorized Supply Overrun:**

Any volume of gas taken by the Applicant on a day at the Terminal Location which exceeds the sum of:

i. any applicable Load Balancing Provision pursuant to Rate 300 and/or provisions of Rate 315, plus

ii. the volume of gas delivered by the Applicant on that day shall constitute Unauthorized Supply Overrun Gas.

The Company may also deem volumes of gas to be Unauthorized Supply Overrun gas in other circumstances, as set out in the Load Balancing Provisions of Rate 300.

Any gas deemed to be Unauthorized Overrun gas shall be purchased by the customer at a price (Pe), which is equal to 150% of the highest price in effect for that day as defined below*.

7. **Unauthorized Supply Underrun:**

Any volume of gas delivered by the Applicant on any day in excess of the sum of:

i. any applicable Rate 300 Load Balancing Provision pursuant to Rate 300 and/or provisions of Rate 315, plus

ii. the volume of gas taken by the Applicant at the Terminal Location on that day shall be classified as Supply Underrun Gas.

The Company may also deem volumes of gas to be Unauthorized Supply Underrun gas in other circumstances, as set out in the Load Balancing Provisions of Rate 300.

Any gas deemed to be Unauthorized Supply Underrun Gas shall be purchased by the Company at a price (P_u) which is equal to fifty percent (50%) of the lowest price in effect for that day as defined below**.

* where the price P_e expressed in cents / cubic metre is defined as follows:
$P_e = (P_m * E_r * 100 * 0.03769 / 1.055056) * 1.5$

P_m = highest daily price in U.S. $/mmBtu published in the Gas Daily, a Platts Publication, for that day under the column "Absolute", for the Niagara export point if the terminal location is in the CDA delivery area, and the Iroquois export point if the terminal location is in the EDA delivery area.

E_r = Noon day spot exchange rate expressed in Canadian dollars per U.S. dollar for such day quoted by the Bank of Canada in the following days Globe & Mail Publication.

1.055056 = Conversion factor from mmBtu to GJ.

0.03769 = Conversion factor from GJ to cubic metres.

** where the price P_u expressed in cents / cubic metre is defined as follows:
$P_u = (P_l * E_r * 100 * 0.03769 / 1.055056) * 0.5$

P_l = lowest daily price in U.S. $/mmBtu published in the Gas Daily, a Platts Publication, for that day under the column "Absolute", for the Niagara export point if the terminal location is in the CDA delivery area, and the Iroquois export point if the terminal location is in the EDA delivery area.

Term of Contract:

A minimum of one year. A longer-term contract may be required if incremental assets/facilities have been procured/built for the customer. Migration from an unbundled rate to bundled rate may be restricted subject to availability of adequate transportation and storage assets.

Right to Terminate Service:

The Company reserves the right to terminate service to customers served hereunder where the customer's failure to comply with the parameters of this rate schedule, including interruptible service and load balancing provisions, jeopardizes either the safety or reliability of the gas system. The Company shall provide notice to the customer of such termination; however, no notice is required to alleviate emergency conditions.

Load Balancing:

Any difference between actual daily-metered consumption and the actual daily volume of gas delivered to the system less the UFG shall first be provided under the provisions of Rate 315 - Gas Storage Service, if applicable. Any remaining difference will be subject to the Load Balancing Provisions.

LOAD BALANCING PROVISIONS:

Load Balancing Provisions shall apply at the customer's Terminal Location.

In the event of an imbalance any excess delivery above the customer's actual consumption or delivery less than the actual consumption shall be subject to the Load Balancing Provisions.

Definitions:

Aggregate Delivery:

The Aggregate Delivery for a customer's account shall equal the sum of the confirmed nominations of the customer for delivery of gas to the applicable delivery area from all pipeline sources plus, where applicable, the confirmed nominations of the customer for Storage Service under Rate 316 or Rate 315 and any available No-Notice Storage Service under Rate 315 for delivery of gas to the Applicable Delivery Area.

Applicable Delivery Area:

The Applicable Delivery Area for each customer shall be specified by contract as a Primary Delivery Area. Where system-operating conditions permit, the Company, in its sole discretion, may accept a Secondary Delivery Area as the Applicable Delivery Area by confirming the customer's nomination of such area. Confirmation of a Secondary Delivery Area for a period of a gas day shall cause such area to become the Applicable Delivery Area for such day. Where delivery occurs at both a Terminal Location and a Secondary Delivery Area on a given day, the sum of the confirmed deliveries may not exceed Contract Demand, unless Demand Overrun and/or Make-up Gas is authorized.

Primary Delivery Area:

The Primary Delivery Area shall be delivery area such as EGD's Central Delivery Area (CDA) or EGD's Eastern Delivery Area (EDA).

Secondary Delivery Area:

A Secondary Delivery Area may be a delivery area such as Dawn where the Company, at its sole discretion, determines that operating conditions permit gas deliveries for a customer.

Actual Consumption:

The Actual Consumption of the customer shall be the metered quantity of gas consumed at the customer's premise.

Net Available Delivery:

The Net Available Delivery shall equal the Aggregate Delivery times one minus the annually determined percentage of Unaccounted for Gas (UFG) as reported by the Company.

Daily Imbalance:

The Daily Imbalance shall be the absolute value of the difference between Actual Consumption and Net Available Delivery.

Cumulative Imbalance (also referred to as Banked Gas Account):

The Cumulative Imbalance shall be the sum of the difference between Actual Consumption and Net Available Delivery.

Maximum Contractual Imbalance:

The Maximum Contractual Imbalance shall be equal to 60% of the customer's Contract Demand.

Winter and Summer Seasons:

The winter season shall commence on the date that the Company provides notice of the start of the winter period and conclude on the date that the Company provides notice of the end of the winter period. The summer season shall constitute all other days. The Company shall provide advance notice to the customer of the start and end of the winter season as soon as reasonably possible, but in no event not less than 2 days prior to the start or end.

Operational Flow Order:

An Operational Flow Order (OFO) shall constitute an issuance of instructions to protect the operational capacity and integrity of the Company's system, including distribution and/or storage assets, and/or connected transmission pipelines.

Enbridge Gas Distribution, acting reasonably, may call for an OFO in the following circumstances:

- Capacity constraint on the system, or portions of the system, or upstream systems, that are fully utilized;
- Conditions where the potential exists that forecasted system demand plus reserves for short notice services provided by the Company and allowances for power generation customers' balancing requirements would exceed facility capabilities and/or provisions of 3rd party contracts;
- Pressures on the system or specific portions of the system are too high or too low for safe operations;
- Storage system constraints on capacity or pressure or caused by equipment problems resulting in limited ability to inject or withdraw from storage;
- Pipeline equipment failures and/or damage that prohibits the flow of gas;
- Any and all other circumstances where the potential for system failure exists.

Daily Balancing Fee:

On any day where the customer has a Daily Imbalance the customer shall pay a Daily Balancing Fee equal to:

(Tier 1 Quantity X Tier 1 Fee) + (Tier 2 Quantity X Tier 2 Fee) + (Applicable Penalty Fee for Imbalance in excess of the Maximum Contractual Imbalance X the amount of Daily Imbalance in excess of the Maximum Contractual Imbalance)

Where Tier 1 and 2 Fees and Quantities are set forth as follows:

Tier 1 = Daily Imbalance of greater than 2% but less than 10% of the Maximum Contractual Imbalance and shall be subject to a charge of 0.8857 cents/M3

Tier 2 = Daily Imbalance of greater than 10% but less than Maximum Contractual Imbalance shall be subject to a charge of 1.0628 cents/m3

The customers shall also pay any Load Balancing Agreement (LBA) charges imposed by the pipeline on days when the customer has a Daily Imbalance provided such imbalance matches the direction of the pipeline imbalance. LBA charges shall first be allocated to customers served under Rate 125 and 300. The system bears a portion of these charges only to the extent that the system incurs such charges based on its operation excluding the operation of customers under Rates 125 and 300. In that event, LBA charges shall be prorated based on the relative imbalances.

A Daily Imbalance in excess of the Maximum Contractual Imbalance shall be deemed to be Unauthorized Supply Overrun or Underrun gas, as appropriate.

Customer's Actual Consumption cannot exceed Net Available Delivery when the Company issues an Operational Flow Order in the winter. Net nominations must not be less than consumption at the Terminal Location. Any negative Daily Imbalance on a winter Operational Flow Order day shall be deemed to be Unauthorized Supply Overrun. Customer's Net Available Delivery cannot exceed Actual Consumption when the Company issues an Operational Flow Order in the summer. Actual Consumption must not be less than net nomination at the Terminal Location. Any positive Daily Imbalance on a summer Operational Flow Order day shall be deemed to be Unauthorized Supply Underrun.

The Company will waive Daily Balancing Fee and Cumulative Imbalance Charge on the day of an Operational Flow Order if the customer used less gas that the amount the customer delivered to the system during the winter season or the customer used more gas than the amount the customer delivered to the system during the summer season. The Company will issue a 24-hour advance notice to customers of Operational Flow Orders and suspension of Load Balancing Provisions.

Cumulative Imbalance Charges:

Customers may trade Cumulative Imbalances within a delivery area.

Customers shall be permitted to nominate Make-up Gas, subject to operating constraints, provided that Make-up Gas plus Aggregate Delivery do not exceed Contract Demand. The Company may, on days with no operating constraints, authorize Make-up Gas that, in conjunction with Aggregate Delivery, exceeds Contract Demand.

The customer's Cumulative Imbalance cannot exceed its Maximum Contractual Imbalance. The excess imbalance shall be deemed to be Unauthorized Overrun or Underrun gas, as appropriate.

The Cumulative Imbalance Fee shall be equal to of 0.4362 cents/m3 per unit of imbalance.

The customer's Cumulative Imbalance shall be equal to zero within five (5) days from the last day of the Service Contract.

EFFECTIVE DATE:

To apply to bills rendered for gas delivered on or after January 1, 2007, or, on or after April 1, 2007, depending on the start date chosen by the customer. This rate schedule is effective January 1, 2007.

APPLICABILITY:

This rate is available to any customer taking service under Distribution Rates 125 and 300. It requires a Service Contract that identifies the required storage space and deliverability. In addition, the customer shall maintain a positive balance of gas in storage at all times or forfeit the use of Storage Services for Load Balancing and No-Notice Storage Service.

A daily nomination for storage injection and withdrawal except for No-Notice Storage Service, hereunder, which is used automatically for daily Load Balancing, shall also be required.

The maximum hourly injections / withdrawals shall equal 1/24th of the daily Storage Demand. No-Notice Storage Service is available up to the maximum daily withdrawal rights less the nominated withdrawal or the maximum daily injection rights less the nominated injections.

Storage space shall be based on the storage space algorithm [(customer's average winter demand – customer's average annual demand) x 151]. Gas fired power generation customers have the option to have storage space determined based on the methodology approved in EB-2005-0551.

Maximum deliverability shall be 1.2% of contracted storage space. The customer may inject and withdraw gas based on the quantity of gas in storage and the limitations specified in the Service Contract. Both injection and withdrawal shall be subject to applicable storage ratchets as determined by the Company and posted from time to time.

CHARACTER OF SERVICE:

Service shall be firm when used in conjunction with firm distribution service. Service is interruptible when used in conjunction with interruptible distribution service. All service is subject to contract terms and force majeure.

The service is available on two bases:

(1) Service nominated daily based on the available capacity and gas in storage up to the maximum contracted daily deliverability; and

(2) No-Notice Storage Service for daily Load Balancing consistent with the maximum hourly deliverability.

RATE:

The following rates and charges shall apply in respect to all gas received by the Company from and delivered by the Company to storage on behalf of the Applicant.

Monthly Customer Charge:	**$150.00**
Storage Reservation Charge:	
Monthly Storage Space Demand Charge	**0.0346 ¢/m³**
Monthly Storage Deliverability/Injection Demand Charge	**12.0982 ¢/m³**
Injection & Withdrawal Unit Charge:	**0.4999 ¢/m³**

Monthly Minimum Bill: The sum of the Monthly Customer Charge plus Monthly Demand Charges.

FUEL RATIO REQUIREMENT:

The Fuel Ratio per unit of gas injected and withdrawn is 0.35%.

All Storage Space and Deliverability/Injection Demand Charges are applicable monthly. Injection and withdrawal charges are applicable to each unit of gas injected or withdrawn based on daily nominations and No-Notice Storage Service quantities.

All deemed withdrawal quantities under the No-Notice Storage Service provisions of this rate will be adjusted for the UFG provisions applicable to the distribution service rates.

In addition, for each unit of injection or withdrawal there will be an applicable fuel charge adjustment expressed as a percent of gas.

TERMS AND CONDITIONS OF SERVICE:

1. **Nominated Storage Service**:

Nominations under this rate shall only be accepted at the standard North American Energy Standards Board ("NAESB") nomination windows. The customer may elect to nominate all or a portion of the available withdrawal capacity for delivery to the applicable Primary Delivery Area, which may be EGD's Central Delivery Area (CDA) or EGD's Eastern Delivery Area (EDA). All volumes nominated from storage are delivered first for purposes of daily Load Balancing of available supply assets. When system conditions permit, the customer may nominate all or a portion of the available withdrawal capacity for delivery to Dawn or to the customer's Primary Delivery Area for purposes other than consumption at the customer's own meter.

Storage not nominated for delivery will be available for No-Notice Storage Service. The sum of gas nominated for storage injection and for the Terminal Location shall not exceed the customer's Contract Demand (CD).

The customer may also nominate gas for delivery into storage by nominating the storage delivery area as the Primary Delivery Area. Gas nominated for storage delivery will not be available for No-Notice Storage Service. The sum of gas nominated for storage injection and for the Terminal Location shall not exceed the customer's CD.
Any gas in excess of the contract demand will be subject to cash out as injection overrun gas.

The Company reserves the right to limit injection and withdrawal rights to all storage customers in certain situations, such as major maintenance or construction projects, and may reduce nominations for injections and withdrawals over and above applicable storage ratchets. The Company will provide customers with one week's notice of its intent to limit injection and withdrawal rights, and at the same time, shall provide its best estimate of the duration and extent of the limitations.

In situations where the Company limits injection and withdrawal rights, the Company shall proportionately reduce the Storage Deliverability/Injection Demand Charge for affected customers based on the number of days the limitation is in effect and the difference between Deliverability/Injection Demand, subject to applicable storage ratchets, and the quantity of gas actually delivered or injected.

2. **No-Notice Storage Service**:

The Company, at its sole discretion based on operating conditions, may provide a No-Notice Storage Service that allows customers taking gas under distribution service rates to balance daily deliveries using this Storage Service. No-Notice Storage Service requires that the customer grant the Company the exclusive right to use unscheduled service available from storage to reduce the daily imbalance associated with the actual consumption of the customer.

No-Notice Storage Service is limited to the available, unscheduled withdrawal or injection capacity under contract to serve a customer. Where the customer serves multiple delivery locations from a single storage Service Contract, the customer shall specify the order in which gas is to be delivered to each Terminal Location served under a distribution Service Contract. The specified order of deliveries shall be used to administer Load Balancing Provisions to each Terminal Location.

The availability of No-Notice Storage Service is subject to and reduced by any service schedule from or to storage. To the extent that the quantity of gas available in storage is insufficient to meet the requirements of the customer under a No-Notice Storage Service, the customer will be unable to use the service on a no-notice basis for Load Balancing service. To the extent that the scheduled injections into storage plus No-Notice Storage Service exceed the maximum limit for injection, No-Notice Storage Service will be reduced and the remainder of the gas will constitute a daily imbalance. Gas delivered in excess of the maximum injection quantity shall be deemed injection overrun gas and cashed out at 50% of the lowest index price of gas.

Other provisions

If the customer elects to use the contracted storage capacity at less than the full volumetric capacity of the storage, the Company may inject its own gas provided that such injection does not reduce the right of the customer to withdraw the full amount of gas injected on any day during the withdrawal season or to schedule its full injection right during the injection season.

Term of Contract:

A minimum of one year.

A longer-term contract may be required if incremental contracts/assets/facilities have been procured/built for the customer.

EFFECTIVE DATE:

To apply to bills rendered for gas delivered on or after January 1, 2007, or, on or after April 1, 2007, depending on the start date chosen by the customer.

This rate schedule is effective January 1, 2007.

APPLICABILITY:

To any Applicant whose delivery of natural gas to the Company for transportation to a Terminal Location has been interrupted prior to the delivery of such gas to the Company.

CHARACTER OF SERVICE:

The volume of gas available for backstopping in any day shall be determined by the Company exercising its sole discretion. If the aggregate daily demand for service under this Rate Schedule exceeds the supply available for such day, the available supply shall be allocated to firm service customers on a first requested basis and any balance shall be available to interruptible customers on a first requested basis.

RATE:

The rates applicable in the circumstances contemplated by this Rate Schedule, in lieu of the Gas Supply Charges specified in any of the Company's other Rate Schedules pursuant to which the Applicant is taking service, shall be as follows:

	Billing Month **January to December**
Gas Supply Charge	
Per cubic metre of gas sold	**37.6720 ¢/m³**

provided that if upon the request of an Applicant, the Company quotes a rate to apply to gas which is delivered to the Applicant at a particular Terminal Location on a particular day or days and to which this Rate Schedule is applicable (which rate shall not be less than the Company's avoided cost in the circumstances at the time nor greater than the otherwise applicable rate specified above), then the Gas Supply Charge applicable to such gas shall be the rate quoted by the Company.

EFFECTIVE DATE:

To apply to bills rendered for gas consumed by customers on and after January 1, 2007 under Sales Service and Transportation Service. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates as the Board Order, EB-2006-0288.

APPLICABILITY AND CHARACTER OF SERVICE:

Service under this rate schedule shall apply to the Transmission and Compression Service Agreement with Union Gas Limited dated April 1, 1989, and the Transmission, Compression and Pool Storage Service Agreement with Centra Gas Ontario Inc. dated May 30, 1994. Service shall be provided subject to the terms and conditions specified in the Service Agreement.

RATE:

The Customer shall pay for service rendered in each month in a contract year, the sum of the following applicable charges:

	Transmission & Compression $\$/10^3m^3$	**Pool Storage $\$/10^3m^3$**
Demand Charge for:		
Annual Turnover Volume	**0.1652**	**0.1935**
Maximum Daily Withdrawal Volume	**14.9334**	**17.5558**
Commodity Charge	**1.4724**	**0.5817**

FUEL RATIO REQUIREMENT:

Fuel Ratio applicable to per unit of gas injected and withdrawn is 0.35%.

MINIMUM BILL:

The minimum monthly bill shall be the sum of the applicable Demand Charges as stated in Rate Section above.

EXCESS VOLUME AND OVERRUN RATES:

In addition to the charges provided for in the Rate Section above, the Customer shall pay, for services rendered, the sum of the following applicable charges as they are incurred:

TERMS AND CONDITIONS OF SERVICE:

1. Excess Volumes will be billed at the total of the Excess Volume Charges as stated above.

2. Transmission and Compression, and Pool Storage Overrun Service will be billed according to the following:
   (a) At the end of each month, in a contract year, the Company will make a determination, for each day in the month, of

      (i) the difference between the volume of gas actually delivered, exclusive of the fuel volume, for Customer's account into the Company System, at the Point of Delivery and the Customer's Maximum Daily Injection Volume, and

      (ii) the difference between the volume of gas actually delivered, exclusive of the fuel volume, for Customer's account from the Company System, at the Point of Delivery, and the Customer's Maximum Daily Withdrawal Volume.

	Excess Volume Charge $/10³m³ / Year	Overrun Charge $/10³m³ / Day
Transmission & Compression		
Authorized	**2.1804**	**0.4910**
Unauthorized	**-**	**197.1212**
Pool Storage		
Authorized	**2.5549**	**0.5772**
Unauthorized	**-**	**231.7365**

(b) For each day of the month, where any such differences exceed 2.0 percent of the Customer's relevant Maximum Daily Injection Volume and/or Maximum Daily Withdrawal Volume, the Customer shall pay a charge equal to the relevant Overrun rates, as stated above, for such differences.

BILLING ADJUSTMENT:

1. Injection deficiency - If at the beginning of any Withdrawal Period the Customer's Storage Balance is less than the Customer's Annual Turnover Volume, due solely to the Company's inability to inject gas for any reason other than the fault of the Customer, then the applicable Demand Charge for Annual Turnover Volume for the contract year beginning the prior April 1 as stated in Rate Section as applicable, shall be adjusted by multiplying each by a fraction, the numerator of which shall be the Customer's Storage Gas Balance as of the beginning of such Withdrawal Period and the denominator shall be the Customer's Annual Turnover Volume as it may have been established for the then current year.

2. Withdrawal deficiency - If in any month in a contract year for any reason other than the fault of the Customer, the Company fails or is unable to deliver during any one or more days, the amount of gas which the Customer has nominated, up to the maximum volumes which the Company is obligated by the Agreement to deliver to the Customer, then the Demand Charge for maximum Contract Daily Withdrawal Volume in the contract year otherwise payable for the month in which such failure occurs, as stated in Rate Section above, as applicable, shall be reduced by an amount for each day of deficiency to be calculated as follows: The Demand Charge for maximum Contract Daily Withdrawal Volume for the contract year for the month will be divided by 30.4 and the result obtained will then be multiplied by a fraction, the numerator being the difference between the nominated volume for such day and the delivered volume for such day and the denominator being the Customer's maximum Contract Daily Withdrawal Volume for such contract year.

TERMS AND EXPRESSIONS:

In the application of this Rate Schedule to each of the Agreements, terms and expressions used in this Rate Schedule have the meanings ascribed thereto in such Agreement.

EFFECTIVE DATE:

To apply to bills rendered for gas delivered on and after January 1, 2007. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates, as the Board Order, EB-2006-0288.

RATE NUMBER: **330**	**TRANSMISSION AND COMPRESSION AND POOL STORAGE**

APPLICABILITY:

To any Applicant who enters into a Storage Contract with the Company for delivery by the Applicant to the Company and re-delivery by the Company to the Applicant of a volume of natural gas owned by the Applicant.

CHARACTER OF SERVICE:

Service under this rate is for Full Cycle or Short Cycle storage service; with firm or interruptible injection and withdrawal service, all as may be available from time to time.

RATE:

The following rates and charges shall apply in respect of all gas received by the Company from and re-delivered by the Company to the Applicant.

	Full Cycle		**Short Cycle**
	Firm	**Interruptible**	
	$/10³m³	**$/10³m³**	**$/10³m³**
Monthly Demand Charge per unit of Annual Turnover Volume:			
Minimum	**0.3587**	**0.3587**	**-**
Maximum	**1.7936**	**1.7936**	**-**
Monthly Demand Charge per unit of Contracted Daily Withdrawal:			
Minimum	**32.4892**	**25.9914**	**-**
Maximum	**162.4461**	**129.9569**	**-**
Commodity Charge per unit of gas delivered to / received from storage:			
Minimum	**2.0541**	**2.0541**	**0.8942**
Maximum	**10.2706**	**10.2706**	**38.1075**

FUEL RATIO REQUIREMENT:

The Fuel Ratio per unit of gas injected and withdrawn is 0.35%.

TRANSACTING IN ENERGY:

The conversion factor is 37.74MJ/m3, which corresponds to Union Gas' System Wide Average Heating Value, as per the Board's RP-1999-0017 Decision with Reasons.

MINIMUM BILL:

The minimum monthly bill shall be the sum of the applicable Demand Charges.

OVERRUN RATES:

The units rates stated below will apply to overrun volumes. The provision of Authorized Overrun service will be at the Company's sole discretion.

	Full Cycle		Short Cycle
	Firm $/10³m³	Interruptible $/10³m³	$/10³m³
Authorized Overrun			
Annual Turnover Volume			
Negotiable, not to exceed:	**38.1075**	**38.1075**	**38.1075**
Authorized Overrun			
Daily Injection/Withdrawal			
Negotiable, not to exceed:	**38.1075**	**38.1075**	**38.1075**
Unauthorized Overrun			
Annual Turnover Volume			
Excess Storage Balance			
September 1 - November 30	**381.0754**	**381.0754**	**381.0754**
December 1 - October 31	**38.1075**	**38.1075**	**38.1075**
Unauthorized Overrun			
Annual Turnover Volume			
Negative Storage Balance			

TERMS AND CONDITIONS OF SERVICE:

1. All Services are available at the Company's sole discretion.
2. Delivery and Re-delivery of the volume of natural gas shall be from/to the facilities of Union Gas Limited and / or TransCanada PipeLines Limited in Dawn Township and/or Niagara Gas Transmission Limited in Moore Township.
3. The Customers daily injections or withdrawals will be adjusted to provide for the fuel ratio stated in the Fuel Ratio Section. In the event that a Short Cycle service does not require fuel for injection and/or withdrawal, the fuel ratio commodity charge may be waived.

EFFECTIVE DATE:

To apply to bills rendered for gas delivered on and after January 1, 2007. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates, as the Board Order, EB-2006-0288.

APPLICABILITY:

To any Applicant who enters into a Contract with the Company for transportation on the Company's Tecumseh Transmission System.

CHARACTER OF SERVICE:

Service under this rate is for firm transportation service as may be available from time to time.

RATE:

The following rates and charges shall apply in respect of all gas received by the Company from and re-delivered by the Company to the Applicant.

	Firm $\$/10^3m^3$	Interruptible $\$/10^3m^3$
Monthly Demand Charge per unit of Maximum Contracted Daily Delivery:	**4.4780**	**-**
Commodity Charge per unit of gas delivered:	**-**	**0.1770**

MINIMUM BILL:

The minimum monthly bill shall be the sum of the applicable Demand Charges.

TERMS AND CONDITIONS OF SERVICE:

1. Delivery of the volume of natural gas by the Applicant shall be at the interconnection of the Company's Tecumseh transmission facilities with that of Niagara Gas Transmission Limited at the Tecumseh Compressor Station.

2. Re-delivery of the volume of natural gas shall be at the interconnection of the Company's facilities with those of interconnecting pipelines in Dawn Township.

EFFECTIVE DATE:

To apply to bills rendered for gas delivered on and after January 1, 2007. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates, as the Board Order, EB-2006-0288.

Applicants located off the piping networks noted below or off piping systems supplied from these networks may be curtailed to maintain distribution system integrity.

The Town of Collingwood
The Town of Midland

APPLICABILITY:

This rider is applicable to any Applicant who enters into Gas Transportation Agreement with the Company under any rate other than Rates 125 and 300.

MONTHLY DIRECT PURCHASE ADMINISTRATION CHARGE:

Base Charge	$50.00	per month
Maximum Charge	$815.00	per month
Account Charge		
New Accounts	$0.50	per month per account
Renewal Accounts	$0.15	per month per account

The above Basic Charge shall be increased up to the maximum charge, by the new account charge for each new account and by the Renewal Account charge for each renewal account in a Direct Purchase Contract.

T-SERVICE CREDIT:

In T-Service Arrangements excluding Ontario ABC-T arrangements, between the Company and an Applicant, and with a T-Service Arrangement and a contractually specified Point of Acceptance as indicated below, the Company shall pay or charge the Applicant the Transportation Service Credit or Debit shown for any volumes of natural gas owned by the Applicant and received by the Company at the Point of Acceptance. The ability of the Company to accept deliveries under FT-type arrangements at Dawn is constrained and the availability of this service is at the Company's sole discretion.

TOLLS CREDIT	**Type of Arrangement**	
Point of Acceptance	Firm Transportation (FT)	Firm Service Tendered (FST)
Western Canada	0.0000 ¢/m³	0.0000 ¢/m³
CDA, EDA	3.5241 ¢/m³	0.0000 ¢/m³
Dawn	3.0336 ¢/m³	0.0000 ¢/m³
Intra-Alberta	-0.4649 ¢/m³	N/A

Effective February 1, 2001, in Ontario ABC-T arrangements with a contractually specified Point of Acceptance in the CDA and/or EDA, the toll credit shall equal the Eastern Zone Firm Transportation tolls approved by the National Energy Board for TCPL at a 100% load factor.

<u>TCPL FT CAPACITY TURNBACK:</u>

APPLICABILITY:

To Ontario T-Service customers who have been or will be assigned TCPL capacity by the Company.

TERMS AND CONDITIONS OF SERVICE:

1. The Company will accommodate TCPL FT capacity turnback from customers to the extent that the Company is allowed to turnback FT capacity to TCPL.

2. The Company will accommodate all TCPL FT capacity turnback requests in a manner that minimizes stranded and other transitional costs. The Company is committed to maintaining the integrity of its distribution system and the sanctity of all contracts.

3. The Company may amend any contracts to accommodate a customer's request to turnback capacity.

4. Notice of TCPL FT turnback capacity will be accepted on Enbridge's Election for Enbridge Firm Transportation Assignment form or other authorized written notice.

5. The daily contractual right to receive natural gas would still be subject to the delivery, on a firm basis, of the full Mean Daily Volume into the Company's Central Delivery Area (CDA) and/or Eastern Delivery Area (EDA). The delivery area must match the area in which consumption will occur.

6. The proportion of TCPL FT capacity that an eligible customer may request to be turned back each year ("percentage turnback") shall not exceed the proportion of the TCPL capacity that Enbridge is entitled to turn back that year. This percentage turnback will be applied to calculate the customer's turnback capacity limit based on the renewal volume of the direct purchase agreement.

7. If the Company is unable to accommodate all or a portion of an eligible customer's request to turnback TCPL FT capacity in the month requested by the customer, the Company will indicate the month(s) when such customer request can be fully satisfied and the costs, if any, associated with accommodating this request. The customer may then advise the Company as to whether or not they wish to proceed with the TCPL FT capacity turnback request.

8. All TCPL FT capacity turnback requests will be treated on an equitable basis.

9. Customers may withdraw their original election given they provide notice to the Company a minimum of one week prior to the deadline specified in the TransCanada tariff for FT contract extension.

10. The percentage turnback of TCPL FT capacity will be applied at the Direct Purchase Agreement level.

11. Written notice to turnback capacity must be received by the Company the earlier of:

    (a) Sixty days prior to the expiry date of the current contract.

    or

    (b) A minimum of one week prior to the deadline specified in TransCanada tariff for FT contract extension.

EFFECTIVE DATE:

To apply to bills rendered for gas delivered on and after January 1, 2007. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates, as the Board Order, EB-2006-0288.

RIDER: B	BUY / SELL SERVICE RIDER

APPLICABILITY:

This rider is applicable to any Applicant who entered into a Gas Purchase Agreement with the Company, prior to April 1, 1999, to sell to the Company a supply of natural gas.

MONTHLY DIRECT PURCHASE ADMINISTRATION CHARGE:

Base Charge	$50.00	per month
Maximum Charge	$815.00	per month
Account Charge		
New Accounts	$0.50	per month per account
Renewal Accounts	$0.15	per month per account

The above Basic Charge shall be increased up to the maximum charge, by the new account charge for each new account and by the Renewal Account charge for each renewal account in a Direct Purchase Contract.

BUY / SELL PRICE:

In Buy/Sell Arrangements between the Company and an Applicant, the Company shall buy the Applicants gas at the Company's actual FT-WACOG price determined on a monthly basis in the manner approved by the Ontario Energy Board. For Western Buy/Sell arrangements the FT-WACOG price shall be reduced by pipeline transmission costs.

FT FUEL PRICE:

The FT fuel price used to establish the Buy price in Western Buy/Sell arrangements without fuel will be determined monthly based upon the actual FT-WACOG.

EFFECTIVE DATE:

To apply to bills rendered for gas delivered on and after January 1, 2007. This rate schedule is effective January 1, 2007 and replaces the identically numbered rate schedule that specifies, as the Effective Date, January 1, 2007 and that indicates, as the Board Order, EB-2006-0288.

RIDER: C	GAS COST ADJUSTMENT RIDER

The following adjustment is applicable to all gas sold or delivered during the period January 1, 2007 to December 31, 2007.

Rate Class	Sales Service (¢/m³)	Transportation Service (¢/m³)
Rate 1	0.0000	0.0000
Rate 6	0.0000	0.0000
Rate 9	0.0000	0.0000
Rate 100	0.0000	0.0000
Rate 110	0.0000	0.0000
Rate 115	0.0000	0.0000
Rate 135	0.0000	0.0000
Rate 145	0.0000	0.0000
Rate 170	0.0000	0.0000
Rate 200	0.0000	0.0000

RIDER: E	REVENUE ADJUSTMENT RIDER

The following adjustment shall be applicable to billed volumes during the period April 1, 2007 to December 31, 2007.

Rate Class	Sales Service (¢/m³)	Transportation Service (¢/m³)
Rate 1	0.2688	0.2310
Rate 6	0.0798	0.0185
Rate 9	0.2598	0.2586
Rate 100	(0.1788)	(0.1732)
Rate 110	(0.0327)	(0.0346)
Rate 115	0.0132	0.0117
Rate 135	0.0038	0.0038
Rate 145	(0.1556)	(0.1402)
Rate 170	0.0174	0.0153
Rate 200	0.1244	0.1204
Rate 300	0.0000	(0.0640)

RIDER: F	ATMOSPHERIC PRESSURE FACTORS

The following elevation factors shall be applicable to metered volumes measured by a meter that does not correct for atmospheric pressure.

Zone	Elevation Factor
1	0.9644
2	0.9652
3	0.9669
4	0.9678
5	0.9686

36	1.0051
37	1.0059
38	1.0170

	Rate (excluding GST)
New Account Or Activation	
New Account Charge Turning on of gas, activating appliances, obtaining billing data and establishing an opening meter reading for new customers in premises where gas has been previously supplied	$25.00
Appliance Activation Charge - Commercial Customers Only Commercial customers are charged an appliance activation charge on unlock and red unlock orders, except on the very first unlock and service unlock at a premise.	$65.00 minimum 1/2 hour work. Total Amount depends on time required
Meter Unlock Charge - Seasonal or Pool Heater Seasonal for all other revenue classes, or Pool Heater for residential only	$65.00
Statement of Account	
Lawyer Letter Handling Charge Provide the customer's lawyer with gas bill information.	$15.00
Statement of Account Charge (for one year history)	$10.00
Cheques Returned Non-Negotiable Charge	$20.00
Gas Termination	
Red Lock Charge Locking meter or shutting off service by closing the street shut-off valve (when work can be performed by Field Collector)	$65.00
Removal of Meter Removing meter by Construction & Maintenance crew	$260.00
Cut Off At Main Charge Cutting service off at main by Construction & Maintenance Crew	$1,200.00
Valve Lock Charge Shutting off service by closing the street	
shut-off valve - work performed by Field Investigator	$125.00
- work performed by Construction & Maintenance	$260.00

RIDER: **G**

<u>Safety Inspection</u>

Inspection Not Ready Charge (safety inspection) When a builder requests an unlock and the appliance(s) are not ready for inspection, this charge will apply to cover the cost of returning to the same property for the additional inspection.	$65.00
Inspection Reject Charge (safety inspection) Energy Board Inspection rejects are billed to the meter installer or homeowner.	$65.00

<u>Meter Test</u>

Meter Test Charge When a customer disputes the reading on his/her meter, he/she may request to have the meter tested. This charge will apply if the test result confirms the meter is recording consumption correctly.	
Residential meters	$97.50
Non-Residential meters	Time & Material per Contractor

<u>Street Service Alteration</u>

Street Service Alteration Charge For installation of service line beyond allowable guidelines (for new residential services only)	$32.00

<u>NGV Rental</u>

NGV Rental Cylinder (weighted average)	$12.00

<u>Other Customer Services (ad-hoc request)</u>

Labour Hourly Charge-Out Rate	$130.00
Cut Off At Main Charge - Commercial & Special Requests Cut Off At Main charges for commercial services and other residential services that involve significantly more work than the average will be custom quoted.	custom quoted
Cut Off At Main Charge - Other Customer Requests Other residential Cut Off At Main requests due to demolitions, fires, inactive services, etc. will be charged at the standard COAM rate.	$1,200.00
Meter In-Out (Residential Only)) Relocate the meter from inside to outside per customer request	$260.00
Request For Service Call Information Provide written information of the result of a service call as requested by home owners.	$30.00
Temporary Meter Removal As requested by customers.	$260.00
Damage Meter Charge	$360.00

APPLICABILITY:

This rider is applicable to any Applicant who enters into Gas Transportation Agreement with the Company under any rate.

ENHANCED TITLE TRANSFER SERVICE:

In any Gas Transportation Agreement between the Company and the Applicant, the Applicant may elect to initiate a transfer of natural gas between the Company and another utility, regulated by the Ontario Energy Board, at Dawn for the purposes of reducing an imbalance between the customer's deliveries and consumption within the Enbridge Gas Distribution franchise areas. The ability of the Company to accept such an election may be constrained at various points time for customers obtaining services under any rate other than Rate 125 or 300 due to operational considerations of the Company.

The cost for this service is separated between an Adminstration Charge that is applicable to all Applicants and a Bundled Service Charge that is only applicable to Applicants obtaining services under any rate other than Rate 125 or 300.

Administration Charge:

Base Charge	$50.00	per transaction
Commodity Charge	$1.3115	per 10^3m^3

Bundled Service Charge:
The Bundled Service Charge shall be equal to the absolute difference between the Eastern Zone and Southwest Zone Firm Transportation tolls approved by the National Energy Board for TCPL at a 100% Load Factor.

GAS IN STORAGE TITLE TRANSFER:

An Applicant that holds a contract for storage services under Rate 315 or 316 may elect to initiate a transfer of title to the natural gas currently held in storage between the storage service and another storage service held by the Applicant, or a other Applicant that has contracted with the Company for storage services under Rate 315 or 316. The service will be provided on a firm basis up to the volume of gas that is equivalent to the more restrictive firm withdrawal and injection parameters of the two parties involved in the transfer. Transfer of title at rates above this level may be done on at the Company's discretion.

For Applicants requesting service between two storage service contracts that have like services, each party to the request shall pay an Administration Charge applicable to the request. Services shall be considered to be alike if the injection and deliverability rate at the ratchet levels in effect at the time of the request are the same and both services are firm or both services are interruptible. In addition to like services, the Company, at its sole discretion based on operational conditions, will also allow for the transfer of gas from a storage service contract that has a level of deliverability that is higher than the level of deliverability of the storage service contract the gas is being transfered to with only the Administration Charge being applicable to each party.

In addition to the Administration Charge, Applicants requesting service between two storage service contracts not addressed in the preceding paragraph would be subject to the injection and withdrawal charges specified in their contracts.

Administration Charge:	$25.00	per transaction

Hydro One Networks Inc., For 2007 and 2008 Electricity Transmission Revenue Requirements, Decision with Reasons, EB-2006-0501

Ontario Energy Board

Commission de l'Énergie de l'Ontario

EB-2006-0501

IN THE MATTER OF AN APPLICATION BY

HYDRO ONE NETWORKS INC.

FOR 2007 AND 2008 ELECTRICITY TRANSMISSION REVENUE REQUIREMENTS

DECISION WITH REASONS

August 16, 2007

Summary of the Decision with Reasons
(EB-2006-0501)

Chapter	Application	Board Decision
2	Revenue Requirement Adjustment Mechanism for 2009 and 2010	Not approved.
3	Board's jurisdiction to provide guidance on human resource costs	Board has the authority to make findings and provide guidance on the reasonableness of compensation costs.
4	OM&A expenses	Approved. Data on asset condition to be improved.
	Compensation levels	Approved. Improved reporting required and any reductions in executive compensation to be tracked.
5	Capital expenditure budget	Approved. Data on asset condition to be improved.
	Prudence of Niagara Reinforcement Project	Approved.
6	Special treatment for designated capital projects	Not approved.
	Special treatment of Niagara Reinforcement Project	Applicant allowed to expense carrying costs.
7	Return on Equity	Not approved. Applicant to use the Distribution ROE formula.
	Capital Structure	Same as allowed for electricity distributors.
8	OEB Costs deferral account	Not approved.
	2006 Earnings Sharing Mechanism	Adjustments required to excess income calculation. Capital contribution treatment not allowed.
	2007 Revenue Deficiency Deferral Account	To be effective January 1, 2007.
9	Load forecast	Weather-normal peak load forecast approved. Report required on weather normalization and differences with the IESO forecast.
	CDM impact	Reduced by 350 MW.
10	Charge determinants	Status quo approved.
11	Implementation	Uniform Ontario Transmission Rates to be set in a further proceeding; targeted effective date of change November 1, 2007.

This summary excludes the particulars in the Settlement Proposal and does not form part of the Decision nor does it itemize all findings. It is not to be relied on for the purpose of applying or interpreting the Decision.

DECISION WITH REASONS

August 16, 2007

1. INTRODUCTION

1.1 THE APPLICATION

Hydro One Networks Inc. (“Hydro One”, the “Company”, the “Utility” or the “Applicant”) filed an application dated September 12, 2006 (the “original Application”) with the Ontario Energy Board (the “Board”) under section 78 of the *Ontario Energy Board Act, 1998*; S.O. c.15, (Sched. B) (the “Act”), for an order or orders approving “the revenue requirement for the test years 2007 and 2008; customer rates for the transmission of electricity to be implemented on May 1, 2007; changes to the current capital structure with an increase in the return on common equity; the inclusion into rate base of certain capital costs; a revenue requirement adjustment mechanism for 2009 and 2010”; and other matters related to the fixing of just and reasonable rates for the transmission of electricity. The Board assigned file number EB-2006-0501 to the Application. Updates to certain parts of the original Application were filed on February 23, 2007 (the “updated Application”).

The transmission revenue requirement of Hydro One Networks Inc. (then known as Ontario Hydro Networks Company Inc.) was last set in proceeding RP-1998-0001 when the Board approved a Transitional Rate Order, dated March 31, 1999 and effective April 1, 1999. This revenue requirement was amended to update Hydro One’s Rate of Return on Common Equity on March 1, 2000 (EB-1999-0526). On May 26, 2000 the Board issued its decision on Hydro One’s transmission cost allocation and rate design application (RP-1999-0044).

Appendix 1 contains details regarding the procedural aspects of the Application, including a list of witnesses and a list of active parties.

1.2 THE SETTLEMENT CONFERENCE AND SETTLEMENT PROPOSAL

An Issues List was provided to parties with Procedural Order No. 2 on December 20, 2006. On March 26, 2007 a Settlement Conference was held to settle as many of the issues as possible. The Settlement Conference resulted in a Settlement Proposal which was filed with the Board on April 3, 2007. The Board considered the Settlement Proposal at a hearing held on April 10, 2007. The Board issued its Settlement Proposal Decision on April 18, 2007. The Settlement Proposal and the Settlement Proposal Decision are attached to this decision as Appendices 2 and 3 respectively.

Of the 40 issues on the Issues List, the Settlement Proposal fully settled 24 issues (the “Settled Issues”) and partially settled two issues (“Partially Settled Issues”). The parties were unable to reach agreement on the remaining 14 issues.

Fully Settled Issues

Issue 1.1	Effectiveness and Efficiency of Affiliate Service Agreements
Issue 1.2	Board directions from previous proceedings (some specifics to be addressed part of other issues, principally issues, 9.1, 3.4 and 2.2).
Issue 1.6	Economic and Business Planning Assumptions
Issue 2.3	Cost Allocation between Distribution and Transmission
Issue 2.4	Depreciation Expense
Issue 2.5	Overhead Capitalization Rate
Issue 2.6	Capital and Property Taxes
Issue 2.7	Income Taxes and Methodology
Issue 3.3	Capital and Common Asset Allocation
Issue 3.5	Lead Lag Study for Working Capital Calculation
Issue 3.6	Asset Condition Assessment
Issue 3.7	Allowance for Funds Used During Construction
Issue 5.1	External Revenues
Issue 6.1	Cost Pools and Allocation to the pools
Issue 6.2	Dual Function Lines
Issue 6.3	Wholesale Meter Pool
Issue 6.4	Directly Connected Customers and Line Connection Charges
Issue 6.5	Cost Pools and Local Loop allocation
Issue 7.2	Forecast for Charge Determinants
Issue 7.4	Continuation of the Export Transmission Tariff
Issue 8.1	Deferral and Variance Accounts (establishment and methodology)
Issue 8.2	Deferral and Variance Accounts (amounts and disposition)

Issue 8.3 Service Levels and Performance Standards
Issue 8.4 Demonstration of Need for Leaside/Birch Junction project

Partially Settled Issues

Issue 3.1 Rate Base
Issue 7.3 Charge Determinants for Network and Connection Service

Settlement Proposal Decision

The Board accepted the Settlement Proposal on April 10, 2007 save for the three issues below, which were addressed in its Settlement Proposal Decision of April 18, 2007:

Issue 7.4	The Board modified the language for the settlement of the Export Transmission Rates issue.
Issue 8.4	The Board did not accept the Settlement Proposal and directed Hydro One to present evidence on the need to relieve loading on the connection lines between Leaside TS and Birch Junction TS in the oral hearing.
Issues 8.1 & 8.2	The settlement of the Ontario Energy Board Cost Account was not accepted by the Board.

