

**6.2 Asset Management Technology Replacement**

**Q. Will the proposed software purchase require that current integrations as described in section 2.2.2 (page 7) require individual programming to integrate with the proposed software? If not, please explain. If so, then at what cost?**

A. The current asset management technology integrates with other systems to facilitate information flow. While a replacement technology has not yet been chosen, integrations with other systems will be necessary. The estimated internal labour cost for these integrations is approximately \$600,000 and is included in the total project cost.

As part of the Request for Information ("RFI") to asset management technology vendors, integrations required to other Newfoundland Power technologies were included. Therefore, the total project cost provided by each vendor is inclusive of these integrations and is included in the total vendor cost associated with the project.