This Decision with Reasons addresses the 14 non-settled issues, beginning at Chapter 2.

1.3 PARTIAL DECISION AND ORDER

In a letter dated February 14, 2007 Hydro One requested that a 2007 revenue deficiency deferral account be established, beginning January 1, 2007, to record the revenue deficiency between the approved revenue for 2007 and the forecast revenues at currently approved transmission rates. Hydro One requested a decision from the Board on this issue by March 31, 2007. On March 30, 2007, the Board issued a Partial Decision and Order approving the establishment of the 2007 revenue deficiency deferral account. The Partial Decision and Order is attached as Appendix 4. Further details regarding this account are found in Chapter 8 of this decision.

1.4 UNIFORM TRANSMISSION RATES

In this decision, the Board is approving the revenue requirements and charge determinants for Hydro One Transmission which will form the basis for the Hydro One Networks' portion of the Ontario Uniform Transmission Rates. The Ontario Uniform Transmission Rates and the revenue shares of each of the other transmitters in the transmission rates pool (Great Lakes Power Inc., Five Nations Energy Inc., and Canadian Niagara Power Inc.) will be established in a subsequent proceeding.

1.5 THE HEARING, SUBMISSIONS AND EXHIBITS

The hearing took place at the Board hearing room in Toronto on April 23, 24, 26 and May 7, 8, 11, 14, 15, 17, 18, 22, 28 and June 13, 2007. Copies of the evidence, exhibits, arguments, and transcripts of the proceeding are available for review at the Board's offices.

2. PROPOSED REVENUE REQUIREMENT ADJUSTMENT MECHANISM

Hydro One's Proposal

In addition to an order from the Board approving the revenue requirement for test years 2007 and 2008, Hydro One sought approval for a Revenue Requirement Adjustment Mechanism (RRAM) to set transmission revenues for 2009 and 2010 and to replace a full cost-of-service proceeding for those years.

Hydro One described its RRAM for 2009 and 2010 as an indexed revenue requirement plan that is an extension of the 2008 rate setting process. Each of the components of the company's revenue requirement for 2009 and 2010 – operating, maintenance and administration (OM&A) expenses; depreciation; capital taxes; income taxes; and return on capital – would be recomputed prior to each year and submitted to the Board for approval. The Company submitted that its RRAM process would require a much smaller commitment of resources, time and cost than would a full cost-of-service proceeding.

The most significant aspects of the proposed RRAM are the mechanisms used to compute OM&A expenses and the capital expenditures to be included in rate base. Hydro One's approach to these items (set out in its prefiled evidence, and modified by the testimony of its witnesses) is summarized in Table 1. The table deals only with the 2009 calculations but similar calculations would be done for 2010.

Hydro One proposed that the return on capital in 2009 and 2010 would be based upon the debt-equity ratio and cost of debt approved for 2008. The allowed return on equity would be calculated using the OEB-approved return on equity (ROE) formula for 2008, updated for the then current long Canada bond yield. Depreciation expense and taxes for 2009 and 2010 would be simple recalculations based on the updated expense, rate base, and return on capital.

Table 1: Calculation of 2009 Revenue Requirement/Rate Base Amounts Under Proposed RRAM

Expense/capital addition	Calculation of 2009 Amounts
OM&A expenses	(2008 approved OM&A) multiplied by (1 + inflation factor – productivity factor + "OM&A asset aging" adjustment factor)
Sustaining, Operations, and Shared Services capital expenditures added to rate base	(2008 approved Sustaining, Operations, and Shared Services capital expenditures) multiplied by (1 + inflation factor – productivity factor + "capital asset aging" adjustment factor)
Non-IPSP Development capital expenditures added to rate base	Forecast capital expenditures on projects expected to be in service in 2009 *
IPSP Development capital expenditures added to rate base	Forecast capital expenditures on projects expected to be in service in 2009 *
"Supply mix" capital expenditures added to rate base	Forecast capital expenditures expected to be incurred in 2009 (without regard to the in-service dates of the assets) *

**The amounts added to rate base would be subject to a half-year rule.*

Hydro One submitted that the review and approval process for an adjusted revenue requirement for 2009 could commence in June 2008 and could involve at least two rounds of interrogatories and workshops with intervenors. A negotiated settlement would be presented to the Board for approval. While intervenors strongly opposed the proposal, Hydro One said it believes such a process is achievable based on the experience of the British Columbia Utilities Commission, which has used a similar approach in regulating FortisBC .

Dr. Poray of Hydro One stated that the Company was not seeking to have all the details of its proposed plan approved by the Board in this proceeding. Hydro One, he said, would be "willing to work with the intervenors to try and sort out the details, but I think Hydro One would like the assurance of having a concept approved by the Board as a mechanism for moving forward, where the details would be subject to a review, but it would be a review which is much more streamlined than a full cost of service.” [1] During his examination-in-chief, Dr. Poray listed the specific approvals that Hydro One was requesting as part of this proceeding:

> First of all, we want the Board to approve the concept behind the revenue adjustment mechanism, that is to say the mechanical adjustment mechanism that uses inflation, productivity and asset-aging adjustment factors to calculate the respective increments in OM&A and capital cost components for 2009 and 2010, starting from Board-approved values.
>
> Secondly, we want the Board to approve the concept behind the derivation of the asset-aging factors, which is based on Board-approved information that Hydro One filed as part of the current proceeding.
>
> Thirdly, we want the Board to approve the setting of a constant productivity factor at one percent for the 2009 and 2010 period.
>
> Fourth, we would want the Board to approve the treatment of capital development costs as we’ve outlined previously.”[2]

Hydro One was clear that its RRAM proposal is not a comprehensive incentive regulation plan. In its pre-filed evidence, the Company noted:

> It will not be realistic to design an effective comprehensive incentive regulation regime before that time [2010] for a number of reasons. Most importantly, the industry is currently going through a period of significant uncertainty. This includes structural changes for the industry as well as uncertainty related to supply mix options and timing. Stability will not be achieved until the OPA’s IPSP [Ontario Power Authority’s Integrated Power System Plan] is filed and approved by the OEB and until significant progress is made in implementation planning. In addition, it will be necessary to collect appropriate cost data for several years so that cost functions can be estimated as a basis for setting the cost and

[1] Tr. Vol. 6, p.36

[2] Tr. Vol. 5, p.107 (Dr. Poray is referring to a previous discussion recorded in Volume 5 of the transcript, pages 92 to 99, where he outlines the treatment of capital expenditures in the proposed adjustment mechanism.)

quality parameters for the incentive regulation model that is ultimately adopted as was the case in other jurisdictions[3].

The principal argument made by Hydro One for its RRAM proposal is that it will streamline the approval process during two years that Hydro One expects to have a heavy workload in connection with its capital programs and asset sustainment activities.[4] Other reasons cited by Hydro One were:

- The base year for the adjustment mechanism, 2008, will have been subject to a full cost-of-service review.
- The costs borne by customers for additional operating and capital spending on Hydro One's aging infrastructure will be limited by the pre-approved OM&A and capital adjustment mechanisms.
- The two-year RRAM period will be followed by a full cost-of-service review.
- The two-year RRAM period will allow Hydro One to align subsequent transmission and distribution rate filings.
- The RRAM will reduce the uncertainty with respect to the cost borne by transmission customers in 2009 and 2010, while providing an incentive for Hydro One to contain cost within the envelope established by the adjustment mechanism.
- The RRAM may serve as a first step towards a more comprehensive incentive regulation plan as part of Hydro One's cost-of-service filings for post-2010 rates[5].

[3]Ex.A/Tab13/Sch.1/p.9

[4]Tr. Vol. 5, p. 111

[5] Ex.A/Tab13/Sch1/pp.2-3.

Intervenor Arguments

The RRAM proposal was severely criticized by each of the five consumer groups that participated in the hearing (Association of Major Power Consumers in Ontario "AMPCO"; Consumers' Council of Canada "CCC"; Energy Probe; Schools Energy Coalition "SEC"; and Vulnerable Energy Consumers' Coalition "VECC"). No other intervenors dealt with the RRAM proposal in their arguments. The five consumer groups submitted that the Board should reject Hydro One's proposal and, instead, should require Hydro One to file a full cost-of-service application in respect of 2009 and 2010.

In summary, the intervenors argued that:

- RRAM is only a concept; one that Hydro One acknowledges requires further definition and stakeholdering. The Board should not consider approving an ill-defined proposal.

- It is premature for the Board to approve any automatic revenue requirement adjustment mechanism given the significant uncertainties about the nature and extent of Hydro One's future costs and activities. It was submitted that automatic rate adjustment mechanisms work best when a utility operates in a relatively steady-state environment, which Hydro One admits is not the case today in its transmission business. Some intervenors also submitted that a period of instability and uncertainty is precisely the time when regulatory oversight should be maintained, not relaxed.

- The proposed method of calculating revenue requirement adjustments is flawed. Intervenors raised several issues but were especially critical of the proposed use, and method of calculation, of the OM&A and capital asset aging factors. Intervenors noted that the proposed aging factors were the result of a simple calculation based on the change in spending between 2003 and 2008; no evidence was provided to link the change in spending with asset aging. They also noted that the proposed productivity factor was developed by Hydro One and is not based on external benchmarks.

Board Findings

The Board has been supportive of regulatory mechanisms that provide greater regulatory predictability, reduce regulatory burden, and offer appropriate incentives to regulated utilities. This is clearly demonstrated by the Board's multi-year rate-setting plan for electricity distributors and its current initiative on multi-year incentive regulation for natural gas utilities.

A multi-year revenue requirement adjustment mechanism for electricity transmission may ultimately be appropriate for Hydro One; however, the Board cannot accept the RRAM proposed by Hydro One.

This proceeding is the first cost-of-service review of Hydro One's transmission revenue requirement since 2000. Hydro One pointed out on many occasions that its transmission business today is facing significant change in its spending levels and work programs. During the hearing, Hydro One stressed what it described as an unprecedented increase in capital expenditures driven by government directives and system growth. Hydro One's evidence and its witnesses also referred at length to the significant increase in spending related to Hydro One's aging asset base. The Board also heard evidence about the possible impact of the OPA's IPSP, which has not yet been filed with the Board, on Hydro One's investment plans and spending.

Given these significant changes and uncertainties, the Board does not believe that this is the time to adopt a revenue requirement adjustment mechanism for 2009 and 2010. Before setting the post-2008 revenue requirement, it will be important to examine how actual OM&A expenses and capital expenditures in 2007 and 2008 compare with Hydro One's forecasts (and to determine the reasons for any significant variations), and to test forecasts of spending in subsequent years. That can only be accomplished through a cost-of-service proceeding.

Even if the environment were more stable, the Board would be unable to accept the proposed RRAM because it is not a fully developed plan. The Board does not see how it could approve a mechanism in concept when many of the elements of the mechanism are not clearly defined or are open to change based on future consultations. While the Board appreciates that Hydro One is willing to consult with stakeholders on various aspects of its proposal, it believes that consultation should occur prior to a proposal being submitted to the Board in a rates case.

The Board also shares the intervenors' concerns about some aspects of the proposed indexing of OM&A and certain capital expenditures, especially the use and calculation of the proposed asset aging factors. In its evidence, Hydro One stated that the residual growth in OM&A spending from 2003 to 2008 was "deemed to represent the effect of asset aging on OM&A costs."[6] Should Hydro One choose to submit a multi-year adjustment mechanism that contains asset aging factors as part of its next transmission rates case, the Board will expect detailed evidence to establish that such factors are appropriate estimates of the increase in costs due to asset aging. The Board also expects that any productivity factors will be supported by detailed information and external comparisons.

The Board does not accept Hydro One's proposed Revenue Requirement Adjustment Mechanism for 2009 and 2010. The revenue requirement for those years should be established through a full cost-of-service proceeding. Multi-year incentive regulation for Hydro One Transmission could be implemented in subsequent years.

[6] Ex.A/Tab13/Sch1/p.14

3. JURISDICTION

The Society of Energy Professionals (the "Society") has challenged the Board's jurisdiction to provide detailed guidance to Hydro One with respect to compensation costs negotiated as part of the collective bargaining process with its various unions. In its written submissions it stated:

> It is the position of the Society that the statutory jurisdiction of the Ontario Energy Board to set rates for the transmission of electricity does not include the jurisdiction to:
>
> 1. Issue directions or orders which would in effect require Hydro One to violate the terms of a binding collective agreement with any of the unions representing Hydro One employees;
> 2. Issue directions or orders regarding positions Hydro One must take or objectives it must pursue in collective bargaining with unions representing Hydro One employees;
> 3. Issue directions or orders which in any other way would have the effect of pre-empting free and good faith collective bargaining between Hydro One and the unions representing Hydro One employees.

The Board notes that the Society did not challenge a specific decision of the Board. Rather, the Society appears to be anticipating reasons from the Board similar to those issued in Hydro One's 2006 Distribution Rates Decision (RP-2005-0020/EB-2005-0378), the "Distribution decision"; in particular, certain paragraphs which state clearly the Board's concerns with the Company's labour rates and compensation costs. In its Distribution decision the Board said:

> 3.4.3 The Board notes that the high compensation issue for Hydro One has a considerable history before this Board, dating back to the Ontario Hydro days.

> The Board has noted in this proceeding that since the de-merger of Ontario Hydro, Hydro One has taken a number of steps to control its overall compensation costs by, for example, instituting a voluntary retirement program, outsourcing, use of the PWU hiring hall, initiating various cost efficiency programs, holding the line on compensation increases for management employees and imposing a two-tiered pension structure or a pension plan that is less generous for new employees represented by the Society of Energy Professionals. These are positive steps and the Board expects the company to continue and enhance such efforts in the future and report to the Board at the next main rates case. The Board is particularly concerned about the apparently high labour rates. In this respect, the Board expects Hydro One to identify what steps the company has taken or will take to reduce labour rates.
>
> 3.4.4 Even so, the comparisons between Hydro One's cash compensation with certain other utilities presented by intervenors are of concern. For example, SEC calculated that by applying Ottawa Hydro's compensation costs to Hydro One employees there would a reduction of about $85 million in Hydro One's cash compensation. The Board recognizes that there may be some roughness in the derivation of that figure and some differences in the profile of the two utilities. However the contrast between the compensation structures is of concern to the Board.
>
> 3.4.5 The Board will not make an adjustment to the proposed OM&A costs based on compensation levels at this time but expects the utility to demonstrate in the future that lower compensation costs per employee have been achieved or demonstrate concrete initiatives whereby compensation costs will be brought more in line with other utilities.

In the Society's view, such directions are beyond the jurisdiction of this Board as they interfere with and have the effect of frustrating the statutorily mandated collective bargaining process at the utility.

The Society also contended that in so far as the Board appears to mandate reductions in labour rates or compensation costs, it has assumed a direct role in the negotiation process which is improper and inconsistent with the collective bargaining process. It suggests that in such circumstances, the Board has become "the ghost at the bargaining table" imposing limits on the scope of negotiation without any direct accountability to others participating in the process.

While it appears to find the Board's comments in the Distribution decision to be problematic, the Society did not seek a review of that decision, either at the Board or elsewhere. A consideration of jurisdictional issues is best undertaken when a specific action or decision by the tribunal is considered by a party to fall outside its jurisdiction. Dealing with jurisdictional issues on a speculative or theoretical basis is awkward, and not particularly useful.

If the Society regards some aspects of this Decision to be outside the Board's jurisdiction, it has a range of remedies available to it where its concerns can be addressed and adjudicated. Nonetheless, it may be helpful and appropriate to address some of the issues raised by the Society now.

The scope of the Board's jurisdiction is always subject to its own assessment in light of specific challenges, and, ultimately, when invoked by a party, to that of the Court.

The Board's jurisdiction with respect to ratemaking has been the subject of considerable recent examination by the Board itself and by the courts. While most of that commentary has concerned the process for establishing gas distribution rates, it is clear that the Legislature has endowed the Board with broad powers in the establishment of just and reasonable rates for electricity transmission as well. The Board's jurisdiction derives from the following sections of the Act:

> 19(1) The Board has in all matters within its jurisdiction authority to hear and determine all questions of law and fact.
>
> 19(6) The Board has exclusive jurisdiction in all cases and in respect of all matters in which jurisdiction is conferred on it by this or any other Act.
>
> 78(1) No transmitter shall charge for the transmission of electricity except in accordance with an order of the Board, which is not bound by the terms of any contract.
>
> 78(3) The Board may make orders approving or fixing just and reasonable rates for the transmitting or distributing of electricity and for the retailing of electricity in

> order to meet a distributor's obligations under section 29 of the *Electricity Act, 1998*.
>
> 78(7) Upon an application for an order approving or fixing rates, the Board may, if it is not satisfied that the rates applied for are just and reasonable, fix such other rates as it finds to be just and reasonable.
>
> 78(8) Subject to subsection (9), in an application made under this section, the burden of proof is on the applicant.
>
> 78(9) If the Board of its own motion, or upon the request of the Minister, commences a proceeding to determine whether any of the rates that the Board may approve or fix under this section are just and reasonable, the Board shall make an order under subsection (3) and the burden of establishing that the rates are just and reasonable is on the transmitter or distributor, as the case may be.
>
> 128(1) In the event of conflict between this Act and any other general or special Act, this Act prevails.

In addition, when carrying out its responsibilities under the Act, the Board is subject to explicit objectives to protect the interests of consumers with respect to prices and the adequacy, reliability and quality of electricity service; to promote economic efficiency and cost effectiveness in the transmission of electricity; and to facilitate the maintenance of a financially viable electricity industry.

In assessing the Society's assertions it is important to note that where there is jurisdiction to regulate there is also an obligation to regulate. A regulatory body such as the Board has a positive obligation to fulfill the mandate bestowed upon it by the Legislature.

The Board has a positive obligation pursuant to section 78 to ensure that the rates governing the transmission of electricity are just and reasonable. In a decision that has been relied upon and cited numerous times, the Supreme Court of Canada has held that just and reasonable rates are those which strike an appropriate balance between the interests of consumers on one hand, and the right of the utility to make a reasonable return on its investment, on the other.[7]

A number of intervenors argued, and Board staff observed, that the Board's method of determining just and reasonable rates does not include prohibiting the subject utility from making expenditures or incurring costs at rigidly prescribed levels. Rather, the Board approves a revenue requirement that is consistent with its findings on various cost categories, including operating costs. The courts have recognized that operating costs include compensation costs[8], and that in the course of setting just and reasonable rates, numerous costs may be subject to challenge including those related to compensation plans[9].

The Board's obligation to arrive at just and reasonable rates, and to protect the interests of consumers, requires it to assess the reasonableness of all cost categories for which recovery is sought. The Board has a wide discretion to allow, disallow or adjust the components of both rate base and expense[10].

In the Distribution decision, the Utility's labour rates and compensation costs appeared consistently higher than those of comparable North American utilities. As a result, the Board panel deciding the Distribution case asked the Utility to identify steps it had taken or would take to reduce labour rates in the next Distribution rates case filing. The panel also required the Utility "to demonstrate in the future that lower compensation costs per employee have been achieved or demonstrate concrete initiatives whereby compensation costs will be brought more in line with other utilities".

[7] "Just and reasonable" rates have been defined by the courts as those which are fair to the consumer and which permit the company to earn a fair return on the capital invested: *Northwestern Utilities, Ltd.* v. *City of Edmonton et al*., [1929] S.C.R. 186, cited in *Re Union Gas Ltd.* v. *Ontario Energy Board et al*. (1983) 1 D.L.R. (4th) 698 (Ont. H.C.J.), p. 706.

[8] *Re Union Gas Ltd. v. Ontario Energy Board et. al*., ibid., p. 702.

[9] *Transcanada Pipelines Ltd*. v. *Canada (National Energy Board)* [2004] F.C.J. No. 654. (C.A.), para. 34.

[10] *Re Union Gas Ltd. v. Ontario Energy Board et al*., *supra.*, p. 712.

That panel also required the Utility to provide further detailed information respecting the full extent of what appeared to be a disparity in comparative compensation costs. The underlying rationale for this finding was to ensure that the costs incurred by the Utility with respect to labour rates and compensation costs are reasonable, and can therefore form the basis of part of the overall revenue requirement of the Utility.

The same approach is taken for all other categories of costs that comprise a utility's revenue requirement. In making the finding that it did in the Distribution case, the Board was giving the Utility fair warning that the Board had concerns about the apparent disparity in comparative labour rates and compensation costs.

The Board did not and does not prohibit the Utility from paying to its workforce whatever it negotiates within the context of its labour relations environment. What the Board does do is limit the recovery as part of the revenue requirement to that portion of compensation cost which the Board finds to be reasonable.

In other words, the Utility is free within the negotiating environment to arrive at whatever resolution it sees fit. It has to do so, however, with knowledge that full recovery of the consequential cost may not be available to the extent that the Board considers the settlement to be unreasonable.

To do otherwise would make the ratepayers captive to whatever private arrangements are agreed to by the Utility and its unions. The Board can only meet its responsibility to protect the interests of consumers if it assesses the reasonableness of the costs which result from such settlements and provides for recovery according to a fair, transparent, and principled regulatory approach.

In its Reply submission, the Society argued that the Board has no authority to make orders which have the effect of compelling the Utility to violate labour relations agreements to which it is bound.

It is not the practice of this Board to make any such orders. The Board is expressly not bound by the terms of any contract in its establishment of just and reasonable rates pursuant to Section 78 of the Act. The Board assesses the reasonableness of the cost consequences of the utility's arrangements, and establishes the revenue requirement on the basis of that assessment. The Board's view of the reasonableness of compensation costs is just one of the factors that the parties at the bargaining table must take into account. The consequence of a Board finding that this category of cost is excessive is a possible disallowance of a portion of the amount claimed by the utility for inclusion in the revenue requirement. In that hypothetical case, the utility would decide whether to attempt to change its compensation practices or to source the additional funding from the shareholder.

Accordingly, the Board finds that it has the authority to make findings and to provide guidance with respect to the reasonableness of a utility's compensation costs for the purpose of setting just and reasonable rates for utility service.

4. OPERATIONS, MAINTENANCE AND ADMINISTRATION

This chapter contains the Board's findings on Hydro One's proposed Operations, Maintenance and Administration expenses (OM&A) as well as the level of the Company's compensation costs.

4.1 OM&A EXPENSES

Hydro One's updated evidence showed a forecast for OM&A expenses of $394.1 million for the 2007 test year with a slight decrease to $387.5 million in the 2008 test year. The 5.1% increase for 2007 was in addition to an increase of almost 10% in the 2006 bridge year. Table 2 shows Hydro One's forecast amounts compared with those in the preceding four years.

Table 2: OM&A Expenses 2003 – 2008

	Historic			Bridge	Test	
$ millions	**2003**	**2004**	**2005**	**2006**	**2007**	**2008**
OM&A by category						
Sustaining	$146.9	$153.9	$166.3	$179.0	$200.1	$200.9
Development	2.2	5.0	6.7	8.1	8.0	8.1
Operations	36.6	49.5	38.3	42.9	45.8	46.2
Shared services and other	125.8	81.9	59.9	76.3	67.4	57.1
Taxes, other than income taxes	55.4	68.1	70.5	68.6	72.8	75.1
Total OM&A	$366.8	$358.4	$341.8	$374.8	$394.1	$387.5
Year over year % change						
Sustaining OM&A		4.8%	8.1%	7.6%	11.8%	0.4%
Total OM&A		-2.3%	-4.6%	9.7%	5.1%	-1.7%

This part of the hearing focused mainly on Sustaining OM&A expenditures as this category represents just over half of the OM&A total. The Sustaining OM&A budget represents spending required to maintain existing transmission lines and station facilities so they will continue to function as originally designed and meet overall system reliability, environmental and safety requirements.

One reason for intervenor interest in the Sustaining category is the fact that it has had consistent increases in expenditures from 2003 through to the test years. Sustaining spending in 2007 is forecast to be almost 12% higher than in 2006, a year in which spending rose by 7.6% over 2005 levels.

Hydro One defended its Sustaining OM&A expenditure plans on the basis of its business planning process where it uses leading measures related to the performance, condition and age of the specific assets which make up the transmission system. The information supporting Hydro One's plans include asset performance (asset failure rate) studies, asset condition assessments and asset demographics information.

The asset demographic information identified the number of assets which are expected to enter specific critical age regions, such as mid-life, where incremental maintenance requirements are necessary to ensure continued asset performance, and end-of-life where it becomes uneconomic to try to sustain the required performance levels. Hydro One emphasized that both the volume and scope of OM&A work is increasing for Hydro One's aging fleet of assets. It is the Company's position that the business planning process utilized by Hydro One has established the appropriate level of sustaining work, based on a detailed needs identification and work program prioritization[11].

VECC highlighted that in Hydro One's original application, Sustaining OM&A expenditures were increasing by 28% from $155.9 million in 2006 to $200.1 million in

[11] Ex.A/Tab14/Sch1

2007. In the evidence update, the Sustaining OM&A spending for 2006 was revised upwards to $179.0 million.

Hydro One’s explanation for the higher than expected spending in 2006 was that higher than anticipated failure rates were experienced that year, associated with a specific transformer design and storms. Unexpected difficulty in getting cleanup crews to the affected sites increased unanticipated expenses Hydro One testified that this higher 2006 spending does not impact on spending plans for 2007 and 2008.

VECC did not accept Hydro One’s assertion that assets and performance were actually deteriorating. VECC noted that as the updated information provided by Hydro One showed that outages of 230kV circuit breakers were lower in 2006 than in any of the previous three years, and that outages of 230 kV transformers were well below 2005 levels and in line with those in 2003 and 2004.

VECC also argued that the 2006 asset condition assessment did not show a marked difference in overall condition of the transmission assets and did not substantiate the requested increase in OM&A Sustaining spending.

VECC also noted that Hydro One’s evidence indicated that a significant portion of the Priority 1 (“very poor”) and Priority 2 (“poor”) assets will actually be replaced over the 2006-2008 period. VECC submitted that if this level of replacement proceeds, it will have a direct impact on the level of Sustaining OM&A spending needed for these assets and should reduce overall maintenance requirements. VECC also noted that in the High Level Transmission Benchmarking Study prepared by the PA Consulting Group (September 6, 2006), [12] Hydro One Networks OM&A spending was close to the average for those utilities surveyed when normalized on either a total Gross Asset Basis or a MWh transmitted basis using data from 2003-2005. Similarly, Hydro One’s reliability was shown to be about average. VECC held that this evidence showed that current levels of spending were reasonably adequate.

[12] Ex.A/Tab15/Sch2

In conclusion, VECC submitted that the proposed Sustaining OM&A budgets be reduced by 6% in both test years to $188.1 million in 2007 and $188.8 million in 2008.

AMPCO questioned whether the evidence established that assets are aging at a specific rate, or a rate greater or lesser than in the past, or that asset aging is creating a significant deterioration in reliability. AMPCO urged the Board to direct Hydro One to provide clear evidence on asset aging at its next rate hearing.

Citing evidence which appeared to show that the 2006 outage performance was better than previously indicated, AMPCO argued that Hydro One’s data did not support a claim of significant and increasing problems with asset performance.

AMPCO maintained that Canadian Electrical Association data did not indicate a significant deterioration in system performance over the period 2003 to 2006. In addition, Hydro One’s evidence showed that the Company achieved first quartile system performance compared to American utilities over the five-year period from 2000 to 2005.

AMPCO also submitted that the higher proposed capital spending should reduce the need for additional sustainment OM&A spending in future years.

Based on the above, AMPCO submitted that the 2007 Sustaining budget should be reduced to $185 million, and the 2008 budget to $195 million. AMPCO noted that Hydro One’s proposals for Development, Operations, Shared Services and Other OM&A appeared reasonable.

CCC supported the AMPCO analysis of asset aging, asset condition and asset performance. CCC was also concerned about the increased bridge year spending revealed in the update, with no reduction shown in 2007 and 2008 plans. CCC recommended Sustaining OM&A spending be reduced by $10 million to $190.1 million in 2007.

SEC also submitted that planned Sustaining OM&A increases were too high in the test years. SEC argued that expenditure increases should have taken place earlier, citing evidence from Hydro One's 1999 transmission rates proceeding which indicated Hydro One was already aware that blocks of assets were reaching the end of their service lives.

SEC argued a prudent company, operating in a competitive market, which foresaw an imminent need to refurbish or replace aging assets would not wait until all of those assets reached a certain age before taking action. Rather, it would seek to smooth the impact of those investments to avoid problems with cash flow in a given year.

SEC also referred to the improvement in asset failure rates and forced outages in 2006, as shown in the updated evidence. SEC focused on Exhibit L1.3 where comparisons of OM&A per line kilometre show a 12% increase from 2006 to 2007 compared to an average annual increase between 2003 and 2006 of only 7%. SEC recommended that the Sustaining OM&A budget should be frozen at the updated 2006 level of $179 million for each of 2007 and 2008. This would mean a reduction in the OM&A budget of $21.1 million in 2007, and $21.9 million in 2008. SEC's rationale for the reduction is based on its view that although planned expenditures in 2007 and 2008 are needed, they are unreasonable for inclusion in 2007 and 2008 rates because they are the result of imprudently low expenditures in the historic years. It contends that the Company should have been investing in the business during a period of overearning, and should not make up for that failure during the test years. SEC also asserts that the proposed spending levels do not take into account the higher 2006 spending levels revealed in the evidence update in February. In its view, this higher spending in 2006 should result in lower spending in the test years.

The Power Workers' Union ("PWU") supported the levels of OM&A spending applied for by Hydro One on the basis that Hydro One demonstrated the need for the levels of spending through their planning methods (asset condition assessment, outage data and asset aging data). PWU argued that if the Board found that these planning methods are reasonable, then the results should be accepted as well. PWU submitted that as more units of work are required, and wages and material costs are increasing also, the increased costs are justified. PWU also submitted that if reductions are ordered, the impact of not doing this work on service quality, reliability and safety must also be taken into account.

Board Findings

Hydro One is seeking approval of a significant increase in its Sustaining OM&A spending. The key issue is the need for planned spending in 2007 which is almost 30% higher than the $155.9 million originally planned for 2006.

The primary concern of intervenors with respect to this increase is its magnitude when compared to spending in this area in the recent past. Hydro One's response was that the need for such increases became apparent recently, and as the result of improved analytical and planning techniques. It argues that it would not have been prudent to make larger investments in preceding years, given its understanding of the condition of its plant at that time.

It is the view of the consumer intervenors that such large program increases require strong and objective evidence of a broadly-based deterioration in system performance or a demonstrated severe and rapid deterioration of a major asset class. They argue that no such evidence has been provided by Hydro One.

Intervenors suggest that it is impossible to conclude from the evidence provided by Hydro One that its asset base is aging at any specific rate, that this rate is greater or less than it has been in the past, or that further asset aging is creating a significant deterioration in reliability. Intervenors also assert that the evidence does not support claims of significant and increasing problems with Hydro One's assets or system performance deterioration.

Hydro One answers that the use of historic data to extrapolate an appropriate spending level for the test year is unsound. It argues that transmission system reliability is a lag indicator – by the time impairments in reliability become apparent it is too late. The Company relies on an improved package of leading indicators to plan its expenditures in this category.

The Company also asserts that while the evidence shows there was a marginal decrease in the failure rate of a single asset class in 2006, the trend is that of increasing and continuing deterioration overall.

The Company also disputes the claim made by some of the intervenors that the 2003/2006 Asset Condition Assessment comparison does not show asset condition deterioration. It suggests that the comparison made by the intervenors is inappropriate, given that it is based on two materially different data bases. The Company also separates its significant increases in capital expenditures to replace assets from its OM&A budget. It argues that there is no good reason to conclude that the replacement program contemplated will have any material effect on the short-term OM&A requirements.

The Board notes that the concerns of the intervenors with respect to the proposed level of spending were heightened by Hydro One's request that the Board approve a RRAM for 2009 and 2010. Under the proposed RRAM, the approved OM&A spending for 2008 would find its way into a rate adjustment mechanism for the following years. As noted in Chapter 2, the Board has not approved Hydro One's request for the RRAM, and the revenue requirement for 2009 will be based on a cost-of-service examination.

In the OM&A section of the Application, as in a number of other sections, the Board found some of the evidentiary record to be inadequate or incomplete. For example and as noted above, the Applicant insisted that the overall trend of its assets was continued and increasing deterioration while the evidence it placed before the Board on that point showed a marginal decrease in the failure of a single asset class in 2006. The Board has concerns about the comparatively low spending levels in the years preceding the bridge year. It would be expected that a large and capable transmission company, such as the Applicant, would have had a more reliable asset condition assessment capability than appears to have been the case until recently. The Board would expect that the Company would attempt to smooth spending on this category of expense as much as possible, given the nature of the activity, which is, by definition, incremental in nature. It is concerning that the revenue requirement would include such a steep increase from one year to the next. While the Company has provided an explanation for its request for the sharp increase sought there remains ambiguity about the real state of the asset base. The evidence presented by the Company is not always consistent with the claims advanced.

It would have been better had the Company had been able to demonstrate with more acuity the statistical and technical underpinning of its point of view. The safe and reliable operation of the system is of paramount importance to the province’s economy, and the well being of its population. This Application, and many other matters currently before the Board, documents the fact that the transmitter is engaged in very significant extensions and reinforcements of the system.

In the Board’s view, resolving the ambiguity of the asset reliability evidence against the applicant by reducing the proposed OM&A budget would be inappropriate and unsafe. The Board is convinced that the Company has genuinely formed the judgment, based on its engineering expertise and its enhanced analytical capability, that increases of the nature applied for are needed to maintain a robust, safe, and reliable transmission system.

Accordingly, the Board will approve the OM&A budget as applied for the years 2007 and 2008. However, the Board directs the Applicant to work with intervenors to develop the type of and format for data reflecting asset condition. In particular, the Board directs Hydro One to provide asset aging data which includes data by value and importance of the type of asset, as suggested in AMPCO's submissions, in its next transmission rates proceeding.

It is important that an approach is found that will allow all parties to make better assessments of the state of the asset base at the time of the next revenue requirement case. This data must enable the Company to bring to its next cost of service application a reliable representation of all important parameters of the condition and reliability of the asset base and the financial implications thereof. The Applicant will report to the Board no later than six months from the date of this decision on the progress made in the development of its improved asset database. It is the Board's intention that this stakeholdered exercise be implemented in time to provide a very clear representation of the condition of the Company's plant in time for its expected cost of service application for the 2009 revenue requirement.

4.2 EMPLOYEE COMPENSATION

Several intervenors directed their arguments to the overall size and growth of Hydro One's employee compensation cost. These issues are covered in this section. Some intervenors also raised issues with respect to two narrower compensation issues. Those issues are the rate treatment of incentive pay, and the possible impact on senior management compensation of the recommendations of the Province of Ontario's Agency Review Panel. Those two smaller issues are covered at the end of this chapter in section 4.3.

Hydro One conducts both its transmission and distribution businesses within a single corporate entity, Hydro One Networks Inc. Table 3 provides summary information on combined compensation cost and headcount for Hydro One's transmission <u>and</u> distribution businesses for the past four years, and the proposed amounts for 2007 and 2008.

Table 3: Employee Headcount and Compensation (total Hydro One Networks)

	Historic			*Bridge*	*Test*	
Compensation cost in $ millions	**2003**	**2004**	**2005**	**2006**	**2007**	**2008**
No. of employees at year end						
Regular	3,696	3,841	3,904	4,018	4,204	4,158
Non-regular	906	1,032	1,174	1,283	1,605	1,645
Total	4,602	4,873	5,078	5,301	5,809	5,803
Compensation cost *	$388.1	$404.2	$397.9	$459.3	$493.0	$508.0

* Includes base salary, overtime pay, incentive pay, benefits (other than costs for pensions and other post-employment benefits), and other compensation.

Source: Exhibit J1.40

A portion of Hydro One's compensation cost is included in OM&A expenses and the balance is included in the cost of various capital projects. Hydro One did not file any information in this proceeding about the amount of total forecast corporate compensation cost for 2007 and 2008 that will be borne by the transmission business (either as OM&A expenses for 2007 and 2008 or as additions to the transmission business rate base). The Company did estimate that just under 50% of full-time equivalent employees for the test year 2008 would be allocated to the transmission business based on the split of work programs between transmission and distribution.

The Board considered compensation issues at Hydro One most recently in its hearing on 2006 rates for the company's distribution business. Given the short interval between the release of the Board's decision on Hydro One's distribution rates in April 2006, and the filing of Hydro One's transmission rates application in September 2006, it is understandable that most of the compensation issues raised by intervenors in this case would be the same as those addressed in the distribution rates case.

In the Distribution decision, the Board made the following observations (in paragraphs 3.4.3 to 3.4.5):

- in future rate cases it expects Hydro One to identify what steps the company has taken or will take to reduce labour rates;
- the contrast between the compensation structures of Hydro One and some other utilities is of concern; and
- in future rate cases it expects Hydro One to demonstrate that lower compensation costs per employee have been achieved or to have concrete initiatives in place to bring compensation costs more in line with other utilities.

Hydro One stated that its approach to compensation has to be considered in light of several environmental factors. First, over 90% of Hydro One's workforce, including its engineers, is unionized, which places significant constraints on its ability to reduce compensation cost per employee. The two largest unions are the PWU and the Society. In the event of a strike by the PWU, which represents 70% of the company's workforce, Hydro One stated that it would be unable to sustain operations. Second, like many other entities in the power sector, Hydro One has an aging workforce, with over 1,000 employees eligible to retire by the end of 2008. The Company said it was working hard to strike a balance between the need to control compensation costs, and the need to hire new workers and to retain existing staff. Third, over the next few years, Hydro One must complete a large work program involving asset sustainment and major development projects.

Despite these factors, Hydro One submitted that it has had some success with its two major unions. It listed five areas in which it believes it has made gains in negotiations with the PWU (such as eliminating incentive pay) and three areas in which it has made gains in negotiations with the Society (including a pension arrangement for new Society employees that is 25% less costly than the pensions for existing employees). The Company also intends to increase its reliance on external consultants and contractors as a way to deal with its major work programs.

Hydro One filed a benchmarking study, prepared by PA Consulting in September 2006 (the "study"[13]), which compared 21 of the Company's business performance metrics with 13 North American utilities. It also provided specified wage rate and overtime policy comparisons for three job classifications with 13 Canadian regulated transmission or distribution companies. With regard to the specified wage rate and overtime policy comparisons, Hydro One's rates were highest for two of the job classifications and third highest for the other.

Hydro One argued that the benchmarking study was completed under tight time constraints on a "best efforts" basis and has several shortcomings which limit its usefulness. The study itself referred to several limitations and noted that further substantial effort and investigation would be required before any conclusions can be drawn. Hydro One stated that given more time it would not necessarily have selected the 13 companies for a benchmarking study on salaries.

PWU supported the forecast compensation costs for 2007 and 2008. It submitted that given the heavily unionized and aging workforce, and Hydro One's need to complete a major work program over the next few years, the Board should not expect any material reduction in cash compensation per employee. It also argued that the results of the benchmarking study were incomplete and inconclusive, and cautioned the Board against drawing any conclusions from the study's labour rate comparisons.

The Society argued that compensation costs for Hydro One's unionized employees are not high. It cited many of the same environmental factors noted by Hydro One as support for this view. It also submitted that total compensation cost per employee is not a useful measure of the Company's efficiency. Rather, it would be better to assess Hydro One's performance against productivity measures such as units of

[13]Hydro One was directed by the Board in the Distribution decision to prepare a high level benchmarking study for the next distribution rates case, based on a list of comparable North American companies with similar business models (transmission and/or distribution) and to report on high level comparative performance and costs information for Hydro One and the companies. The Company was directed to submit the study "on a best efforts basis" in its transmission rates application for 2007.

accomplishments per employee.

Although the Society accepts Hydro One's compensation budget, it said that if the Board continues to have concerns there are better ways for Hydro One to increase efficiency than to reduce compensation for unionized employees. It recommends that Hydro One address what the Society considers to be an unnecessarily high manager-to-employee ratio, made worse in 2006 as the result of the transfer of 155 Society-represented positions to management positions.

CCC said it continues to be concerned about the overall level of Hydro One's compensation costs. It did not, however, recommend any reduction in Hydro One's proposed revenue requirement as a result of such concerns. Instead, it urged the Board to direct the Company to work with stakeholders to propose and undertake a meaningful review of costs relative to comparators.

Energy Probe described Hydro One's overall compensation cost as clearly excessive and above market. It acknowledged that the issue requires management's attention over a number of years and said it is difficult to move towards market-based compensation every year. It argued that, as part of Hydro One's next distribution rates case, the Company should be required to provide more responsive evidence on initiatives to achieve cost per employee closer to market value.

SEC submitted that Hydro One's evidence on compensation was not responsive to the Board's direction to the Company in the last distribution rates case. It said the various negotiated gains cited by Hydro One in this application pre-dated the Board's April 2006 decision on distribution rates. It also challenged Hydro One's statement that the elimination of incentive pay for PWU-represented employees was a gain as it appears that the gain was offset by higher base pay.

Despite its concerns, SEC did not recommend any change in the forecast compensation costs except for a component of forecast management compensation. In 2006, Hydro One increased the minimum and maximum pay bands for management employees, an action SEC said was not appropriate because management salaries “set the bar for all the Company’s pay bands.” SEC recommended that the Board disallow the portion of forecast compensation costs resulting from this change without specifying an amount, or if the amount involved is material.

SEC said the Board should reaffirm the direction given in the Distribution decision and warn Hydro One that it will risk not recovering all of its compensation costs if it fails to take reasonable steps to reduce compensation.

VECC and SEC noted that the compensation comparisons provided by Hydro One look only at base salary and short-term incentives. Both intervenors recommended that in future filings Hydro One should provide information on how its total compensation, including pension and similar benefits, compares to other companies. VECC also recommended that Hydro One should develop measures that would allow parties to judge whether the size of the Company’s management group is appropriate.

Board Findings

The Board finds itself in the same position after this hearing as it was after the hearing on Hydro One’s 2006 distribution rates – it has lingering concerns about the size and growth of overall compensation costs at Hydro One. Having said that, the Board will accept the forecast compensation costs for 2007 and 2008. The evidence on compensation costs in this proceeding, while less than optimal, is sufficient to enable the Board to make this finding. While intervenors have expressed concerns about these costs, they have not been able to challenge these amounts convincingly, nor have they provided any coherent basis upon which the costs could be reduced. The Board notes that none of the intervenors recommended any disallowances except for SEC, which advocated that due to widening pay bands, any increases in management compensation should be disallowed.

Some intervenors recommended that the Board should direct Hydro One to prepare a more comprehensive study of its compensation costs and how they compare with the costs of comparable utilities. Hydro One indicated during the hearing that it is carrying out further work now that will be filed as part of its next distribution case.

The Board looks forward to the filing of a study which provides useful and reliable information concerning Hydro One's compensations costs, and how they compare to those of other regulated transmission and/or distribution utilities in North America.

To that end, the Board directs Hydro One to consult with stakeholders about the type of information to be gathered and the types of utilities and other companies that should be used for comparison purposes. The Board also expects Hydro One to gather and compare data reflecting total compensation costs, not just base salaries. Detailed comparisons of compensation costs for specific job categories are of some help in understanding how Hydro One compares to others in the industry. Equally important is the size and trend of labour costs per unit of output of various sustainment, development, and corporate activities. In the study that Hydro One is now preparing, the Board expects it to provide empirical evidence which reveals the relative productivity of its workforce in comparison to other utilities. Deficiencies in the evidence which are not fully justified could be construed against the utility in its next rates case.

The PA study filed in this Application suffered from various deficiencies and shortcomings, as noted by the authors of the study, the Applicant and the intervenors. The Board expects the new study to be comprehensive and reliable, with none of the limitations of the PA study. If Hydro One cannot correct all of these deficiencies in time for the Company's 2008 Distribution rate filing, the Board expects them to be corrected in the 2009 transmission filing.

4.3 OTHER COMPENSATION ISSUES

In its decision on Hydro One's 2006 distribution rates, the Board approved the inclusion of incentive compensation payments in the revenue requirement. The Board also made the following comment:

> While the Board does not consider the achievement of net income to be a factor that works only for the benefit of the shareholder, as customers benefit from a healthy utility through higher credit ratings and good service, the Board would be concerned if this factor predominated compared to the other factors determining incentive pay. The Board expects Hydro One to file appropriate evidence in its next main rates case to establish that none of the incentive compensation should be charged to the shareholder."[14]

Budgeted incentive payments for Hydro One's transmission and distribution businesses are $6.9 million for 2007 and $8.5 million for 2008. Hydro One did not file information that specified the portion of those amounts that relate solely to its transmission business. (As noted in section 3.2 above, Hydro One estimated that just under 50% of its full-time equivalent employees would be allocated to its transmission business.) The amount of incentive payments are linked to 14 performance measures included in the company's balanced scorecard, one of which is the achievement of net income targets.

Although the amounts may not be significant, CCC recommended that as a matter of principle none of the forecast incentive pay for 2007 and 2008 should be recovered through transmission rates. CCC submitted that this would be consistent with the methodology the Board has applied to electricity distributors. Energy Probe accepted that incentive payment targets do benefit ratepayers but argued that 25% of the amounts should be disallowed because Hydro One failed to file evidence that none of the cost should be borne by its shareholder. VECC also recommended a 25% disallowance. SEC recommended the disallowance of an unspecified portion of the forecast payments.

CCC and VECC also recommended that Hydro One be directed to establish a deferral account to track any cost reductions in 2007 and 2008 that result from Hydro One's implementation of the findings of the Agency Review Panel, established in January 2007. It released its Phase I report on executive compensation at Hydro One and four other provincial electricity sector institutions on June 27, 2007. At that time, the Minister

[14] Decision With Reasons, RP-2005-0020/EB-2005-0378, April 12, 2006. para. 3.4.6.

of Energy announced that he has directed each institution to implement the Panel's recommendations.

Board Findings

The Board accepts the inclusion in the revenue requirement of the forecast incentive payments.

The concern of intervenors is the inclusion of a net income target in Hydro One's balanced scorecard, which is the basis for incentive payments. The Board acknowledges that its 2006 Distribution Rate Handbook ("2006 EDR Handbook") stated that incentive payments related to benefits to shareholders would not be recoverable in the 2006 revenue requirement of a distributor. In the Board's view, our decision to allow incentive compensation costs in Hydro One's transmission revenue requirement is not in conflict with the 2006 EDR Handbook. First, net income is only one of 14 performance measures in Hydro One's balanced scorecard; there is no evidence that the net income performance measure predominates, which was the concern expressed by the Board in the Hydro One distribution decision. Indeed, Hydro One pointed out that incentive payments are contingent on meeting a range of performance measures; no payouts would occur if the net income target were met but other measures were not achieved. Second, there is no evidence that would allow the Board to make an objective determination of how much of the forecast incentive payments relate to shareholder benefits. Even if that were possible, it appears to the Board that the amount, if any, would be very small given that the total incentive payments allocated to the transmission business for the test years are not particularly significant.

Executive compensation costs in Hydro One's application obviously could not have reflected the recommendations of Agency Review Panel. The impact of the recommendations on Hydro One's executive compensation for 2007 and 2008 is unknown given that the Company's Board of Directors would only recently have started the implementation process. In addition, the effective date of any new compensation practices at Hydro One is also unknown. Accordingly, there is no way to predict if the impact in 2007 and 2008 of the implementation of the Agency Review recommendations will be significant.

The Board would generally not require a utility to track variances in routine costs when new information about the extent of those costs in the test years becomes known only after the rates hearing is completed and the parties have submitted argument.

In this case, the Board believes an exception is warranted. In his announcement of the release of the Panel’s report, the Minister of Energy noted that the government wants to ensure that compensation for top executives strikes an appropriate balance between being competitive on the one hand, and fair to ratepayers, on the other. The Board directs Hydro One to track any reduction in executive pay during 2007 and 2008 that results from implementing the Panel’s recommendations and to report that amount at its next transmission rate case.

5. CAPITAL EXPENDITURES

Hydro One's updated evidence shows a significant increase in transmission capital spending. The Company has requested approval for capital expenditures of $691.5 million in the 2007 test year and $768.2 million in 2008, as shown in Table 4. The 2007 amount is 72% higher than bridge year levels and the 2008 amount is 11% higher than 2007. The bridge year amount of $401.6 million was 15% higher than 2005 levels. The two main areas of this growth are the Sustaining and Development capital budgets, which comprise over 90% of the total proposed capital expenditures.

Table 4: Capital Expenditures 2003 – 2008

	Historic			*Bridge*	*Test*	
$ millions	**2003**	**2004**	**2005**	**2006**	**2007**	**2008**
Capital Expenditure by Category						
Sustaining	$160.3	$173.7	$168.9	$178.5	$288.1	$295.6
Development	59.5	217.3	134.6	179.4	298.7	409.4
Operations	38.9	20.7	10.2	9.4	20.1	20.4
Shared Services & Othe	28.7	20.2	35.5	34.1	84.6	42.7
Total*	$287.4	$431.9	$349.2	$401.4	$691.5	$768.1
Year over year % change						
Sustaining		8.4%	-2.8%	5.7%	61.4%	2.6%
Development		265.2%	-38.1%	33.3%	66.5%	37.1%
Total Capital Expenditures		50.3%	-19.1%	14.9%	72.3%	11.1%

**Note: Totals may not add due to rounding.*
Source: Exhibit D1/Tab3/Sch1

Hydro One defended its capital budgets on the basis of what it considers a comprehensive planning process that encompasses the effects of an aging asset base, the results of the asset condition assessment and monitoring of failure rates. In addition, its process takes into account significant expansion of the transmission system to accommodate what the Utility describes as the changing electricity infrastructure needs of the province.

Intervenors generally limited their arguments to the Sustaining and Development budgets.

5.1 SUSTAINING

The Sustaining budget is growing from $178.5 million in 2006 to $288.1 million in 2007, an increase of 61% with a further small increase in 2008 of 2.6%.

Sustaining expenditures include the cost of investment required to replace or refurbish components to ensure that existing transmission system facilities function as originally designed. The evidence showed that these capital expenditures are largely driven by the same factors as OM&A spending, that is, asset condition assessment, asset aging records and data respecting failures and outages.

Intervenors' concerns fell largely into three categories: concerns that the asset assessment was not sufficiently robust to accurately determine the need to replace the assets; criticism that Hydro One spent insufficient funds on asset maintenance in previous years; and concerns that Hydro One would not be able to spend all the funds budgeted.

Part of Hydro One's asset analysis relied on information on asset failure rates. VECC argued that updated information on failure rates showed that outages were actually lower than those used to develop the sustaining budget. In addition, VECC argued that the 2006 asset condition assessment was not much different than the previous (2003) assessment. Overall, VECC questioned whether this information justified the large increase in sustaining capital expenditure.

SEC reiterated the arguments it made with respect to the OM&A budget, namely that Hydro One had ample information regarding the state of its asset base during the historic period to justify gradual increases in expenditures so as to avoid major increases in the test years. SEC suggested that this demonstrated that the Sustaining capital budget should be reduced, but did not suggest a specific reduction in the test years.

AMPCO's position was that the evidence on asset aging was not clear, and urged the Board to direct Hydro One to provide better evidence of asset aging at its next rate hearing. AMPCO also questioned the evidence that system performance was deteriorating. In addition, AMPCO cited Hydro One's performance compared to analogous utilities. Further, AMPCO argued that there should be significant sustainment benefits arising from the proposed large increase in development spending, which will result in the replacement or upgrading of existing components in capital projects. AMPCO submitted that the sustainment budget should be reduced to $215 million in 2007 and $255 million in 2008.

Hydro One responded that its capital spending plans are based on multi-year trends in asset failures, and a slight reduction in failures in 2006 would not cause it to alter its plans for single year results or for a single asset group.

Hydro One also argued that the asset condition assessment methodology for 2006 was markedly different than the 2003 study, with a larger asset base, refined techniques, improved data quality and enhanced algorithms. Hence, the results of the two assessments were not directly comparable. Hydro One maintained that the evidence it had in the earlier period, when it completed its business planning, did not justify higher expenditures in the years leading up to the test year. There was no reason to increase expenditures during that period, given that the information available at that time did not show a need to accelerate replacements or upgrades. In addition, Hydro One asserted its evidence points to increasing numbers of mid-life and end-of-life assets, largely the result of a high growth period in the 1950s and 1960s.

PWU supported the Hydro One request for Sustaining capital, citing the asset aging and performance evidence as well as raising the risk to reliability, service quality, safety and increased maintenance costs, if capital spending were to be reduced from planned levels. The PWU stated that some of the increased budget for Sustaining capital was a result of the increasing cost of material and equipment in a time of unprecedented transmission development globally.

Board Findings

The findings in this decision on OM&A expenditures are very relevant to these findings, as increases in both cases are largely based on aging assets. Hydro One is seeking approval of a sustainment capital budget that increases by an extraordinary 61% from 2006 to 2007. Intervenors are understandably concerned. Their concerns regarding asset assessment information are equally relevant to sustainment capital and OM&A.

The Board accepts that Hydro One’s asset assessment methodology and information is improved over previous years. However, it still lacks clarity and robustness. While Hydro One’s quantitative evidence is not compelling, the Board finds that Hydro One’s qualitative evidence provides assurance that capital costs are escalating significantly. The Board accepts that the high growth period of the 1950s and 1960s likely results in a similar period of a high number of assets coming to the end of their useful life. Though the most recent failure information did show some improvement in failure trends, the Board also acknowledges Hydro One’s position that plans for sustaining investment must take into account more than a one-year or short-term improvement when planning capital spending programs. In addition, the Board notes Mr. McQueen’s evidence that increasing costs are also a result of escalating global demand for material and equipment. No intervenor refuted this evidence. Therefore, the Board accepts that both the number of replacements and the cost per replacement are escalating.

Intervenors asserted that Hydro One could have avoided the proposed significant increase in expenditures by recognizing the asset aging problem sooner and smoothing the expenditures over the past several years. The Board accepts that it is difficult to smooth a capital budget over several years and that it is both imprudent to invest too soon in capital replacements and imprudent to wait until the system deteriorates to very low levels of reliability before action is taken. Hydro One must balance the immediate investment needs of the system with an eye to proactive action to prevent an unsupportable level of failure and reliability levels.

AMPCO submitted that a large capital investment program should result in lower sustaining capital expenses and suggested that the Board should take this into consideration. The Board agrees that the replacement of old equipment during a capital program should have the effect of lowering sustaining capital costs. We anticipate that there will be a lag in the effect, and expect Hydro One to provide evidence on the 2009 and 2010 sustainment capital benefits of 2007 and 2008 capital expenditures as the newer facilities come into service and replace the aging fleet. However, the Board does not accept AMPCO's rationale for its recommended reduction to OM&A expenses for the test years.

The Board approves the amounts applied for sustaining capital in 2007 and 2008 rates. As noted earlier in this decision in the OM&A chapter, the Board must have improved asset aging data for the next Hydro One cost-of-service proceeding. In approving the Sustaining capital investment plans, the Board expects Hydro One to continue to improve its asset condition assessment work and its work on the influence of asset aging on investment levels. The Board refers the reader to Chapter 3 of this decision for the Board's direction on developing this information.

5.2 DEVELOPMENT

The Development budget is growing from $179.4 million in 2006 to 298.7 million in 2007, an increase of 66% with a further increase of 37% in 2008 to a level of $409.4 million.

The Development Capital category covers funding for projects related to new or upgraded transmission facilities. Those facilities provide inter-area network transfer capability provide adequate capacity to deliver electricity to local areas, connect new generation and load customers to the transmission system, and maintain the performance of Hydro One's transmission system in accordance with Delivery Point Performance Standards. Hydro One showed project detail for all projects with budgets in excess of $3 million.

Hydro One classified the proposed Development projects on the basis of in-service date and the nature of the approval the applicant was seeking from the Board.

Category 1 included 15 projects with in-service dates in 2007 and 2008. The Applicant seeks to include the budgeted expenditures in the rate base the Board for 2007 and 2008.

Category 2 included six projects with in-service dates in 2009 and 2010. These projects do not require Board approval pursuant to section 92 (leave to construct), but will come before the Board again when the Company applies to include the costs associated with them in rate base. As these projects require significant spending in 2007 and 2008, the Applicant seeks assurance from the Board that the projects appear to be necessary, and the costs of the projects appear to be reasonable and prudent. The most significant project in this group is the Claireville/Cherrywood 500 kV circuit unbundling project.

Category 3 included seven projects that will require section 92 approvals. In the course of those proceedings the Company will present evidence establishing need and cost. However, for reasons that will be outlined below, Hydro One requested a determination by the Board of the need for the Leaside to Birch Junction project in this proceeding.

Category 4 consisted of two projects which may be part of the Integrated Power System Plan process, and which will have in-service dates beyond the test years. The evidence regarding these projects will be brought before the Board in a subsequent rate proceeding for inclusion in rate base. The Company did not seek any decisions from the Board with respect to these projects in this proceeding, and the Decision does not comment on those projects.

Board Findings – Development Category 1 Projects

In the Board's view, Hydro One's justification for the bulk of Category 1 projects was extensive and thorough. Support for these projects from sources such as the OPA, the IESO and preliminary documents related to the IPSP is persuasive. The Board also notes the support provided by Toronto Hydro and OPG for some of these investment projects.

There were no Intervenor or Board staff concerns with any of the Category 1 projects. The Board is of the view that these projects are well documented and substantiated by the evidence presented by Hydro One. The Board approves the inclusion into rate base of the budgeted amount of these projects. The total amount projected to be included in rate base in connection with the Category 1 projects is $256 million.

Board Findings – Development Category 2 Projects

Of the Category 2 projects, the Claireville/Cherrywood project was the most discussed. This project, which has an expected capital cost of $107 million, involves unbundling two 500 kV lines that are now connected and operated as a "super" circuit. Currently when one of the two circuits is out of service due to a planned or forced outage, generation connected to the 500 kV system in eastern Ontario must be curtailed. If constructed, the project will result in over 3,000 MW of transfer capability between the Claireville and Cherrywood transmission stations. The project was included in the June 2006 and March 2007 editions of the IESO's Ontario Reliability Outlook ("ORO").[15]

[15] In its final argument, the IESO said that "The inclusion of a project in the ORO … underscores the IESO's assessment that a proposed project meets a reliability need that has been identified or confirmed by the IESO. … To be clear, the inclusion in the ORO is not a directive for a transmitter or other entity to undertake construction, but agreement from the IESO that the proposal meets a specific need to improve reliability of the IESO-controlled grid or the load it serves."

Intervenors were generally in support of the Claireville/Cherrywood project and found the economics and rationale compelling. Toronto Hydro supports the project as it will improve supply reliability to Toronto's distribution system. OPG supports the Claireville/Cherrywood project as it is critical to the integrity of the power system, and benefits the electricity system and the operations and safety of the Darlington Nuclear station once completed. According to OPG, the project will reduce the risk of sudden generation reduction, which results in a revenue loss per event in the range of $0.5 million to $1 million.

Toronto Hydro also supported the Hydro One Development Capital program, making submissions for 16 specific projects cited in the Hydro One evidence, including several Category 2 projects. PWU supported the Hydro One Development capital budget proposals, citing the IPSP, OPA procurement activities and the IESO ORO reports as justification for these investment plans.

Regarding the Category 2 projects, including Claireville/Cherrywood, VECC was concerned with Hydro One's desire for assurance from the Board that "the capital program that the company is proposing is an appropriate approach, subject to coming back later to demonstrate to you that the costs have been reasonable and prudently incurred." [16] VECC submitted that the Board should not grant this assurance and that any such conclusion should be no more than an observation that the projects are reasonable.

The Board agrees with VECC. The costs of these projects will be subject to approval in a future proceeding. However, the Board does make the observation that these projects appear to be needed and, based on the limited evidence available, the Board did not identify any concerns about the proposed costs. The need for at least some portion of the Claireville/Cherrywood project appears to be non-discretionary. As Hydro One will be returning in 2008 for a 2009 test year application, the Board expects to see updates and progress reports on all these projects at that time, for final scrutiny and

[16] Tr. Vol.2, p.121

consideration of approval of the inclusion of these amounts into rate base. For discretionary projects, the Board expects Hydro One to quantify the reliability and other benefits of the projects.

Board Findings – Development Category 3 Projects

In this proceeding, the Board need make only one finding regarding the Category 3 projects. This is the need determination for the Leaside TS to Birch Junction TS project. Approval of all of the elements of the other projects will be covered under Leave to Construct (section 92) applications.

The Settlement Proposal stated:

> The parties agreed that the Applicant has demonstrated the need to relieve loading on the existing 115kV connection lines and Leaside and Birch Junction TSs.
>
> The Applicant has agreed that the issues regarding options, alternatives and costing of the mitigating alternatives will be deferred from this rate application to be dealt with in a separate section 92 application to the Board.

Notwithstanding this settlement, the Board determined that the need for this project should be examined on the record. Hydro One presented witnesses to address this issue in the oral hearing and provided evidence of need supported by the IESO and Toronto Hydro. Other intervenors did not comment on the evidence respecting need but submitted that the scope of the finding that the Board makes should not be broader than that agreed to in the Settlement Proposal.

The Board agrees. The evidence clearly demonstrates the need for the project as it addresses specific reliability issues. The Board finds that the need to relieve loading on the existing lines between Leaside TS and Birch Junction TS has been demonstrated. The Board accepts that the issues on options, alternatives and costing of mitigating alternatives be deferred to a section 92 application, as agreed to by parties in the Settlement Decision.

5.3 ECONOMIC JUSTIFICATION OF THE NIAGARA REINFORCEMENT PROJECT

The Board in its July 8, 2005 Decision on the Niagara Reinforcement Project ("NRP") (RP-2004-0476), granted leave to construct without a determination that Hydro One had proven the economic benefits of the project. As part of that decision, Hydro One was directed to demonstrate the benefits when seeking to recover the costs associated with the project. The Company provided evidence respecting the economic benefits of the project in this proceeding.

Hydro One indicated that the NRP, when operational, will increase import capability from New York by 350 MW. To assess the economic benefit of the project, Hydro One compared, for a 30-year period, the cost of acquiring additional generation capacity through the installation of a 350 MW single cycle combustion turbine unit with the NRP costs. According to Hydro One's evidence the present value of the cost of the 350 MW combustion turbine unit is $309 million and the present value of the cost of the NRP of $103 million. The implied net present value is about $200 million.

Part of the evaluation involved estimating the difference in cost between buying energy in the New York market versus producing energy in Ontario from the combustion turbine. The difference was estimated to be about $70 million in favour of the New York purchase option. The assumptions underlying this estimation were the subject of significant cross examination concerning energy price differentials between the New York and Ontario markets.

Intervenors generally did not comment on the NRP economic justification issue in their final submissions. Only VECC raised concerns regarding Hydro One's analysis. While VECC accepted that the NRP offers benefits that allow new generation in the Niagara Peninsula and increases access to imports, it questioned the 30-year time horizon of the analysis. VECC suggested that the Board direct Hydro One to revise its economic analysis of the project, add congestion costs to the calculation and file the revised analysis prior to requesting any determination from the Board that all of the costs of the NRP (when in-service) be recovered from ratepayers.

Board Findings

While the Board agrees that the further analysis suggested by VECC might have been helpful, the Board finds it was reasonable to compare the transmission reinforcement to a 350 MW single cycle gas combustion turbine. The Board accepts that the need for NRP should be assessed based on the circumstances that existed at the time the project was initially conceived and the information available at that time. For this project, the relevant time period was 2004/2005. When the historical context is taken into account, the economic evaluation provided by the Company is sufficiently persuasive to allow the Board to make this finding. The Board accepts the expenditures associated with the project as prudent, and requires no further analysis from Hydro One to justify the expenditures incurred to date.

However, the Board is concerned that the economic evaluation presented by the Company had shortcomings, which should not be repeated in future applications. In preparing economic justification for similar projects, the Board expects a more complete, precise and rigorous evaluation which includes an analysis of the option of not proceeding with a project, (the “do nothing” scenario) and sharply improved efforts to quantify reliability benefits.

Hydro One is seeking extraordinary relief to recover the costs of this uncompleted project in rate base. The discussion of this aspect of the NRP and the Board’s decision on the matter can be found in Chapter 6 of this Decision.

5.4 OPERATIONS AND SHARED SERVICES

Shared Services capital spending for the test years is substantially higher than spending in 2006 and earlier years. This is mainly due to the Hydro One's Cornerstone information technology project.

Phase One of the Cornerstone project involves the replacement of the PassPort asset and work information system with an integrated Enterprise Asset Management application. The evidence showed that capital spending on this phase alone will be $102 million in 2007, with $57 million allocated to the transmission business.

Although there was significant cross examination on this project, intervenors did not address this issue in their final arguments. According to the Company's evidence, the net present value of the first phase of the project is a $60 million cost over the seven years from 2008 to 2015. Hydro One asserts that the benefits of the project will follow full implementation.

Board Findings

Hydro One was able to demonstrate that the Company's information systems cannot provide the information required to efficiently manage its work and assets. Indeed, the difficulty in getting robust asset aging information in this proceeding was partially attributed to the poor information systems. The Board accepts the Operations and Shared Services capital costs for the 2007 and 2008 rate years, including funding for the Cornerstone project. The Board anticipates greater scrutiny of the cost of Cornerstone in the next transmission rate proceeding when more detailed information will be available.

5.5 CAPITAL CONTRIBUTIONS

Hydro One estimated the total cost of Cambridge Preston TS project cost to be $21.2 million. The Company is not requiring a capital contribution from the customer based on the Company's interpretation of the Transmission System Code (TSC). The appropriate interpretation of the TSC regarding capital contributions is being considered in another Board proceeding, the Connections Procedures case (EB-2006-0189). The decision in that case will clarify the interpretation of the relevant sections of the TSC regarding capital contributions.

VECC submitted that if the EB-2006-0189 decision is not rendered in time to have it reflected in the revenue requirement for 2007 and 2008, then a deferral account should be set up to track the impact of any capital contributions, should that decision reflect an interpretation of the TSC contrary to that taken by the Company in this proceeding. Hydro One argued that a deferral account would not be necessary, but if it is determined that a capital contribution is required, a deferral account could be used to adjust rate base. Hydro One indicated that were a capital contribution required, the customer would have to pay $17 million. The Board estimates the effect on the revenue requirement of such a capital contribution would be less than $2 million in 2007 and 2008.

Board Findings

Since the outcome of the EB-2006-0189 proceeding is not known, the Board accepts VECC's position that a deferral account should be established. Entries in the account will be necessary only if the Board's decision in EB-2006-0189 results in the customer being required to make a capital contribution in respect of the Cambridge Preston TS project.

5.6 EARNINGS/SHARING MECHANISM

While VECC and CCC did not recommend a reduction in the proposed capital budget, they did suggest that Hydro One's capital spending plans were too ambitious and there was a risk that they may not be completed as planned. VECC also questioned Hydro One's prioritization methods. VECC suggested that underspending of the capital budget be returned to ratepayers through an earnings sharing mechanism. CCC supported this recommendation.

Hydro One submitted an earnings sharing mechanism was not necessary and cited evidence that the capital additions expected to come into service during the test years were manageable. The Company also pointed out that earnings sharing proposal would be inconsistent with a cost-of-service filing that is based on future test years.

Board Findings

Hydro One submitted evidence comparing the Company's actual capital spending to budget forecasts for the years 2003 through 2006. The results show variances of up to 20%, both positive and negative. The Board is concerned with the magnitude of the variances but has no basis to believe that the forecast budget for 2007 and 2008 will be under spent. The Board finds that an earnings sharing proposal to guard against variances to budget is unnecessary. As a result of the Board's decision to deny Hydro One's request for a 2009/2010 RRAM, the Board expects Hydro One to file a cost-of-service application for 2009 rates. At that time, the Board expects Hydro One to provide evidence on 2007 and 2008 actual capital spending compared to the Board-approved budget. Future decisions on capital budgets will be informed by Hydro One's performance to plan.

SUMMARY BOARD FINDINGS ON CAPITAL EXPENDITURES

In summary, the Board approves the capital budget for 2007 and 2008 as presented by Hydro One. This includes the budgets for all categories of the capital spending including the Operations and Shared Services categories. The Board reiterates the need for more robust data regarding some of the categories of capital expenditures, as outlined more fully in text above, which the Board expects Hydro One to file in its next transmission rates application.

6. HYDRO ONE'S REQUEST FOR SPECIAL TREATMENT FOR DESIGNATED TRANSMISSION PROJECTS

Hydro One requested special regulatory treatment for four transmission projects: the Bruce Project, a proposed new transmission line to support additional electricity generation from Bruce Power and proposed or possible wind generation projects; the Quebec Intertie, a 1,250 MVA interconnection with Hydro-Québec's transmission system; the installation of static VAR compensators in southwestern Ontario; and the Niagara Reinforcement Project ("NRP"), a new transmission line that is virtually complete. Table 5 shows actual and forecast spending on these projects.[17]

For each of these projects, Hydro One proposed:

- Increasing rate base as expenditures are incurred rather than waiting until the projects are in-service;[18]
- Commencing amortization of the project costs as funds are spent (that is, before they are in-service and are being used) and including the amortization in the revenue requirement; and
- Holding Hydro One financially harmless in respect of the designated projects in the event of abandonment for reasons outside the Company's control.

[17] In its evidence, Hydro One referred to these four projects as "supply mix capital projects". It was not clear to the Board why Hydro One decided to use that description. The Minister of Energy's June 13, 2006 directive to the OPA on the supply mix goals of the Integrated Power System Plan did not mention any particular transmission projects. Two of the projects – the Quebec Intertie and the NRP – were planned and approved before the Minister issued the directive. The other two projects are being initiated before the OPA files its IPSP. In this chapter of the Decision, the Board refers to these projects as the "designated projects", not "supply mix capital projects."

[18] Hydro One also requested that this adjusted rate base would be used to set the revenue requirement under the Company's proposed revenue requirement adjustment mechanism for 2009 and 2010. As noted in Chapter 2 of this Decision, the Board denied Hydro One's request for the RRAM. Therefore, this request is now moot.

The proposed approach differs from the conventional regulatory approach of capitalizing interest costs during construction, and waiting until the project is in-service to transfer the costs to rate base and to commence amortization.

Table 5: Actual and Forecast Expenditures on the Designated Projects

($ millions)	*Historic*		*Bridge*	*Test*		*Total (including future years)*	*Expenditure Period*
	2004	*2005*	*2006*	*2007*	*2008*		
Bruce Project	-	-	-	5	52	613	2007 - 2011
Quebec Intertie	-	-	1	65	48	115	2006 - 2009
Static Var Compensators	-	-	-	-	10	54	2008 - 2009
Niagara Reinforcement	1	35	61	2	0	101	2004 - ?? *
Total	**1**	**35**	**62**	**72**	**110**	**883**	

* Project is almost complete but work has been suspended.

Only three projects were designated for special treatment in Hydro One’s September 2006 application; the NRP was added when the Company amended its application in February 2007. As most intervenors noted, the NRP is fundamentally different from the other three projects in that it is substantially complete but work has been halted because of events outside of Hydro One’s control. In this chapter, the Board deals with the other three projects in section 6.1 and then separately considers the NRP in section 6.2.

6.1 BRUCE PROJECT/QUEBEC INTERTIE/STATIC VAR COMPENSATORS

Hydro One’s primary rationale for the proposed special treatment is that the designated projects require significant expenditures, must be initiated in the short term, have long lead times, are driven by Ontario’s supply mix initiatives, and are exposed to risks over which Hydro One has limited or no control or influence.

Hydro One submitted that its proposed regulatory treatment is consistent with the approach recently adopted by the Federal Energy Regulatory Commission ("FERC") in the United States, will result in a neutral bottom line and will mitigate rate shock and, will result in ratepayers, the primary beneficiaries of the projects, bearing the risks.

FERC Policy and Precedents

To stimulate private capital investment in transmission infrastructure, the United States Congress directed FERC to establish incentive-based rate treatments to promote investment in transmission infrastructure. In 2006, FERC issued Order No. 679, which identifies the types of rate incentives that FERC will consider for federally-regulated transmission entities when justified by the specific facts and circumstances.[19] The identified incentives include higher rates of return on equity for specific transmission investments; the inclusion of 100 percent of construction work in progress ("CWIP") in rate base; and the assurance of recovery of the costs of a project that is abandoned for reasons outside the control of the utility.

In its evidence, Hydro One cited four transmission projects for which FERC approved various incentives. Table 6 summarizes those projects and the incentives granted by FERC. The American Transmission Company decision pre-dated Order No. 679. The other decisions were issued at the same time or after the issuance of Order No. 679[20].

[19] Federal Energy Regulatory Commission, Order No. 679, *Promoting Transmission Investment Through Pricing Reform*, July 20, 2006. In December 2006, after rehearing certain issues, FERC issued Order No. 679-A, which clarified and amended some aspects of the original order but did not change the overall framework for transmission incentives.

[20] After the oral hearing was completed, Staff circulated *Commonwealth Edison Company*, 119 FERC ¶ 61,238 (2007), the most recent decision on incentives for transmission projects, to all parties. The Board did not rely upon it in making its decision.

Table 6: Recent FERC Cases on Incentives for Transmission Projects

Proponent	Project	Cost (US $ millions)	FERC Incentives
American Transmission Company[21]	Various proposed projects over 10 years	Up to $2,800	▪ 100% of CWIP in rate base ▪ Expense pre-certification costs ▪ Increased ROE
American Electric Power[22]	550 miles of 765 kV lines from West Virginia to New Jersey Target completion date – 2014	$3,000	▪ 100% of CWIP in rate base ▪ Option to expense pre-commercial costs ▪ Increased ROE
Allegheny Energy[23]	240 miles of 500 kV lines from Pennsylvania to northern Virginia Target completion date – 2011	$820	▪ 100% of CWIP in rate base ▪ Expense pre-commercial costs ▪ Increased ROE ▪ 100% of prudently-incurred costs on abandonment
Duquesne Light[24]	New high voltage line; increase capacity of underground 345 kV lines with advanced technology; upgrade certain 69 kV facilities to 138 kV. Target completion date – 2009 (some work already complete)	$184	▪ 100% of CWIP in rate base ▪ Expense pre-commercial cost ▪ Increased ROE ▪ 100% of prudently-incurred costs on abandonment

While the FERC incentives listed in Table 6 are intended to encourage investment in transmission projects, Hydro One stated a different rationale. In response to a question from the Board Panel, Hydro One said:

> What we're asking for is not an incentive in the traditional use of that word, as far as to provide some incentive to encourage a certain behaviour … [what] we're asking for is special regulatory treatment for these projects as opposed to an incentive to do something before the fact.[25]

[21] *American Transmission Company LLC*, 105 FERC ¶ 61,388 (2003), and *order approving settlement*, 107 FERC ¶ 61,117 (2004).

[22] *American Electric Power Service Corporation*, 116 FERC ¶ 61,059 (2006), and *order on rehearing*, 118 FERC ¶ 61,041 (2007).

[23] *Allegheny Energy, Inc*., 116 FERC ¶ 61,058 (2006), and *order on rehearing*, 118 FERC ¶ 61,042 (2007).

[24] *Duquesne Light Company*, 118 FERC ¶ 61,087 (2007), rehearing pending.

[25] Tr., Vol. 7, p. 62

In a concurring statement appended to FERC's decision on the rehearing of the Allegheny Energy application, Commissioner Suedeen Kelly provided a framework for evaluating incentive proposals. She stated:

> I deem it important to identify and assess the following six characteristics of any transmission project in order to make reasoned and consistent decisions on requests for incentives for the project: (1) the public interest benefits of the project; (2) the cost of the project in absolute terms; (3) the cost of the project in proportion to the current transmission rate base of the applicant; (4) the difficulty of completing it due to the number of jurisdictions traversed and whether they are jurisdictions the applicant regularly deals with; (5) the difficulty of relying on normal rate recovery methods due to the length of time it will take to complete; and (6) whether the applicant would otherwise be required to build the project even without an incentive.
>
> The comments submitted in connection with Order Nos. 679 and 679-A, and the experience gained in working on individual incentive cases over the past year lead me to conclude that these particular characteristics are most relevant to deciding whether to award incentives.[26]

A witness for Hydro One said Commissioner Kelly's six criteria "are important characteristics and I believe they're consistent with the criteria that Hydro One has put forward, in terms of assessing the supply mix projects."[27]

Mindful of the fact that there is no government directive in place comparable to that which resulted in FERC Order No. 679, the Board found Commissioner Kelly's framework and criteria of assistance when it considered whether the special regulatory treatment sought by the Applicant for the designated projects was necessary or warranted. While certain of the criteria have reduced significance (for example, the traversing of jurisdictional boundaries poses different problems in the United States than in Ontario[28]) others, such as the costs of designated projects in proportion to rate base

[26] *Allegheny Energy, Inc*., 118 FERC ¶ 61,042 (2007), Kelly concurring statement, p. 1.

[27] Tr., Vol. 6, p. 147

[28]PWU noted, the lion's share of the cost of the Quebec Intertie project will be borne by Hydro-Québec, a fact which may increase the risks associated with that project because it might be dependent on decisions made in Quebec and so beyond the control of Hydro One. Other intervenors, such as CCC, submitted that Hydro One faced no appreciable or substantial jurisdictional risks.

and whether normal rate recovery methods can be relied upon, are of equal significance and importance here.

Many of the intervenors made reference to the criteria in their closing submissions. While none of the intervenors challenged the public interest benefits or the absolute cost of the designated projects, several of the intervenors observed that the aggregate costs of the projects relative to the Applicant's rate base did not present significant risk. Energy Probe noted that, in aggregate, the cost of the projects (including NRP) is less than one-seventh of Hydro One's current rate base, and would be only about 12.8% of Hydro One's forecasted 2008 rate base. PWU made a similar observation. In Energy Probe's view, costs of that magnitude should not create any special risks for the utility, assuming vigilant management. Energy Probe argued that the aggregate costs of the designated projects are comparable to rate base additions in recent years, when no rate changes occurred.

The other criterion which elicited significant comment from the intervenors was whether conventional rate recovery methods were adequate, given the costs of the designated projects and the time period over which the costs would be advanced. It was Hydro One's position that the designated projects are extraordinary in many respects when compared to those normally undertaken by a transmission company, and so merit special rather than conventional regulatory treatment.

VECC submitted the evidence established that the investment community does not perceive an impending risk that would necessitate special treatment. VECC added that regulators in Ontario have considerable experience in dealing with such matters and have traditionally allowed recovery of costs under conventional methods provided the utility has acted responsibly.

CCC submitted that there is no reason to deviate from conventional regulatory approaches and to compensate Hydro One now for risks that have not, and may not, materialize. CCC characterized the proposal by Hydro One to recover a return on expenditures as they are incurred (and to allow for amortization to also be recovered) as a significant departure from the accepted regulatory treatment for capital projects. CCC also pointed out that the bond rating agencies have either maintained positive ratings or improved ratings for Hydro One, without any reference to a need for extraordinary treatment for these projects.

Energy Probe addressed each project separately, and concluded that conventional regulatory treatment was appropriate for all three of the designated projects.

AMPCO submitted that there is no evidence to suggest that, in the absence of special treatment, Hydro One will be left with abandoned or stranded assets from undertaking these projects. AMPCO pointed out that Hydro One may always seek relief from the Board should such an event occur.

Both CCC and VECC were of the view that Hydro One's proposal was solely directed to risk management. VECC observed that the underlying rationale of the FERC initiatives was to provide an incentive to private U.S. transmission owners to make investments, a rationale not present in this case.

The PWU similarly noted that the request for special treatment of the designated projects is not an incentive in the traditional use of the term, as Hydro One is committed to undertake the projects in any case. However, the PWU also submitted that the request is one of fairness in that Hydro One should be protected from any financial harm for reasons outside its control.

Impact on Ratepayers

Hydro One's application states that approval of special regulatory treatment for the designated projects would lower and smooth customer rate impacts, and have a positive impact on the Company's credit ratings and borrowing costs, to the benefit of current customers.

Hydro One also suggested its proposal would result in a neutral financial effect. That conclusion is based on qualitative information obtained in a seminar presented by the National Association of Regulatory Utility Commissioners; Hydro One confirmed that no quantitative analysis had been completed to confirm that the proposed approach would result in a neutral financial effect. In response to an interrogatory, Hydro One advised that it had not estimated the impact of the proposal on its credit rating or borrowing costs; however, in response to another interrogatory, Hydro One stated that the Company may be slightly better off financially under the proposal.

VECC estimated a substantial favourable effect on Hydro One's income by 2010, based on the differential between a pre-tax return on equity and AFUDC. VECC submitted that while Hydro One's intent may not have been to be financially advantaged, the result is that it will derive a substantial financial advantage from the proposed treatment. SEC provided estimated impacts over the long term in noting the proposal is, in essence, an interest free loan to Hydro One from ratepayers that will be paid back over 45 years.

Hydro One also argued that a primary benefit of the proposed special treatment is to avoid rate shock for consumers. VECC, in its argument, notes that Hydro One has done no specific analysis of the rate impact of its proposal. VECC provided its own analysis of total bill impact based on conventional rate making practice. VECC submits that the result (less than 0.3% increase in 2012) does not constitute rate shock.

Energy Probe said that the designated projects are each small, relative to Hydro One's overall rate base, and as the projects have unique in-service dates scattered fairly evenly over future years, the overall rate impact under a conventional ratemaking approach is already smooth.

Board Findings

AMPCO, CCC, Energy Probe, SEC, and VECC argued that the proposed special regulatory treatment for the designated projects should be rejected by the Board. PWU was the only intervenor to support Hydro One's proposal. In summary, the arguments against the proposal were:

- There is no reason why Hydro One should be compensated now for risks that may not materialize.

- The proposal is a significant departure from conventional regulatory treatment for capital projects. The Board should permit departures only under very exceptional circumstances and Hydro One has failed to establish that such exceptional circumstances exist. To allow Hydro One the relief it is seeking would set a precedent that may prompt other Ontario utilities to seek similar relief. Before setting such a precedent, the Board must be satisfied that conventional regulatory treatment is inadequate to meet needs such as those associated with the designated projects.

- If construction is delayed or if there are abandonment issues, Hydro One would be free to come to the Board for relief.

- Hydro One has not established that it is now subject to an increased risk with respect to the recovery of the costs associated with these projects.

- Hydro One has not established the need for "incentives" to undertake or complete those projects.

- FERC precedents arise out of a different regulatory regime and are not applicable in the Ontario context.

- The benefits to ratepayers as articulated by Hydro One have been overstated.

The Board shares these concerns and finds that a departure from conventional regulatory treatment has not been justified.

There is no evidence in this case that any regulator other than FERC has approved a package of special regulatory treatments like those advocated by Hydro One. FERC regulatory initiatives can be important guidance in some cases and the Board will continue to monitor FERC's actions to incent new transmission. However, the Board is not convinced that FERC's approach to incentives for transmission investments justifies the special treatment that Hydro One has requested. The cost of the designated projects, while large in absolute terms, is not particularly significant in relation to Hydro One's rate base, and there is no evidence that Hydro One will have difficulty financing the projects under conventional regulatory treatment.

The Board is not persuaded that ratepayers would benefit from the proposed special regulatory treatment. Specifically, the Board does not accept Hydro One's argument that the treatment would result in revenue neutrality and rate smoothing. The evidence from Hydro One on this point was in conflict and lacked substance.

The Board acknowledges Hydro One's concerns about the magnitude of its capital expansion program. At the same time, based on the evidence from the credit rating agencies, the Board is not convinced that Hydro One will be unable to finance the capital program under the conventional approach.

The Board is of the view that conventional regulatory treatment for the three designated projects provides the appropriate balance between the interests of ratepayers and utilities. The Board agrees with the consensus position of the intervenors that the mitigation of losses that have not, and might not, occur is unnecessary and not appropriate. There is nothing in the record that would justify the burdening of ratepayers with such losses. In addition, Hydro One is reminded that it can come forward with applications for relief, if a special circumstance arises which puts it clearly at risk. The Board has promptly responded to such requests from other applicants in the past. There is no reason to expect that the Board would not deal fairly and promptly with Hydro One on these projects should significant issues arise in the future.

Hydro One's request for special regulatory treatment for these designated projects is denied. In reaching this decision, the Board is not ruling out providing incentives for future projects where there is a compelling case.

6.2 NIAGARA REINFORCEMENT PROJECT

Hydro One was granted approval by the Board in July 2005 to construct the NRP and construction began shortly thereafter. As the result of a land claim by aboriginal peoples and the occupation of a portion of the lands necessary for the completion of the last two kilometers of the project, the project has been frustrated, pending a multi-lateral resolution of the underlying land claim issues.

CCC, SEC and VECC supported some form of relief regarding the NRP, while AMPCO and Energy Probe were of the view that the project should be accorded conventional ratemaking treatment.

SEC submitted that Hydro One should be allowed to expense, rather than capitalize, the AFUDC associated with the project. CCC suggested that Hydro One should be allowed to expense AFUDC for NRP for 2007 and 2008 only. VECC submitted that the Board could consider allowing AFUDC associated with the NRP to be expensed as opposed to capitalized – effective January 1, 2007. If Hydro One required additional relief prior to the project being completed and in-service, then a specific application should be brought before the Board seeking the same.

The common rationale was that, as a result of factors beyond its control, Hydro One has been prevented from placing the asset in service. All but a very short span of the project has been completed, and the overwhelming majority of the funds needed to complete and make serviceable the reinforcement have been expended. The respective positions of these intervenors reflect their assessment that this is an exceptional circumstance requiring a special regulatory response.

PWU also supported relief on the NRP and advised that the Board should focus on the substantive issues underlying the request for special treatment rather than the question of whether or not the NRP fits into the category of the other three designated projects.

Energy Probe took the position that the appropriate course is to disallow recovery of any NRP costs from ratepayers until the project is in service. Once in service, ratepayers should have to pay all costs, except those incurred from the time the Province bought the land in Caledonia until the project is placed in service.

AMPCO was of the view that as Hydro One had asked that the NRP be considered a supply mix project, it should receive the same treatment as the other designated projects.

Board Findings

The Board's role is to make decisions that are in the public interest and to determine an appropriate balance between the interests of the regulated utility and consumers. The Board agrees that special regulatory treatment is appropriate for the NRP because a recognizable risk has materialized out of the land claim dispute in Caledonia, the resolution of which is beyond the control of Hydro One.

In determining the special relief, it is important to take into consideration all aspects of this project.

Hydro One brought an application to the Board in 2004, requesting approval to proceed with this project. Hydro One's decision to initiate the NRP was not the result of OPA planning. In that 2004 application, Hydro One did not provide what the Board considered to be a sound economic rationale for the NRP. As such, the Board decided that Hydro One would be required to provide an acceptable economic justification in the future before the project costs could be recovered from ratepayers.

Hydro One has now spent $97 million on this project and the Board has received the required updated economic rationale in this application. It is not known if the project will eventually be completed, if it will come into service with a different route and additional costs, or if it must be abandoned and written off. The Board is of the view that it would not be in the public interest to shift the entire financial burden of an asset that is not in service to consumers as requested by Hydro One.

However, Hydro One faces carrying costs for these expenditures and the Board agrees with VECC and CCC that a compromise is appropriate. As CCC, VECC and SEC suggested, the Board has decided to allow Hydro One to expense – rather than capitalize – the AFUDC, or carrying costs, associated with the project based on the actual expenditures made to date. While CCC and SEC suggested it should be limited to the test years, the Board agrees with VECC in that it should be effective January 1, 2007, with no explicit time limit as it remains uncertain when the Caledonia dispute will be resolved. If Hydro One requires additional relief prior to the project being completed and in-service, it is free to bring an application seeking such further relief.

7. HYDRO ONE TRANSMISSION ROE AND CAPITAL STRUCTURE

Return on Equity (ROE)

Hydro One Transmission's revenue requirement for the year 2000, the last time the Board conducted a cost-of-service review of the transmission business, was based on a return on common equity ("ROE") of 9.88%. The Company is requesting an increase to 10% in 2007 and 10.25% in 2008.

Hydro One provided evidence in support of its request through Ms. Kathleen McShane of Foster Associates, who initially argued that an ROE of 10.5% in both 2007 and 2008 was appropriate for Hydro One Transmission. In updates of February 23, 2007 and March 1, 2007, Ms. McShane revised her recommendation on the basis that prevailing market conditions warranted lower ROEs of 10.0% in 2007 and 10.25% in 2008.

Ms. McShane's study made use of the equity risk premium, discounted cash flow and comparable earnings tests. Ms. McShane took the position that her recommendation was demonstrably reasonable in light of returns allowed for Hydro One Transmission's U.S. peers (range of 10.5%-12.5%), with whom she submits Hydro One would have to compete for capital to finance close to $2 billion in transmission-related capital expenditures in the 2006-2008 timeframe, and potentially similar levels for the several subsequent years.

CCC and VECC provided evidence through Dr. Laurence Booth of the University of Toronto, who took the position that a fair ROE for Hydro One Transmission would be approximately 7.50%, including a 50 basis point cushion. Dr. Booth submitted that most of Hydro One Transmission's risk comes from its rate design and the amount of debt financing, not its underlying business risk. Dr. Booth saw underlying business risk to be minimal for Hydro One and most regulated utilities in Canada.

The *Report of the Board on Cost of Capital and 2nd Generation Incentive Regulation for Ontario's Electricity Distributors* of December 20, 2006 (the "Cost of Capital Report") incorporates an ROE methodology that, when applied to Hydro One Transmission, produces ROEs considerably lower than the levels proposed by Hydro One and somewhat higher than the level proposed by Dr. Booth. Based on an answer to an undertaking provided by Hydro One, application of the Board's distribution formula to Hydro One Transmission would produce an ROE of 8.53% in 2007 and 8.64% in 2008.

Capital Structure

Hydro One Transmission has a current deemed capital structure of 60% debt, 4% preference equity, and 36% common equity. It is requesting Board approval for a more favourable deemed capital structure of 56% debt, 4% preference equity and 40% common equity.

Hydro One provided evidence in support of its proposed capital structure, again by Ms. McShane, who argued that Hydro One's proposed capital structure was justified in light of its need to maintain an 'A' bond rating. Ms. McShane stated that this bond rating was critical in light of Hydro One's need to access debt markets to finance extraordinary capital expenditures, the more limited market for BBB debt, and the lesser ability of BBB-rated companies to access the long-term (30-year) debt market.

CCC and VECC provided evidence by Dr. Booth on this matter, who recommended that the Board should reduce Hydro One Transmission's allowed common equity ratio to 34%, with a 66% debt ratio. Dr. Booth noted that his recommended common equity ratio was 1% higher than that imposed on the Alberta transmission companies regulated by the Alberta EUB. During his examination-in-chief, Dr. Booth stated that he viewed transmission assets as the lowest risk regulatory assets in Canada, mainly because transmission is a natural monopoly and an essential component in the distribution of electricity. Dr. Booth also noted that Hydro One had the highest bond rating of any regulated utility in Canada. The Board notes that while Hydro One owns over 97% of the transmission system in Ontario, it is not, strictly speaking, a “monopoly”.

The Cost of Capital Report incorporates a capital structure policy for distributors of 60% debt and 40% equity. This is in line with Hydro One Transmission’s presently approved deemed capital structure.

Transmission versus Distribution Risk Differentials

In the course of this proceeding, Board staff retained Professors Fred Lazar and Eli Prisman of York University to undertake a study of whether or not there is a determinable risk differential between Hydro One’s distribution and transmission businesses that would justify differences in the allowed capital structures and cost of capital for the respective businesses.

Professors Lazar and Prisman concluded that “at this time, the results are too mixed, and most often statistically insignificant to reach any conclusion other than to award the same ROEs for both the Transmission and Distribution segments of Hydro One.”

Ms. McShane took a similar view noting that the difference in the level of risk between Hydro One Transmission and Distribution is not material enough to distinguish between the two in terms of either recommended capital structure or return on equity.

Dr. Booth expressed the view that Hydro One Transmission is of lower risk than Hydro One Distribution. During his cross-examination, Dr. Booth stated that he would be amenable to the use of the Board’s distribution rate of return mechanism to set Hydro One Transmission’s ROE, but only on the basis that the Board adjust for Hydro One Transmission’s lower risk through a lower common equity ratio.

Cost of Debt and Preference Shares

Hydro One provided its derivation of the forecast yields for each of the debt issues anticipated for 2007 and 2008, which were based on forecast Government of Canada yields for 5, 10 and 30 year debt with a Hydro One spread applied to them.

Although Ms. McShane updated her evidence on February 23, 2007 and March 1, 2007, and concluded that prevailing market conditions justified a lowering of her ROE recommendation, Hydro One did not update its debt and preference share costs to reflect the changes in market conditions that had occurred since its evidence had been filed in September 2006.

During cross examination, Hydro One acknowledged that it had not updated these costs and had issued new 30-year debt in March of this year. The Company acknowledged that there would be a difference between the cost of that new debt compared to the cost of debt assumed in the evidence. Specifically, the coupon rate of the 30-year debt assumed in the evidence was 5.53%, but the new debt had been issued at a coupon rate of 4.89%.

Hydro One explained that the reason it had not updated these costs while updating its ROE estimate was that the impact of any such update would be far more significant on the ROE than it would be on the cost of debt, as the cost of debt is based on a full portfolio of outstanding bond issues that incorporate placements going back a number of years. Also, Hydro One stated that it viewed the cost of debt as but one of a bundle of assumptions embedded in its Application, and it did not propose to revisit the full suite of its planning assumptions as the revision of some may have been more favourable to one stakeholder, while the revision of others may have been more favourable to another.

Treatment of Designated Projects – Impact on Capital Structure/ROE

Ms. McShane's initial evidence on ROE was submitted with the presumption that three designated capital projects would receive the special treatment applied for. The NRP was not initially included among these projects or as part of her assumptions.

Hydro One subsequently updated its evidence to include the NRP in its request for special treatment of the designated projects; however Ms. McShane's evidence update did not make any reference to this apparent reduction in Hydro One's risk profile.

During cross-examination Ms. McShane was asked about the impact on her recommendations if Hydro One's request for the special designated project treatment was denied. She stated that the ROE calculation would have to be adjusted upward by 25 to 35 basis points, or alternatively that a two-and-a-half to three percentage points increment in the equity ratio would be necessary. Ms McShane noted that her preference was for an adjustment to the equity ratio.

The Board's consideration of the proposed treatment of the designated projects, including the NRP, is dealt with in Chapter 6 in this Decision.

Board Findings

Hydro One asserted that its proposed increase in ROE is necessary to enable it to access capital markets effectively, and to borrow the very large sums needed to fund the expansion and reinforcement of the transmission system at interest rates that are as low as possible.

Access to these markets, and the costs of borrowing, are often seen to be dependent on the opinions expressed by various bond rating organizations. One of the key factors used by these agencies to assess the credit-worthiness of a borrower is the adequacy of its ROE in light of the business risk associated with the borrower. If the ROE is seen to be low given an entity's business risk, the cost of borrowing will rise to account for it. If the disparity is too great between the ROE and the inherent business risk, funds may not be available at all.

In this way, the Company's proposal for an increased return on equity, and an increase in the equity portion of its deemed capital structure, is bound up in many of the other proposals forming part of this rates proceeding.

It is also true that the comparative risk faced by the transmission business of the Company was an overarching theme of this Application. The Company sought to limit or eliminate the regulatory risks it is facing. Hydro One was concerned that the Company would not be granted recovery for expenditures prudently incurred. This is seen in the proposals for the designated projects, and in the assurances requested for portions of the capital projects budget, and in the Company's RRAM proposal.

To consider the Company's proposal, it is necessary to consider the riskiness of its operating environment, the perception of that environment by market analysts, and the appropriateness of the Board's methodology in establishing the appropriate ROE and capital structure.

As the operator of the vast majority of the transmission system in the province, the Company is uniquely capable, and uniquely positioned, to make a wide range of informed decisions respecting system growth and reinforcement. The ratepayer is entitled to expect that the Company makes careful, engineering-based plans, founded on its best judgement as to what the system needs.

Where line connection enhancements are made, the TSC provides a formulaic approach directed to assessing the prudence of a project, and the extent to which those directly benefited by the project are required to contribute capital. This serves to limit the exposure of the transmitter to risk. Although the same formulaic methods do not exist to assess prudence and cost recovery for large capital projects, Hydro One has ample opportunity to address these issues in Leave to Construct applications and rate cases.

A utility which has followed reasonable engineering and financial practice, and has applied the TSC appropriately, is unlikely to be denied recovery of prudently incurred costs. Similarly a utility which is confronted with unusual circumstances is unlikely to be denied relief when events out of the utility's control occur. Indeed, the response of the Board and the intervenors to the Company's dilemma respecting the NRP is evidence of a regulatory approach in the province that is flexible and responsive. This positive regulatory environment is noted in one of the bond rating agency reports.

The Board recognizes that some of the projects the Company becomes involved in are very large, both in terms of their related costs, and their potential impact on the effectiveness of the overall provision of electricity to the province's residents and businesses. It is understandable that the Company has concerns respecting its ability to recover the very large sums that it commits to such projects; however, the Board cannot discern any significant risk for the Company that it will be unable to recover prudently incurred costs.

Under the concept of just and reasonable rates, the Company has a reasonable and enforceable expectation that its prudently incurred costs will be recovered in a timely fashion. This includes an expectation that in considering the prudence of expenditures, the Board will assess the Company's judgement in light of the circumstances prevailing at the time the expenditure is made, and without the distraction of hindsight. The Company's prudence should be adjudicated on the basis of what it knew or ought to have known at the time the expenditure was made, not on the basis of subsequent events or conditions, which may have the effect of making the expenditure appear to be unwise.

There is always a risk that if the Company fails to use good judgement in formulating its plans, or otherwise incurs costs imprudently, it will not be authorized to recover such costs. That is a risk that the Company must bear on its own. No responsible regulator can protect a utility from imprudence, poor judgement or laxity. Nor, to be fair, does Hydro One appear to be asking for protection from these.

The evidence respecting the observations of the bond rating services suggests that they are much more confident than the Applicant in the regulatory regime governing the company's operations. This was particularly evident in the examples cited during the cross-examination of Ms. McShane by counsel for CCC.

One analytical tool useful in determining the appropriate ROE and deemed capital structure lies in assessing the extent to which the transmission business can be considered to be more or less risky than the distribution business. The Board's recent consideration of cost of capital in the Cost of Capital Report is of assistance in determining an appropriate ROE and capital structure for the applicant's transmission business.

The Board has examined the fundamentals of its ROE methodology on a number of occasions in the recent past. The Cost of Capital Report is only the most recent example. In each case, the Board's use of its current methodology has been confirmed.

The Cost of Capital Report was generated to inform the Board with respect to the appropriate ROE and capital structure for the local distribution companies, including Hydro One in its operation of a substantial distribution network. It follows that a consideration of the relative risks as between the transmission business and the distribution business should inform a consideration of the appropriate ROE and deemed capital structure for the transmission business.

Importantly, most of the experts providing evidence in this case were unable to conclude that there was any material difference in the level of risk between the distribution and the transmission undertakings. Dr. Booth alone suggested that transmission was less risky, and therefore should be subject to a lower overall ROE.

With respect, Dr. Booth's view seemed to be analytical, and not data based. He referred to the approach taken by the Alberta Board in the case of Altalink, a comparator that was not demonstrated to be apt.

It is the Board's view that there really is no convincing quantitative evidence before us which suggests that transmission is more or less risky than distribution. It is true that distribution has greater and more immediate exposure to the possibility of bad debts. On the other hand, in absolute terms, the transmission system involves very large capital projects of significant complexity, which can be subject to delay in completion, and consequential delay in expected revenues. On balance, the Board concludes that the evidence before us does not provide a basis upon which we can make a finding that there is any meaningful difference in risk as between distribution and transmission.

The Company is in a unique position compared to other utilities in the province. It alone among all of the utilities in Ontario operates a major transmission business and an equally large distribution business. If the Company believes that there is a significant risk differential between its two business segments, it should have been able to present much more convincing evidence respecting the relative risks. The fact that it did not is telling.

It follows that the ROE for the transmission arm of the company should not enjoy a different ROE than that governing its distribution business.

Accordingly, the Board finds that the ROE formula for electricity distributors, as documented in the December 20, 2006 Report of the Board on Cost of Capital and 2nd Generation Incentive Regulation Mechanism, shall be applied to Hydro One Transmission. The Board has determined that Hydro One's ROE shall be derived based on an application of the Board's formula as of January 1, 2007, using December 2006 *Consensus Forecasts* and Bank of Canada data. This should result in an ROE of 8.35% for both 2007 and 2008.

The Board notes that all of the consumer intervenor groups were receptive to the use of the Board’s distribution formula for setting ROE, although most also argued that Dr. Booth’s lower recommended common equity ratio should be applied in establishing Hydro One Transmission’s capital structure. However, as has been discussed, the Board has not been presented with any convincing quantitative evidence in this proceeding which suggests that transmission is more or less risky than distribution. Accordingly, the Board will also apply the distribution capital structure to Hydro One Transmission.

The Board has further determined that Hydro One’s debt costs will not be updated. The Board notes the comments of some intervenors that the Board should require Hydro One to update its forecast debt costs, as is done for the regulated natural gas utilities. The Board notes that in recent gas proceedings where this has been done, it has usually arisen out of rates agreed to by the respective parties and included in the Settlement Agreements. In the absence of such a settlement on this issue in this proceeding, the relative magnitude of the amounts involved, and the uncertainties surrounding changes in interest rates and Hydro One’s financing plans, the Board is not convinced that the cost of debt should be updated and will use the rates contained in Hydro One’s application for the purpose of rate-setting.

8. DEFERRAL ACCOUNTS

8.1 ONTARIO ENERGY BOARD COST ACCOUNT

Hydro One has used this deferral account to capture the excess of OEB cost assessments during the past several years over the amount included in Hydro One's last approved revenue requirement. The account also includes capitalized interest. Hydro One requested Board approval of the balance of the account and its disposition over four years.

The account was established by Hydro One in 2004. The amount charged to the account in that year, $4.6 million, apparently included amounts dating from 2000.[29] The account balance was $4.8 million at the end of 2005, $7.1 million at the end of 2006, and $7.9 million at April 30, 2007.

The balance of the account and its disposition were settled issues in the Settlement Proposal but the settlement was not accepted by the Board.[30] In its Settlement Decision, the Board instructed Hydro One to provide additional evidence to establish why the Company should recover such costs, given that it did not have a Board-approved deferral account at the time the costs were being incurred.

Hydro One provided a copy of a December 2004 letter to Board staff indicating the Company's intention to implement deferral accounts and practices for tracking OEB costs, similar to those approved by the Board for use by electricity distributors. Hydro One also stated that since 2004 it has consistently included the account in its quarterly reporting, pursuant to the Board's Recordkeeping and Reporting Requirements.

[29] Tr. Vol. 7, p. 178, lines 11 to 15.

[30] EB-2006-0501, Settlement Proposal Decision, April 18, 2007, p. 6.

There is no evidence that the Board's staff acknowledged Hydro One's December 2004 letter or that the Board otherwise approved the deferral account.

Hydro One's position is that OEB costs affect its transmission and distribution businesses in an equivalent manner and it is appropriate for both businesses to maintain a deferral account for these costs. With respect to the lack of approval, Hydro One stated that "the failure to establish an official deferral account was an oversight arising out of a misunderstanding between the OEB Staff and the Applicant. Under those circumstances, Hydro One now asks that an official deferral account be established." [31]

Board Findings

The Board cannot accept that the balance in this account should be recovered from ratepayers. Although, as Hydro One suggests, there might have been a misunderstanding, the fact remains that the account has not been approved by the Board.

The Board might have considered approving recovery of the account had the balance resulted from an extraordinary variation in expenses and if the balance were large enough that non-recovery might be a financial burden on the company. In the Board's view, that is not the case here. At least six years have passed since the Board last examined Hydro One's transmission revenue requirement. Over that period, the revenues and expenses of the transmission business have varied, sometimes significantly, from the amounts approved in the last rates case. In a business with annual revenues in excess of $1.2 billion, it does not seem particularly noteworthy that the cumulative variance in a single expense line over that time is $7.9 million (including capitalized interest). The swing in transmission revenues in any year due to weather and other factors has been many times larger than that.

[31] Hydro One Reply Submission, June 13, 2007, p. 57.

As noted in the following section, an earnings sharing mechanism was in place in 2006. Although the Board disallows recovery of the OEB cost deferral account balance, it will permit Hydro One to deduct the growth in the account in 2006 ($2.3 million) from 2006 earnings in calculating excess earnings.

8.2 2006 EARNINGS SHARING MECHANISM

Calculation of Excess Earnings

The earnings sharing mechanism (ESM) was established by the Board in its February 21, 2006 decision on EB-2005-0501. In that decision, the Board determined that excess earnings of Hydro One’s transmission business from January 1, 2006 until new transmission rates are implemented should be shared equally by ratepayers and the Company. Earnings for 2006 were to be determined from actual results as shown in Hydro One’s 2006 audited transmission business financial statements. In its Partial Decision and Order dated March 30, 2007, the Board approved a 2007 Revenue Difference Deferral Account, which had the effect of terminating the ESM as at December 31, 2006.

In its pre-filed evidence, as updated April 20, 2007, Hydro One calculated total excess after-tax earnings for 2006 of $37.5 million, 50% ($18.7 million) of which would be for the account of ratepayers. In calculating that amount, Hydro One decided to exclude two 2006 income statement credits aggregating $30.2 million, after tax:

- A tax benefit of $16.4 million that was recognized in the first quarter of 2006. According to the 2006 audited financial statements of Hydro One’s transmission business, the benefit related to a “recovery of PILs from prior years following a successful appeal allowing a deduction for certain overhead costs that had been previously capitalized.”

- A $21.6 million recovery in 2006, recorded as a reduction of OM&A expense, of property taxes for the years 1999 to 2005 inclusive. The after-tax impact of this item was $13.8 million.

In its final argument, Hydro One indicated it would increase its calculation of excess earnings as a result of reallocating expenses from its transmission business to its distribution business. This adjustment was made after discussion in the hearing about how to apply the requirements of the Board's February 21, 2006 decision that established the ESM.[32] In its reply argument, Hydro One noted that this reallocation would increase excess pre-tax earnings by $9.5 million ($6 million after tax).

Hydro One submitted that it is appropriate to exclude the two items from income because they resulted from the resolution in 2006 of issues that arose in prior years. In support of its position, Hydro One cited a 2004 Board decision on an Enbridge Gas Distribution earnings sharing mechanism,[33] in which the Board directed Enbridge to exclude from its calculation of excess earnings the write-off in 2004 of a non-recoverable receivable (the balance in a deferral account established in an earlier period). The decision stated: "Earnings determinations should be unfettered by differing accounting treatments and related reporting inclusions and exclusions."

Intervenors disagreed with the exclusion of the two items from the calculation of 2006 excess earnings. They submitted that it is clear from the Board's decision on EB-2005-0501 that the excess earnings should be calculated from the unadjusted 2006 audited financial statements. Hydro One submitted that the intervenors who oppose Hydro One's adjustments are reversing the position they took when they supported the exclusion of expenses from Enbridge's earnings sharing mechanism in 2004. SEC argued, however, that the Board's intent in the 2004 Enbridge Gas Distribution decision

[32] In its decision on EB-2006-0501, the Board ordered Hydro One "to report revenue changes for the 2006 rate year resulting from the Board's decision on cost allocation in RP-2005-0020/EB-2005-0378. The [cost allocation] report will be reviewed with the objective of crediting the resultant cost allocation adjustment to transmission customers in the 2007 rate application." (p. 6)

[33] RP-2003-0203/EB-2004-0468, Decision With Reasons, November 24, 2004.

was simply “to avoid the absurd result whereby an amount previously adjudged to be non-recoverable from ratepayers would become partially recoverable as a result of the earnings sharing mechanism”.[34]

Proposal to Treat Excess Earnings as a Capital Contribution

Hydro One proposed that the pre-tax amount of the ratepayers’ share of the 2006 excess earnings be treated as a capital contribution (that is, the amount would be treated as a reduction of rate base) to be applied against two capital projects that under development.[35] Ratepayers would receive the benefit of the excess earnings through reduced charges in the future for both depreciation and return on capital.

The capital contribution treatment was proposed by Hydro One when the Board first established the ESM in February 2006. The Board did not accept the treatment at that time but indicated that Hydro One could bring the matter forward at the time of disposition of the account balance.

Hydro One cited some U.S. cases as precedents for the capital contribution treatment. In response to concerns that its capital contribution proposal creates intergenerational equity issues (by stretching out the return of the excess earnings to ratepayers over several decades), Hydro One suggested it could credit the excess earnings against capital projects with much shorter useful lives, such as the Cornerstone IT project.

Intervenors were opposed to the capital contribution approach. They objected to ratepayers, who overpaid for transmission service in 2006, receiving the benefits over a protracted period starting in 2009 when the two capital projects are to be in service. AMPCO also argued that capital contribution mechanisms are designed to protect ratepayers who will not benefit from projects requested by specific customers. In

[34] SEC Final Argument, p. 44.

[35] The projects are the Southern Georgian Bay Reinforcement and the Hurontario Switching Station. The aggregate estimated cost of the projects is $135 million. Both developments are expected to be in service in 2009.

AMPCO's view, such mechanisms are inappropriate for returning overearnings to ratepayers.

The intervenors argued that excess earnings should be returned to ratepayers over a much shorter period, either over two years (2007 and 2008) or over four years (the period over which other Hydro One deferral accounts are cleared). CCC, SEC, and VECC supported netting the balance against the RDDA balance (see section 8.3 below) and including the net amount in the revenue requirement over either two or four years.

Board Findings

The Board does not agree with the proposal to exclude the two income items from the calculation of 2006 excess earnings. The Board finds that the EB-2005-0501 decision which established the ESM is clear that the 2006 audited income statement (called the Statement of Operations by Hydro One) is the basis for the calculation. There is nothing in that decision that suggests Hydro One was to have discretion to exclude any income or expense. The section on page 10 of that decision entitled, "By what mechanics should excess earnings be established?" sets out a mechanical approach to the calculation that does not provide for adjustments for "prior period" or "non-recurring" items. In fact, that section states: "The following items will be sourced from the audited financial statements (Transmission): Net Income (actual, not normalized for weather) – from Statement of Operations."

Although the two items in question result from resolution of issues that arose in prior periods, neither item apparently qualified as a prior period adjustment under generally accepted accounting principles; had they so qualified, they would have been omitted from the 2006 audited income statement and included in restated prior period financial statements.

The Board does not agree with Hydro One that the 2004 Enbridge Gas Distribution decision is a relevant precedent. The decision that established the Hydro One ESM is so clear on how the calculation is to be done that there is no need to seek guidance from any other source. In addition, as noted by SEC, the 2004 Enbridge decision concerned the write-off of a regulatory balance that apparently had been determined to be uncollectible from ratepayers, so it would make little sense to require ratepayers to absorb some of that amount thorough an ESM.

The Board will require Hydro One to recalculate the amount of excess 2006 earnings without exclusion of the two income items. As noted in section 8.1 on the OEB cost account, the Board will also permit Hydro One to deduct the growth in that account in 2006 in determining excess earnings.

The Board does not accept the capital contribution approach proposed by Hydro One. In the Board's view, it is important that overearnings be returned to customers as soon as possible; the capital contribution approach results in an inappropriately long "refund" period. That is true even if the excess earnings were to be credited against a capital project with a shorter life than a transmission station. The Board finds that the balance in the ESM account should reduce Hydro One's revenue requirement at the first available opportunity, which is the revenue requirement for the years 2007 and 2008.

8.3 2007 REVENUE DIFFERENCE DEFERRAL ACCOUNT

This account was approved by the Board in a March 30, 2007 Partial Decision and Order. It is intended to capture the difference (positive or negative) between (a) revenue determined using the rates resulting from this proceeding, and (b) revenue determined using currently approved transmission rates. The revenue difference is to be calculated for the period from the effective date of Hydro One's new revenue requirement to the date on which new uniform transmission rates are implemented. The Board did not make a decision on either the effective date or the implementation date in its March 30, 2007 Partial Decision and Order. The Board also did not decide whether the revenue amounts should be based on actual or forecast load.

During the hearing, Hydro One witnesses presented the Company's proposal on the calculation of the balance in the Revenue Difference Deferral Account ("RDDA") and the manner in which new rates should be implemented (Exhibit L7.1). Hydro One proposed that:

- The new revenue requirement resulting from this proceeding should be effective January 1, 2007;
- New uniform transmission rates should be implemented November 1, 2007; and
- The RDDA balance for the 10 months to October 31, 2007 should be calculated based on forecast load, not actual load.

Hydro One set out two options for making the rate change. The first option, and Hydro One's preference, is to implement a single rate change on November 1, 2007 to collect the approved 2007-2008 revenue requirement for the next 14 months and the balance in the RDDA. The second option would be to have two rate changes – one on November 1, 2007 and a second on January 1, 2008.

Three intervenors (CCC, SEC, and VECC) argued that the effective date of the new revenue requirement should depend on whether it is higher or lower than the revenue Hydro One would earn at current rates. If the new approved revenue requirement is lower, all three supported an effective date of January 1, 2007. If the new requirement is higher, all three advocated a later effective date. CCC and VECC supported May 1, 2007, the date Hydro One requested in its initial application. SEC submitted that a higher revenue requirement should only become effective when new uniform transmission rates are implemented. The intervenors acknowledged the assymetrical nature of their recommendations but submitted that the result would be fair given that Hydro One filed its application less than four months before the beginning of 2007. SEC explained its position this way:

> SEC understands that at first blush that position may seem contradictory or even unfair to the Company. However, it is the applicant that controls the timing of rate applications. Accordingly, the Applicant should be at risk of not recovering its revenue deficiency in the event it does not file in time to have its rates in place at the beginning of the test year. It is not acceptable, however, for the Applicant to risk the ratepayers' money by filing in such a way as to ensure that a portion of a rate reduction is not paid to ratepayers as a result of the timing of the application.[36]

With respect to the calculation of the balance in the RDDA, AMPCO supported using actual load while CCC supported using forecast load. Both intervenors supported the first rate implementation option, a single rate change on November 1, 2007. VECC argued that Hydro One should be directed to come forward with a detailed implementation plan once the 2007-2008 revenue requirement is approved.

In reply, Hydro One stated that a January 1, 2007 effective date is simple to implement. It submitted that it was not possible for the Company to file an application any earlier than September 2006. It also said that the intervenors' request for different effective dates depending on the amount of the new revenue requirement was not fair and balanced.

Board Findings

This is the first application by Hydro One Transmission in many years and there is no well established practice for determining the effective date of a new revenue requirement for this business.

The Board acknowledges the intervenor comments that there was no prospect of new transmission rates being implemented on January 1, 2007 given that the application was filed in mid-September 2006. The Board notes that the pooled uniform rates used for electricity transmission in Ontario necessarily will result in a longer period between the application date and the implementation of new rates than is the case in gas and

[36] SEC Final Argument, p. 39.

electricity distribution. For this reason, the Board is not as concerned as some of the intervenors about the relatively short period between the timing of Hydro One's application and its request for a January 1, 2007 effective date.

The Board has determined that Hydro One's new revenue requirement should be effective January 1, 2007. This approach aligns the start date of the new revenue requirement with the beginning of the 2007 test year for which Hydro One filed considerable evidence and analysis. A later date would effectively result in three different revenue calculations for the 2006-2007 period (2006 – revenue based on current rates, adjusted for the ESM; 2007 up to effective date – revenue based on current rates; 2007 after effective date – revenue base on new rates).

The Board is also not supportive of selecting an effective date that is always to the disadvantage of the Applicant, which is what several intervenors advocated (that is, an early date if the revenue requirement falls but a later date if the revenue requirement is increasing). The Board agrees with Hydro One that this would not be fair and balanced.

The Board accepts the use of forecast load to calculate the RDDA balance since that is consistent with the way new rates will determined. The Board also agrees with the first option to rate implementation (a single rate change targeted for November 1), which is a relatively simple approach.

9. LOAD FORECAST

Rates for each of Hydro One's three transmission charge pools – network, line connection, and transformation – are based on a customer's coincident or non-coincident peak load. Thus, a peak load forecast is required to translate the Board-approved revenue requirement for 2007 and 2008 into rates. Customer rates per kW of load are directly affected by the forecast used to derive the rates.

Table 7 shows Hydro One's forecast of average 12-month peak load for the test years for Ontario as a whole and for Hydro One's individual charge pools. Hydro One's estimates of the impact of embedded generation and conservation and demand management (CDM) are also shown.

Table 7: Hydro One Load Forecast

12-month average peak load in MW	ONTARIO DEMAND	HYDRO ONE CHARGE POOL		
		Network	Connection	Transformation
2007				
Forecast before embedded generation and CDM	22,507	22,023	20,892	17,962
Impact of embedded generation	(140)	(140)	(10)	(10)
Impact of CDM	(1,085)	(1,055)	(1,007)	(866)
Net forecast load	21,282	20,828	19,875	17,086
2008				
Forecast before embedded generation and CDM	22,730	22,241	21,099	18,140
Impact of embedded generation	(165)	(165)	(10)	(10)
Impact of CDM	(1,239)	(1,203)	(1,150)	(988)
Net forecast load	21,326	20,873	19,939	17,142

Source: Pre-filed evidence, Exhibit A, Tab 14, Schedule 3, page 19.

Forecast peak load, before the impact of embedded generation and CDM, is based on several methods (econometric models, end-use models, customer surveys, hourly load shape analysis) and is “weather-normal”, that is, the forecast assumes typical weather conditions based on data from the past 31 years.

In the hearing and in final argument, intervenors focussed on two load forecasting issues. The first related to the accuracy of Hydro One’s peak load forecast and the weather normalization methodology used by the Company. The second issue concerned the amount by which weather-normalized peak load should be reduced in respect of CDM activities. None of the intervenors challenged Hydro One’s adjustment for embedded generation or the economic assumptions underlying the forecast, such as forecasts of GDP, housing starts, and population growth.

9.1 WEATHER-CORRECTED FORECAST DEMAND

AMPCO noted that Hydro One’s weather-corrected peak load has been less than actual peak load for each of the last eight years. On average, the actual peak exceeded the weather-adjusted peak by 438 MW per year over that period. AMPCO argued that either the process is flawed or the definition of normal weather is no longer applicable. AMPCO also noted that monthly maximum peak demand in each of the first five months of 2007, as shown in IESO publications, exceeded Hydro One’s forecast.

Hydro One disagreed with the conclusion drawn by AMPCO from the eight years of data. The Company stated that weather is fundamentally unpredictable and past data shows that there can be years of consistent positive or negative differences between forecast and actual load. The Company stated that over the 20 years from 1982 to 2001 the average difference between actual and weather-adjusted monthly peak demand was just 17 MW, which Hydro One says supports its contention that its methodology is sound and unbiased.

Hydro One stated that its weather normalization methodology is consistent with the industry standard and is the most commonly used approach by electricity transmitters and distributors.

AMPCO and VECC commented on the differences between the weather-normal forecast of monthly peak demand published by the IESO and Hydro One's forecast. Forecast demand for each of the 18 months from January 2007 through June 2008 is substantially higher in the IESO forecast. Hydro One indicated that the two forecasts are based on different assumptions, approaches, and definitions that arise from the different purposes of the respective forecasts. In their arguments, AMPCO and VECC disagreed with some of the examples of differences cited by Hydro One.

AMPCO recommended that the Board direct Hydro One to set its charge determinants using the IESO's weather-normal maximum hourly demand forecast. VECC submitted that the unexplained difference between the IESO and Hydro One weather-normal forecasts is growing. However, VECC did not recommend that the Board order Hydro One to use the IESO's forecast.

Board Findings

The Board does not have sufficient evidence to agree with AMPCO's assertion that Hydro One's weather-normalized forecasts have shown a "clear and growing bias" and that the weather-normalization methodology is flawed. The Board acknowledges that Hydro One's weather-normalization method has been applied consistently over the years and is similar to the methods used by most North American utilities. The Board accepts Hydro One's weather-normal peak load forecast for 2007 and 2008 (before the effects of CDM). The Board is, however, convinced that the weather-normalization issue needs further study given the well-publicized concerns about global climate change and the apparently increased occurrence of so-called "extreme weather events" in recent years.

The Board also does not have sufficient evidence to accept AMPCO's recommendation that Hydro One use the IESO weather-normal forecast to set its rates for 2007 and 2008. The IESO forecast was not examined in the hearing in any detail, and the Board has limited understanding of the assumptions and definitions that underpin that forecast. On the surface at least, the two forecasts appear to be directed at essentially the same thing, namely weather-normalized monthly peak load. The IESO's forecasts are publicly available and apparently widely-used by electricity sector participants. Thus the Board concludes that it needs to have a much better understanding of the similarities and differences between the widely-available IESO forecast and the forecast used to set transmission rates, before it can direct the Company to adopt the IESO forecast methodology in place of its own.

Given the concerns set out in the two preceding paragraphs, the Board directs Hydro One to prepare, and to submit to the Board prior to the Company's next transmission rates case, a study of evolving weather-normalization practices of utilities and other relevant entities. The study should include a recommendation, with supporting rationale, for either retaining the current methodology or making modifications. As noted by Hydro One's counsel in final argument, the Board's current three-year business plan includes an initiative to review weather normalization methodologies. That project, which has not yet been fully defined, is intended to deal specifically with the practices of gas distributors. As such, it is not a substitute for the study that the Board is directing Hydro One to undertake.

The Board also directs Hydro One to submit a detailed comparison of its forecasting methodology and assumptions with those used by the IESO in its monthly peak load forecasts before its next rates case. That report should, to the extent possible, identify the reasons for significant differences in the two forecasts in recent years.

9.2 CDM FORECAST

Considerable hearing time was devoted to the question of how much Hydro One should reduce its estimated peak load to recognize the results of CDM activities across

Ontario. Intervenors from consumer groups submitted that Hydro One has overstated the impact of CDM for 2007 and 2008 and, therefore, the Company's peak load forecast after CDM is too low.

As shown in Table 7 above, the impact of Hydro One's proposed CDM adjustment is significant. The 12-month average peak load for each of Hydro One's charge categories is lower by approximately 5% in 2007 and 2008 due to the estimated impact of CDM. According to Hydro One, transmission rates would have to increase by 1% for every 300 MW decrease in peak load.

Hydro One's approach to the 2007 and 2008 CDM adjustment can be summarized as follows:

- The Company's peak load forecast (before embedded generation and CDM) is intended to capture the impact of natural conservation efforts that individuals and businesses undertake. According to the OPA, natural conservation "occurs when Ontarians invest in conservation on their own initiative and when the efficiency of the overall stock of equipment and appliances increases as older, less efficient stock is replaced by more efficient products mandated by Ontario's building and appliance standards."[37]

- Hydro One assumes that the government's 2007 CDM target of a reduction in peak load of 1,350 MW will be achieved. For 2008, a peak load reduction of 1,550 MW is assumed. The reductions in Table 7 are lower than these amounts reflecting the fact that Table 7 shows 12-month average peak loads, not peak load in any single month.

- Hydro One points to its success in forecasting CDM-related load reductions in 2006 as support for its forecast of the impacts in 2007 and

[37] Chief Energy Conservation Officer's 2006 Annual Report, p. 26.

> 2008. In its 2006 forecast, Hydro One reduced peak load by 675 MW for CDM. Information from the OPA suggests that program-driven CDM reductions in 2006 (i.e.. reductions not due to naturally occurring CDM) reached 635 MW by summer 2006, six per cent below Hydro One's estimate. [38]

AMPCO, CCC, SEC, and VECC took issue with several aspects of Hydro One's CDM adjustment.

First, CCC submitted that the 2007 reduction of 1,350 MW is solely based on a provincial target, one that is acknowledged by the OPA to be aggressive.

Second, several intervenors argued that Hydro One has in effect "double counted" load reductions due to natural conservation: once through its normal forecasting process and then a second time by using the full 2007 CDM target of 1,350 MW.

Third, those intervenors also argued that it is inappropriate to reduce a weather-normalized peak load forecast for demand response programs that by their nature are triggered, or become fully effective, only during periods of extreme weather.

The intervenors representing consumer groups, recommended various reductions in Hydro One's CDM adjustment. CCC recommended a reduction from 1,350 MW to 650 MW for 2007 comprised of 400 MW for the double counting of natural conservation and 250 MW for overstated results of demand response programs.

SEC argued for a 400 MW reduction for each of 2007 and 2008.

[38] The 2006 Annual Report from Ontario's Chief Energy Conservation Officer reported, at page 26, that "preliminary analysis suggests that Ontarians have reduced peak demand by 963 megawatts by summer 2006. These savings include 328 megawatts of naturally occurring conservation …" The difference in the two numbers, 635 MW, presumably is the amount of the reduction due to various CDM programs.

VECC recommended a 600 MW reduction for 2007 and a 650 MW reduction for 2008. AMPCO did not recommend a specific reduction of the CDM adjustment because its concerns about all load forecasting issues were reflected in its suggestion (referred to in section 9.1) that the Board order Hydro One to use the IESO monthly forecast.

PWU supported Hydro One's CDM adjustment. It stated that the Board should exercise caution in relying on estimates of 2006 CDM-related load reductions published by the OPA. It also argued that any adjustments are premature because the OPA is in the process of developing evaluation, measurement and verification standards for CDM programs.

Board Findings

The Board acknowledges that forecasting the impact of CDM on peak loads is not a simple task at this time. The impact and effectiveness of particular CDM programs is sometimes elusive, and hard to define with precision. Having said that, the Board is not satisfied that Hydro One's proposed CDM adjustments are appropriate. While we do not object to Hydro One starting its analysis with the provincial target of 1,350 MW for 2007, we agree with intervenors that Hydro One has double counted the impact of natural conservation. It is clear from the evidence that the OPA intends to count natural conservation in determining if the 2007 target of 1,350 MW has been met.[39] Hydro One testified that its forecast, before the CDM adjustment, already factors in natural conservation. Therefore, the Board fails to understand how Hydro One can rationalize not reducing the 1,350 MW target for estimated natural conservation.

The Board also agrees with the consumer group intervenors with respect to the impact of demand response programs. Hydro One's base forecast is weather-normal, which means that extreme weather events are excluded. It would seem logical to reduce the

[39] This is particularly clear from OPA comments submitted by AMPCO on May 24, 2007 in response to Undertaking K10.3.

impact of demand response programs, which are most effective in extreme weather situations, when adjusting a weather-normal forecast.

The Board finds that Hydro One should reduce the expected impact of CDM on total Ontario peak demand by 350 MW. This adjustment is intended to address both the natural conservation and demand response issues discussed above. The Board acknowledges that this reduction is probably at the low end of an acceptable range given that it is only marginally above the 328 MW of natural conservation for 2006 referred to in the Chief Energy Conservation Officer's 2006 annual report. The Board finds there is sufficient data to support a reduction of 350 MW but also finds there is not enough reliable data to support a larger reduction as advocated by some intervenors.

The Board directs Hydro One to recalculate the average monthly forecast peak load for each charge determinant category for 2007 and 2008 based on Ontario peak load reductions of 1,000 MW in 2007 and 1,200 MW in 2008.

CDM adjustments were also addressed in Hydro One's last distribution rates case. The Decision in that case stated: "The Board was dissatisfied with the clarity and precision of the determination of the forecast CDM and expects Hydro One to provide a more sound analysis of CDM program details and reduction objectives in future applications[40]." The Board recognizes that Hydro One's transmission application was filed not long after those comments were made. It would be unfair to expect Hydro One to have rectified all of the issues identified in the distribution case. The Board does expect, however, that the CDM adjustments to the load forecast included in Hydro One's next transmission filing will be based on a much more rigorous analysis, including, where possible, load impacts attributable to specific programs.

[40] Decision With Reasons, RP-2005-0020/EB-2005-0378, April 12, 2006, para. 2.3.9.

10. CHARGE DETERMINANTS

Hydro One proposed to continue with the status quo charge determinants for its Network, Line Connection, and Transformation Connection services. The connection-related charge determinants were settled leaving only the Network determinants as an issue. AMPCO was the only intervenor with a particular interest in changing the Network charge determinants. It submitted evidence and presented a witness panel.

The current Network charge determinant, which was approved by the Board in 2000,[41] is the higher of (i) a customer's demand in kW in the hour during a month that overall system demand is at its peak (coincident peak), and (ii) 85% of the customer's peak demand during the period 7:00 am to 7:00 pm on weekdays that are not holidays (non-coincident peak). The current charge for Network service is $2.83 per kW per month.

Before it filed its application, Hydro One consulted with stakeholders about rate design options and possible changes to charge determinants. Its application described two alternatives for the Network charge determinant that it said received the most consideration. Those were coincident peak only (that is, elimination of the 85% of non-coincident peak aspect of the calculation), and coincident demand in the hours when the system peak exceeds 90% of the monthly system peak demand. Hydro One concluded that the status quo was superior to the alternatives when judged against the following criteria – cost causality, electricity market benefits, revenue stability/security, cost shifting, alignment with precedents, and implementation issues.

Provided its revenue requirement is protected in some fashion, Hydro One should be financially neutral regardless of the charge determinant selected. But changing charge

[41] Decision With Reasons, RP-1999-0044, May 26, 2000.

determinants could shift, possibly by material amounts, transmission charges incurred by individual customers or customer groups.

AMPCO's Proposal

In its evidence, AMPCO proposed that the Network charge determinant should be a customer's peak demand during the hour when system peak demand occurs in the five months of January, February, June, July and August. This method was referred as a "five-coincident-peak" approach (5-CP). AMPCO indicated that a similar method is used by transmission owners in the PJM Interconnection in the United States, where some of AMPCO's members operate manufacturing facilities.

In its final argument, AMPCO modified its proposal to some extent and recommended that the Board direct Hydro One to do three things:

- Eliminate the second element of the current Network charge determinant (85% of non-coincident peak demand, referred to by AMPCO as the "85% ratchet").

- Work with the IESO, OPA and stakeholders to define those peak demand months of the year that are of concern to system planners, operators, and Hydro One in terms of system reliability, adequacy of supply, and the need for future peaking supply. AMPCO proposed there would be just five or six such months.

- Develop an appropriate non-ratcheted charge determinant based on the identified peak months.

In its evidence, AMPCO proposed a "balancing account" for Hydro One to mitigate the risk of revenue instability due to elimination of the "85% ratchet." Its witnesses stated that AMPCO had not yet developed the details of how to calculate the revenue differences to be included in the account.

AMPCO's rationale for changing the Network charge determinant is that the current design "is incorrect in principle and constitutes a barrier to demand response and the efficient use of the transmission system.[42]" It submitted that the 85% ratchet is inconsistent with practices in other jurisdictions. In AMPCO's view, the "ratchet" reduces (by 85%) a transmission customer's incentive to control its demand during system peak hours. AMPCO submitted few large power consumers can shift all of their consumption away from the peak weekday hours from 7:00 am to 7:00 pm. Even if such consumers shifted load away from the individual peak hour, they will only receive a 15% reduction in their network transmission charges. AMPCO also suggested that it is inappropriate to charge consumers for Network service every month of the year when total demand in many months is not material from a system planning and operational standpoint.

AMPCO asserted that its approach would increase demand response during peak periods, which would be consistent with Ontario government policy, and would reduce electricity costs for all consumers.

Opposition to AMPCO's Proposal

AMPCO's proposal was opposed by Hydro One and all intervenors who commented on the issue (CCC, EDA, IESO, SEC, Toronto Hydro-Electric System, and VECC). The intervenors submitted several criticisms of AMPCO's proposal; some of the significant criticisms are summarized below.

Intervenors argued that AMPCO presented no evidence that its proposal would avoid or defer capital spending on the transmission system. VECC noted that much of the anticipated capital expenditures on the transmission system in the near term, such as

[42] AMPCO Final Argument, p. 27.

the Bruce to Milton line, are driven by new generation projects or local area load constraints, not system-wide capacity issues.

EDA noted that in the decision which set the current charge determinants (RP-1999-0044) the Board stated:

> A rate design aimed at customer demand reduction during the system's coincident peak hours would meet the test of economic efficiency, but only if the network transmission system is generally capacity-constrained. This is not the case for the OHNC [Hydro One] network transmission system either today or in the foreseeable future. (paragraph 3.4.27)

EDA submitted that AMPCO did not provide any evidence that Hydro One's system is capacity constrained now. EDA argued that the Board's finding in RP-1999-0044 remains sound. Hydro One confirmed that the transmission system is generally not capacity constrained.

EDA suggested that the AMPCO proposal would benefit only those transmission customers with the ability to shift consumption away from the peak hours. Toronto Hydro pointed out that it and other local distribution companies (LDCs) have little or no ability to shift their demand away from the peak because LDCs have little control over when their customers consume power. They would, therefore, pay a larger share of Hydro One's Network charges.

AMPCO provided little evidence that its 5-CP method would lead even its own members to shift their demand significantly. From the evidence, it appears that only steel companies have the operational flexibility to shift a significant amount of load off peak.

AMPCO provided no evidence that its proposal would lower commodity costs for the benefit of all electricity consumers even if it is assumed that it would result in significant load shifting by large industrial and commercial consumers. VECC noted Hydro One submitted data for 2005 showing that high-priced hours in the IESO-administered electricity market were poorly correlated with transmission system peak hours. If this relationship cannot be established, the “benefits” associated with the AMPCO proposal become elusive.

AMPCO filed a 2003 Navigant Consulting study, *A Blueprint for Demand Response in Ontario*, as support for its views on the commodity price impact of its proposal. VECC submitted that the study’s conclusions on the value of demand response did not support AMPCO’s premise, in part because Navigant Consulting estimated the impact of demand response for many more hours than would be relevant under AMPCO’s 5-CP proposal. A further concern was that the study was prepared several years ago when there were few organized demand response programs in Ontario. AMPCO acknowledged that a more current study would be helpful and that “it may be that a lot of the commodity savings that Navigant talked about have been mined.”[43]

EDA submitted that AMPCO’s proposal is more complex than the status quo and noted that it is unclear how the proposed “balancing account” would work. The IESO, which is responsible for billing transmission charges for all transmitters, indicated that AMPCO’s 5-CP proposal would take a minimum of six months and cost $150,000 to make the required information system changes.

During the hearing, Board staff noted that days defined a holidays by the IESO (which calculates Network transmission charges) differ from the days defined as holidays by the Board for purposes of its Regulated Price Plan. The IESO suggested that the best approach would be to have Board staff work with the IESO to implement a consistent holiday schedule.

Board Findings

The Board finds that Hydro One should continue to charge for its Network service using its current charge determinant. It does not accept AMPCO’s recommendation that the

[43] Tr. Vol. 10, p. 142.

Board should order Hydro One to work with the IESO, OPA and other stakeholders to design a new method.

AMPCO's 5-CP proposal was not well defined and, as became evident during cross examination of its witnesses, it appeared the proposal was really more of a concept than a workable alternative to the status quo. More fundamentally, the Board is not convinced that AMPCO has made a compelling case either that the current Network charge determinant has significant defects or that its 5-CP proposal is superior.

In reaching these conclusions, the Board is not saying that it is impossible to improve on the current methodology, nor is it saying that it is not open to considering changes in the future. As the Board knows from RP-1999-0044, the proceeding in which the current approach to the Network service charge determinants was approved, designing transmission rate structures requires considerable evidence and the involvement of a wide range of stakeholders. Parties that advocate changes in how customers should pay for transmission service need to submit a strong case for change, with detailed evidence and analyses showing why the status quo has undesirable effects and is inappropriate. In the Board's view, AMPCO did not put forward that case in this proceeding.

With respect to achieving a consistent definition of "holiday," the Board agrees with the IESO that the issue need not be resolved in this proceeding. It is more appropriate for Board staff to work with the IESO to implement a consistent holiday schedule.

11. IMPLEMENTATION AND COST AWARDS

Hydro One applied for a transmission revenue requirement of $1,240 million for the 2007 test year and $1,277 million for the 2008 test year. The Board made a number of findings that will affect these amounts.

During the course of the oral hearing, Hydro One provided two options for transmission rate implementation.

Option 1, is a proposal for a single uniform transmission rate change on November 1, 2007, covering a 14 month period, including:

- An RDDA amount consisting of: [Approved 2007 Revenue Requirement x 10 month forecast volume/ forecast annual volume] **less** [2000 Rates x 10 month volume], *(revenue share adjustment is not mentioned).*
- 2007 approved revenue requirement for 2 months in 2007 (Nov. and Dec.)
- 2008 approved revenue requirement for 12 months in 2008.

Option 2, is a proposal for two rate changes, one on November 1, 2007 and one on January 1, 2008.

As noted in Chapter 8, the Board finds that a single rate change (Option 1) should be implemented by Hydro One.

Therefore the Board directs the Company to file with the Board and all intervenors of record, a draft exhibit outlining the final revenue requirements and charge determinants to reflect the Board's findings in this decision. The Company should file this exhibit within 10 days of the issuance of this decision. In addition, an exhibit should be filed which includes the calculation of the uniform transmission rates, charge determinants and revenue shares resulting from this decision. This exhibit will be used in the uniform transmission rates proceeding to establish the Ontario Uniform Transmission Rates.

Hydro One should provide a clear explanation of all calculations and assumptions used in deriving the amounts used in these exhibits. Intervenors shall have 10 calendar days to respond to the Company's exhibit. The Company should respond as soon as possible to any comments by intervenors.

Cost Awards

A number of intervenors were deemed eligible for cost awards in this proceeding. On June 26, 2007, Procedural Order No. 5 was issued directing those intervenors to file their cost claims with the Board by July 10, 2007. Hydro One was to reply to those claims by July 23, 2007 and any intervenor reply to Hydro One's submissions was to be submitted by August 1, 2007.

The following eligible intervenors requested recovery of their costs and filed cost statements: Energy Probe, VECC, CCC, SEC, Electricity Distributors Association ("EDA"), and AMPCO.

Hydro One did not comment on the cost claims submitted by the eligible intervenors.

The Board wishes to commend all intervenors for coordinating their cross-examination, which resulted in efficiencies with no perceived compromise in effectiveness. The Board awards all eligible parties (Energy Probe, VECC, EDA, CCC, AMPCO and SEC) 100 percent of their reasonably incurred costs. The precise amounts will be confirmed after a review by the Board's Cost Assessment Officer to ensure that the rates or fees claimed and disbursements do not exceed the Board's guidelines contained in the Practice Directions. Hydro One shall pay the amounts of the intervenor cost awards immediately upon receipt of the Board's cost orders.

Hydro One shall also pay the Board's costs upon receipt of the Board's invoice.

DATED at Toronto August 16, 2007.

APPENDIX 1

HYDRO ONE NETWORK INC.
2007 AND 2008 ELECTRICITY TRANSMISSION RATES

DECISION WITH REASONS

BOARD FILE NO. EB-2006-0501

PROCEDURAL DETAILS
INCLUDING LISTS OF PARTIES AND WITNESSES

August 16, 2007

PROCEDURAL DETAILS INCLUDING LISTS OF PARTIES AND WITNESSES

THE PROCEEDING

On October 17, 2006, the Board issued a Letter of Direction and Notice of Application to Hydro One Networks Inc.

The Board issued Procedural Order No.1 on November 30, 2006, establishing the procedural schedule for a number of early events prior to the oral hearing. These events included an Issues Conference on December 7, 2006, and an Issues Day on December 14, 2006;

On Issues Day, the Board heard submissions from the SEC, CCC, VECC, PWU and AMPCO.

The Board issued Procedural Order No. 2 on December 20, 2006, which included the Board's decision on the contested issues identified on Issues Day. The Issues List for the proceeding was attached to Procedural Order No. 2. The Board also directed that notice be given to all transmitters and their customers, informing them that this proceeding would deal with the issue of charge determinants. Procedural Order No. 2 also included Schedule 1, consisting of excerpts of certain findings and observations from the Distribution decision (RP-2005-0020/EB-2005-0378). A number of hearing event dates were also amended:

- Written interrogatories to the Applicant by Board staff due on December 21, 2006 and by the intervenors due on January 11, 2007;
- Written interrogatory responses from the Applicant due by January 29, 2007;
- Intervenor evidence filed by February 14, 2007; interrogatories on this evidence by February 23, 2007 and responses due on March 2, 2007;
- Applicant evidence update on February 23, 2007 with a related technical conference on the update on March 6, 2007;

- A Settlement Conference was set for March 26, 2007 and the Settlement Proposal Hearing set for April 10, 2007;

- The oral hearing set to begin on April 19, 2007.

The Board issued Procedural Order No.3 on March 2, 2007, amending the start date for the oral hearing to April 23, 2007.

In a letter dated February 14, 2007 Hydro One requested that a 2007 revenue deficiency deferral account be established beginning January 1, 2007 to record the revenue deficiency between the approved revenue for 2007 and the forecast revenues at currently approved transmission rates. Hydro One requested a decision from the Board on this issue by March 31, 2007. The Board issued Procedural Order No. 4 on March 12, 2007 inviting intervenors to make submissions on this request.

On March 30, 2007, the Board issued a Partial Decision and Order approving the establishment of the 2007 revenue deficiency deferral account.

The Settlement Conference was held on March 26, 2007 and on April 3, 2007 the Settlement Proposal was filed with the Board and was the subject of the Settlement Proposal hearing held on April 10, 2007. The Board issued its Settlement Decision on April 18, 2007.

The oral hearing began on April 23, 2007 and concluded on June 13, 2007.

Procedural Order No. 5 was issued on June 26, 2007 regarding submission of cost claims by eligible intervenors.

PARTICIPANTS AND REPRESENTATIVES

Below is a list of participants and their representatives who were active either at the oral hearing or at another stage of the proceeding. A complete list of intervenors is available at the Board’s offices.

Ontario Power Generation	Tony Petrella
Association of Major Power Consumers of Ontario	Mark Rodger Wayne Clark
Energy Probe	David MacIntosh Tom Adams
School Energy Coalition	John De Vellis
Vulnerable Energy Consumer's Coalition	Michael Buonaguro Bill Harper
Power Workers Union	Richard Stephenson

WITNESSES

There were 20 witnesses who testified at the oral hearing.

The following Company employees appeared as witnesses at the oral hearing:

Frank Jacob	Manager, Program Integration and Regulatory Filing
Mike Penstone	Director, System Investment
George Carleton	Director, Supply Chain Services, Finance
Andy Stenning	Director, Station Maintenance

Naren Pattani	Manager, Transmission System Development
Nairn McQueen	Vice President, Engineering and Construction Services
Paul Tremblay	Director, Network Operating, Grid Operations
Judy McKellar	Director, Human Resources
Sandy Struthers	Chief Information Officer
Greg Van Dusen	Director, Business Integration
Ian Innis	Director, Corporate Planning and Regulatory Finance
William Paolucci	Assistant Treasurer, Treasury Division
Andy Poray	Director, Regulatory Policy and Support
Stanley But	Manager, Economics and Load Forecasting
Henry Andre	Manager, Regulatory Affairs, Corporate Regulatory Affairs

In addition, the Company called the following witness:

Kathleen McShane	President and Senior Consultant, Foster Associates Inc.

Witnesses called by intervenors:

For AMPCO:

Wayne Clark	Consultant, SanZoe Consulting, Inc.
Darren MacDonald	Director of Energy, Gerdau Ameristeel
Gary Saleba	President and CEO, EES Consulting

For VECC/CCC:

Dr. Laurence D. Booth	CIT Chair, Structured Finance, Rotman School of Management, University of Toronto

In addition, evidence was filed by York University professors Dr. Fred Lazar and Dr. Eli Prisman on behalf of Board staff. Drs. Lazar and Prisman did not appear as witnesses in the oral hearing.

APPENDIX 2

HYDRO ONE NETWORK INC.
2007 AND 2008 ELECTRICITY TRANSMISSION RATES

DECISION WITH REASONS

BOARD FILE NO. EB-2006-0501

SETTLEMENT PROPOSAL

August 16, 2007

Hydro One Networks Inc.
Test Year 2007/2008 Transmission Rates
EB-2006-0501

SETTLEMENT PROPOSAL

Preamble:

This settlement proposal is filed with the Ontario Energy Board ("the Board") in connection with the application by Hydro One Networks for an Order or Orders approving the revenue requirement and customer rates for the transmission of electricity to be implemented in 2007.

Further to the Board's Procedural Order No. 2 dated December 20, 2006, a settlement conference was held on March 26 and 27, 2007 in accordance with the *Ontario Energy Board Rules of Practice and Procedure* ("Rules") and the Board's Settlement Conference Guidelines ("Guidelines").

Hydro One Networks and the following intervenors ("the parties") participated in the settlement conference:

Association of Major Power Consumers in Ontario ("AMPCO")
Consumers Council of Canada ("CCC")
Electrical Distributors Association (EDA)
Energy Probe Research Foundation ("Energy Probe")
Independent Electricity System Operator ("IESO")
Ontario Power Generation ("OPG")
Power Workers' Union ("PWU")
School Energy Coalition ("SEC")
Society of Energy Professionals (SEP)
Vulnerable Energy Consumers Coalition ("VECC")

Ontario Energy Board staff also participated in the settlement conference but are not party to this settlement proposal.

Outlined below are the positions of the parties following the settlement conference. The settlement proposal follows the format of the Approved Issues List for ease of reference. The issues are characterized as follows:

Settled: If the settlement proposal is accepted by the Board, the parties will not adduce any oral evidence during the hearing as the applicant and the intervenors who take any position on the issue agree to the proposed settlement.

Partially Settled: If the settlement proposal is accepted by the Board, the parties will only adduce evidence on portions of the issues as the applicant and the intervenors who take any position on the issue were able to agree on some, but not all, aspects of the particular issue.

Not Settled: The applicant and the intervenors who take a position on the issue will adduce evidence at the hearing on the issue as the parties were unable to reach agreement.

For ease of reference, the following outlines the status of the issues as outlined in the settlement proposal:

Settled: Issue completely resolved. Parties will not adduce evidence at the hearing.	**Partially Settled:** Issue partially resolved. Parties will adduce evidence at hearing on certain portions of the issue.	**Not Settled:** Issue not resolved. Evidence to be adduced on entirety of issue.
# issues settled: 24	# issues partially settled: 2	# issues not settled: 14

The positions taken by the various parties on each of the settled or partially settled issues are identified throughout the settlement proposal.

The settlement proposal provides a brief description of each of the settled and partially settled issues, together with references to the evidence filed to date. The parties to the settlement proposal agree that the evidence filed to date in respect of each settled or partially settled issue supports the proposed settlement. In addition, the parties agree that the evidence filed in support of each settled or partially settled issue contains sufficient detail, rationale and quality information to allow the Board to make findings in keeping with the settlement or partial settlement reached.

The settlement of issues 8.1 and 8.2 are proposed as a package. The balance of the issues in the settlement proposal are not proposed to the Board as a package settlement. As such, the parties acknowledge that the Board may accept settlement on any individual issue, or combination of them.

1. ADMINISTRATION (Exhibit A)

1.1 Are the Affiliate Service Agreements still cost effective and efficient in delivering services? Have any changes occurred in these arrangements since the 2006 distribution rates proceeding (RP-2005-0020/EB-2005-0378)? (A1/T8/S2)

Settled. The parties accept the Applicant's position on this issue.

Evidence:

A-8-2 Affiliate Service Agreements

J-1-1, J-1-2, J-1-3, J-5-1, J-5-2, J-5-3, J-5-4, J-5-5, J-5-6, J-9-36, J-9-37, J-9-38

Supporting Parties: AMPCO, CCC, Energy Probe, PWU, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG

1.2 Has Hydro One addressed all relevant Board directions from previous proceedings? (A/T17/S1)

Settled. The parties accept the Applicant's position on this issue, as it was agreed that the following matters, for which agreement could not be reached, would be addressed in the context of other issues. The particulars are outlined below.

a) Intervenors are concerned about Hydro One's interpretation of the Board's RP-2005-0501 Decision, which established an Earnings Sharing Mechanism, including the appropriateness of prior year adjustments being made to the 2006 Earnings/Sharing calculation.

The parties agreed this concern would be dealt with as part of the Board's consideration of issue 9.1.

b) Intervenors are concerned about the accuracy of the Net Income amount proposed by Hydro One for the Transmission Earning/Sharing mechanism.

The parties agreed this concern would be dealt with as part of the Board's consideration of issue 9.1.

c) Is Hydro One's proposal to apply the Earnings/Sharing amount as contributed capital appropriate?

The parties agreed this concern would be dealt with as part of the Board's consideration of issue 9.1.

d) Intervenors raised a concern relating to the justification for the Niagara Reinforcement Project

The parties agreed this concern would be dealt with as part of the Board's consideration of issue 3.4. However, the parties were unable to reach agreement on intervenors' concerns relating to the economic justification of the Niagara Reinforcement Project.

e.) Intervenors, except the SEP, raised a concern regarding whether the Company has complied with the following directives, relating to compensation issues, given by the Board in its Decision with Reasons dated April 12, 2006 in EB-2005-0378: "the Board expects Hydro One to identify what steps the company has taken or will take to reduce labour rates." [para. 3.4.4]; and, "The Board expects Hydro One to file appropriate evidence in the next main rates case to establish that none of the incentive compensation should be charged to the shareholder." [para. 3.4.7]

The parties, except the SEP, agreed this concern would be dealt with as part of the Board's consideration of issue 2.2.

Evidence:

Exhibit A-17-1, Table 1 (entitled Board Directives from Proceeding RP-1998-0001) identifies the reference exhibit which contains Hydro Ones response to the related directives.

Supporting Parties: AMPCO, CCC, Energy Probe. PWU, SEC, SEP (with the exception that the SEP requested to be excluded from comments in 1.2e), VECC

Parties taking no position: EDA, IESO, OPG,

1.3 <u>Is the proposal to establish a revenue requirement beyond the 2007 and 2008 test years without a separate cost of service approval appropriate?</u>

Not settled. The parties were unable to reach agreement on this issue.

1.4 <u>Is the proposed methodology to establish the future revenue requirement beyond 2007 and 2008 appropriate?</u>

Not settled. The parties were unable to reach agreement on this issue.

1.5 Is the proposal to include capital spending as incurred in Rate Base for 2009-2010 appropriate? (A1/T13/S1)

Not settled. The parties were unable to resolve this issue.

1.6 Are Hydro One's Economic and Business Planning Assumptions for 2007 and 2008 appropriate?

Settled. Intervenors had no concerns with respect to Hydro One's economic and business planning assumptions for 2007 and 2008, except for the assumed interest rates regarding cost of capital. The parties agreed that business and economic planning assumptions utilized by Hydro One for 2007 and 2008 are appropriate.

The parties agreed that concerns regarding Hydro One's interest rates assumptions as they affect cost of capital would be addressed under issue 4.2.

Evidence:

A-9-1 Hydro One Transmission Financial Statements for the Year Ended 2005

A-10-1 Hydro One Inc. – Historic Year Annual Reports

A-10-2 Hydro One Inc. – Budget Year Quarterly Reports

A-14-1 Planning Process

A-14-2 Economic Indicators

A-14-4 Project and Program Approval and Control

J-1-15, J-1-16, J-1-17, J-5-26, J-10-1, J-10-2, J-10-3, J-10-4

Supporting Parties: AMPCO, CCC, Energy Probe, IESO, PWU, SEC, SEP, VECC

Parties taking no position: EDA, OPG

2. COST OF SERVICE (Exhibit C)

2.1 Are the overall levels of the 2007 and 2008 Operation, Maintenance and Administration Budgets appropriate? (C1/T1/S1)

Not settled. The parties were unable to reach agreement on this issue.

2.2 Is the 2007 and 2008 budget for Human Resources related costs (wages, salaries, benefits, incentive payments and pension costs) including employee levels, appropriate? (C1/T3/S1&2)

Not settled. The parties were unable to reach agreement on this issue.

2.3 Is the proposed level of corporate O&M costs allocated to the transmission business for 2007 and 2008 appropriate and in line with the O&M cost allocation approved by the Board in Hydro One's 2006 distribution proceeding (RP-2005-0020/EB-2005-0378)? (C1/T5/S1&2)

Settled. The parties accept the Applicant's position on this issue.

The methodology for allocation of costs, for purposes of setting 2007 and 2008 rates, has been accepted, subject to impacts of Hydro One's Human Resource related costs which is an unsettled issue (Issue #2.2).

Evidence:

C1-5-1 Common Corporate Cost Allocation and Cost Allocation Methodology

J-1-29, J-1-42, J-1-43, J-1-44, J-1-45, J-1-46, J-1-47, J-1-48, J-1-49, J-1-99, J-5-65, J-5-66, J-5-67, J-5-68, J-5-69, J-9-36, J-9-37, J-10-8

Supporting Parties: AMPCO, CCC, Energy Probe, PWU, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG

2.4 Is Hydro One's depreciation expense appropriate for 2007 and 2008 and in line with the depreciation methodology approved by the Board in Hydro One's 2006 distribution application (RP-2005-0020/EB-2005-0378)? (C1/T6/S1&2)

Settled. The parties accept the Applicant's position on this issue.

Evidence:

C1-6-1 Depreciation and Amortization Expenses

C1-6-2 Depreciation Rate Review

C2-5-1 Depreciation and Amortization Expenses

J-1-50, J-5-70, J-9-54

Supporting Parties: AMPCO, CCC, Energy Probe, PWU, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG

2.5 Is Hydro One's proposed transmission overhead capitalization rate appropriate? (C1/T5/S2)

Settled. The parties accept the Applicant's proposed overhead capitalization rate.

Evidence:

C1-5-2 Overhead Capitalization Rate

J-1-51, J-1-52, J-1-53 (overlap with issue 3.3), J-1-54, J-1-77ii, J-5-71

Supporting Parties: AMPCO, CCC, Energy Probe, PWU, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG

2.6 Are the amounts proposed to be included in 2007 and 2008 revenue requirements for capital and property taxes appropriate? (C2/T4/S1)

Settled. The parties accept the Applicant's position on this issue.

Note the Capital Tax amount for 2006 is currently under review and will be revised subject to finalization of results and audit review. Audited Transmission Financial statements will be filed when available during the hearing. Hydro One commits to filing an update of 2006 capital taxes using the audited 2006 financial statements.

Evidence:

C2-4-1 Capital Taxes

C1-2-6 Property Taxes

J-1-55, J-1-56, J-1-57, J-1-58, J-5-72, J-7-23

Supporting Parties: AMPCO, CCC, Energy Probe, PWU, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG

2.7 Is the amount proposed to be included in 2007 and 2008 revenue requirements for income taxes, including the methodology, appropriate? (C1/T7/S1)

Settled. The parties accept the Applicant's position on this issue.

Additional information was provided during the Settlement process. It was agreed that the 2007 Federal and Provincial Budgets will not have a material impact on HONI's revenue requirement in 2007. Any impacts arising from those budgets will be captured in the proposed Tax Rate Changes Variance Account.

Evidence:

C1-7-1 Payments in Lieu of Corporate Income Taxes

C2-6-1 Calculation of Utility Income Taxes

J-1-59, J-1-60, J-1-62

Supporting Parties: AMPCO, CCC, Energy Probe, PWU, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG

3. RATE BASE (Exhibit D)

3.1 Are the amounts proposed for the 2007 and 2008 Rate Base appropriate? (D1/T1/S1)

Partially Settled. The parties have agreed that the proposed amounts for the 2007 and 2008 rate base are appropriate, except for the amounts proposed for capital expenditures in 2007 and 2008 to be dealt with under issue 3.2. Rate base will be modified to reflect any subsequent changes to capital expenditures in 2007 and 2008 resulting from the resolution of issue 3.2.

During the Settlement Conference, additional information was provided that deals with $7.3M of OEFC owned assets in Hydro One's rate base[1].

Evidence:

D1-1-1 Rate Base

D1-1-3 Level and Appropriateness of Transmission Assets

D2-1-1 Statement of Utility Rate Base

J-1-58, J-1-63, J-1-64, J-1-65, J-5-73

Supporting Parties: AMPCO, CCC, Energy Probe, PWU, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG

3.2 Are the amounts proposed for Capital Expenditures in 2007 and 2008 appropriate? (D1/T3/S1&3)

---

[1] Hydro One made payment for these assets as part of the settlement for the acquisition of assets from Ontario Hydro.

Due to jurisdictional issues and due to the fact that underlying land permits did not allow assignment without federal governmental consent, assets owned by Ontario Hydro on Reserves did not pass to HONI under the transfer orders. Instead, these were held by OEFC, as the continuation of Ontario Hydro, in trust for HONI. Pursuant to an Indemnity and Trust Agreement between OEFC and HONI, it is clear that OFEC is merely holding these assets in trust for HONI as the beneficial owner. HONI has all of the operational responsibility for the assets and has indemnified OEFC completely and comprehensively from any and all liabilities and responsibilities arising from the assets, or the underlying permits.

Not settled. The parties were unable to reach agreement on this issue.

3.3 Is Hydro One's corporate asset allocation for the transmission business in line with the common capital and common asset allocation approved by the Board in Hydro One's 2006 distribution application (RP-2005-0020/EB-2005-0378)? (C1/T5/S3) (D1/T3/S5)

Settled. The parties accept the Applicant's position on this issue.

Evidence:

C1-5-3 Common Asset Allocation

J-1-53 (overlap with issue 2.5), J-1-99, J-5-91

Supporting Parties: AMPCO, CCC, Energy Probe, PWU, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG

3.4 Is the proposed inclusion of "Supply Mix" Capital Project expenditures in 2007 and 2008 Rate Base as they are incurred, appropriate? (D1/T1/S4)

Not settled. The parties were unable to reach agreement on this issue.

In addition, the parties were unable to reach agreement on intervenors' concerns relating to the economic justification of the Niagara Reinforcement Project (from issue 1.2).

3.5 Is the submitted Lead Lag study appropriate for the development of the Working Capital component of the Rate Base? (D1/T1/S5)

Settled. The parties accept the Applicant's position on this issue.

Evidence:

D1-1-5 Working Capital and Lead/Lag Study

J-1-63, J-1-104, J-5-94, J-7-28

Supporting Parties: AMPCO, CCC, Energy Probe, PWU, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG

3.6 Does the Asset Condition Assessment adequately address the current condition of the transmission system assets and the determination of capital needs of the system in the future? (D1/T2/S1)

Settled. The parties accept the adequacy of the Applicant's Asset Condition Assessment but without prejudice to their position on capital spending levels.

Evidence:

D1-2-1 Asset Condition Study

J-1-105, J-1-106, J-3-4, J-5-29, J-5-31, J-5-34, J-5-77, J-5-95, J-5-96, J-5-97, J-5-98, J-6-2

Supporting Parties: AMPCO, CCC, Energy Probe, PWU, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG

3.7 Is the method that Hydro One has used to calculate AFUDC appropriate? (D1/T4/S1)

Settled. Hydro One has agreed that the AFUDC will be calculated using the rate approved by the Board for distribution companies, to be effective January 1, 2007.

Evidence:

D1-4-1 Allowance for Funds Used During Construction

J-1-68, J-1-69

Supporting Parties: AMPCO, CCC, Energy Probe, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG, PWU ("not opposed")

4. COST OF CAPITAL/CAPITAL STRUCTURE (Exhibit B)

4.1 What is the appropriate Capital Structure for Hydro One Networks' transmission business for the 2007 and 2008 test years? (B1/T1/S1) (B1/T3/S2)

Not settled. The parties were unable to reach agreement on this issue.

4.2 What is the appropriate Return on Equity (ROE) for Hydro One Networks' transmission business for the 2007 and 2008 test years? (B1/T1/S1) (B1/T3/S2)

Not settled. The parties were not able to reach agreement on this issue.

4.3 Are Hydro One's proposed costs for its debt and preference share components of its capital structure appropriate? (B1/T2/S1)

Not settled. The parties were not able to reach agreement on this issue.

4.4 Should the Capital Structure, Capital Costs and Rate of Return on Equity vary between Hydro One's distribution and transmission businesses? (B1/T3/S1)

Not settled. The parties were unable to reach agreement on this issue.

5. REVENUE REQUIREMENT (Exhibit E)

5.1 Is the proposed amount for 2007 and 2008 External Revenues, including the methodology used to cost and price these services, appropriate? (E3/T1/S1)

Settled. The parties accept the Applicant's position on this issue.

Evidence:

E3-1-1 External Revenues

J-5-104, J-5-105, J-7-41, J-7-42, J-7-43

Supporting Parties: AMPCO, CCC, Energy Probe, PWU, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG

6. COST ALLOCATION (Exhibit G)

6.1 Are Hydro One's proposed cost pools appropriate and have the costs assigned to these pools been allocated appropriately? (G1/T1-6)

Settled. The parties accept the Applicant's position on this issue.

Evidence:

G1-1-1 Cost Allocation and Charge Determinants

G1-2-1 Description of Cost Allocation Methodology

G1-3-1 Network and Line Connection Pools

G1-4-1 Transformation Connection Pool

G1-5-1 Wholesale Meter Pool

G1-6-1 Cost Data for Low Voltage Switchgear Compensation

G2-5-1 Detailed Revenue Requirement by Rate Pool

H1-5-3 Disposition of Export Transmission Service Revenues

J-1-4, J-1-136, J-1-138, J-5-106, J-5-107, J-5-108, J-5-109, J-5-110, J-5-111, J-5-112, J-5-113, J-5-114, J-5-115, J-5-123, J-8-4

AMPCO Evidence, Testimony of Gary S. Saleba, Pg. 11 Line 16-18

J-13-1 (Pg.2 under the heading "Hydro One Cost Allocation")

Supporting Parties: AMPCO, CCC, Energy Probe, IESO, OPG, PWU, SEC, SEP, VECC

Parties taking no position: EDA

6.2 Is the proposed cost allocation treatment of "dual function" lines appropriate? (G2/T2/S1)

Settled. The parties accept the Applicant's position on this issue.

Evidence:

G1-2-1 Description of Cost Allocation Methodology

G1-3-1 Network and Line Connection Pools

G2-2-1 Allocation Factors for Dual Function Lines

G2-4-1 Asset Value by Functional Category

G2-4-2 Total Depreciation by Functional Category

G2-4-3 Return on Capital and Income Taxes by Functional Category

G2-4-4 OM&A Costs by Functional Category

J-5-107, J-5-108, J-5-109, J-5-111, J-5-114, J-5-115,

Supporting Parties: AMPCO, CCC, Energy Probe, PWU, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG

6.3 Is it appropriate to create a Wholesale Meter pool and was the establishment of this pool done appropriately? (G1/T5/S1)

Settled. The parties accept the Applicant's position on this issue.

Evidence:

G1-2-1 Description of Cost Allocation Methodology

G1-5-1 Wholesale Meter Pool

G2-5-1 Detailed Revenue Requirement by Rate Pool

J-5-107, J-5-111

Supporting Parties: AMPCO, CCC, Energy Probe, IESO, OPG, PWU, SEC, SEP, VECC

Parties taking no position: EDA

6.4 Should the customers directly connected to Network Stations that do not pay Line Connection Charges pay them and if so, what mechanism should be used? (G1/T3/S1)

Settled. The parties agreed to resolve this issue and agree that the status quo is appropriate for this case. Hydro One has undertaken to conduct an internal study on connection facilities terminating in Network Stations and associated connection charges to be submitted as part of the next transmission rate application.

Evidence:

G1-3-1 Network and Line Connection Pools

J-1-137

Supporting Parties: AMPCO, CCC, Energy Probe, PWU, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG

6.5 <u>To what cost pools should "Local Loops" be allocated? (G1/T3/S1)</u>

Settled. The parties accept the Applicant's position on this issue.

Evidence:

G1-3-1 Network and Line Connection Pools

J-1-138, J-5-115

Supporting Parties: AMPCO, CCC, Energy Probe, PWU, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG

7. RATE DESIGN and CHARGE DETERMINANTS (Exhibit H)

7.1 <u>Is the load forecast and methodology appropriate and have the impact of Conservation and Demand Management initiatives been suitably reflected? (A1/T14/S2&3) (H1/T2/S1)</u>

Not settled. The parties were unable to reach agreement on this issue.

7.2 <u>Have the proposed charge determinants been forecast appropriately for each of the transmission revenue pools? (G1/T1/S1) (H1/T3/S1)</u>

Settled. The parties accept the Applicant's position on this issue.

Evidence:

G1-1-1 Cost Allocation and Charge Determinants

H1-3-1 Charge Determinants

H1-4-1 Rates for Wholesale Meter Service

Supporting Parties: AMPCO, CCC, Energy Probe, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG, PWU ("not opposed")

7.3 <u>Is the proposal to continue with the status quo charge determinants for Network and Connection service appropriate? (H1/T3/S1)</u>

Partially settled. The parties were able to agree that the current charge determinants for Connection service are appropriate. The parties were unable to reach agreement on whether the current charge determinants for Network service are appropriate.

Evidence:

H1-3-1 Charge Determinants

J-5-122

Supporting Parties: AMPCO, CCC, EDA; Energy Probe, IESO, PWU, SEC, SEP, VECC

Parties taking no position: OPG

7.4 <u>Is it appropriate to continue the Export Transmission Service Tariff and should this tariff be changed? (H1/T5/S1, 2 & 3)</u>

Settled. The parties were able to reach agreement on this issue.

After identifying alternatives as directed by the Board, Hydro One assumed that the status quo of $1.00/MWh would continue, for the purposes of its application.

The parties have agreed that the status quo ETS tariff of $1/MWh should be maintained for the time being, but that the IESO should now be identified as the entity responsible to pursue and negotiate, with neighbouring jurisdictions, acceptable reciprocal arrangements with the intention to eliminate the ETS tariff, and study the appropriate ETS tariff, including those options identified in H1/T5/S1. The IESO will seek input from market participants and interested intervenors in this proceeding and keep the parties informed of the progress of negotiations and the study. It is agreed that the IESO will make its report available to the Board upon completion which will be no later than June 1, 2009 with the results of reciprocal arrangement negotiations and the study including recommendations for an appropriate ETS tariff. Hydro One Networks Inc. remains responsible for seeking changes to its approved transmission revenues and rates and will do so as part of the 2010 transmission rate-resetting process period, following the publishing of the study.

Evidence:

H1-5-1 Rates for Export Transmission Service

H1-5-2 Review of Export Tariffs in Other Jurisdictions

H1-5-3 Disposition of Export Transmission Service Revenues

J-1-144, J-1-145, J-1-146, J-1-147, J-1-148, J-5-106, J-5-125, J-5-126

Supporting Parties: AMPCO, CCC, Energy Probe, IESO, OPG, SEC, SEP, VECC

Parties taking no position: EDA, PWU ("not opposed")

8. OTHER ISSUES

8.1 <u>Is the proposal for the establishment and methodology of Hydro One's 2007 and 2008 Deferral and Variance Accounts appropriate? (F1/T3/S1)</u>

Settled. The parties have agreed, as part of a package, to resolve this issue together with issue 8.2 as follows:

i) The amount of the Deferred Export Transmission Service Credit is $54.5M (Update).

ii) The Ontario Energy Board Cost Account will not be altered to reflect load growth.

iii) The Market Ready Cost Account will be reduced by 10%, even though it has already been reduced to reflect the OEB Distribution decision. This value after a 10% reduction is $16.7M as at April 30, 2007.

Note: The 10% reduction to principal was calculated effective December 2004 (consistent with the date of adjustments arising from the Distribution market ready decision). This amount is then interest improved to arrive at the value of $16.7M as at April 30, 2007.

iv) Interest on all variance accounts will be that approved by the Board for distribution companies, to be effective January 1, 2007.

v) All variance accounts will be cleared over four years in order to facilitate rate smoothing.

In addition, as it relates to new accounts, the parties agree that the following requested new variance accounts should be approved:

1. OEB Cost Assessment Differential

2. Tax Rate Changes

3. Transmission System Code Changes

4. Pension Cost Differential

The parties further agree to await the Board’s decision on the 2007 Revenue Deficiency Deferral Account presently under reserve.

As the recent federal and provincial budgets have not been formally passed into law, any tax impacts of those budgets will be recorded in the new Tax Rate Changes Account, once formalized.

Evidence:

F1-1-1 Regulatory Assets

F1-1-2 Variances Resulting From Board Decisions

F1-2-1 Planned Disposition of Regulatory Assets

F1-3-1 Variance Account Requested

F2-1-1 Regulatory Assets

F2-1-2 Schedule of Annual Recoveries

J-1-149, J-1-150, J-1-151, J-1-152, J-1-153, J-1-154, J-1-155, J-5-19, J-5-127, J-5-128, J-5-129

Supporting Parties: AMPCO, CCC, Energy Probe, IESO (v), SEC, SEP, VECC

Parties taking no position: EDA, IESO [(i) to (iv) and new accounts], OPG, PWU ("not opposed")

8.2 Is the proposal for the amounts and disposition of Hydro One's existing Deferral and Variance Accounts (Regulatory Assets) appropriate? (F1/T1/S1)

Settled. The parties have resolved this issue as a package with issue 8.1, outlined above.

Evidence: see issue 8.1 above.

Supporting Parties: AMPCO, CCC, Energy Probe, SEC, SEP, VECC

Parties taking no position: EDA, IESO, OPG, PWU ("not opposed")

8.3 Has Hydro One delivered an adequate level of service and other performance compared with other jurisdictions and other relevant performance standards? (A1/T15/S1, 2&3)

Settled. The parties accept the Applicant's position on this issue. The parties have agreed that the issue related to customer delivery point performance standards would be addressed as part of proceeding RP-1999-0057/EB-2002-0424.

Evidence:

A-15-1 Transmission Business Performance

A-15-2 Transmission Benchmarking

A-15-3 Customer Delivery Point Performance Standards

J-1-33, J-1-35, J-1-36, J-1-38, J-1-156, J-1-157, J-1-158, J-1-159, J-1-160, J-1-161, J-1-162, J-1-163, J-1-164, J-1-166, J-2-6, J-3-1, J-3-4, J-3-5, J-5-130, J-5-131, J-5-132, J-5-133, J-5-134, J-5-135, J-5-136, J-5-137, J-6-3, J-6-4, J-7-7, J-8-5

Supporting Parties: AMPCO, CCC, Energy Probe, IESO, OPG, PWU, SEC, SEP, VECC

Parties taking no position: EDA

8.4 Has Hydro One demonstrated the need to reinforce the existing 115kV connection lines between Leaside TS and Birch Junction TS in the city of Toronto project? (D2/T2/S3)

Settled. The parties were able to reach agreement on this issue. The parties agreed that the applicant has demonstrated the need to relieve loading on the existing 115kV connection lines between and Leaside and Birch Junction TSs.

The Applicant has agreed that the issues regarding options, alternatives and costing of the mitigating alternatives will be deferred from this rate application to be dealt with in a separate section 92 application to the Board.

Evidence:

D2-2-3 Justification for Programs or Projects in excess of $3 Million (#D18 Leaside x Birch Junction Transmission Reinforcement)

J-1-167, J-5-138

Supporting Parties: AMPCO, CCC, Energy Probe, IESO, PWU, SEC, SEP, VECC

Parties taking no position: EDA, OPG

9. RATE IMPLEMENTATION

9.1 <u>How should the Board deal with any revenue implications regarding the Hydro One Transmission earnings/sharing mechanism (EB-2005-0501) established by the Board?</u>

Not settled. The parties were unable to reach agreement on this issue.

Also, the parties agreed that the following concerns would be dealt with as part of the Board's consideration of issue 9.1 rather than issue 1.2.

a) Intervenors are concerned about Hydro One's interpretation of the Board's RP-2005-0501 Decision, which established an Earnings Sharing Mechanism, including the appropriateness of prior year adjustments being made to the 2006 Earnings/Sharing calculation.

b) Intervenors are concerned about the accuracy of the Net Income amount proposed by Hydro One for the Transmission Earning/Sharing mechanism.

c) Is Hydro One's proposal to apply the Earnings/Sharing amount as contributed capital appropriate?

9.2 <u>Are the bill impacts as a result of this application for various customer groups reasonable? (A1/T2/S1)</u>

Not settled. The parties agreed that this issue could not be resolved at this time.

APPENDIX 3

HYDRO ONE NETWORK INC.
2007 AND 2008 ELECTRICITY TRANSMISSION RATES

DECISION WITH REASONS

BOARD FILE NO. EB-2006-0501

SETTLEMENT DECISION

August 16, 2007

EB-2006-0501

IN THE MATTER OF the *Ontario Energy Board Act 1998*, S.O.1998, c.15, (Schedule B);

AND IN THE MATTER OF an Application by Hydro One Networks Inc. for an Order or Orders approving or fixing just and reasonable rates and other charges for the transmission of electricity commencing January 1, 2007.

SETTLEMENT PROPOSAL DECISION

Hydro One Networks Inc. ("Hydro One" or the "Company") filed an Application, dated September 12, 2006, with the Ontario Energy Board under section 78 of the *Ontario Energy Board Act 1998, S.O. 1998*, c.15, Schedule B. The Board assigned file number EB-2006-0501 to the Application and issued a Notice of Application dated October 17, 2006.

On April 3, 2007, Hydro One Networks Inc. filed a Settlement Proposal that was developed and agreed to by Hydro One and ten intervenors in this proceeding. The Settlement Proposal indicates that the parties reached full settlement on 24 issues and partial settlements on two issues. There was no settlement on fourteen issues.

Hydro One presented the proposal to the Board at a settlement hearing on April 10, 2007 (together with some additional clarifying statements on settled Issues 1.2 and 6.5). Board staff made submissions on two settled issues – 8.1 and 8.2, which relate to deferral and variance accounts – and recommended that those issues be removed from the proposal.

On April 10, 2007, the Board accepted the Settlement Proposal[1] except for issues 7.4, 8.1, 8.2 and 8.4. The Board's decision on these issues is below.

Issue 7.4 – Export Transmission Service Tariff

Issue: "Is it appropriate to continue the Export Transmission Service Tariff and should this tariff be changed?"

The settlement proposal stated that the status quo of $1.00/MWh would continue. It also went on to describe agreement on the role that the IESO would take in negotiating acceptable reciprocal arrangements with neighbouring jurisdictions, studying the appropriate ETS tariff and making its report available to the Board. At the settlement hearing, the Board asked the parties to consider whether or not the issue could be settled by simply agreeing to the status quo and removing the additional discussion in the proposal on future actions by the Independent Electricity System Operator (IESO)[2].

After consulting with the settling parties, on April 11, 2007, Hydro One filed with the Board modified settlement language for this issue. Although the settlement continues to refer to possible future action by the IESO, the language makes clear that the Board is not approving the future actions of the IESO and that any change to the ETS charge must be made through a Board rates process. The settlement language is now in a form satisfactory to the Board. The Board accepts the modified settlement proposal for this issue.

Issue 8.4 – Leaside TS to Birch Junction TS Reinforcement

Issue: "Has Hydro One demonstrated the need to reinforce the existing 115kV connection lines between Leaside TS and Birch Junction TS in the City of Toronto project?"

[1] Transcript, April 10, 2007, page 91.
[2] Transcript, April 10, 2007, page 36.

The settlement proposal agreed that the need to relieve loading on the existing 115kV connection lines between Leaside TS and Birch Junction TS had been demonstrated and was accepted. The proposal also stated agreement that the issues regarding options, alternatives and costing of the mitigating alternatives will be deferred from this rate application to be dealt with in a separate section 92 application to the Board. In the oral hearing of the settlement proposal, the Board indicated that it could not accept the proposed settlement on this issue because it would mean the need for this project would not be examined on the record.[3] The Board asked Hydro One to consider two options for addressing the need for this project: moving the issue from this rates case to the Section 92 leave to construct proceeding for the project, or by having a Hydro One witness panel address the need issue as part of this rate hearing.

On April 11, 2007, Hydro One informed the Board that it will present evidence on the need to relieve loading on the existing 115kV connection lines between Leaside TS and Birch Junction TS at this hearing. The Board accepts the remainder of the settlement on this issue, being the deferral of issues on options, alternative and costing of mitigating alternatives to a section 92 application.

Issues 8.1 and 8.2 – Deferral and Variance Accounts

Issue 8.1, "Is the proposal for the establishment and methodology of Hydro One's 2007 and 2008 Deferral and Variance Accounts appropriate?"
Issue 8.2, "Is the proposal for the amounts and disposition of Hydro One's existing Deferral and Variance Accounts (Regulatory Assets) appropriate?"

At the settlement hearing, Board staff made submissions on general policy issues with respect to deferral and variance accounts being established through settlement agreements. Staff also expressed some particular concerns on the specific accounts referred to in the proposed settlement of Issue 8.1. The Board

[3] Transcript, April 10, 2007, page 80.

indicated it would consider the issues further in light of the submissions by Board staff.

Policy Issues

Board staff submitted that there are "policy dimensions to creating the variance and deferral accounts that Staff believes should be addressed on a more comprehensive basis than is permitted by the settlement process."[4] Staff noted that its concerns extended to the disposition of account balances as well as the creation of accounts. Staff advocated that Issues 8.1 and 8.2 not be accepted by the Board as settled issues; rather, the issues should be explored in the hearing. In addition, Board staff submitted that "for policy reasons perhaps it is now the time for the Board to consider whether or not the creation of such accounts should in fact be part of a settlement proposal."[5]

Hydro One, VECC and CCC indicated that in other rates cases the Board has accepted many settlement agreements that have dealt with deferral and variance accounts. Hydro One submitted that if the Board wishes to establish a policy that these accounts should not be considered in settlement agreements, it should seek input from larger group than just the parties in this particular rates case.

Specific Deferral and Variance Accounts

Three existing deferral accounts are covered by Issues 8.1 and 8.2. Board staff submitted that the Board should not accept the settlement because the Board should explicitly address whether the accounts were authorized, the prudence of the expenditures included in the accounts, and the disposition of the accounts.[6] Staff observed that Hydro One did not seek, and was not given, permission by

[4] Transcript, April 10, 2007, pp. 57 and 58.
[5] Transcript, April 10, 2007, page 48.
[6] Transcript, April 10, 2007, page 63.

the Board to establish one of the accounts, the Ontario Energy Board Cost Account.

None of the parties to the settlement proposal object to Hydro One establishing the following four new variance accounts: OEB Cost Assessment Differential; Tax Rate Changes; Transmission System Code Changes; and, Pension Cost Differential. Board staff submitted that the Board should reject the settlement on these accounts and, instead, should consider whether the accounts meet criteria used in the past by the Board when granting deferral and variance accounts for electricity distributors.

The settlement proposal for Issue 8.1 refers to a possible fifth new account and states: “The parties further agree to await the Board’s decision on the 2007 Revenue Deficiency Deferral account presently under reserve.” The Board understands that this language was included in error and is unnecessary given that the Board has already authorized that account in Procedural Order No. 4 issued on March 12, 2007.

Board Findings

With respect to the general policy issues raised by Board staff, the Board does not believe that this rates case is the right forum to address those issues. The Board agrees with Hydro One that if this issue is to be addressed the Board should seek input from a wider group, including parties active in the natural gas sector.

Deferral and variance accounts are used extensively by the OEB in both natural gas and electricity rates cases The OEB may want to review its regulatory agenda to determine if it should initiate a public policy process to examine the issues associated with the use of these accounts.

The Board will accept the settlement proposal for existing deferral accounts, including the four-year period over which the balances will be cleared, except that the Board will not accept the settlement in respect of the Ontario Energy Board Cost Account. As Board staff noted, Hydro One never applied to the Board to establish that account. If Hydro One continues to believe that the balance in that account should be recovered through future rates, then the Board expects Hydro One to provide evidence in this hearing as to why it would be appropriate for the company to recover such costs given that it did not apply to the Board for a deferral account at the time the costs were being incurred.

The Board also accepts the settlement proposal to establish four new variance accounts. Hydro One and the other parties to the settlement should be aware that the Board is providing no assurance that any amounts in those accounts in the future will be included in rates, nor does the approval of the establishment of these accounts indicate any acceptance by the Board of the types of expenditures being recorded in the accounts.

APPENDIX 4

HYDRO ONE NETWORK INC.
2007 AND 2008 ELECTRICITY TRANSMISSION RATES

DECISION WITH REASONS

BOARD FILE NO. EB-2006-0501

PARTIAL DECISION AND ORDER
Issued
March 30, 2007

August 16, 2007

Ontario Energy Board

Commission de l'Énergie de l'Ontario

EB-2006-0501

IN THE MATTER OF the *Ontario Energy Board Act 1998*, S.O.1998, c.15, (Schedule B);

AND IN THE MATTER OF an Application by Hydro One Networks Inc. for an Order or Orders approving or fixing just and reasonable rates and other charges for the transmission of electricity commencing January 1, 2007.

PARTIAL DECISION AND ORDER

Hydro One Networks Inc. ("Hydro One" or the "Company") filed an Application, dated September 12, 2006, with the Ontario Energy Board under section 78 of the *Ontario Energy Board Act 1998, S.O. 1998*, c.15, Schedule B. The Board assigned file number EB-2006-0501 to the Application and issued a Notice of Application dated October 17, 2006.

By letter dated February 14, 2007 and in the February 23, 2007 update to its application, Hydro One requested that a 2007 revenue deficiency deferral account be established beginning January 1, 2007 to record the revenue deficiency between the approved revenue for 2007 and forecast revenues at currently approved transmission rates. Hydro One requested a decision from the Board on this issue by March 31, 2007.

On March 12, 2007 the Board issued Procedural Order #4 requesting that Hydro One make further submissions addressing the following issues:

- The need for the revenue deficiency deferral account;
- Why the issue of the account must be dealt with on an expedited basis;

- What will be booked into the account, and the accounting entries that are proposed to be made;
- The date upon which Hydro One proposes to start booking entries into the account; and
- What, if any, consequences follow if the account is not established at all, or is not established prior to March 31, 2007 as requested.

The procedural order also invited intervenors to respond to Hydro One's submissions and then provided for Hydro One's subsequent reply submissions.

Hydro One Submissions:

Hydro One, in its March 13, 2007 submissions, stated that the EB-2005-0501 transmission earnings sharing mechanism (ESM) was intended to end once new transmission rates were implemented. The establishment of the 2007 revenue deficiency deferral account (RDDA) beginning January 1, 2007, would replace and end the ESM.

Hydro One claimed that the proposed RDDA was more transparent than the ESM, and would be easier to justify and implement for a portion of a year (as un-audited financial results would be used.) In contrast, the part-year RDDA calculations would be based upon approved data consistent with Hydro One Transmission 2007 rate filing. A rates decision in late 2007 would lead to regulatory lag and uncertainty regarding Hydro One in financial markets. An RDDA was also consistent with the Great Lakes Power Limited (GLPL) deferral account (EB-2005-0241) granted in 2005. A decision by March 31, 2007 was requested due to first quarter financial reporting requirements to external investors.

Under the proposed plan, Hydro One submitted that no amounts would be recorded for the ESM in 2007; however, on a monthly basis, the deficiency between the proposed revenue 2007 requirement (per the Hydro One Transmission rate filing) and revenue calculated using current approved rates (by applying a weather normal monthly load forecast consistent with the 2007 load forecast) would be reflected in the deferral account. Monthly carrying costs would be applied to this entry using the short-term interest rate included in the 2007 revenue requirement. Disposition of the account would be subject to future OEB review and approval. Entries would be booked immediately upon receiving a favourable decision from the OEB reflecting the commencement date of January 1, 2007.

Intervenors' Submissions:

Four intervenors responded to the Hydro One submission. The Vulnerable Energy Consumers Coalition (VECC) and Schools Energy Coalition (SEC) argued against granting the account. The Association of Major Power Consumers (AMPCO) and the Power Workers Union (PWU) were supportive of the request.

VECC argued that approval of this account was retroactive ratemaking and should not be approved by the Board. The GLPL case should not be considered as a precedent in this application as the deferral account granted to GLPL was only one aspect of a comprehensive settlement agreement. In addition, the GLPL account only applied to deficiencies starting on April 1, 2005, not January 1. VECC also argued that if the account was granted, no interest should be collected in the account.

SEC argued that the Board does not have the authority to revisit rates. SEC noted that in the EB-2005-0501 ESM decision, the Board stated that it was reluctant to have existing rates declared interim and if the Board had meant the mechanism to last only until January 1, 2007, it would have said so. SEC indicated that it would be unfair to ratepayers to allow Hydro One to revisit rates during a period where it anticipates a revenue deficiency but not do so during a period of over-earning. SEC also mentioned the fact that the GLPL deferral account was part of a comprehensive settlement agreement. SEC also noted that recent decisions of the Board have refused to implement rates retroactively on basis that the applicant had not demonstrated that the delay in arriving at just and reasonable rates by the beginning of the test year was not due to factors within the applicant's control, citing the January 2, 2007 Erie Thames Powerlines Corporation rate order.

AMPCO did not object to the establishment of the RDDA as this action would reassure investors that regulatory risk is minimal. AMPCO stressed that this approval should not pre-empt the Board's hearing process or be misconstrued as prior approval of Hydro One's revenue requirement. AMPCO submitted that any revenue deficiency calculation should be based on actual, non-weather corrected revenue under current rates and that the RDDA should be based only on continuance of program expenditures at the level Hydro One executed in 2006 and not on the increased levels being requested for 2007.

The PWU also supported the approval of the RDDA citing the need for utilities to have sufficient financial certainty so that they can carry out existing and new transmission work programs. The PWU also agreed with Hydro One that the RDDA was consistent with the GLPL decision and stated that the extended application of ESM for 2007 was inappropriate.

Hydro One Reply Submissions:

In its March 21, 2007 reply, Hydro One indicated that it was not requesting prior approval of its proposed 2007 programs or revenue requirements. Hydro One also submitted that SEC's assertions regarding "retroactive rate increases" are not supported as the OEB is not retroactively setting rates and that it is not revisiting rates for a period during which final rates were in place. Hydro One also noted that the settlement agreement in the GLPL case was the basis for the final order issued November 14, 2005, while the deferral account was granted much earlier on March 22, 2005.

Hydro One also stated that it believes that by requiring the use of audited financial statements for the ESM calculations, the Board intended full year application of the ESM, not part year application.

Hydro One submitted that AMPCO's suggestions that the revenue deficiency be calculated on the basis of non-weather corrected actual 2007 revenue and to use 2006 actual program costs is inconsistent with typical regulatory practice and the GLPL decision. Hydro One also pointed out that the GLPL decision included carrying costs in the approved deferral account.

Findings

It often happens that rate proceedings occur within timeframes that do not coincide with the conventional rate period. This can occur for a variety of reasons. In such situations an issue arises as to when the rates approved by the Board will become effective. Determining the effective date for rates is an important aspect of the Board's jurisdiction, and it can have significance for Applicants and ratepayers.

It is clear that such a situation will arise this year with respect to the revenue requirement for Hydro One. It is likely that the final determination of its revenue requirement for 2007 will not be made until the latter half of 2007.

Deferral accounts, such as the one applied for by Hydro One in this proceeding, are accounting devices intended to allow an entity to capture and record in an identifiable location an aspect of operations, the final quantum and disposition of which is dependent on some future unknown event.

In the case of the deferral account applied for by Hydro One, the unknown future event is the Board's final determination of the 2007 revenue requirement, the effective date governing that revenue requirement, and the terms and conditions imposed by the Board on the disposition, if any, of the amounts recorded in the deferral account.

Parties commenting on Hydro One's request for the Revenue Deficiency Deferral Account have raised issues respecting rate retroactivity, and have attempted to define with great particularity the terms and conditions that should govern the creation of the account, if the Board sees fit to approve its creation.

In the Board's view, the time to make these arguments is in the course of the revenue requirement proceeding per se, and, if necessary, at the time Hydro One seeks to have the amounts recorded in the account disposed of, so as to effect its revenue requirement or the resulting rates derived from it. Parties will be free to make whatever submissions they see fit as to the appropriateness of any disposition option.

At this stage, the Board is simply concerned with ensuring that the account meets the objective of administrative and accounting utility.

Accordingly, the Board approves the creation of a deferral account, effective January 1, 2007, to be referred to as the Revenue Difference Deferral Account. This account will record the sufficiency or deficiency arising from the difference between the 2006 Transmission rates, that is, rates that are currently in force, and the rates that would result from the new revenue requirement as determined by the Board in this proceeding. Parties will note that the Board has made the deferral account symmetrical to account for the possibility that the new revenue requirement as found by the Board may be lower than that which underpinned the 2006 rates.

In its materials, the Applicant referenced the Earnings Sharing Mechanism (ESM), which was instituted by a previous Board panel. In the Board's view, the creation of the deferral account as approved by the Board in this proceeding has the effect of terminating the ESM as of December 31, 2006. That is so because the Revenue Difference Deferral Account now accommodates the tracking of sufficiency as well as deficiency and this fact makes the continuation of the ESM unnecessary. If the new revenue requirement is higher than that underpinning the 2006 rates, the account will represent a credit to the utility to the extent of the difference. On the other hand, if the new revenue requirement is lower than that upon which the 2006 rates are based, the entire amount reflected in the account will be to the credit of ratepayers.

The final balance in the account will reflect a series of decisions made by the Board in its determination of the revenue requirement for 2007.

The Board's approval of the creation of this deferral account should not be construed in any degree as predictive of the quantum of, the terms of or the timing of the disposition, if any, of the contents of this account.

THE BOARD THEREFORE ORDERS THAT:

1. Hydro One shall establish a deferral account in which to record the differences in revenue between 2006 Transmission rates currently in force, and the rates that would result from the new revenue requirement as determined by the Board in this proceeding, beginning January 1, 2007. Hydro One is directed to prepare and submit a draft accounting order to the Board reflecting this order.

Regulatory Services Division

IN THE MATTER of an application by Maritime Electric Company, Limited for approval of proposed amendments to its rates.

Contents

IN THE MATTER of an application by Maritime Electric Company, Limited for approval of proposed amendments to its rates.

Reasons for Order

1. Introduction

[1] This is an application under the ***Electric Power Act***, R.S.P.E.I. 1988, Cap. E-4 (the "*Act*"), by Maritime Electric Company, Limited (the "Applicant", "Maritime Electric" or the "Company") seeking, among other things, an order or orders of the Island Regulatory and Appeals Commission (the "Commission") approving an increase in the Company's basic rates of 3.35% effective July 1, 2006.

[2] The application in this matter was filed on January 31, 2006 and publicly noticed in the Province's daily newspapers and on the Commission's website. In response to the notice, the Commission received a formal intervention from the Prince Edward Island Power Company Limited ("PEI Power") and also received a comment from a member of the public generally opposing the application and a request from a member of the public to make a presentation. The latter request was granted but a presentation was not forthcoming.

[3] The formal intervention filed by PEI Power concerns itself with an application by Maritime Electric for approval of a wind power purchase agreement with the P.E.I. Energy Corporation and the P.E.I. Government. That application is being dealt with separately by the Commission under docket UE21007. PEI Power has also intervened in that case.

[4] Given that PEI Power's interventions in both cases are virtually identical, the Commission will consider the intervention within the context of docket UE21007.

2. The Application

[5] Maritime Electric seeks an Order or Orders of the Commission:

- confirming Maritime Electric's rate bases for the years ended December 31, 2003- 2005 at $188,526,407, $197, 685,922 and $202,501,831 respectively, for establishment of its projected rate bases at $243,638,600 for the year ended December 31, 2006 and at $258,185,100 for the year ended December 31, 2007;
- setting the return on average rate base for the year ending December 31, 2006 of 8.71% to 8.92% and 8.32% to 8.52% for the year ending December 31, 2007; and
- approving an increase in basic rates of 3.35% for July 1, 2006 together with the general Rules and Regulations which relate to those rates for the period July 1, 2006 to December 31, 2007.

3. Discussion & Findings

3.1 Introduction

[6] The application before the Commission involves an assessment of several issues, including the Company forecast of sales and expenditures as well as other matters directly related to the proposed rate increase. In the discussion that follows, the Commission will review these issues and render its findings.

3.2 Sales Forecast

[7] The sales forecast is critical in determining many of the Company's operating expenses particularly those relating to energy purchases. A sales forecast that underestimates growth can, for example, result in a requirement for rates that is higher than necessary and revenue surplus to the needs of the Company.

[8] Prior to deregulation in 1994, the Company's sales forecast was based on an economic model that used historical sales, customer data, population statistics, provincial economic indicators and other related data. This rate application reintroduces these sales modeling techniques; however only short term sales forecasts are provided. Short term energy sales forecasts are based on a two-year average growth rate calculation and the rate of year-to-date growth over the previous year-to-date growth.

[9] Table 1 shows actual and forecast sales levels, by rate class, from 2004 to 2007.

Table 1

Energy Sales 2005 to 2007

	2004 Actual	2005 Actual	2006 Forecast	2007 Forecast
Energy Sales (MWh)				
Residential	410,672	412,122	414,801	418,949
General Service I	341,517	346,149	350,995	356,085
General Service II	5,003	4,850	4,802	4,807
Large Industrial	145,296	145,514	147,279	149,318
Small Industrial	67,412	73,342	77,119	79,626
Street Lighting/Unmetered	6,865	7,273	7,627	7,825
Total Energy Sales	976,765	989,250	1,002,623	1,016,610
Growth Rate (%)				
Residential	3.4	0.4	0.7	1.0
General Service I	0.5	1.4	1.4	1.4
General Service II	0.5	(3.0)	(1.0)	0.1
Large Industrial	(1.8)	.1	1.2	1.4
Small Industrial	10.4	8.8	5.1	3.2
Street Lighting/Unmetered	3.8	5.9	4.9	2.6
Overall Growth Rate	2.0	1.3	1.4	1.4

[10] To assess the reasonableness of the forecast, the Commission has looked at recent actual-to-forecast results, the modeling approach used and the inputs and assumptions used in the model. Past forecast information was not available to the Commission during the period of deregulation. The 1993 general rate case—the last review of the Company's rates prior to deregulation—concluded that there was a positive trend on the part of the Company's forecasting accuracy.

[11] Table 2 compares the most recent forecast-to-actual results.

Table 2

	2004 Forecast	2004 Actual	Actual to Forecast (%)	2005 Forecast	2005 Actual	Actual to Forecast (%)
Energy Sales (MWh)						
Residential	408,184	410,672	0.61%	418,388	412,122	(1.5%)
General Service I	341,820	341,517	(0.09%)	345,922	346,149	0.07%
General Service II	5,027	5,003	(0.48%)	5,135	4,850	(5.55%)
Large Industrial	147,859	145,296	(1.73%)	149,077	145,514	(2.39%)
Small Industrial	68,969	67,412	(2.26%)	72,590	73,342	1.04%
Street Lighting/Unmetered	6,811	6,865	0.79%	6,924	7,273	5.04%
Total Energy Sales	978,670	976,765	(0.19%)	998,036	989,250	(0.88%)

[12] Historically, forecast results have tended to err on the low side of actual results. In the Commission's view, however, the above shows reasonable accuracy in the Company's recent forecasting techniques and provides the Commission with confidence in the forecasts for 2006 and 2007.

[13] Maritime Electric has filed with the Commission its Demand Side Management Plan, Phase 1 for the period 2006-2010 as required by the *Renewable Energy Act*. This *Act* calls for a 5% reduction, by 2010, in the intensity of peak demand as measured in 2004. The impact of this plan is not expected to impact the revenue forecast contained in this application, but will need consideration in the future.

[14] The Commission finds that the projected growth rate of 1.4% in 2006 and 2007 appears reasonable. Although lower than the forecast general growth in the Canadian economy of 3.1% as reported in April by the Bank of Canada, it is more in line with local P.E.I. economic conditions. The Commission accepts the Company's sales forecast of 1,002,623 mWh for 2006.

3.3 Operating Expenditure Forecast

[15] The operating expenses of Maritime Electric are made up of production, transmission, distribution and administrative costs. Production costs—or costs associated with energy supply—represent the largest component of the Company's expenses and overall revenue requirement. These expenses include energy costs to be procured under pre-negotiated energy purchase contracts as well as expenditures associated with the Company's generation facilities in Charlottetown and Borden. Energy purchases from NB Power fall under three contracts: the Point Lepreau Unit Participation Agreement, the Dalhousie Unit Participation Agreement and an Energy Purchase Agreement. Both unit participation agreements extend for the life of the generating stations while the Energy Purchase Agreement is a short-term supply agreement that expires on October 31, 2006.

[16] A summary of energy supply costs is shown below.

Table 3

Energy Cost by Source 2005 to 2007

Source	2005 Actual	2006 Forecast	2007 Forecast
Point Lepreau	$10,590,075	$11,182,800	$11,204,900
Dalhousie	9,092,354	9,717,700	9,878,700
Firm Energy Purchases	24,104,756	5,465,400	10,492,400
System Energy Purchases	15,014,887	36,421,300	37,865,100
Charlottetown Plant	3,011,124	2,662,900	2,781,500
50 MW Combustine Turbine	-	2,177,500	2,158,500
Borden Plant	219,844	245,600	234,800
Wind	2,162,168	4,876,600	13,946,800
Ancillary Services	988,112	1,123,100	1,142,400
Other Purchases	703,778	3,024,400	3,225,900
Amortization Point Lepreau Writedown	560,000	93,400	93,400
Total	$66,447,098	$76,990,700	$93,024,400

[17] The energy cost per source varies by contract and by the fuel source. While some costs are stable and predictable, many are not.

[18] Energy supply constraints with ever increasing demand for energy are causing rising energy costs throughout the marketplace. The rising price of crude oil is a good example of the affects of supply constraints with increasing consumer demand. This is a concern as it may have an impact on new energy supply contracts that will take effect in the fall of 2006.

[19] Transmission expenses relate to those facilities that make up the Company's bulk energy delivery system, from the submarine cables to the inputs in the Company's distribution system. Distribution expenses cover the day to day operating costs of the Company's distribution system and include expenses such as planned maintenance, breakdown and forced outages and equipment failure. General expenses include internal and external costs associated with the overall operation and management of the Company.

[20] A summary of these expenditures, by major category, follows:

Table 4

Maritime Electric Company Limited
Expenses
2005 to 2007

Description of Expenses	Expenditures			% Increase	
	2005 Actual	2006 Forecast	2007 Forecast	2006 Forecast	2007 Forecast
General and Administrative	9,668,500	9,952,500	10,227,100	2.94%	2.76%
Transmission	354,259	363,700	374,100	2.66%	2.86%
Distribution	2,512,277	2,584,900	2,684,300	2.89%	3.85%
Total	12,535,036	12,901,100	13,285,500	2.92%	2.98%

[21] Table 4 shows overall cost increases of 2.92% in 2006 and 2.98% in 2007.

[22] Within the context of published economic forecasts for 2006 and 2007, the Company's forecast appears reasonable. The Commission has, as well, spent considerable time reviewing detailed budget data submitted in response to staff interrogatories and has satisfied itself that forecast expenditure levels are reasonable and prudent.

3.4 Rate of Return

[23] The Commission is guided in determining the allowable return on average common equity rates by the *Electric Power Act* which requires that the return be just and reasonable. Considerable jurisprudence in this area clearly directs that the return must be fair to both the consumer and the shareholder.

[24] Maritime Electric maintains that the rate of return must:

- Earn a return on the value of its property commensurate with that of comparable risk enterprises;
- Maintain its financial integrity; and
- Attract capital on reasonable terms.

[25] Maritime Electric is proposing a return on average common equity in the range of 10.0% to 10.5%. The Company states it will continue to strengthen its capital structure by increasing its common equity ratio to 45% from 42.69% in 2006 by the retention of earnings.

[26] A major input factor in the selection of return on common equity rates is business risk. As described in the rate application, business risk comes in the form of :

- The marketplace under which the utility operates;
- The nature of the utilities operations and energy supply;
- The regulatory risk faced by the utility; and
- The forecasting risk.

[27] The Company concludes that it is a higher risk utility than the other two investor-owned Atlantic Province electric utilities, Newfoundland Power and Nova Scotia Power. The Company provided the following actual return information for both investor-owned electric utilities:

Table 5

Earned Returns 2002 to 2004(%)

Year	Newfoundland Power	Nova Scotia Power
2002	10.7%	9.8%
2003	10.2%	10.4%
2004	10.3%	10.0%
2005	9.24%	9.8%
Average	10.11%	10.0%

[28] The Commission has reviewed the Company's submissions on this matter and agrees that the Company operates with a higher degree of business risk than other investor owned utilities in Atlantic Canada. This is due, in part, to the relative small size of the Company. In our view, this risk is, however, mitigated somewhat through the operation of the Energy Cost Adjustment Mechanism, which is discussed in more detail below.

[29] The Commission finds that a rate of return on average common equity of 10.25% is just and reasonable. This is viewed by the Commission as an upper limit or the maximum allowable return.

3.5 Deferred Costs Recoverable from Customers

[30] Section 47 of the *Electric Power Act* reads, in part, as follows:

> *47. (1) On and after January 1, 2004, Maritime Electric Company, Limited shall provide service in the province at the rates, tolls and charges, and on the terms and conditions of service, that were established and in effect under the former Act and the former regulations immediately before January 1, 2004 until such time as those rates, tolls and charges, and those terms and conditions of service, are altered or modified under this Act. 2003,c.3,s.23.*
>
> Annual report
>
> *(2) Prior to March 1, 2004, Maritime Electric Company, Limited shall provide an annual report to the Commission for the calendar year beginning January 1, 2003 that complies with the requirements of section 15. 2003,c.3,s.23.*
>
> Submission of proposed rates, tolls and charges
>
> *(3) Prior to May 1, 2004, Maritime Electric Company, Limited shall make a submission to the Commission under section 20 for the review and approval of its rates, tolls and charges. 2003,c.3,s.23.*
>
> Recovery of deferred costs, interest and unamortized expenses
>
> *(4) When approving or determining and fixing the rates, tolls and charges of Maritime Electric Company, Limited pursuant to a submission made under section 20 in accordance with subsection (3), or in accordance with any later application made in accordance with section 20, the Commission shall allow Maritime Electric Company, Limited*
>
> *(a) to recover, over such period of time and on such terms and conditions as the Commission considers just and reasonable,*
>
> *(i) the deferred costs that Maritime Electric Company, Limited would have been able to recover under the former Act and the former regulations,*
>
> *(ii) the unamortized portion of any deferred cost incurred before January 1, 2004 by Maritime Electric Company, Limited in respect of any power purchase agreement, and*
>
> *(iii) a reasonable return on the unrecovered deferred costs referred to in subclauses (i) and (ii); and*
>
> *(b) to recover, as an annual expense, the amounts payable by Maritime Electric Company, Limited pursuant to any power purchase agreement Maritime Electric Company, Limited has entered into before January 1, 2004 that continues in force on and after that date. 2003,c.3,s.23.*

[31] Commission Order UE05-01 approved the recovery of deferred costs in the amount of $1,500,000 in 2004 and $2,500,000 in 2005. This leaves $13,983,600 yet to be recovered from rates. Maritime Electric is requesting that a further $1,500,000 be recovered in 2006 and $1,300,000 in 2007. These are the amounts included in the proposed rates.

[32] Although the Commission has not, to date, defined the time period over which the remainder of the deferred account must be amortized or recovered through rates, the Commission believes that it is time to do so. We will, however, give the Company an opportunity to make a submission before doing

so. The Commission will order the filing of such a submission before the end of 2006. The proposed amount for 2006 will, however, be allowed. A decision on the 2007 amount will be deferred pending the filing of the above submission.

3.6 Proposed Rates

[33] A summary of current and proposed basic rates is summarized in Table 6.

Table 6

Basic Rates	Present Rates	Proposed Rates July 1, 2006
Residential Service Rate Schedule		
Residential Urban	$21.55	$22.27
Residential Rural	$23.60	$24.39
Residential Energy Charge for first 1200kWh/billing period	$0.1033/kWh	$0.1068/kWh
General Service Rate Schedule		
General Service 1	$21.55	$22.27
General Service Energy Charge		
Demand Charge (first 20kW no charge)	$11.78/kW	$12.17/kW
Energy Charge - first 5000kWh	$0.1291/kWh	$0.1334/kWh
Energy Charge - balance of kWh	$0.0813/kWh	$0.0840/kWh

[34] Maritime Electric states that the proposed 3.35% basic rate increase will be largely offset on July 1, 2006 due to the effects of the Energy Cost Adjustment Mechanism ("ECAM"). The Company states that the overall impact on a Rural Residential customer on July 1, 2006 using 650kWh per month (including GST) is a total increase of 1.6%. The following table illustrates the proposed rate increase for the average rural residential customer.

Table 7

Rural Residential Billing Comparison **Base charge and Energy charge**	July 1, 2005	July 1, 2006	July 1, 2007	Dec.31/07
Basic Service Charge	$23.60	$24.39	$24.39	$24.39
Energy charge (650KWh)	67.15	69.42	69.42	69.42
Subtotal	90.75	93.81	93.81	93.81
GST(6%)	5.44	5.63	5.63	5.63
Total	96.19	99.44	99.44	99.44
Base service charge and energy rate increase	3.35% →		0.00% →	

[35] In 2004, the Company applied for, and received Commission approval of, the present ECAM. The ECAM provides a mechanism that automatically adjusts monthly billings to customers to reflect changes in defined energy related costs.

[36] Without a mechanism to adjust for variations in energy supply costs, the Company's earnings would, in theory, fluctuate beyond reasonable ranges, resulting in the need for frequent Commission hearings. Maritime Electric

maintains that the ECAM, in its present form, provides stability to the Company resulting in reduced basic rates. For example, an increase or decrease in energy costs of $2,000,000—or approximately 3%—would see a variation of approximately 15% in the Company earnings. According to the Company, debt holders and shareholders would demand higher returns to offset this volatility. Maritime Electric maintains that the stability associated with this adjustment mechanism eliminates the need for frequent and costly rate hearings.

[37] Commission Order UE05-05, dated March 16, 2005, approved the interim and transitional ECAM currently in effect. Order UE05-06, dated June 24, 2005, ordered the replacement of the current ECAM with one containing fewer accounts. The transition to a new ECAM was to take effect on July 1, 2006.

[38] During 2004 and 2005, the ECAM was the subject of an independent study carried by consultant John Murphy. The Murphy study recommended a number of changes to the ECAM which were commented upon by the Company. In summary, Murphy recommended:

(1) That certain expense classifications that should be excluded from the ECAM; and
(2) that volume level changes in total purchased power should be excluded from the ECAM.

[39] Maritime Electric now requests that the Commission delay any changes to the ECAM pending receipt and review:

(1) of a depreciation study and cost allocation study ordered by the Commission, by Order UE06-02, to be filed in the summer-fall of 2006;
(2) of new energy supply agreements; and
(3) of the refurbishment costs associated with the Point Lepreau nuclear generating station.

[40] The Commission agrees with Maritime Electric that the pending studies will have implications on the ECAM. As a result, the Commission will, for now, order the continuation of the interim and transitional ECAM currently in effect.

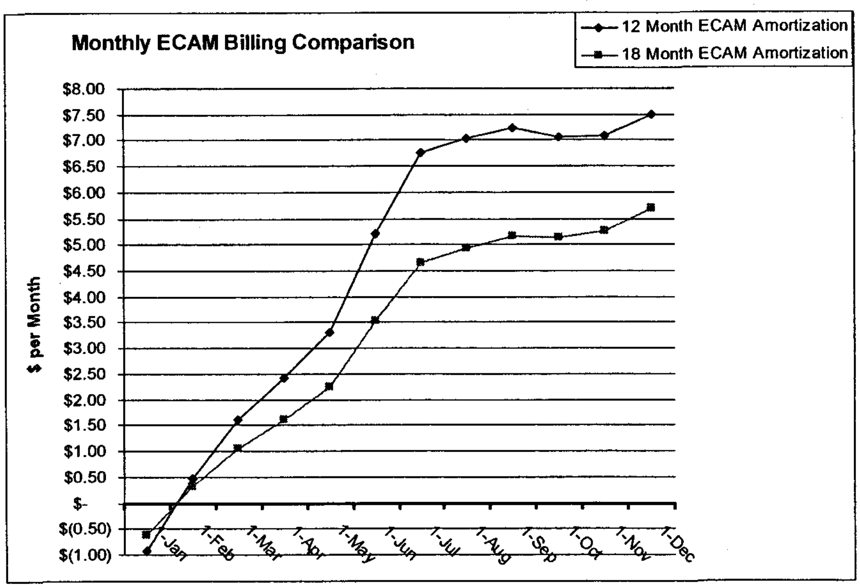
[41] The Commission has reviewed the forecasted impact the monthly ECAM charges will have on consumer electricity charges for 2006 and 2007. Currently, customers are enjoying the benefits of an ECAM adjustment that reduces monthly customer bills. The main reason for this lies in the present energy supply contracts negotiated several years ago when energy was less expensive and denominated in US dollars. The appreciating Canadian dollar has assisted in reducing the costs of purchased energy.

[42] It is unlikely that Maritime Electric will, in future, be immune from rising energy costs experienced by all jurisdictions. New energy supply contracts will

no doubt be more expensive than current agreements and will be based on a higher valued Canadian dollar.

[43] The Commission is concerned about the impact of rising ECAM adjustments and the rising balance of the ECAM account due to the 18 month amortization of energy costs. Deferring energy costs to a future period when costs are rising will place further burden on customers. The Commission is of the view that utility energy costs should be recovered within the year the energy is used. As an alternative, the Commission has considered an ongoing 12 month amortization period. This results in a higher recovery of ECAM charges as shown by the following figure which compares amortizations periods of 18 months and 12 months, commencing in January of 2007. The figure depicts the change in the bill of a residential customer who consumes 650 kWh per month.

Figure 1



[44] The ECAM balance to be recovered from customers using the currently authorized 18 month amortization period spreads the ECAM recovery over a longer period of time. The Company is owed this money and it appears as an account receivable on year-end financial statements. A 12 month amortization period, commencing on January 1, 2007, would recover these energy charges from customers faster and the Company is owed less money at year end. The following table shows the comparison.

Table 8

Unrecovered post 2003 costs recoverable	Actual 2004	Actual 2005	Forecast 2006	Forecast 2007
18 month amortization	$2,725,400	($3,343,488)	$1,675,800	$14,832,200
12 month amortization	n/a	n/a	$1,675,800	$12,305,781

[45] Thus, an additional $2,526,419 would be collected from customers with the 12 month amortization period. The impact to customer monthly billing for the average residential customer using 650kWh of electricity monthly is shown on Table 9.

Table 9

Residential Billing Comparison Forecast ECAM adjustment	July 1, 2005	July 1, 2006	July 1, 2007	Dec.31, 2007
Forecast monthly ECAM adjustment (650kWh)	0.98	-2.51	5.21	7.50
GST(6%)	0.06	-0.15	0.31	0.45
ECAM adjustment plus GST	1.04	-2.66	5.52	7.95

[46] The Commission finds that a 12-month amortization period better represents the true costs to the consumer. The Commission will order an amendment to the ECAM to reflect the implementation of 12-month amortization period effective in January, 2007.

4. Disposition

[47] An order will therefore issue implementing the findings and conclusions contained in these reasons.

IN THE MATTER of an application by Maritime Electric Company, Limited for approval of proposed amendments to its rates.

Order

UPON receiving an application by Maritime Electric Company, Limited (the "Company") for approval of proposed amendments to its rates;

AND UPON considering the application as well as the evidence of the Company and responses to staff interrogatories;

NOW THEREFORE, for the reasons given in the annexed Reasons for Order;

IT IS ORDERED THAT

1. the requested increase in basic rates and charges is approved in accordance with Appendix 1 contained in the application for effect with meter readings taken on and after July 1, 2006;
2. the current interim and transitional Energy Cost Adjustment Mechanism ("ECAM") shall continue in effect pending receipt and review of certain studies and filings described in the within Reasons for Order;
3. the amortization period of 18 months contained in the ECAM shall be changed to 12 months, effective January 1, 2007;
4. the maximum allowed return on average common equity is set at 10.25 percent;
5. the Company shall continue the amortization of the December 31, 2003 deferred costs recoverable from customers in the amount of $1,500,000 in 2006 with the balance to be recovered over such time and in such annual amounts as the Commission will further order; and

6. the Company shall prepare a report setting out options for the full recovery of the remaining deferred costs in equal annual amounts with the said report to be filed with the Commission by December 31, 2006.

DATED at Charlottetown, Prince Edward Island, this 27th day of June, 2006.

BY THE COMMISSION:

(Sgd) *Maurice Rodgerson*

Maurice Rodgerson, Chair

(Sgd) *Weston Rose*

Weston Rose, Commissioner

(Sgd) *James Carragher*

James Carragher, Commissioner

(Sgd) *Anne Petley*

Anne Petley, Commissioner

NOTICE

Section 12 of the *Island Regulatory and Appeals Commission Act* reads as follows:

> *12. The Commission may, in its absolute discretion, review, rescind or vary any order or decision made by it or rehear any application before deciding it.*

Parties to this proceeding seeking a review of the Commission's decision or order in this matter may do so by filing with the Commission, at the earliest date, a written Request for Review, which clearly states the reasons for the review and the nature of the relief sought.

Sections 13.(1) and 13(2) of the *Act* provide as follows:

> *13.(1) An appeal lies from a decision or order of the Commission to the Appeal Division of the Supreme Court upon a question of law or jurisdiction.*
>
> *(2) The appeal shall be made by filing a notice of appeal in the Supreme Court within twenty days after the decision or order appealed from and the Civil Procedure Rules respecting appeals apply with the necessary changes.*

- Union des consommateurs (UC);
- Union des municipalités du Québec (UMQ).

TABLE DES MATIÈRES

1. INTRODUCTION

Le 10 mars 2004, Société en commandite Gaz Métro (SCGM) introduit à la Régie de l'énergie (la Régie) une demande de modification de ses tarifs à compter du 1er octobre 2004.

Le 29 avril 2004, par sa décision D-2004-88, la Régie permet la mise en place d'un Groupe de travail, fixe les lignes directrices pour le processus d'entente négociée (PEN) et détermine les sujets référés au PEN et ceux devant être étudiés en audience.

Le 5 mai 2004, SCGM dépose à la Régie la preuve sur le renouvellement du mécanisme automatique d'ajustement du taux de rendement et sur tous les sujets d'audience. Elle demande également une ordonnance de confidentialité pour les pièces SCGM-4, document 1, section 8 (Optimalité de la structure d'équilibrage) et SCGM-4, document 9 (Comparaison des coûts entre les structures d'équilibrage réalisables).

Le 10 juin 2004, la Régie rend la décision D-2004-117 dans laquelle elle accorde la confidentialité demandée par SCGM. Le Groupe de travail dépose, pour sa part, son rapport final.

Le 5 juillet 2004, le distributeur demande, par lettre, l'autorisation à la Régie de créer un compte de frais reportés pour y inclure un montant remboursable aux clients de 88 000 $ représentant l'impact net de la disposition des comptes de frais reportés et des modifications tarifaires des taux de Union Gas Limited (Union Gas) sur les tarifs d'équilibrage de SCGM.

Le 27 juillet 2004, le distributeur transmet à la Régie une demande d'autorisation de modifier immédiatement les taux du tarif de transport et de créer un compte de frais reportés pour le montant de réduction de 53 000 $ au prix du service d'équilibrage. Cette demande fait suite à l'ordonnance AO-1-TGI-07-2003 de l'Office national de l'énergie (ONÉ), laquelle modifie les tarifs de TransCanada Pipelines Limited sur une base provisoire à compter du 1er août 2004. La disposition de ces comptes de frais reportés se fera dans le présent dossier. Le 5 août 2004, la Régie acquiesce à la demande de SCGM, conformément aux modalités approuvées par la décision D-2001-232[1].

L'audience se tient les 17 et 18 août 2004 et le dossier est pris en délibéré le 31 août 2004, date de la réception de la demande amendée et des pièces modifiées pour tenir compte des

[1] Dossier R-3463-2001, 27 septembre 2001.

effets de la décision de l'ONÉ ainsi que de la mise à jour relative aux taux obligataires long terme et au taux d'inflation conformément à l'entente sur le mécanisme incitatif.

2. CONCLUSIONS RECHERCHÉES

Les conclusions recherchées dans la demande réamendée de SCGM, en date du 31 août 2004, sont les suivantes :

> « ***RECONDUIRE*** *jusqu'au 30 septembre 2006 les programmes et conditions tarifaires suivants déjà reconduits jusqu'au 30 septembre 2005 par la décision D-2003-180 : 1) programme de flexibilité tarifaire bi-énergie; 2) programme de flexibilité tarifaire mazout pour les clients des tarifs D1, D3 et DM;*
>
> ***APPROUVER****, à compter du 1er octobre 2004, les modifications proposées à certaines conditions d'applications des programmes de rabais à la consommation et de rétention par voie de rabais à la consommation (P.R.C. et P.R.R.C.);*
>
> ***APPROUVER****, à compter du 1er octobre 2004, le programme additionnel alternatif à l'actuel programme commercial axé sur le financement (« PCAF »), tel que décrit à la pièce SCGM-2, document 7;*
>
> ***APPROUVER*** *le plan d'approvisionnement de SCGM pour l'exercice 2005, tel que décrit à pièce SCGM-4, document 1, conformément à l'article 72 de la Loi;*
>
> ***APPROUVER****, pour l'exercice financier 2005, les modifications proposées au « Programme de produits financiers dérivés, les volumes totaux pouvant être protégés en vertu de ce programme ainsi que le plafond applicable aux contrats d'échange à prix fixes »;*
>
> ***APPROUVER*** *l'application à l'exercice 2005 du mécanisme incitatif à l'amélioration à la performance approuvé par la Régie dans sa décision D-2004-51;*
>
> ***AUTORISER*** *l'utilisation des sommes imputées au Fonds d'efficacité énergétique (FEÉ) conformément au plan d'action du FEÉ présenté à la pièce SCGM-9, document 8;*
>
> ***AUTORISER*** *le coût en capital moyen de 9,01% sur la base de tarification pour l'exercice financier 2005, lequel provient, entre autres, de l'application du mécanisme automatique d'établissement du taux de rendement sur l'avoir moyen des actionnaires énoncé dans les décisions D-99-11, D-99-150 et D-2003-180 dont SCGM propose la reconduction pour les exercices 2005, 2006 et 2007, ainsi que d'une bonification résultant de l'application du mécanisme incitatif à l'amélioration de la performance approuvé dans la décision D-2004-51;*

***AUTORISER**, dans l'évaluation des projets d'investissements prévus par SCGM pour l'exercice financier 2005, le coût en capital prospectif de 7,04% résultant de l'utilisation des taux déterminés selon les paramètres contenus dans la décision D-97-25;*

***MODIFIER**, à compter du 1er octobre 2004, les tarifs de SCGM de façon à ce qu'ils génèrent les revenus requis totalisant 794 125 000 $, de façon à permettre à SCGM de récupérer l'ensemble de ses coûts pour assumer ses services;*

***AUTORISER** la répartition tarifaire proposée à la pièce SCGM-12, document 6;*

***APPROUVER** le texte des tarifs proposé à la pièce SCGM-13, document 1.* »

3. REVENU REQUIS

Le dossier tarifaire 2005 est le premier à être préparé selon les termes du mécanisme incitatif approuvé par la Régie dans la décision D-2004-51[2]. Ce mécanisme ne diffère pas fondamentalement de celui qui était appliqué depuis le 1er octobre 2000.

Le fonctionnement du mécanisme de rendement incitatif à l'amélioration de la performance de SCGM est basé sur une comparaison entre le revenu plafond découlant de l'application du mécanisme incitatif et le revenu requis, tel qu'il aurait été établi selon la méthode du coût de service. En début d'exercice, dans le cas ou le revenu requis est inférieur au revenu plafond, l'écart favorable, considéré comme un gain de productivité, est partagé avec les clients dans la proportion de 50 % pour ces derniers et de 50 % pour SCGM à titre de bonification du rendement de base sur l'avoir des actionnaires ordinaires.

Le tableau 1 présente le calcul du gain de productivité applicable pour l'année témoin 2004-2005 et son partage ainsi que le revenu plafond et le revenu requis selon les composantes distribution (D), inventaires (F, C, T), transport (T) et équilibrage (É).

---

2 Décision D-2004-51, dossier R-3494-2002, 3 mars 2004.

TABLEAU 1
Calcul du gain de productivité et son partage
(000 $)

	2003-2004	2004-2005				
	TOTAL	**Distribution (D)**	**Inventaires* (F, C, T)**	**Transport (T)**	**Équilibrage (É)**	**TOTAL**
Revenu plafond	770 363	461 577	14 605	248 189	87 595	811 966
Revenu requis (avant partage)	743 797	425 896	14 605	248 189	87 595	776 285
Gain de productivité	26 566	35 681	-	-	-	35 681
Part des clients 50 %**	12 619	17 841	-	-	-	17 841
Part de SCGM 50 %**	13 947	17 841	-	-	-	17 841
Rendement additionnel de SCGM après impôts	1,52 %	1,95 %	-	-	-	1,95 %

* La composante inventaires (F, C, T) représente les coûts directement reliés au maintien des inventaires se rapportant aux services de fourniture de gaz naturel, de gaz de compression et de transport.
** En 2003-2004, la part des clients était de 47,5 %, celle de SCGM était de 52,5 %.

Source : Pièces SCGM-8, documents 1, 2 et 3 et SCGM-12, documents 2 et 3.

Le revenu plafond est établi à partir de celui de l'exercice antérieur, lequel est ajusté pour tenir compte de la variation des volumes projetés et de l'évolution des prix à la consommation (IPC Québec) de 1,51 %[3] moins un facteur de productivité de 0,5 %. Le revenu plafond, qui est comparé au revenu requis, est ajusté pour tenir compte de l'impact des facteurs exogènes et des exclusions. Le revenu plafond des autres composantes est égal au revenu requis déterminé selon la méthode du coût de service.

Le revenu requis de distribution est établi en suivant le même procédé que dans un mode de réglementation par les coûts. Les coûts de distribution sont principalement constitués des dépenses d'exploitation et du rendement sur la base de tarification de la composante distribution. Les coûts de transport et d'équilibrage sont en majeure partie déterminés par les contrats conclus avec les fournisseurs des services de transport et d'entreposage et les volumes projetés.

[3] Pièce SCGM-8, document 1, page 1.

La part de SCGM du gain de productivité, 17 841 000 $, représente une bonification après impôts de 1,95 %[4] du taux de rendement de base sur l'avoir des actionnaires ordinaires.

3.1 BASE DE TARIFICATION

Pour l'exercice financier 2005, SCGM projette une base de tarification moyenne de 1 674 777 000 $. Les additions à la base de tarification s'élèvent à 145 648 000 $. Elles sont présentées sous deux rubriques générales : les frais reportés pour un total de 31 031 000 $ et les immobilisations, regroupées sous cinq catégories, pour un total de 114 617 000 $ conformément à l'article 5 du R*èglement sur les conditions et les cas requérant l'autorisation de la Régie de l'énergie*[5].

Développement et renforcement du réseau

Pour le développement du réseau, SCGM prévoit investir 44 565 000 $ ventilés de la façon suivante : 3 769 000 $ pour des projets d'extension subventionnés dont le coût est supérieur à 1,5 M$, 15 429 000 $ pour des projets de raccordement sur réseau et 25 366 000 $ pour des projets de raccordement hors réseau[6]. Pour le renforcement du réseau, un montant de 14 210 000 $ est projeté dont 9 510 000 $ pour l'enlèvement et la relocalisation de la conduite située sous le pont Jacques-Cartier.

Amélioration des réseaux de distribution et de transmission

Afin d'assurer la fiabilité du service de distribution du gaz et la sécurité du réseau, SCGM prévoit des investissements de 17 233 000 $ pour l'amélioration du réseau et de 545 000 $ pour le raccordement et la régularisation du réseau de transmission.

---

4 Pièce SCGM -8, document 3, page 1.
5 (2001) 133, G.O. II, 6165.
6 Pièce SCGM -6, document 3, page 10.

Entreposage du gaz

Le distributeur propose d'investir 895 000 $ pour l'entreposage du gaz. Cet investissement est nécessaire afin d'effectuer des mises à niveau aux normes de l'Association canadienne de normalisation, d'assurer la fiabilité et la sécurité entourant l'usine de liquéfaction et d'améliorer les procédés.

Installations générales

SCGM prévoit des investissements de 28 598 000 $ afin d'assurer l'entretien et l'amélioration des autres installations.

Frais généraux capitalisés

Ces investissements de 8 571 000 $ correspondent aux frais généraux encourus pour la réalisation des investissements ci-dessus mentionnés.

3.2 TAUX MOYEN DU COÛT DU CAPITAL

Le taux de rendement sur la base de tarification correspond au coût moyen pondéré des différentes composantes de la structure de capital. SCGM utilise, pour l'exercice financier 2005, une structure de capital constituée de 38,5 % d'avoir des actionnaires ordinaires, de 7,5 % d'actions privilégiées et de 54 % de dette. Le taux moyen du coût en capital, avant partage du gain de productivité, est de 8,26 %. Ce taux comprend, entre autres, un coût moyen de la dette de 7,697 % et un taux de rendement sur l'avoir des actionnaires ordinaires de 9,69 %, avant bonification[7]. Après bonification, le taux de rendement demandé s'établit à 11,64 % sur l'avoir des actionnaires ordinaires et à 9,01 % sur la base de tarification[8].

8 *Ibid.* à la page 2.

3.3 DEMANDE DE RECONDUCTION DU MÉCANISME D'AJUSTEMENT AUTOMATIQUE DU TAUX DE RENDEMENT ET DE LA STRUCTURE DE CAPITAL

3.3.1 PREUVE DE SCGM

Mécanisme d'ajustement automatique du taux de rendement

SCGM demande à la Régie de reconduire, pour une période de trois ans, jusqu'à l'année tarifaire 2006-2007 inclusivement, le mécanisme d'ajustement automatique du taux de rendement sur l'avoir des actionnaires ordinaires ainsi que la structure de capital.

SCGM reconnaît que le mécanisme incitatif en vigueur depuis l'année 2000 a généré un taux de rendement supérieur au taux de rendement de base établi en vertu du mécanisme d'ajustement automatique. SCGM soumet qu'il est important de dissocier le taux de rendement de base établi à partir de la formule d'ajustement automatique du taux de rendement bonifié obtenu par l'application du mécanisme incitatif. Le taux de base représente un taux de rendement à être octroyé par la Régie afin de rencontrer les différents facteurs énumérés plus bas. Le mécanisme incitatif vient rémunérer SCGM pour une performance supérieure à la performance attendue dans le mode traditionnel de réglementation. Combiner le résultat du mécanisme incitatif avec la formule d'ajustement automatique du taux de rendement reviendrait, selon SCGM, à lui demander de cesser ses efforts de développement et d'amélioration de la productivité[9].

Dans le présent dossier, SCGM ne vise pas à justifier la formule. Cela a déjà été fait dans le dossier R-3397-98 et dans la décision D-99-11. Dans cette décision, la Régie approuvait un mécanisme d'ajustement automatique du taux de rendement basé sur les variations des taux obligataires sans risque en tenant compte des facteurs suivants :

- contexte financier de l'entreprise et son risque d'entreprise;
- contexte économique général;
- taux d'intérêt et rendement des obligations de long terme;
- méthodes d'estimation du taux de rendement présentées par les experts et contexte réglementaire dans les juridictions voisines;
- maintien de l'intégrité financière de l'entreprise.

[9] Notes sténographiques (NS), volume 1, pages 50 et 51.

L'approche de SCGM consiste à reprendre les différents éléments sur lesquels repose cette décision, à en suivre l'évolution depuis 1999 et à démontrer qu'ils n'ont pas, globalement, changé de façon significative. Par conséquent, la formule peut être qualifiée de raisonnable encore aujourd'hui.

Structure de capital

SCGM souhaite la reconduction de sa structure de capital. Pour appuyer sa demande, SCGM réfère à la décision D-96-31 de la Régie du gaz naturel, notamment aux passages suivants :

> « *La Régie est d'avis également qu'on ne peut modifier fréquemment ou subitement la structure de capital d'une entreprise car cela pourrait créer une instabilité financière qui pourrait inquiéter les investisseurs.*
>
> […] *à moins de circonstances exceptionnelles qui le justifieraient, on ne remettra pas en cause à chaque année cette structure que la Régie juge optimale, et qui respecte les principes qui l'ont guidée dans sa décision, à savoir: assurer à long terme un coût de capital le plus bas possible, et maintenir la santé financière du distributeur.* »[10]

Selon le distributeur, la preuve présentée en appui à la demande de reconduction du mécanisme d'ajustement automatique du taux de rendement est transposable à la demande de maintien de la structure de capital. La conclusion est similaire étant donné qu'aucune circonstance exceptionnelle n'est survenue depuis 1999 qui justifierait la remise en question de la structure de capital.

3.3.2 POSITION DE L'ACIG

Seule l'ACIG s'est prononcée sur la proposition de SCGM. Bien que l'intervenante ne partage pas totalement l'ensemble des éléments de preuve du distributeur dans sa demande, elle considère, pour l'instant, inutile d'approfondir l'analyse de cette question, compte tenu du fait que le distributeur ne propose pas de modifications à la formule actuelle[11].

---

[10] Décision D-96-31, dossier R-3351-96, 9 octobre 1996, page 67.
[11] Plaidoirie écrite de l'ACIG, pages 6 et 7.

3.4 OPINION DE LA RÉGIE

Sur l'application du mécanisme incitatif

La Régie note que les participants au Groupe de travail sont d'avis que les pièces produites par SCGM respectent le mécanisme incitatif à l'amélioration de la performance approuvé dans la décision D-2004-51 et permettent, en conséquence, à la Régie de fixer les tarifs de SCGM à compter du 1er octobre 2004[12]. Bien que SÉ/AQLPA ait réservé ses droits de faire des représentations sur les documents SCGM-9, documents 2 et 9[13], il ne remet pas en question le niveau du revenu requis.

La Régie constate que l'entente déposée par le Groupe de travail est conforme à l'application du mécanisme incitatif et l'approuve.

Sur la demande de reconduction du mécanisme d'ajustement automatique du taux de rendement et de la structure de capital

La Régie juge que globalement les facteurs retenus dans la décision D-99-11 n'ont pas changé d'une manière significative, notamment ceux ayant trait aux contextes économique, d'affaires et financier. Par conséquent, elle approuve la demande de SCGM de reconduire le mécanisme d'ajustement automatique du taux de rendement pour une période de trois ans, soit jusqu'à l'année tarifaire 2006-2007 inclusivement et de maintenir la structure de capital.

4. BAISSE TARIFAIRE

Les tarifs sont fixés de manière à générer le revenu plafond moins la part des clients du gain de productivité, nette des sommes investies dans le Fonds en efficacité énergétique (FEÉ).

Cette année, les clients petit et moyen débits n'ont pas eu à contribuer au FEÉ parce que les revenus d'intérêt du FEÉ de l'année tarifaire précédente (sur la base de sept mois réels et cinq mois projetés) ont excédé les fonds engagés pour l'année tarifaire précédente (toujours sur la base de sept mois réels et cinq mois projetés).

---

[12] Rapport du Groupe de travail, pièce SCGM -1, documents 3 et 4.

[13] Les rapports de suivi et les tableaux financiers du Plan global d'efficacité énergétique (PGEÉ) et le Compte d'aide à la substitution d'énergies plus polluantes (CASEP).

La baisse tarifaire demandée est obtenue en comparant le revenu requis, après partage, au revenu obtenu en appliquant les tarifs en vigueur aux volumes projetés pour l'année témoin 2004-2005.

Cette baisse globale de 1,19 % est le résultat net de la baisse du revenu requis des composantes distribution et inventaires ainsi que de la hausse du revenu requis des composantes transport et équilibrage. La baisse de la composante distribution s'établit à 3,01 %. Le tableau 2 présente le détail.

TABLEAU 2
Calcul de l'ajustement tarifaire global
(000 $ et en %)

	Distribution (D)	Inventaires (F, C, T)	Transport (T)	Équilibrage (É)	TOTAL

4.1 STRATÉGIE TARIFAIRE POUR RÉPARTIR LA BAISSE

De façon générale, l'ajustement tarifaire requis des inventaires (F, C, T) de même que des services de transport et d'équilibrage a été réparti au prorata des volumes correspondant au service fourni à la classe tarifaire.

L'ajustement tarifaire à la baisse applicable à la composante distribution s'élève à 13,644 M$. La majeure partie de ce montant, 13,753 M$, est attribuable aux coûts de distribution excluant ceux découlant du traitement des trop-perçus antérieurs, du PGEÉ et du FEÉ.

Exception faite des coûts du PGEÉ qui sont répartis selon la méthode d'allocation approuvée dans la décision D-2001-232, tous les autres coûts sont répartis uniformément en pourcentage des revenus de distribution de la classe tarifaire. Les coûts du FEÉ n'affectent que les clients des tarifs de distribution D_1, D_3 et D_M[14]. Les clients bénéficiant du tarif fixe de distribution ne sont touchés par aucun des ajustements.

Une fois cette répartition complétée, les grilles tarifaires doivent être modifiées pour refléter la réduction appliquée aux rabais transitoires. Par la suite, les grilles tarifaires du service de distribution sont ajustées pour intégrer les modifications proposées aux méthodes d'allocation des coûts de transport et d'équilibrage ainsi que les modifications aux structures tarifaires.

4.2 MODIFICATIONS AUX MÉTHODES D'ALLOCATION DES COÛTS DE TRANSPORT ET D'ÉQUILIBRAGE

Dans sa décision D-2003-180[15], la Régie demandait au distributeur d'évaluer s'il y avait lieu de réviser les éléments suivants en regard du nouveau contexte gazier :

- méthode de répartition des coûts de transport;
- fonctionnalisation entre la pointe et l'espace pour les coûts d'équilibrage;
- pointe pour les clients en service interruptible.

Le distributeur juge qu'il y a lieu de modifier les deux derniers éléments et fait de nouvelles propositions.

[14] Pièce SCGM-12, document 6.
[15] Dossier R-3510-2003, 26 septembre 2003.

4.2.1 MÉTHODE DE RÉPARTITION DES COÛTS DE TRANSPORT

En ce qui concerne la méthode de répartition des coûts de transport, le distributeur mentionne que son positionnement stratégique procure des bénéfices au niveau des coûts d'équilibrage et estime que la répartition demeure adéquate dans le contexte actuel.

4.2.2 FONCTIONNALISATION ENTRE LA POINTE ET L'ESPACE POUR LES COÛTS D'ÉQUILIBRAGE

Le distributeur propose une nouvelle méthodologie se basant sur les consommations journalières historiques de la dernière année.

Dans un premier temps, il détermine un ordre de priorité d'utilisation des différents outils d'équilibrage dont il dispose et les superpose. Le débit journalier potentiel atteint par chaque outil est ensuite comparé aux paramètres consommation journalière moyenne annuelle (A), consommation journalière moyenne de l'hiver (H) et consommation journalière de pointe (P).

La part des volumes du débit journalier entre A et H est fonctionnalisée en espace et celle entre H et P est fonctionnalisée en pointe. Pour cette opération, les consommations réelles pour chacune des journées de l'année sont utilisées.

La proposition a pour effet d'augmenter la proportion fonctionnalisée sous la pointe de 18 % à 41 % et de diminuer celle sous l'espace de 82 % à 59 %. L'impact de cette modification sur les revenus d'équilibrage est présenté ci-dessous.

TABLEAU 3
Impact de la fonctionnalisation entre la pointe et l'espace sur les revenus
Budget 2003-2004 – (000 $)

	Revenu d'équilibrage			Revenu de transport, d'équilibrage et de distribution	
Tarif de distribution (D)	**Méthode actuelle** (1)	**Méthode proposée** (2)	**Écart** (3)=(2)-(1)	**Revenu** (4)	**%** (5)=(3)/(4)
1	67 919	70 621	2 702	497 119	0,5 %
M	10 583	12 567	1 984	86 184	2,3 %
3	624	741	118	12 334	1,0 %
4	2 113	2 349	236	115 318	0,2 %
5 volet 1A	-2 319	-5 441	-3 222	38 728	-8,3 %
5 volet 1B	1 331	-485	-1 816	12 676	-14,3 %

Source : Pièce SCGM-11, document 1, page 9.

4.2.3 POINTE POUR LES CLIENTS EN SERVICE INTERRUPTIBLE

Le distributeur propose de revoir l'hypothèse d'une pointe à zéro pour les clients interruptibles puisque ces derniers, en particulier les clients du volet 1B, utilisent une part des outils de pointe. Il mentionne que les clients interruptibles ne doivent pas se voir allouer une pointe équivalente à celle des clients continus en raison du service de qualité moindre que reçoivent les clients interruptibles.

Le distributeur propose d'utiliser une fraction de la pointe pour les clients du tarif D_5 basée sur le nombre de jours de pointe où ces clients sont présents. Le distributeur évalue que durant l'hiver, il y a 70 jours où les outils de pointe sont utilisés. Il détermine le pourcentage qui devrait être attribué aux clients interruptibles en prenant le nombre de jours maximum affiché au texte des tarifs par rapport à ces 70 jours.

Ainsi, les clients du tarif D_5 volet 1A ne se voient pas attribuer de pointe puisque leur nombre de jours d'interruption maximum est supérieur à ces 70 jours. Pour leur part, les clients du tarif D_5 volet 1B se voient attribuer une pointe proportionnelle au nombre de jours de pointe où ils sont présents.

L'impact de cette proposition est illustré au tableau suivant.

TABLEAU 4
Impact de l'application d'une pointe à l'interruptible
Budget 2003-2004 – (000 $)

	Revenu d'équilibrage			**Revenu de transport, d'équilibrage et de distribution**	
Tarif de distribution (D)	**Méthode actuelle** (1)	**Méthode proposée** (2)	**Écart** (3)=(2)-(1)	**Revenu** (4)	**%** (5)=(3)/(4)
1	67 919	67 194	-725	497 119	-0,1 %
M	10 583	10 418	-165	86 184	-0,2 %

4.3 MODIFICATIONS AUX STRUCTURES TARIFAIRES

4.3.1 PRINCIPALES MODIFICATIONS

SCGM propose certaines modifications aux structures tarifaires. Plus spécifiquement les sujets abordés sont les suivants :

- ajustements reliés aux inventaires;
- service de fourniture – service fourni par le client;
- service d'équilibrage;
- service de distribution D_1 et D_M;
- structure tarifaire et efficacité énergétique ;
- texte des tarifs.

La nature, les modalités et les motifs sous-tendant ces modifications ainsi que, le cas échéant, leurs effets sont présentés à l'annexe 1.

4.3.2 EFFET SUR LES TARIFS

Le tableau 5 présente de façon globale l'effet de la stratégie tarifaire, des rabais transitoires ainsi que des modifications aux structures tarifaires.

TABLEAU 5
Répartition tarifaire[16]

	Revenus selon D-2003-180 2003- 2004 (000 $)					Revenus proposés 2004-2005 (000 $)

Source : Pièce SCGM-12, document 8, pages 1 et 4.

---

16 Certaines données diffèrent légèrement d'un tableau à l'autre. Ces différences, déjà présentes dans les pièces au dossier, sont causées par l'arrondissement.

Les tarifs de distribution diminuent en moyenne de 3,01 %. Cette baisse tient compte du remboursement à partir du FEÉ de 4 M$ fait aux clients petit et moyen débits. Ce remboursement représente une partie des gains de productivité de ces clients affectée au FEÉ. La baisse se répartit comme suit :

- D1 - 3,9 %;
- DM - 2,8 %;
- D3 - 2,2 %;
- D4 - 1,1 %;
- D5 + 8,5 %.

La distribution n'est qu'une composante de la facture totale du client. En tenant compte des autres composantes (inventaires, transport, équilibrage), la baisse globale moyenne des tarifs est de 1,19 %. La baisse se répartit comme suit :

- tarif 1 - 1,7 %;
- tarif M + 0,3 %;
- tarif 3 + 0,1 %;
- tarif 4 + 0,5 %;
- tarif 5 - 3,8 %.

4.4 OPINION DE LA RÉGIE

4.4.1 SUR LA STRATÉGIE TARIFAIRE

La Régie accepte la stratégie tarifaire proposée. Elle est conforme à l'approche retenue dans le mécanisme incitatif.

4.4.2 MODIFICATIONS AUX MÉTHODES D'ALLOCATION DES COÛTS DE TRANSPORT ET D'ÉQUILIBRAGE

Sur la méthode de répartition du coût de transport

La Régie prend acte qu'il n'y a pas lieu de modifier la méthode de répartition des coûts de transport.

Sur la fonctionnalisation entre la pointe et l'espace pour les coûts d'équilibrage

La Régie juge que l'augmentation de la proportion des coûts fonctionnalisés sous la composante pointe et la diminution de celle fonctionnalisée sous la composante espace reflète plus adéquatement la structure contractuelle des coûts d'entreposage du distributeur que les proportions utilisées actuellement. Pour ce motif la Régie accepte la proposition.

Toutefois, la Régie souhaite que certains aspects soient approfondis dans le prochain dossier tarifaire notamment :

- l'utilisation de données réelles aux fins de la fonctionnalisation des outils d'équilibrage entre la pointe et l'espace (par exemple : l'effet sur la stabilité des tarifs d'équilibrage à travers le temps, le lien de causalité avec le plan d'approvisionnement);
- l'inclusion des consommations des clients en service interruptible dans l'évaluation des journées de pointe;
- la fonctionnalisation de la provision de pointe.

Sur la pointe pour les clients en service interruptible

En ce qui concerne l'attribution d'une pointe aux clients du tarif D_5, la Régie considère que la proposition permet de capter les coûts associés à la planification des outils d'équilibrage contractés pour desservir cette catégorie de clients. En ce sens, la proposition permet de mieux refléter la causalité des coûts au niveau des outils d'équilibrage et d'ajuster la tarification en conséquence. La Régie accepte donc la proposition du distributeur.

4.4.3 MODIFICATIONS AUX STRUCTURES TARIFAIRES

La Régie accepte les modifications proposées aux structures tarifaires ainsi que les changements au texte des tarifs tels qu'explicités aux pièces SCGM-11, document 2 et SCGM-13, document 1.

La Régie relève que les ajustements à la méthode de tarification de l'équilibrage ont été, dans une large mesure, envisagés dans la perspective de rendre le tarif moins volatil aux effets du nombre réel de jours d'interruption. Afin que les modifications proposées n'aient pas d'impacts négatifs sur les autres clients, la Régie accepte que le transfert de coûts soit neutralisé à travers l'ajustement des grilles tarifaires de distributions interruptible et continu.

La Régie comprend que ces propositions ne devraient pas, dans le présent cas, créer d'interfinancement entre les services dégroupés d'équilibrage et de distribution. Quant à l'interfinancement entre les catégories de clients à l'intérieur d'un même service, la Régie prend acte de l'engagement du distributeur d'en cibler les déplacements (résultant d'un possible amenuisement du transfert de coûts) et de corriger, le cas échéant la situation. L'importance de cet interfinancement sera mesurée dans la prochaine étude d'allocation du coût de service.

5. PROGRAMME DE PRODUITS FINANCIERS DÉRIVÉS

La preuve de SCGM sur le programme de produits financiers dérivés est présentée sous la cote SCGM-5, document 2. L'annexe 2 présente un résumé des propositions relatives au programme de produits financiers dérivés. SCGM propose de maintenir ce programme. Les outils autorisés ne changent pas. Le prix d'exercice maximal pour l'achat des options est maintenu et celui pour contrats d'échange et plancher des colliers est mis à jour. Des modifications affectent les balises temporelles et volumétriques.

5.1 MODIFICATION AFFECTANT LES BALISES TEMPORELLES

SCGM propose d'utiliser une plus longue période sur laquelle la balise temporelle peut s'appliquer. La balise temporelle actuelle qui est une période roulante de 36 mois est portée à une date fixe qui ne dépassera pas octobre 2008 pour le dossier tarifaire 2005 et octobre 2009 pour le dossier tarifaire 2006 et ainsi de suite[17].

Le passage à une date fixe se justifie, selon SCGM, par la forme de la courbe des prix à terme du gaz naturel. Depuis quelques années, la courbe à terme est inversée, c'est-à-dire que plus l'échéance est lointaine, plus le prix d'achat du gaz naturel est bas[18]. SCGM veut mettre en place, à la suite de l'autorisation de la Régie, des opérations de couverture à long terme à des prix inférieurs à ceux anticipés par le marché à terme pour la prochaine saison gazière[19].

---

17 NS, volume 1, page 281, lignes 24 à 27.
18 Pièce SCGM-5, document 1, pages 3 et 4.
19 NS, volume 1, page 281, lignes 12 à 15.

En outre, le marché des produits dérivés sur le gaz naturel fonctionne par saison gazière, soit l'hiver et l'été. Il est plus avantageux de transiger par saison, tant pour la rapidité d'exécution que pour l'obtention de la meilleure cote possible[20].

5.2 MODIFICATIONS AFFECTANT LES BALISES VOLUMÉTRIQUES

Puisque l'utilisation de dérivés financiers par SCGM a comme prémisse de ne pas être spéculative, il est primordial de s'assurer que les volumes protégés dans le temps ne dépasseront jamais les volumes en service de fourniture de gaz naturel.

La méthodologie pour quantifier la limite volumétrique annuelle repose sur des hypothèses de déplacement des volumes en service de fourniture de gaz naturel de SCGM vers les achats directs ou d'autres sources d'énergie (facteur de déplacement) et sur le degré de précision de la prévision des prix des contrats d'échange dans le temps (facteur d'incertitude).

5.2.1 FACTEUR DE DÉPLACEMENT

Depuis le dossier tarifaire 2002[21], SCGM utilise les données historiques de consommation projetées pour établir le facteur de déplacement. SCGM recommande d'utiliser dorénavant les données historiques de consommation réalisées, car elles sont beaucoup moins volatiles[22]. Ces données de consommation réalisées ont également l'avantage de refléter la réelle variation des volumes achetés. De plus, les données de consommation projetées, bien que plus conservatrices, échouent aux tests statistiques de normalité[23].

5.2.2 FACTEUR D'INCERTITUDE

Le facteur d'incertitude fixe le portefeuille cible de protection en fonction du temps. La méthodologie utilisée intègre la relation inverse entre la période de temps et le degré de confiance.

---

20 Pièce SCGM-5, document 1, page 3.
21 Dossier R-3463-2001.
22 Pièce SCGM-5, document 1, page 8.
23 *Ibid.*

L'évolution future des prix du gaz naturel est incertaine. En raison d'éléments aléatoires, imprévisibles et souvent exogènes dans le comportement des prix, il y aura systématiquement une différence entre les prix protégés et les prix réellement observés. L'erreur de prévision qui en découle est généralement d'autant plus grande que l'horizon de prévision est loin[24].

Pour la première année, SCGM souhaite protéger par l'utilisation de l'un ou l'autre des outils financiers autorisés, au moins 20 %, mais au maximum 75 % des volumes prévus en service de fourniture de gaz naturel. Ce sont les mêmes valeurs que celles présentées dans le dossier tarifaire 2004. Pour les années subséquentes, SCGM propose d'utiliser successivement un facteur d'incertitude fixe de 75 %[25].

Ce facteur est fixé à 75 % pour des raisons opérationnelles. Sur une base quotidienne, SCGM conserve près de 25 % de ses approvisionnements en achat au comptant et le solde à indice. Fixé à 75 %, le facteur permet de conserver le niveau opérationnel d'achat au comptant, même s'il se produit une forte migration du service de fourniture de gaz naturel vers les achats directs ou les achats à prix fixe[26]. Le facteur d'incertitude proposé se veut simple et plus explicite qu'auparavant.

5.3 LIMITES FINANCIÈRES DES PRIX D'EXERCICE

Prix maximal pour contrat d'échange et plancher de colliers

SCGM recommande de faire passer le prix maximal pour contrats d'échange et plancher de colliers de 6,48 $/GJ à 6,91 $/GJ à AECO dans le but de maintenir une marge de manœuvre suffisante tout en restant compétitive[27].

Avec un prix de 6,91 $/GJ, SCGM démontre que ses tarifs sont compétitifs avec ceux offerts par Hydro-Québec pour plus de 92 % de la clientèle commerciale en service de fourniture. SCGM soumet que pour être compétitive auprès de 100 % de la clientèle commerciale, elle devrait utiliser un prix maximal de 5,80 $/GJ[28]. Au niveau actuel des prix,

---

24 Dossier R-3463-2001, pièce SCGM-1, document 3, page 12; dossier R-3510-2003, pièce SCGM-5, document 1, page 11; dossier R-3529-2004, pièce SCGM-5, document 1, page 14.
25 Pièce SCGM-5, document 1, page 14.
26 *Ibid.*
27 *Ibid.* à la page 5.
28 *Ibid.* à la page 17.

cette limite empêcherait toute fixation des prix à l'aide de contrats d'échange pour les hivers 2005 et 2006 et limiterait les transactions sur les années gazières 2006, 2007 et 2008[29].

Prix d'exercice maximal pour les options ou combinaisons d'outils

SCGM recommande que le prix d'exercice maximal soit maintenu à 11 $/GJ, à l'achat. En contexte de prix élevés et de grande volatilité des prix, le prix d'exercice maximal à l'achat de 11 $/GJ demeure approprié[30].

L'utilisation d'options d'achat peut s'avérer un puissant outil de contrôle des prix lorsque le marché subit des chocs sur l'offre. La marge de manœuvre permise par un prix d'exercice maximal pour les options d'achat à 11 $/GJ est donc toujours nécessaire.

5.4 OPINION DE LA RÉGIE

La Régie note que les modifications sont d'ordre technique et n'affectent pas les trois principaux objectifs initiaux du programme de dérivés financiers :

- limiter l'impact des flambées de prix lors de cycles haussiers ou lors de pointes de la demande sur le marché;
- saisir des opportunités de marché pour protéger la position concurrentielle du gaz naturel;
- stabiliser le prix du gaz naturel en réduisant la volatilité du portefeuille.

Sur les modifications aux balises temporelles et volumétriques

La Régie accepte la proposition du distributeur de modifier la balise temporelle. Dans un contexte de courbe des prix à terme inversée, la Régie juge raisonnable d'accorder à SCGM la possibilité de pouvoir transiger sur une période plus longue et ainsi mettre en place des opérations de couverture à long terme à des prix inférieurs à ceux anticipés par le marché pour la prochaine saison gazière.

---

29 Pièce SCGM-5, document 1, page 5.
30 *Ibid.* à la page 6.

La Régie accepte les modifications techniques proposées aux facteurs de déplacement et d'incertitude et les limites volumétriques qui en découlent. Les modifications proposées rendent les calculs plus simples. Elles permettent de mieux refléter la réelle variation des volumes achetés et de conserver un niveau d'approvisionnement au comptant pouvant tenir compte d'une migration des clients du service de fourniture de gaz naturel vers les achats directs ou les achats à prix fixe.

Sur les limites financières des prix d'exercice

La Régie accepte la proposition du distributeur de fixer à 6,91 $/GJ à AECO le prix maximal pour les contrats d'échange et plancher de colliers. La Régie accepte également la proposition de reconduire le prix d'exercice maximal pour l'achat des options de moins de un an à 11 $/GJ à AECO. Les explications présentées par SCGM quant aux conditions de marchés très volatiles et quant aux prix très élevés sont justifiées dans le présent contexte gazier.

6. PLAN D'APPROVISIONNEMENT GAZIER – HORIZON 2005-2007

Tel que requis par le *Règlement sur la teneur et la périodicité du plan d'approvisionnement*[31], SCGM dépose son plan d'approvisionnement gazier à la pièce SCGM-4. Ce plan présente la prévision triennale de la demande de gaz ainsi que les outils d'approvisionnement requis pour satisfaire cette demande.

6.1 DEMANDE DE GAZ NATUREL

Hypothèses économiques et situation concurrentielle

SCGM présente deux scénarios de demande : un scénario de base et un scénario favorable.

Le scénario de base repose sur les hypothèses suivantes :

- une croissance économique annuelle soutenue se situant entre 3,1 % et 3,3 %;

[31] (2001) 133 G.O. II, 6037.

- une prévision du prix de la fourniture de gaz provenant de l'Alberta variant entre 5,65 $/GJ et 6,32 $/GJ;
- un prix du mazout n° 6 variant entre 30,87 $ et 32,58 $ CA/baril;
- une augmentation annuelle ajustée au taux d'inflation pour les tarifs d'électricité régulière et l'équivalence entre le tarif régulier et le tarif bi-énergie d'Hydro-Québec à partir d'avril 2006.

En vertu du scénario de base, la position concurrentielle du gaz naturel dans les différents marchés est défavorable par rapport au mazout sur tout l'horizon du plan. La position concurrentielle du gaz naturel par rapport à l'électricité est favorable dans le marché commercial, mais défavorable dans le marché résidentiel.

Le scénario favorable repose sur une situation concurrentielle avantageuse du gaz par rapport au mazout n° 6 ainsi que sur la modification d'autres facteurs affectant à la hausse la demande des clients de la grande entreprise.

Prévision de la demande

Sous le scénario de base les livraisons dans le marché des grandes entreprises diminueront de 10 % (273 $10^6 m^3$) entre 2005 et 2006 en raison du non-renouvellement anticipé du contrat d'un client majeur en service continu. Les livraisons aux clients petit et moyen débits augmenteront d'environ de 2,7 % (80 $10^6 m^3$) par année en raison de la croissance économique soutenue et de l'abrogation au 1er avril 2006 du tarif bi-énergie d'Hydro-Québec. Bien qu'en 2007, les livraisons projetées dans le secteur de la grande entreprise augmentent de près de 41 % (988,3 $10^6 m^3$) à cause de la demande de la nouvelle génération électrique, la demande totale approvisionnée par le distributeur subit une décroissance de 5,4 % entre 2005 et 2007. En effet, la demande créée par la génération électrique n'a pas d'impact sur le plan d'approvisionnement et en est donc exclue. Le distributeur considère que le client fournira son approvisionnement gazier.

SCGM émet l'hypothèse que le prix du service de fourniture de gaz naturel anticipé pour 2005 n'aura pas d'impact négatif sur la demande à cause des mesures prises par le distributeur pour limiter les impacts de la volatilité élevée des prix sur la demande de gaz naturel.

Le tableau 6 présente les prévisions, excluant la génération électrique, anticipées sous les deux scénarios. Ces prévisions tiennent compte des pertes de consommation attribuables aux programmes d'efficacité énergétique.

TABLEAU 6
Demande de gaz naturel 2005-2007
excluant celle de la génération électrique
(avant interruptions) – 10^6 m³

	Scénario de base			Scénario favorable		
	2005	**2006**	**2007**	**2005**	**2006**	**2007**
Service continu	4 816	4 550	4 641	4 816	4 893	4 984
Service interruptible	801	752	672	801	1 233	1 137
Total	5 617	5 302	5 314	5 617	6 126	6 121

Source : Pièce SCGM -4, document 1, pages 19, 23 et 25.

6.2 CONTEXTE ET STRATÉGIES D'APPROVISIONNEMENT

Selon le distributeur, l'objectif premier du plan est de procurer aux clients un approvisionnement sécuritaire tout en s'assurant que le coût d'utilisation du gaz naturel soit le plus bas possible et concurrentiel avec celui des énergies alternatives. Spécifiquement, le distributeur contracte les outils nécessaires afin de rencontrer la demande en pointe et la demande saisonnière des clients en service continu et, dans la mesure du possible, celle des clients interruptibles. Ces approvisionnements doivent être suffisamment flexibles pour faire face aux fluctuations causées par le climat et par l'économie.

6.2.1 FOURNITURE

Le distributeur prévoit évoluer dans un contexte de prix élevé du gaz ainsi que d'une grande volatilité des prix. Sa stratégie d'acquisition de la fourniture varie en fonction du point d'acquisition. À AECO, SCGM sélectionne les fournisseurs en procédant par appel d'offres et limite à des périodes de 12 et 24 mois ses contrats d'achat à indice mensuel. Cette flexibilité permet de réévaluer plus souvent le crédit des fournisseurs.

À Dawn, le distributeur préfère avoir des contrats au moins deux ans à l'avance afin de pouvoir se repositionner à AECO advenant le tarissement de ce marché secondaire. À ce point d'acquisition, les fournisseurs sont sélectionnés par invitation selon les critères suivants : la cote de crédit, la crédibilité et la prime de lieu demandée.

De façon générale, SCGM planifie contracter entre 65 % et 75 % de ses besoins avant le début de l'année gazière et conserver au moins 25 % de ses achats au comptant afin d'être en mesure de réagir aux variations de la demande causées par la migration entre les clients en achats directs et ceux sous le service de fourniture du distributeur, ainsi qu'aux aléas de la température.

6.2.2 TRANSPORT

SCGM poursuit son objectif de minimiser son coût de transport en diminuant la capacité longue distance (FTLH) et en y jumelant des achats à Dawn. Ces achats à Dawn sont transportés sur un contrat de courte distance (FTSH), à des coûts moindres. Le transport provenant du bassin sédimentaire de l'Ouest canadien est presque entièrement utilisé, alors que le transport provenant de Dawn est celui qui s'ajuste à la variation de la demande. Tout comme pour la fourniture, SCGM surveille la valeur du transport sur le marché secondaire afin de se repositionner à AECO advenant le cas où la valeur du marché secondaire annulerait les économies reliées à cette option à Dawn.

Pour l'année 2005, le coefficient d'utilisation anticipé sur les contrats de transport FTLH est de 99,8 %.

6.2.3 ÉQUILIBRAGE

Le portefeuille d'outils d'équilibrage de SCGM est constitué de trois sites d'entreposage souterrain, d'une transaction d'échange de gaz naturel été-hiver et de l'usine de liquéfaction dont SCGM est propriétaire.

Le tableau 7 montre les capacités contractuelles des sites d'entreposage et les capacités requises pour l'année 2005.

TABLEAU 7
Année 2005

Entreposage	Capacités contractuelles (10^3m^3)	Capacités requises (10^3m^3)
Pointe du Lac*	22 592	67 000
Saint-Flavien*	95 487	107 000
Gaz naturel liquide (GNL)	58 591	42 000
Union Gas	597 625	550 000

* Possibilité d'approvisionner ces sites d'entreposage plus d'une fois dans l'année.
Source : Pièces SCGM-3, document 1, page 7 et SCGM-3, document 4.

6.2.4 SOURCES D'APPROVISIONNEMENT ET DEMANDE

Pour l'année 2005, le distributeur anticipe une demande de pointe des clients en service continu pour une température de 44 degrés-jours (DJ) de 30 279 10^3m^3. Afin de répondre à cette demande de pointe, le distributeur a contracté des outils pouvant desservir une consommation de 31 710 10^3m^3. L'écart entre la demande et les outils à la disposition du distributeur correspond à la provision de pointe et représente 4,7 % de la demande totale en pointe.

Le distributeur prévoit interrompre un volume de 56 10^6m^3 durant l'hiver 2005. Ce volume représente 7 % de la demande des clients en service interruptible.

6.3 CARACTÈRE OPTIMAL DE LA STRUCTURE CHOISIE

SCGM mentionne que l'expérience des dernières années lui a démontré que pour faire face à la réalité opérationnelle et commerciale de l'approvisionnement, elle doit dégager du plan une provision de pointe de l'ordre de 3,5 % à 6 %.

Cette marge de manœuvre permet de combler les besoins de pointe des clients en service interruptible du volet 1B pour un volume de 709 10^3m^3 et de faire face aux variations de la consommation découlant des fluctuations de la température et de la demande des clients industriels.

Le distributeur fait valoir qu'il doit se positionner dans le marché nord-américain particulièrement au niveau de l'équilibrage. Il considère que l'entreposage de Union Gas est un actif hautement recherché et qu'il fait partie des outils stratégiques à conserver dans son portefeuille. Cette approche découle de la demande grandissante en gaz naturel pour la génération électrique et de la rareté des sites géologiques d'entreposage.

6.4 OPINION DE LA RÉGIE

La Régie juge que le plan d'approvisionnement couvrant l'horizon 2005 à 2007 est conforme aux exigences du *Règlement sur la teneur et la périodicité du plan d'approvisionnement*. Elle évalue ce plan d'approvisionnement sous les aspects suivants : la sécurité d'approvisionnement et le caractère optimal du plan.

Sur la sécurité d'approvisionnement

La Régie note que le portefeuille d'approvisionnement rencontre les besoins annuels, saisonniers et de pointe de la clientèle.

L'examen de la preuve démontre que, pour les besoins de pointe, les outils à la disposition du distributeur permettent de rencontrer une demande pour une température de 44 DJ. À ce chapitre, la Régie observe qu'au cours des dix dernières années de telles journées ont été très peu fréquentes[32]. La Régie note qu'en ce qui concerne les besoins de pointe pour l'année 2005, le distributeur maintient une provision représentant 4,7 % de la demande de pointe.

La Régie constate que, pour la demande saisonnière en hiver, le volume d'interruption est de 7 % et qu'il est proportionnellement plus faible que celui du dossier tarifaire de l'an dernier qui était de 14 %[33]. De plus, comme l'illustre le tableau 7, elle note que l'entreposage à l'usine de liquéfaction et chez Union Gas n'est pas complètement utilisé.

Dans ces conditions, la Régie juge que le plan d'approvisionnement montre suffisamment de flexibilité pour faire face aux fluctuations de la demande. La Régie est satisfaite des

32 Pièce SCGM-3, document 4.6, pages 2 et 3.
33 Dossier R-3510-2003, pièce SCGM-3, document 4, page 1.

stratégies du distributeur quant à la sécurité d'approvisionnement de la franchise sur l'horizon du plan.

Sur le caractère optimal du plan d'approvisionnement

La Régie doit examiner le plan et en apprécier son optimalité de manière à s'assurer que les tarifs de transport et d'équilibrage qui en découlent soient justes et raisonnables pour l'ensemble des clients. L'exercice requiert d'évaluer et d'apprécier les moyens proposés et leurs coûts. Pour ce faire, la Régie doit pouvoir, à partir de la preuve déposée au dossier, être en mesure de faire cette analyse.

La Régie est satisfaite des explications données en audience concernant l'optimalité du plan. Par ailleurs, la Régie prend note de l'engagement du distributeur d'établir, lors du prochain dossier tarifaire, des paramètres ou des repères qui permettront d'apprécier les marges de manœuvres nécessaires et optimales à la réalisation du plan.

En conclusion, la Régie approuve le plan d'approvisionnement gazier pour l'année 2005.

7. AUTRES SUJETS D'AUDIENCE

7.1 MODIFICATIONS AUX P.R.C. ET P.R.R.C.

PREUVE DE SCGM

L'objectif du programme de rabais à la consommation (P.R.C.) est de réaliser une nouvelle vente de gaz naturel chez un nouveau client ou chez un client existant alors que l'objectif du programme de rétention par voie de rabais à la consommation (P.R.R.C.) est de maintenir la consommation de gaz chez un client existant[34].

L'évolution récente du marché ainsi que le désir de SCGM de poursuivre son développement amène le distributeur à proposer certains ajustements et améliorations à ces programmes[35].

---

[34] Pièce SCGM-2, document 10, page 2.
[35] Pièce SCGM-2, document 8, page 1.

Un ajustement important est l'admissibilité aux P.R.C et P.R.R.C. de tous les équipements à gaz naturel. Selon SCGM, l'impact marginal de un mètre cube de gaz consommé est le même peu importe l'appareil ou l'application pour lequel il est utilisé.

Dans le cas du P.R.C. nouvelle construction, cet élargissement permet à SCGM de favoriser, dans le marché résidentiel, l'installation d'un maximum d'appareils périphériques, tels que les foyers, cuisinières, barbecues ou chauffe-piscine.

Avec cet élargissement, la clause exemptant les clients des tarifs de distribution D_1, D_2 et D_M de l'obligation annuelle est maintenue, sauf pour les bénéficiaires de l'aide financière utilisant le gaz naturel majoritairement pour des procédés. Cette exception vise à protéger les investissements du distributeur.

Désormais, le rabais ne s'applique que sur le tarif du service de distribution.

POSITION DE SÉ/AQLPA

S.É/AQLPA émet des réserves quant à l'admissibilité de certains équipements périphériques, tels que les foyers et les barbecues. Les équipements périphériques ayant une efficacité inférieure à 50 % devraient être exclus des dépenses admissibles. Quant aux autres équipements, il y aurait lieu d'énumérer spécifiquement les équipements admissibles après que la Régie aura comparé leur efficacité et leurs émissions atmosphériques à celles des équipements des filières concurrentes[36].

De plus, il devrait être requis que le client installe les accessoires adéquats pour maximiser l'efficacité de ces équipements, tels que des thermostats électroniques programmables ou d'autres équipements de contrôle[37].

---

[36] Pièce SÉ/AQLPA-2, document 2, page 12.
[37] *Ibid.* à la page 10.

7.2 PROGRAMME DE FINANCEMENT POUR LA CLIENTÈLE AFFAIRES

PREUVE DE SCGM

Dans sa décision D-2000-188[38], la Régie autorise SCGM à offrir un programme commercial axé sur le financement (PCAF) qui consiste à octroyer un financement correspondant à l'écart entre le coût des équipements ainsi que leur installation et le rabais tarifaire offert au client en vertu des P.R.C. et P.R.R.C. Toutefois, depuis l'implantation de ce programme, SCGM a octroyé uniquement deux prêts à des clients existants[39].

Constatant que le PCAF ne répondait pas aux besoins de sa clientèle, le distributeur a sollicité à l'automne 2002 les services des institutions financières au Québec pour offrir un programme de financement en partenariat avec SCGM[40].

La Banque Scotia et SCGM, en partenariat avec l'entreprise GHR Systems[41] ont développé un concept de traitement des demandes de prêts et d'enquêtes de crédit complètement automatisé et un système informatique pour traiter les demandes de financement dans un délai de 48 heures. De plus, les gestionnaires et les représentants aux ventes de SCGM ont accès au système informatique sur le site Internet de GHR Systems pour vérifier l'avancement des dossiers de crédit[42].

SCGM propose de lancer un nouveau programme de financement pour permettre à ses clients affaires existants et potentiels d'avoir accès, rapidement et de façon simple et directe, à du financement d'équipement et de matériel de chauffage ainsi que de procédés à gaz naturel. Ce nouveau programme sera utilisé et promu par les représentants et les partenaires certifiés de SCGM[43].

La clientèle visée par ce programme est celle des marchés multilocatif, commercial et industriel aux tarifs 1, 3 et M excluant les entreprises en démarrage (moins de 24 mois d'existence) et le secteur de la restauration. Le programme de financement est destiné aux propriétaires de petites entreprises dont le chiffre d'affaires est inférieur à environ 5 M$ et il

---

38 Dossier R-3447-2000, 23 octobre 2000.
39 Pièce SCGM-2, document 7, page 3.
40 *Ibid.* à la page 5.
41 GHR Systems est le fournisseur de systèmes informatiques et service spécialisés dans le financement.
42 Pièce SCGM-2, document 7, page 9.
43 *Ibid.* à la page 8.

vise à financer des montants entre 5 000 $ et 50 000 $ servant à l'achat et à l'installation d'appareils à gaz naturel[44].

Selon l'entente entre SCGM et la Banque Scotia, cette dernière sera responsable de traiter les demandes de financement à partir du moment où elle reçoit une demande de crédit, et ce, jusqu'à l'échéance du prêt. Le taux d'intérêt sera établi par la Banque Scotia et sera révisé trimestriellement[45].

De son côté, SCGM est responsable de promouvoir le programme de financement auprès de sa clientèle et de compléter la confirmation d'identification du client lorsque ce dernier désire faire une demande de crédit pour financer son installation[46].

Selon l'entente négociée avec SCGM, la Banque Scotia assume les frais reliés à l'élaboration et à la mise en place du programme ainsi que les frais d'administration y incluant le coût de la gestion des prêts, de l'administration du programme de même que les frais d'étude et d'évaluation des dossiers de crédit[47].

En contrepartie, SCGM s'engage à contribuer au coût du programme de manière à compenser la Banque Scotia pour une proportion des pertes de crédit, le montant étant limité à 220 000 $ pour les deux premières années. Deux ans après le lancement du programme, un nouveau plafond sera fixé par le Comité de direction pour les années subséquentes en vue d'assurer que ce plafond reflète adéquatement la proportion du coût du programme par rapport aux ventes effectuées. Par ailleurs, SCGM désire imputer les coûts du programme de financement à son coût de service[48].

En raison de l'application limitée du programme, SCGM souhaite que le PCAF demeure disponible, et ce, tant et aussi longtemps qu'une alternative n'aura pas été mise au point et qu'elle ne satisfera pas l'ensemble de la clientèle visée par le PCAF[49].

---

44 Pièce SCGM-2, document 7, page 8.
45 *Ibid.* aux pages 8 et 9.
46 *Ibid.* à la page 9.
47 *Ibid.* à la page 12.
48 *Ibid.*
49 *Ibid.* à la page 8.

POSITION DE LA FCEI

La FCEI soumet que les critères d'admissibilité au programme développé en partenariat avec la Banque Scotia devraient être modifiés afin d'offrir ce service à l'ensemble de la clientèle, et ce, en incluant les entreprises en démarrage et les entreprises du secteur de la restauration[50].

La FCEI souligne les difficultés de financement croissantes des petites et moyennes entreprises auprès des institutions financières. L'intervenante est d'avis que tous les clients d'une même classe tarifaire devraient avoir accès aux mêmes services, d'autant plus si ces derniers en supportent les coûts. La FCEI prétend que SCGM devrait se satisfaire de l'évaluation de crédit effectuée par l'institution financière comme critère d'acceptation sans discrimination quant au type de marché de sa clientèle[51].

7.3 PROGRAMMES DE FLEXIBILITÉ TARIFAIRE MAZOUT ET BI-ÉNERGIE

SCGM demande à la Régie de reconduire, pour une période de deux ans se terminant le 30 septembre 2006, les programmes de flexibilité tarifaire mazout et bi-énergie pour les tarifs 1, 3 et M. Depuis leur instauration, ces programmes ont permis de prévenir une perte de volumes et de revenus transport, équilibrage et distribution ainsi que la hausse tarifaire qui en résulterait auprès de l'ensemble de la clientèle[52].

7.4 OPINION DE LA RÉGIE

Sur les P.R.C. et P.R.R.C.

Les modifications proposées aux P.R.C. et P.R.R.C. visent à apporter des précisions, à enlever des irritants ainsi qu'à éliminer certaines incohérences.

50 Pièce FCEI -1, page 6.
51 *Ibid.* à la page 5.
52 Pièce SCGM -2, document 1, pages 2 et 3.

La Régie ne juge pas opportun, dans le cas présent, d'exiger que tous les équipements admissibles aux P.R.C. et P.R.R.C. rencontrent les normes maximales d'efficacité énergétique. La Régie réitère qu'elle considère inapproprié d'imposer des conditions quant au choix des équipements admissibles au programme. Elle juge préférable que le client garde le libre choix des équipements qu'il désire installer. En outre, de telles conditions risquent de rendre plus difficile l'atteinte des résultats du programme[53].

La Régie juge que les équipements périphériques ne doivent pas être admissibles aux programmes en cause. Bien que la Régie soit sensible aux considérations « marketing » mises de l'avant par le distributeur, elle est toutefois d'avis qu'elle ne peut pas, étant donné la nature des équipements considérés, faire supporter les subventions éventuelles par la communauté des usagers.

Sur le programme de financement pour la clientèle affaires

La Régie note que le nouveau programme de financement pour la clientèle affaires a le même objectif que celui approuvé par la décision D-2000-188. Il s'en distingue notamment par le recours à une tierce partie pour la gestion du financement et l'exclusion des entreprises en démarrage ainsi que celles du secteur de la restauration. L'exclusion a été assimilée à une certaine forme de discrimination.

Lorsqu'un motif de discrimination est soulevé, la Régie doit d'abord vérifier s'il y a effectivement un traitement discriminatoire envers certains usagers. Dans l'affirmative, la Régie doit examiner, à la lumière des faits connus au dossier, si cette discrimination est indue.

L'exclusion explicite prévue pour un certain type de clientèle amène la Régie à conclure que le programme de financement pour la clientèle affaires est, à sa face même, discriminatoire puisqu'il accorde un traitement différent à certains clients à l'intérieur des mêmes catégories tarifaires.

D'une part, la Régie constate que l'exclusion de ces segments de marché relève d'une exigence de l'institution financière pour se conformer aux besoins spécifiés par SCGM dans son appel d'offres. Selon la compréhension de la Régie, l'institution financière est prête à offrir un taux de financement fixe compétitif et à respecter les conditions de l'appel d'offres

[53] Décision D-2000-188, R-3447-2000, 23 octobre 2000.

en autant que les segments de marché qu'elle juge plus à risque soient, dans un premier temps, exclus[54].

D'autre part, la Régie constate que l'exclusion des entreprises en démarrage et du secteur de la restauration pourrait n'être que temporaire. SCGM est consciente du problème causé par ce type de discrimination et elle entend le régler dès l'automne 2005[55].

Entre temps, compte tenu de l'application limitée du nouveau programme proposé, SCGM conserve le PCAF dans sa forme actuelle. Cette solution temporaire sera en vigueur tant et aussi longtemps qu'une alternative n'aura pas été mise en place pour satisfaire l'ensemble de la clientèle visée par le PCAF[56].

Dans ces circonstances, la Régie juge que l'exclusion des entreprises en démarrage et celles du secteur de la restauration ne constitue pas une discrimination indue. Toutefois, SCGM devra présenter, dans le cadre du prochain dossier tarifaire, le résultat de ses travaux et la solution envisagée pour desservir les entreprises en démarrage et celles du secteur de la restauration.

Sur les programmes de flexibilité tarifaire mazout et bi-énergie

La Régie accepte de reconduire pour deux ans le programme de flexibilité tarifaire mazout. Quant au programme de flexibilité tarifaire bi-énergie gaz-électricité, la Régie rappelle que, conformément à la décision D-96-24[57] de la Régie du gaz naturel, le distributeur doit mettre fin à ce programme si le programme bi-énergie d'Hydro-Québec se termine.

Par conséquent, la Régie maintient, jusqu'au 30 septembre 2005, tel que décidé dans la décision D-2003-180, le programme de flexibilité tarifaire gaz-électricité et demande à SCGM de lui démontrer, lors du prochain dossier tarifaire, la pertinence de maintenir le programme de flexibilité tarifaire bi-énergie gaz-électricité, étant donné la récente décision D-2004-170 de la Régie dans le dossier R-3531-2004.

8. RAPPORTS SPÉCIFIQUES DEMANDÉS PAR LA RÉGIE ET SUIVI DE DÉCISIONS

8.1 PGEÉ

SCGM présente des rapports de suivis pour le PGEÉ. Ces rapports comparent les résultats du PGEÉ aux prévisions, pour la période de six mois se terminant le 31 mars 2004. Au cours de cette période, SCGM a réalisé 52 % des économies envisagées, pour un total de 3,5 Mm^3, a rejoint 47 % des participants prévus et a dépensé 91 % du budget anticipé[58].

Plan 2004-2007

Le coût direct du PGEÉ sur l'horizon 2004-2007 est estimé à 16,5 M$, dont 12,3 M$ pour l'aide financière directe et 4,2 M$ pour les dépenses d'exploitation.

SCGM prévoit des économies cumulatives de près de 422,7 Mm^3 sur la durée de vie utile des mesures implantées, générant des économies nettes de 160,4 M$ (en dollars de 2004) pour les participants, comparativement à 154,1 M$ pour le PGEÉ 2003-2006. L'application du test du coût total en ressources indique des économies nettes de 63,9 M$, comparativement à 73,3 M$ pour le PGEÉ 2003-2006.

Pour l'année 2004-2005, SCGM demande à la Régie l'approbation d'un budget de 5,1 M$, dont 3,7 M$ d'aide financière et 1,4 M$ de dépenses d'exploitation. La prévision initiale du PGEÉ 2003-2006 pour l'année 2004-2005 correspondait, à peu de chose près, au même montant[59].

Pour la première année d'implantation du PGEÉ 2004-2007, SCGM envisage des économies annuelles de 10,6 Mm^3, générant pour les participants des économies monétaires nettes de 51,6 M$ sur la durée de vie utile des programmes. SCGM prévoit des pertes de revenus de 0,7 M$ et estime à 1,332 % l'impact tarifaire du PGEÉ, basé sur des revenus de distribution de 436,96 M$[60].

58 Pièce SCGM-9, document 1, page 25; pièce SCGM-9, document 2, page 2.
59 Pièce SCGM-9, document 1, page 4.
60 *Ibid.* aux pages 4, 65 et 67.

À cet égard, SCGM précise qu'aucun plafond n'est établi, *a priori*, en matière d'impact tarifaire et que ce dernier est fixé annuellement, en fonction des besoins. SCGM demeure néanmoins préoccupée par l'évolution de ses tarifs dans son appréciation des exigences en matière d'efficacité énergétique[61].

Le PGEÉ 2004-2007 comporte quinze programmes dont trois ne génèrent aucune économie d'énergie comptabilisée. Ces trois programmes, dits intangibles, visent la sensibilisation de tous les marchés à l'efficacité énergétique. SCGM offre cinq programmes tangibles pour le marché résidentiel et sept pour le marché commercial, institutionnel et industriel (CII), incluant les clients de la grande entreprise et les clients des immeubles multilocatifs[62].

SCGM met à jour le portefeuille du PGEÉ 2004-2007. Ce PGEÉ diffère du plan de l'année précédente sous quatre aspects[63] :

- pour le marché résidentiel, SCGM retire le programme de la trousse énergétique (PE 110), en raison d'une transformation du marché[64];
- le taux d'opportunisme appliqué aux programmes destinés à la clientèle de la grande entreprise (VGE) passe à 50 %, conformément à la décision D-2003-180. SCGM compte étudier, au cours de la prochaine année, la possibilité de réduire ce taux d'opportunisme en adaptant ou en modifiant ces programmes[65];
- l'incitatif à la performance est aboli, conformément à la décision D-2004-51[66];
- quatre programmes du PGEÉ sont transférés au FEÉ : le programme communautaire (PE 104), le programme de rénovation pour les habitations unifamiliales (PE 108) et pour les duplex et triplex (PE 112), ainsi que le programme d'enveloppe du bâtiment pour le marché de la nouvelle construction (PE 206).

SCGM présente l'état d'avancement de l'évaluation des programmes du PGEÉ[67]. Elle mentionne être consciente d'un retard quant à l'évaluation de certains programmes et reporte à un dossier ultérieur le dépôt de certains éléments de cette évaluation[68].

67 Pièce SCGM-9, document 1, pages 11 et 12.
68 NS, volume 1, page 29.

SCGM poursuit l'évaluation des taux d'attraction et de fidélisation de la clientèle. Cependant, les recherches de SCGM à ce sujet se soldent « *par un néant absolu. Les seules études portant sur l'effet de fidélisation s'adressent à la rétention d'équipements promus par un programme donné, mais rien sur la clientèle* ». Toutefois, SCGM compte intégrer dans ses exercices d'évaluations futures des questions sur la rétention auprès de la clientèle existante et sur l'attraction auprès de ses nouveaux clients participants à un programme du PGEÉ[69].

Transfert de programmes du PGEÉ au FEÉ

Lors de leur planification triennale respective, les représentants du PGEÉ et du FEÉ se sont consultés afin d'éviter le dédoublement d'efforts et le chevauchement de programmes.

Les parties ont convenu que le PGEÉ concentrera ses activités sur l'implantation de mesures liées aux appareils et systèmes connexes alimentés par le gaz naturel. Le FEÉ se concentrera sur les mesures touchant l'enveloppe du bâtiment et les nouvelles technologies autres que celles alimentées au gaz naturel. Le FEÉ favorisera également les interventions à caractères communautaire ou social. Ainsi, quatre programmes du PGEÉ sont transférés au FEÉ. Le transfert de ces quatre programmes ne réduit aucunement les efforts de SCGM en matière d'efficacité énergétique, puisque la réduction budgétaire d'environ 310 000 $ résultant de ce transfert a été réallouée aux programmes et activités du présent PGEÉ[70].

8.2 FEÉ

Le rapport d'étape 2003-2004 du FEÉ fait état des résultats obtenus et des coûts réels des programmes offerts[71]. En date du 20 juillet 2004, environ 49 % du budget prévu est engagé[72].

72 Pièce SCGM-9, document 11.

Plan d'action 2004-2005

Le Plan d'action 2004-2005 Horizon 2007 du FEÉ propose des investissements de près de 3,2 M$ pour la mise en oeuvre de 20 programmes devant générer des économies annuelles de l'ordre de 6,8 Mm^3 de gaz naturel au cours de la période du 1er octobre 2004 au 30 septembre 2005[73]. Le Comité de gestion du FEÉ est confiant que ce budget de 3,2 M$ est réaliste, compte tenu de l'expérience vécue et des modifications apportées à l'offre financière des programmes[74].

Pour la clientèle résidentielle, quatre des quatorze programmes proposés visent spécifiquement la clientèle à faible revenu et deux programmes s'adressent au milieu sociocommunautaire[75]. Ces programmes d'aide technique ou financière visent la construction ou la rénovation résidentielle, l'analyse énergétique des bâtiments, l'intervention communautaire, l'installation de panneaux réflecteurs de chaleur ou de murs solaires, la récupération de la chaleur des eaux grises et l'achat de fenêtres certifiées Energy Star.

La clientèle CII bénéficie de six programmes de subvention et de financement portant sur la construction ou la rénovation de bâtiments, l'installation de panneaux réflecteurs de chaleur, de systèmes solaires ou de systèmes récupérateurs de chaleur des eaux grises ainsi que sur la végétalisation des toits en milieu urbain.

Le Plan d'action 2004-2005 prévoit aussi des investissements de 200 000 $ pour effectuer une veille technologique ainsi que des frais de 500 000 $ pour la gestion et la commercialisation du FEÉ. Ces montants sont inclus au budget total proposé. Le coût unitaire des économies d'énergie se chiffre à 0,46 $\$/m^3$[76].

Plan d'action triennal

Pour donner suite à une demande de la Régie, le Comité de gestion du FEÉ dépose une planification sur trois ans de ses activités.

[73] Pièce SCGM-9, document 8, page 4.
[74] NS, volume 1, page 213.
[75] Pièce SCGM-9, document 8, page 4.
[76] *Ibid.*

Le Plan d'action 2004-2005 Horizon 2007 du FEÉ propose 20 programmes axés sur l'enveloppe du bâtiment, l'implantation d'une technologie émergente ou l'expérimentation d'une nouvelle approche commerciale. À l'horizon 2007, ce Plan d'action propose des investissements d'un peu plus de 11 M$[77], dont environ 33 % sont consacrés à la clientèle résidentielle et 67 % à la clientèle CII[78]. Les économies annuelles associées à ces investissements totaux s'élèvent à plus de 26,6 Mm^3 [79].

Tel que décrit à la section 8.1, quatre programmes du PGEÉ ont été transférés au FEÉ. Par ailleurs, un appel de propositions sera lancé afin de solliciter des projets novateurs.

8.3 CASEP

Le mécanisme incitatif maintient le compte d'aide à la substitution d'énergies plus polluantes (CASEP). Le mécanisme incitatif prévoit qu'une somme annuelle de 1 M$ est versée dans un compte pour réaliser des conversions de formes d'énergies plus polluantes vers le gaz naturel.

En 2002-2003, le volume équivalent d'énergie déplacée était de 10,4 Mm^3 et il s'agissait principalement de mazout n° 2[80]. Cependant, le volume équivalent d'énergie déplacée pour l'année à venir n'a pas été estimé par SCGM, puisque le potentiel de déplacement « *est plus grand que les sommes* […] *qui seraient disponibles* »[81].

8.4 OPINION DE LA RÉGIE

Sur le PGEÉ

La Régie constate que les rapports de suivi du PGEÉ respectent les orientations des décisions précédentes en termes de type de données et de qualité de l'information fournis. De plus, les coûts réels du PGEÉ sont conformes aux budgets présentés antérieurement et les frais d'administration sont maintenus à un niveau raisonnable.

---

77 Pièce SCGM-9, document 8, page 4.
78 *Ibid.* à la page 11.
79 *Ibid.* à la page 4.
80 Pièce SCGM-9, document 6, page 1.
81 NS, volume 1, pages 35 et 37.

La Régie prend acte de la mise à jour du portefeuille et des modalités des programmes du PGEÉ. La Régie autorise, par ailleurs, le retrait du programme de la trousse énergétique (PE 110), compte tenu des arguments présentés par SCGM.

La Régie prend acte du transfert de quatre programmes du PGEÉ au FEÉ. Elle encourage la concertation entre le Comité de gestion du FEÉ et les représentants de SCGM, en autant que cet arrimage n'affecte ni la mission du FEÉ, ni l'ampleur des efforts déployés par SCGM en efficacité énergétique.

La Régie approuve la mise en oeuvre du PGEÉ 2004-2007 et autorise le budget demandé de 5,1 M$. Par ailleurs, la Régie rappelle à SCGM l'importance de déployer les efforts pour se doter des outils nécessaires à l'évaluation de ses programmes selon les échéances fixées.

La Régie partage les préoccupations de SCGM en ce qui a trait à l'évolution de ses tarifs et réitère son inquiétude quant à l'impact grandissant du PGEÉ sur ces derniers. Bien que la Régie ne remette pas en question le principe général du mécanisme d'ajustement de pertes nettes des revenus (MAPR), elle demande à SCGM, lors du dépôt du prochain dossier tarifaire, de lui proposer une méthode d'établissement du niveau de l'impact tarifaire du PGEÉ, notamment en tenant compte d'un plafonnement des sommes incluses au MAPR ou en reconsidérant certaines modalités.

Sur le FEÉ

La Régie observe, cette année, un effort de concertation et de planification des activités du FEÉ et constate que la période de rodage des activités du FEÉ semble complétée. La Régie autorise le budget de 3,2 M$ demandé pour le FEÉ 2004-2005 Horizon 2007. Les représentants du FEÉ devront expliquer tout écart majeur entre les résultats projetés et obtenus.

La Régie demande aux représentants du FEÉ de poursuivre les efforts de planification pluriannuelle de leurs activités et d'en prévoir le dépôt pour le prochain dossier tarifaire.

Sur le CASEP

La Régie est préoccupée par le fait qu'il n'y ait pas d'objectif mesurable associé au CASEP, d'autant plus que le budget maximal est déjà fixé à 1 M$.

La fixation d'objectifs, en termes d'énergie déplacée et de projets réalisés, permet à la Régie de s'assurer que les montants sont adéquatement alloués. La Régie demande à SCGM, d'inclure ces objectifs annuels au prochain dossier tarifaire, en plus de présenter le détail des projets réalisés pour l'année en cours.

VU ce qui précède;

CONSIDÉRANT la *Loi sur la Régie de l'énergie*[82];

CONSIDÉRANT le *Règlement sur la procédure de la Régie de l'énergie*[83];

La Régie de l'énergie :

RECONDUIT jusqu'au 30 septembre 2006 le programme de flexibilité tarifaire mazout pour les clients des tarifs D_1, D_3 et D_M;

MAINTIENT la reconduction du programme de flexibilité tarifaire bi-énergie jusqu'au 30 septembre 2005, conformément à la décision D-2003-180;

APPROUVE, à compter du 1er octobre 2004, les modifications proposées à certaines conditions d'applications des programmes de rabais à la consommation et de rétention par voie de rabais à la consommation (P.R.C. et P.R.R.C), sauf en ce qui a trait à l'admissibilité des équipements périphériques;

---

82 L.R.Q., c. R-6.01.
83 (1998) 130 G.O. II, 1245.

APPROUVE, à compter du 1er octobre 2004, le programme additionnel alternatif à l'actuel programme commercial axé sur le financement (PCAF), tel que décrit à la pièce SCGM-2, document 7;

APPROUVE le plan d'approvisionnement de SCGM pour l'exercice 2005, tel que décrit à la pièce SCGM-4, document 1;

APPROUVE, pour l'exercice financier 2005, les modifications proposées au programme de produits financiers dérivés, les volumes totaux pouvant être protégés en vertu de ce programme ainsi que le plafond applicable aux contrats d'échange à prix fixes;

APPROUVE l'application à l'exercice 2005 du mécanisme incitatif à l'amélioration à la performance approuvé par la Régie dans sa décision D-2004-51;

APPROUVE la mise en œuvre du PGEÉ 2004-2005 et **AUTORISE** le budget de 5,1 M$ prévu à cette fin;

AUTORISE l'utilisation d'une somme de 3 169 883 $ dans la mise en œuvre du Plan d'action 2004-2005 du FEÉ;

AUTORISE le coût en capital moyen de 9,01 % (après partage des gains de productivité) sur la base de tarification pour l'exercice financier 2005;

AUTORISE, dans l'évaluation des projets d'investissements prévus par SCGM pour l'exercice financier 2005, le coût en capital prospectif de 7,04 %;

APPROUVE les modifications aux structures tarifaires décrites à la pièce SCGM-11, document 2;

MODIFIE, à compter du 1er octobre 2004, les tarifs de SCGM de façon à ce qu'ils génèrent les revenus requis totalisant 794 125 000 $, afin de permettre à SCGM de récupérer l'ensemble de ses coûts pour assumer ses services;

AUTORISE la répartition tarifaire proposée à la pièce SCGM-12, document 6;

APPROUVE le texte des tarifs proposé à la pièce SCGM-13, document 1.

ANNEXE 1

MODIFICATIONS AUX STRUCTURES TARIFAIRES

Annexe 1(10 pages)

J.-N. V. _______

A. C.-V. _______

F. R. _______

ANNEXE 1

MODIFICATIONS AUX STRUCTURES TARIFAIRES

SCGM propose certaines modifications aux structures tarifaires. Plus spécifiquement les sujets abordés sont les suivants :

- ajustements reliés aux inventaires;
- service de fourniture – service fourni par le client;
- service d'équilibrage;
- services de distribution D_1 et D_M;
- structure tarifaire et efficacité énergétique;
- texte des tarifs.

1. AJUSTEMENTS RELIÉS AUX INVENTAIRES

Le client qui utilise les services de fourniture, gaz de compression ou de transport de SCGM se voit facturer des ajustements pour tenir compte de la variation de la valeur des inventaires résultant d'un changement dans le prix de ces services ainsi que les coûts reliés au maintien de ces inventaires.

Lors du calcul de ces ajustements, tout inventaire négatif est ramené à une valeur minimale de zéro. SCGM propose d'enlever ce plancher minimal au calcul de l'inventaire de sorte que sa valeur puisse être négative.

Les clients sans inventaires, ceux qui font leur pointe de consommation en été ou qui ont un profil uniforme, ne contribuent pas aux coûts reliés aux inventaires. Sans les clients saisonniers d'été, le distributeur devrait constituer des inventaires supérieurs pour desservir les clients à profil « chauffage », augmentant par le fait même les coûts financiers de maintien des inventaires.

Cette proposition permet de reconnaître le bénéfice du profil de consommation estival au niveau de l'inventaire de SCGM. En fixant à zéro la valeur minimale des inventaires, l'économie ainsi créée par ces clients est répartie à l'ensemble des clients responsables des coûts d'inventaires et non à ceux qui permettent une économie.

La modification proposée accorde un crédit aux clients qui contribuent à réduire les niveaux d'inventaires, au même titre que ces clients se voient accorder un crédit au tarif d'équilibrage. Elle ne change pas les fondements de la méthode de calcul des inventaires.

Les clients des tarifs autres que D_1 se verront toujours facturer des ajustements reliés aux inventaires calculés client par client selon le profil de consommation, avec toutefois la possibilité que l'inventaire soit négatif. Dans le cas des clients du tarif D_1, le bénéfice apporté par le profil avantageux des clients saisonniers est alloué à l'ensemble des clients de ce tarif.

1.1 IMPACT DE LA PROPOSITION SUR LA CLIENTÈLE

Globalement, les revenus générés pour le distributeur par les ajustements reliés aux inventaires ne changent pas avec la modification proposée. Ils seront simplement répartis de façon différente entre les utilisateurs des services.

Sur la base du budget 2003-2004, les clients du service général (tarif D_1) subiront une augmentation globale de 367 000 $ puisque les inventaires sont principalement constitués pour les desservir. Sur une base globale, les clients des tarifs de distribution D_M et D_5 auront droit à une diminution des ajustements facturés; leur consommation moyenne en été est quelquefois supérieure à leur consommation moyenne en hiver. Les clients des services à débit stable (tarifs D_3 et D_4) seront peu affectés globalement.

2. SERVICE DE FOURNITURE – SERVICE FOURNI PAR LE CLIENT

2.1 DÉSÉQUILIBRES VOLUMÉTRIQUES QUOTIDIENS

Règlement financier d'un excédent de livraison relativement à un contrat de « gaz d'appoint pour éviter une interruption. »

Les clients interruptibles, qui ne peuvent ou ne veulent pas s'interrompre, contractent, dans la mesure du possible, du « gaz d'appoint pour éviter une interruption », plutôt que de consommer en retrait interdit.

Aucun service d'équilibrage n'est offert avec un contrat de « gaz d'appoint pour éviter une interruption ». Il en découle que les clients en « gaz d'appoint pour éviter une interruption » doivent s'engager à livrer au distributeur, au cours de la journée prévue d'interruption, un volume [volume journalier contractuel (VJC)] égal à leur consommation de la même journée.

Si la consommation de la journée prévue d'interruption diffère du VJC convenu, les règles relatives au déséquilibre volumétrique quotidien s'appliquent. Pour les fins du calcul du déséquilibre volumétrique quotidien, le VJC du client sera égal à sa consommation de la journée prévue d'interruption. Un déséquilibre volumétrique quotidien se mesure en comparant le volume effectivement livré au VJC.

Certains clients, incapables de gérer leur consommation de manière aussi précise, préfèrent livrer davantage de gaz, plutôt que de se retrouver en situation de retrait interdit. Ce faisant, ils se retrouvent en situation de déséquilibre volumétrique quotidien (excédent de livraison).

Selon les règles en vigueur, SCGM rachète l'excédent de livraison, dans la majorité des cas, à un prix inférieur au prix du marché payé initialement par le client. Pour ce dernier, la solution idéale serait de se voir racheter le gaz naturel et le transport au prix du marché. Cette solution n'est pas acceptable pour SCGM, car elle ne permet pas de maintenir le principe de base de garder indemnes les clients desservis par le distributeur.

Il est proposé que les excédents quotidiens de livraison d'un contrat de « gaz d'appoint pour éviter une interruption », sous la clause de déséquilibre volumétrique quotidien, soient reportés au contrat régulier de fourniture. Les déficiences de livraison demeureront assujetties au règlement financier, tel que prévu au texte des tarifs. En ce qui concerne le service de transport, le déséquilibre volumétrique, excédent et déficience, demeurera réglé financièrement, conformément au texte des tarifs. Cette solution n'a pas d'impact négatif pour les clients desservis par le distributeur, lorsque comparée à la situation actuelle.

Il ne s'agit pas d'une option offerte au client. Le report de l'excédent sera appliqué automatiquement, sauf pour des clients utilisant le service de fourniture du distributeur. Ces derniers, n'ayant pas de contrat de fourniture, devront nécessairement régler financièrement les excédents de livraison, au même titre que les déficiences.

2.2 DÉSÉQUILIBRES VOLUMÉTRIQUES DE LA PÉRIODE CONTRACTUELLE

Un déséquilibre de la période contractuelle survient lorsque le client retire, au cours d'une période contractuelle, un volume de gaz naturel différent de celui qu'il s'est engagé à livrer.

Depuis le dégroupement des services, la procédure de report à la période subséquente des déséquilibres de la période contractuelle a été abolie et le règlement financier à la fin de la période contractuelle est actuellement appliqué.

SCGM propose de permettre aux clients, dont les contrats de fourniture prennent effet à partir du 1er octobre 2004, de choisir entre le règlement financier en fin de période contractuelle ou le report du déséquilibre volumétrique à la période contractuelle selon les modalités suivantes :

- le choix devra être fait et signifié à SCGM avant le début de la période contractuelle du contrat de fourniture;
- par défaut le règlement financier sera appliqué;
- le report sera limité à 5 % des volumes retirés au cours de la période contractuelle et le solde sera réglé financièrement selon les modalités prévues au texte des tarifs;
- le report sera étalé sur une période de 12 mois.

De plus, SCGM pourra exiger le règlement financier dans le cas où le client est jugé financièrement à risque.

Les modalités retenues s'appuient sur les motifs qui suivent :

- l'obligation de faire un choix au début du contrat de fourniture reflète le mode administratif choisi par le client qui fournit son propre service et non la valeur économique qui y serait rattachée, celle-ci étant imprévisible 12 mois à l'avance;
- la limite de 5% des volumes retirés permet de contenir l'importance du financement supporté par les clients qui sont desservis par le distributeur;
- l'étalement du report sur une période de 12 mois entraîne moins d'impacts sur le tarif d'équilibrage ainsi que sur la politique de produits dérivés[84].

3 SERVICE D'ÉQUILIBRAGE

Afin de neutraliser l'effet de la fluctuation du prix d'équilibrage à cause de la différence entre le nombre réel de jours d'interruption et la prévision communiquée aux clients interruptibles, SCGM propose, qu'au 1er octobre de chaque année, un prix d'équilibrage pour chaque client des tarifs de distribution D_3, D_4, D_5 et D_M soit évalué. Ce prix tiendra compte de la consommation réelle des 12 derniers mois, corrigée, le cas échéant, pour refléter le nombre maximum de jours d'interruption prévu au texte des tarifs, selon le sous-tarif et le volet applicables au client interruptible. Ce prix sera facturé pour les 12 mois subséquents.

[84] Pièce SCGM-11, document 2.7.

Le tarif est simplifié étant donné la détermination du taux en début d'année. Actuellement, les 12 derniers mois de consommation servent à établir, chaque mois, le prix du service d'équilibrage. Ce dernier demeurera établi selon la formule actuelle du tarif d'équilibrage incluant la transposition des volumes. Toutefois, pour les clients interruptibles, les paramètres A et H seraient modifiés de façon à considérer un nombre de jours d'interruption égal au nombre maximal indiqué au texte des tarifs[85].

La méthode revient à constater le service d'équilibrage fourni au cours de l'année financière qui se termine et d'assumer que le service à fournir lors de la prochaine année sera similaire. Cette hypothèse est, de façon générale, plausible. Par contre, certains profils de consommation et de livraison peuvent résulter en des prix d'équilibrage plus particuliers.

Pour éviter des cas extrêmes, SCGM propose de fixer un prix minimum et un prix maximum pour le service d'équilibrage. Le prix minimum correspond au prix de l'entreposage fonctionnalisé sous l'espace divisé par 365. Le prix maximal est égal à l'écart de prix entre « D_1 & É au tarif D_1 » et « D_M à réduction maximale » pour le client moyen du tarif D_M.

Les prix minimum et maximum seront évalués en fonction des données du dossier tarifaire sous considération et révisés annuellement.

Selon le distributeur, en plus de simplifier le tarifs, la proposition a l'avantage de stabiliser le taux durant l'année, de rendre les coûts prévisibles pour les clients et de maintenir le principe d'utilisateur payeur chez les clients.

3.1 IMPACT FINANCIER DE LA PROPOSITION

Les modifications au tarif d'équilibrage affecteront directement l'interfinancement observé sous ce service, considérant que les méthodes d'allocation des coûts d'équilibrage ne sont pas modifiées pour l'instant.

Les modifications pour tenir compte du nombre de jours maximum d'interruption pour la clientèle interruptible amèneront un déplacement des revenus d'équilibrage entre les tarifs et donc un impact sur l'interfinancement à l'intérieur de ce service. Les ajustements à la méthode de tarification de l'équilibrage ont pour effet de faire supporter aux clients continus une part plus importante des coûts d'équilibrage, soit près de 5,8 M$ de plus. Il est proposé de réduire la différence entre les tarifs de distributions interruptible et continu en ajustant les grilles tarifaires de façon à neutraliser le transfert de coûts.

[85] Pièce SCGM-11, document 2, page 21.

L'impact marginal de la modification des paramètres A et H versus les revenus tenant compte des modifications à la méthode de fonctionnalisation des coûts d'équilibrage entre la pointe et l'espace ainsi que de l'application d'une pointe aux clients interruptibles du volet 1B[86] est de 2,3 M$, selon le dossier tarifaire 2004.

Il est proposé de réduire la différence entre les tarifs de distributions interruptible et continu en ajustant les grilles tarifaires de façon à neutraliser cet impact marginal. Ce dernier dans le présent dossier est de 1,7 M$[87].

L'ajustement de la grille tarifaire de distribution pour tenir compte des changements apportés à l'équilibrage permet de garder indemnes les clients en termes de revenus totaux. La compensation au tarif de distribution a été faite par bloc de tarifs, tarifs D_1/D_M, tarifs D_3/D_4 et finalement tarif D_5. Il est impossible de modifier les grilles tarifaires de distribution de façon à neutraliser pour chaque client l'impact de la modification au tarif d'équilibrage. Ce dernier est établi en fonction du profil de consommation de chaque client, sauf pour les clients au tarif général D_1 alors que les grilles tarifaires de distribution ne sont pas établies selon les mêmes caractéristiques.

L'application, au service de distribution, d'une compensation équivalente au déplacement des revenus d'équilibrage amènera un effet inverse sur l'interfinancement à l'intérieur du service de distribution.

3.2 IMPACT SUR LE TARIF DE DISTRIBUTION

En plus de l'ajustement des grilles tarifaires de distribution, SCGM propose d'éliminer la distinction au tarif de distribution D_5 entre les volets 1A et 1B.

Avec le nouveau tarif d'équilibrage proposé, qui amène un ajustement aux paramètres A et H pour les clients interruptibles ainsi que le nouveau calcul de la pointe pour les clients au volet 1B, il n'y a plus de raison d'avoir une grille tarifaire du service de distribution D_5 différente selon le volet.

86 Voir section 4.2 de la présente décision.
87 Pièce SCGM-11, document 2.12.

3.3 PARTICULARITÉS ADDITIONNELLES

SCGM propose que les prix moyens par tarif et par volet dans le cas du tarif interruptible soient établis lors du dossier tarifaire, inscrits au texte des tarifs et appliqués dans les situations suivantes :

- nouveau client qui s'engage auprès du distributeur en cours d'année financière;
- client existant au 1er octobre ayant moins de 12 mois d'historique au moment de l'établissement du prix, soit au 1er octobre;
- client existant au 1er octobre pour lequel la consommation est de 0 m³ pour les 12 mois, au moment de l'établissement du prix, soit au 1er octobre.

Il est également proposé que le prix d'équilibrage soit révisé en cours d'année à la suite de tout changement contractuel au service de distribution interruptible qui entraîne un changement de sous-tarif ou un passage du volet 1A au volet 1B et vice versa, ou si le client passe d'un service continu à un service interruptible et vice versa.

3.4 AJUSTEMENT RELIÉ AUX INVENTAIRES

Le calcul mensuel actuel de l'ajustement relié aux inventaires est maintenu en utilisant les paramètres A et H du tarif d'équilibrage, après transposition, le cas échéant.

3.5 NORMALISATION DE LA TEMPÉRATURE

La méthode de normalisation de la température devra être adaptée. Actuellement, les revenus d'équilibrage sont normalisés afin de tenir compte de l'impact monétaire d'une variation de la température. Dans le cas du service d'équilibrage, deux aspects influencent la génération des revenus : le niveau de consommation et la répartition de cette consommation en cours d'année. Ainsi, non seulement des volumes retirés en plus ou en moins à cause de températures sous ou au-dessus des températures normales entraîneront-ils des revenus différents de la normale, mais la façon dont ces volumes seront répartis entre les mois influera également.

La proposition d'appliquer un prix moyen pour chacun des clients pour les 12 mois de l'année financière, rend inutile la détermination d'un prix d'équilibrage sous des températures normales. En effet, les variations de température n'auraient plus d'impact en cours d'année sur la consommation journalière moyenne annuelle, sur la consommation journalière moyenne d'hiver et sur la consommation journalière de pointe, paramètres A, H et P respectivement et donc sur les prix.

Par contre le niveau de consommation des clients serait encore influencé par les variations de température. Les revenus d'équilibrage devront donc toujours être normalisés, mais seulement à partir d'une normalisation des volumes.

4. SERVICE DE DISTRIBUTION D_1 ET D_M

Pour tous les clients du tarif D_1, exception faite des clients résidentiels et institutionnels, et pour ceux du tarif D_M, les frais de base passent de 55 ¢/compteur/jour à 45 ¢/compteur/jour. Pour les clients résidentiels et institutionnels du tarif D_1, les frais de base passent de 28 ¢/compteur/jour à 27 ¢/compteur/jour.

Le taux unitaire du premier palier (0 à 30 m³/jour) demeure inchangé, toutefois les taux unitaires des autres paliers sont ajustés afin de générer les mêmes revenus totaux.

La proposition entraîne très peu de modifications sur la facture totale des clients, sauf pour les clients consommant moins de 1 095 m³/année qui verront leur facture diminuer de près de 2 %. Malgré l'augmentation de l'interfinancement, ce niveau se justifie par l'intégration de certaines mesures pour favoriser l'efficacité énergétique et l'amélioration de la situation concurrentielle dans certains créneaux spécifiques.

5. STRUCTURE TARIFAIRE ET EFFICACITÉ ÉNERGÉTIQUE

Afin d'atténuer certains « désincitatifs » à l'efficacité énergétique, SCGM propose d'implanter les modifications suivantes aux structures tarifaires :

- l'assouplissement des seuils d'accès aux tarifs; et
- la révision des engagements contractuels reliés aux obligations minimales annuelles (OMA) et au volume souscrit pour la portion marginale des baisses de consommation réalisées dans le cadre d'un programme d'efficacité énergétique (PEÉ).

5.1 CLIENTÈLE VISÉE PAR LES MODIFICATIONS PROPOSÉES

Les modifications proposées s'appliqueront uniquement aux clients qui prendront part, après le 1er octobre 2004, à un PEÉ encadré par le PGEÉ ou par le FEÉ et pour lequel la quantification des économies d'énergie s'avère possible.

5.2 RÉDUCTION DU SEUIL D'ACCÈS

SCGM propose de maintenir, pour le client qui rencontre les conditions ci-dessus, l'accès au tarif actuel même si sa consommation est réduite.

5.3 RÉDUCTION DE L'OMA DES CLIENTS AUX TARIFS D_1, D_M ET D_5

SCGM propose qu'au moment de l'adhésion au PEÉ, le volume utilisé dans le calcul de l'OMA de distribution et de transport puisse être diminué d'un volume équivalent à la baisse marginale prévue par l'application du programme.

Cette nouvelle approche permet de réduire l'OMA devant être respectée par le client, tout en maintenant le pourcentage d'OMA à son niveau actuel, laissant ainsi intact le pourcentage de réduction pour l'OMA.

Dans le cas d'une adhésion à un PEÉ par un client au tarif D_M, SCGM propose d'accepter une révision du volume projeté utilisé pour le calcul de l'OMA même s'il s'est écoulé moins de 12 mois depuis la dernière révision.

Cette proposition constitue une dérogation aux conditions actuelles qui prévoient qu'un client peut réviser son pourcentage d'OMA une première fois n'importe quand après son adhésion au tarif D_M puis, par la suite, à intervalles minimums de 12 mois.

Les OMA requises pour permettre l'atteinte d'un niveau minimal de revenu dans le cas des clients au service général de distribution D_1 ne sont pas touchées par les modifications proposées. Il en est de même dans le cas des clients au tarif D_M, lorsque de telles OMA sont fixées en ajout de l'OMA tarifaire.

5.4 RÉDUCTION DU VOLUME SOUSCRIT ET DE L'OMA DE TRANSPORT AUX TARIFS D_3 ET D_4

Au moment de l'adhésion à un PEÉ, il est proposé que :

- le volume souscrit puisse être diminué d'un volume équivalent à la baisse marginale prévue par l'application du PEÉ et que ce volume souscrit révisé puisse être inférieur à 333 m³/jour;
- le volume annuel utilisé dans le calcul de l'OMA de transport puisse être diminué d'un volume équivalent à la baisse marginale prévue par l'application du PEÉ.

Les restrictions prévues en 5.3 concernant l'OMA requise pour permettre l'atteinte d'un niveau minimal de revenu s'appliquent.

5.5 DÉTERMINATION DE LA BAISSE POUR AJUSTER LE SEUIL D'ACCÈS AUX TARIFS ET LES MODALITÉS CONTRACTUELLES DU CLIENT

La diminution du seuil d'accès et des modalités contractuelles est limitée à un niveau équivalent à la baisse marginale. La baisse marginale est évaluée en faisant la différence entre la consommation d'un client résultant de la mise en place de la mesure plus performante et la consommation d'un client à la suite de l'implantation d'une mesure dite normale.

5.6 DÉTERMINATION DE LA DURÉE RECONNUE DE LA MESURE D'EFFICACITÉ ÉNERGÉTIQUE POUR AJUSTER À LA BAISSE LE SEUIL D'ACCÈS AU TARIF

La durée de vie doit être déterminée *a priori*, indépendamment des conditions particulières à chaque client. Aucune vérification ne doit être faite chez le client afin de vérifier si les appareils installés sont toujours en place et utilisés. SCGM propose que la baisse marginale reconnue le soit pour une durée moyenne, évaluée *a priori*, pour le type de mesure d'efficacité énergétique implantées.

6. TEXTE DES TARIFS

Le texte des tarifs intègre les modifications proposées aux structures tarifaires. Il inclut également des modifications à l'écriture visant simplement à uniformiser le texte ou à en faciliter la lecture et la compréhension.

Le texte des tarifs contient une proposition de modification de l'article 2 « Tarif » de la section « Fourniture – C) Service de gaz d'appoint » afin de permettre au distributeur de contracter lui-même la fourniture et le gaz de compression requis pour répondre au besoin en gaz d'appoint d'un client et de lui revendre le tout au prix réel.

ANNEXE 2

RÉSUMÉ DES PROPOSITIONS DU PROGRAMME DE DÉRIVÉS FINANCIERS

OUTILS AUTORISÉS

- Contrat d'échange à prix fixe
- Achat et vente d'options d'achat et de vente
- Combinaison des outils précités

BALISE TEMPORELLE

- Couverture maximale : ne dépassant pas le 30 octobre 2008
  - ? La balise temporelle se voit attribuer une date maximale au lieu d'être une période mobile de 36 mois. Couverture maximale : 48 mois
  - ? En moyenne, l'augmentation de la base temporelle est de 6 mois

ENVELOPPE BUDGÉTAIRE POUR LE PAIEMENT DES PRIMES

- Maximum de 1,5 % du coût annualisé du service de fourniture de gaz naturel de SCGM et de gaz de compression

PRIX MAXIMAL POUR CONTRATS D'ÉCHANGE ET PLANCHERS DE COLLIERS

- 6,91 $/GJ à AECO équivalent MTL

PRIX D'EXERCICE MAXIMAL POUR L'ACHAT DES OPTIONS AVEC UNE ÉCHÉANCE INFÉRIEURE À

- Octobre 2005 : 11,00 $/GJ à AECO
- Octobre 2006 : 10,43 $/GJ à AECO (1)
- Octobre 2007 : 9,97 $/GJ à AECO (1)
- Octobre 2008 : 9,60 $/GJ à AECO (1)
